FOREWORD

I read Admiral Rickover’s book when I was on a vacation Caribbean cruise in 1960, in which year I was taking courses to switch from secretarial work to teaching. The other paperback book in my suitcase was Dr. Rudolf Flesch’s Why Johnny Can’t Read, and What You Can Do About It (Harper & Row, Publishers, Inc., New York: 1955). Dr. Flesch’s book was shattering. It also explained something to me which had puzzled me greatly. In the fall of 1958, I had attended a Saturday morning English class at Fairleigh Dickinson University in Rutherford, New Jersey. A back row of young ex-servicemen in that class had not been able to read simple material aloud correctly when the professor, Dr. Lloyd Haberle, had asked them to do so. The inability of these young men to read correctly had astonished me. Yet it was nothing to the astonishment I felt when I began teaching third grade in September, 1963, and found that the alarm bells being rung by Admiral Rickover and Dr. Flesch had largely fallen on deaf ears in the public schools.

In the twenty-two and one-half years I spent teaching primary grades in public schools, never once did the school administration endorse the kind of true phonics program which Dr. Flesch endorsed. Some attempts were made to improve the teaching of mathematics and science, but the attempts could do little good with a school population that had been crippled in its reading skills. This was particularly so since for many of the students, unlike those ex-servicemen I remember, their disability was hidden. (My text explains why the reading disability is so often hidden, and that the disability is the direct result of teaching beginning reading with the “meaning” method instead of the “sound” method.) It was because of the obtuse refusal of the school administrators to institute real phonics that I spent so much time remediating reading disabilities and developed the desire to do something about the problem myself. The oral reading research I carried out in my sabbatical half-year (September, 1977-January, 1978) and the years since then that I spent researching library materials have resulted in this history of beginning reading.

The section of this history from about 1820 to 1840 uses the frame of reference provided by Samuel Blumenfeld’s brilliant history of that period, Is Public Education Necessary? (Devin-Adair, 1981; The Paradigm Company, Boise, Idaho, 1985). Blumenfeld’s book documented the activities of the group of organized zealots from about 1820 to 1840 who largely succeeded in replacing private education in America with government education. The present-day use of the terms, “public” and “private” to distinguish government schools from non-government schools probably originated with the early nineteenth-century American zealots about whom Blumenfeld wrote. In the previous century in England, “private” education had instead meant home education, and “public” education had instead meant education outside the home. That usage still persists in the very exclusive “public” schools of England, which charge high fees and which are largely used only by the upper classes.

This history is also in debt to Blumenfeld’s 1973 book, The New Illiterates (Arlington House, New Rochelle, New York, presently published by the Paradigm Company), for originally uncovering the fact that the American sight-word method is actually based on the deaf-mute method for teaching reading, as developed by the Abbe de l’Epee of France. The New Illiterates also documents the fact that the deaf-mute method was endorsed and used by Thomas Gallaudet for hearing children in America in 1830 and later.
Attention was originally focused both on Gallaudet and on the sight-word controversy in Boston by Mitford Mathews’ very important book, Teaching to Read, Historically Considered, The University of Chicago: 1966. However, Mathews did not realize that Gallaudet was promoting true sight-words, nor did he recognize Gallaudet’s influence on the Boston sight-word controversy. Yet Mathews had uncovered enough of the historical path so that Blumenfeld knew the direction in which to travel.

In her 1967 book, Learning to Read: the Great Debate, McGraw Hill Book Company, New York, Dr. Jeanne S. Chall of Harvard University dispassionately and thoroughly traced the experimental data from the early twentieth century to establish which favored “meaning” and which favored “phonics” (sound) in the teaching of beginning reading. Of course, Dr. Chall found that “sound” won out overwhelmingly over “meaning.” My entire historical text, and my own oral reading research, is concerned with the use of “meaning” or “sound” in the teaching of beginning reading and with the contrast in results. At the beginning of my historical research, I relied heavily on Dr. Chall’s excellent material.

The rejection of the McGuffey Myth by this history will be jarring to many people initially. The McGuffey Myth is the so-called “fact” that the presumably “phonic” McGuffey series was used by eighty or ninety per cent of Americans in the nineteenth century. An explanation is given for the invention of that Myth which dates only from the late 1920’s, long after the McGuffey readers were supposed to have been dominant. A reason is also given for the curious fact that the Myth is most completely accepted by those people who are the best informed on other matters.

Some terms used in this text should be defined. “Meaning” approaches in teaching the reading of alphabetic print are labeled “Code 1,” and are considered the lowest on a scale from one to ten. “Sound” approaches are labeled Code 10, the highest on that scale from one to ten. Approaches falling in between are indicated by higher or lower code numbers.

Such a rating scale is particularly needed to evaluate those programs which purport to teach “phonics” but do an inadequate or faulty job, and which in practice depend heavily on “meaning.” For instance, in its 1995 materials, the widely advertised Hooked on Phonics program, which superficially appears to have a strong “phonic” emphasis, actually rates, in my opinion, only a Code 3. That is because of its remarkably heavy and early introduction of sight words, its surprisingly inept, incredibly badly organized and unsatisfactory phonics lessons, and its apparent expectation that a learner working alone can go through the extensive practice exercises when he has no way of checking whether he is reading material correctly. That is the equivalent of classic and faulty “silent reading,” since almost all of the learner’s practice material is omitted from the recorded tapes. By contrast, Sing, Spell, Read and Write by Sue Dickson, St. Petersburg, Florida, a Code 10 program which also uses music and tapes, gives heavy oral practice drill on phonic elements through games and texts, but the oral drill is meant to be carefully monitored every step of the way by the teacher or parent.

In this history, the term, “synthetic phonics,” refers to the building up, or synthesizing, of words from phonetic elements, and is not a label for imitation phonics. Imitation phonics is referred to as “phony phonics.” (Phony phonics is not true isolated-letter-based phonics but is actually only an exercise with parts of previously memorized, whole, meaning-bearing words, in which those whole words are pulled apart and then put together again in different combinations, like so many jigsaw puzzle pieces.) Analytic phonics, which is the reverse of synthetic phonics, refers to identifying letter sounds in syllables or words. At present in English-speaking countries, what is called “analytic phonics” is usually only phony phonics. However, in German-language countries, analytic phonics has been used successfully, in combination with synthetic phonics, since the early nineteenth century.

Before Blaise Pascal of France invented synthetic phonics in 1655, analytic phonics was the only kind of “sound” approach known. At that time, unlike today in English-speaking countries, analytic phonics
dealt with all the phonic elements in syllables and words. Sometimes the analytic phonics approach used
rhyming sequences of known words or syllables, such as cake, make, take or fight, bright, sight. The
classic syllable “sound” method was another analytic approach. It used the memorization of tables of
regularly formed printed syllables, whose very regularity was the key to memorizing their phonic
elements, or sounds: ba, be, bi, bo, bu, ab, eb, ib, ob, ub; da, de, di, do, du, ad, ed, id, od, ud, etc.

The use of rhyming in poetry only became general after the days of ancient Greece and ancient Rome.
Therefore, it is not surprising that the rhyming “sound” approach (cake, make, bake) is far newer in the
teaching of beginning reading than the regularity “sound” approach (ba, be, bi, bo, bu; da, de, di, do, du,
etc.). That ancient syllable method (ba, be, bi, bo, bu) was meant to demonstrate the differences in vowel
sounds, as well as to drill on consonant sounds. By contrast, the rhyming approach does not demonstrate
differences in vowel sounds.

Since the syllable method demonstrates the differences between vowel sounds, it is very conceivable
that it was invented in ancient Greece almost immediately upon the invention of the vowels themselves
about 800 B. C. (The addition of the vowels to the Phoenician alphabet about 800 B. C. is discussed in
this history.) Such a device as the syllable method which can demonstrate the differences between vowel
sounds would have been necessary to demonstrate the purpose and precision of the newly invented
vowels to those people who already knew the grave limitations of the consonants in the already existing
Phoenician alphabet. As discussed in this history, the ancient syllable method is known to have already
been in use by the Etruscans by about 600 B. C., and the Etruscans got their alphabet from the Greeks.
The probability is that they got the syllable method from the Greeks, along with the alphabet itself, some
time before 600 B.C.

However, analytic methods which are not thorough in teaching either rhyming or sound regularities
omit the keys to the sounds of the syllables. They are therefore equivalent to sight-word methods.
# Table of Contents

FOREWORD.................................................................................................................................. v

PART 1   CONCERNING TODAY’S “READING INSTRUCTION”......................................................... 1

Introduction .................................................................................................................................. 3

Chapter 1   Evidence on Present-day Disabilities From the Deaf-Mute, Guessing, “Meaning” Method .................................................................................................................. 18

Chapter 2   The American Promoters Since 1883 of the Present-day Deaf-Mute Guessing “Meaning” Method for Teaching Beginning Reading ......................... 22

PART 2   THE HISTORY OF READING INSTRUCTION UNTIL THE EARLY EIGHTEENTH CENTURY.......................................................................................... 27

Chapter 3   Reading Instruction Materials of the Different Periods........................................... 29

Chapter 4   The Methods Used to Teach Reading From These Materials in the Past, Why The Methods and Materials Developed as They Did, and Some General History as a Framework ................................................................. 111

Chapter 5   A Comparison of the Early with the Late Middle Ages, with a Discussion of the Generally Unacknowledged Drop in the Cultural Level and Its Effect on Literacy .................................................................................. 138

Chapter 6   On the Switch from Latin to the Vernacular in the Teaching of Beginning Reading ......................................................................................................................... 164

PART 3    THE FRENCH SOURCES    THE TEACHING OF READING IN FRANCE, AND ITS INFLUENCE ON THE TEACHING OF READING IN ENGLISH, BOTH CONSIDERED IN THE HISTORICAL CONTEXT OF THE TIMES............................................. 173

Chapter 7   Eighteenth Century Attitudes on Education and the Background on Eighteenth Century Literacy Levels......................................................................................... 175

Chapter 8   The Suppression of Religious Schools and Promotion of Government Schools Originated with the Change-Agents of the Eighteenth Century. The Relationships to the Teaching of the Deaf ........................................................................................................................ 189

Chapter 9   Necessary Background Information on the French Revolution ......................... 201
Chapter 10  The Publishing Record Demonstrates the Influence of the Activists.......... 211

Chapter 11  Summarizing the French Influence................................................................. 263

PART 4  THE FIRST LARGE-SCALE INTENTIONAL MOVE FROM
SOUND TO MEANING IN AMERICA BEGAN IN 1826........................................... 267

Chapter 12  On Reading Texts of the Eighteenth and Early Nineteenth
Centuries, And on the Dame Schools ................................................................... 269

Chapter 13  The Roots of the 1826 Move from Sound to Meaning, and the
Status of Literacy Before that 1826 Programmed Change in Teaching
Methods.................................................................................................................... 311

Chapter 14  That First Group of Activists............................................................................. 326

Chapter 15  The Wrong Use of Pictures Entered the Newfangled Primers and
Promoted Conflicting Reflexes............................................................................. 363

Chapter 16  Sanity Re-entered “Reading Instruction” in 1829, In the Person of
the Anonymous Scottish Schoolmaster ................................................................. 367

Chapter 17  Concerning the Trans-Atlantic Movers-and-Shakers................................. 383

Chapter 18  The Evidence Suggests Deliberate Cooperation Among
Movers-and-Shakers to Bring About Their Braver, Newer World.................... 411

Chapter 19  Contemporary Testimony on the New “Correct” Reading Methods
from the “Experts” Themselves............................................................................. 424

Chapter 20  On the Influence of the Trans-Atlantic Change-Agents......................... 440

Chapter 21  New Textbooks to Match New Methods and Their Results................. 462

PART 5  THE OPPOSITION TO A RETURN TO “SOUND” IN THE 1860’S.
THE RESULTANT “MEANING” MATERIALS. POLLARD
FAILED IN THE 1880’S TO PROMOTE SYNTHETIC PHONICS,
BUT SPELLING PROMOTED “SOUND” BY 1890. THE
MASSIVE USE OF “SUPPLEMENTAL PHONICS” AFTER 1900
AND THE “MEANING” OPPOSITION.............................................................. 509

Chapter 22  The Educational Setting by the 1860’s and the Surprising Entry of
Alexander Graham Bell on the Scene................................................................. 511

Chapter 23  How Phonics in Beginning Reading Re-entered in the 1860’s,
Followed by a New Generation of “Meaning” Activists................................. 525
Chapter 24   Was the Deliberate Promotion of a Deaf-Mute Method for Hearing Children in the 1870’s Originally William James’ Misguided Idea? ............................. 550

Chapter 25   The Reading Texts of the Seventies and Eighties...................................................... 593

Chapter 26   On the History of the McGuffey Readers, On the Origin of Their Last Publisher, American Book Company, and On Their Greatly Inflated Sales Estimates ........................................................................................................... 655

Chapter 27   Sheldon’s 1875 Testimony, Contrasted to Nila Banton Smith’s “History” ................................................................................................................................. 700

Chapter 28   The Testimony of the First of Three Disinterested Observers from 1873 to 1893 ................................................................................................................................. 708

Chapter 29   Pollard’s Phonic Challenge, Its Failure to Effect a Change, and The Appalling Reading Texts Which Followed ................................................................................................................. 715

Chapter 30   Observers’ Reports from the 1890’s................................................................................. 726

Chapter 31   The Turn of the Century Developments and The Beacon Phonic Series, One of the Few Really Successful Phonics Series................................................................. 740

Chapter 32   Anti-Phonic Activists Return As the “Meaning” Aldine Readers Spread Across America, Their Effect Minimized by the Almost Universal Use After 1900 of Supplemental Phonics ......................................................................................................................... 758

Chapter 33   The Howell “Sound” Material, and its Possible Relationships............................... 767

Chapter 34   The Activists By the Turn of the Century Worked to Promote the Teaching of Spelling By “Meaning” Instead of By “Sound,” Reversing the Move Back to Phonic Spellers Like Webster’s and McGuffey’s in the Late 1880’s ......................................................................................................................................................................................... 779

PART 6   THE CLOSE PARALLELS TO AMERICAN DEVELOPMENTS IN THE HISTORY OF BEGINNING READING INSTRUCTION IN GREAT BRITAIN ................................................................................................................. 791

Chapter 36   The Deterioration of Beginning Reading Instruction In Great Britain: From “Sound” to “Meaning” ................................................................................................................................. 793

Chapter 37   The Move Slowly Began Towards Government-Controlled Schools Bringing with It the Change from “Sound” Spelling Books to “Meaning” Primers ......................................................................................................................... 817

APPENDIX F  Copies of Some Papers by Geraldine E. Rodgers Which Were Submitted to Government Entities And Which Were Never Acknowledged in Any Way ................................................................................................................................. 1783
Comments given orally at the July 19, 1989, Open Meeting on Recompetition of Regional Educational Laboratories, Office of Educational Research and Improvement (OERI), Department of Education, 555 New Jersey Avenue NW, Room 328, Washington, D. C., after which a written copy of the remarks was formally submitted. No acknowledgment of the oral remarks or of the written paper has ever been received, eleven years later.

Material Submitted to the National Assessment Governing Board in October, 1989, in a short address at their public meeting, and further material submitted to them by mail in February, 1992. No acknowledgment has ever been received up to 2000, eleven years after that 1989 meeting. The first material was given in person at that public meeting of the Board in Trenton, New Jersey, in 1989. A paper was submitted as a record. The second materials were sent in 1992, eight years ago, in part or all, to over 20 members of the National Assessment Governing Board, none of whom has ever responded. The Board’s meetings in various parts of the country at which the public was invited to speak in 1989 were purportedly held solely because the Board wished to respond to public opinion (presumably, such as my own). That claim was obviously built on a firm foundation of smoke and mirrors.
PART 1
Concerning Today’s “Reading Instruction”
Introduction

The puzzling adoption in 1930 of a deaf-mute method for teaching beginning reading to hearing children in America can only be understood when the long history of teaching beginning reading is known. The deaf-mute method adopted almost immediately after 1930 from the Atlantic to the Pacific Oceans and from Canada to Mexico used a “meaning” approach to teach the beginning reading of alphabetic print, instead of the ages-old “sound” approach. The 1930 “Dick and Jane” deaf-mute-method primers and their later clones are indeed the disgraceful source of America’s so-called functional illiteracy problem. This history is an attempt to bring together most of the contributing historical sources behind those deaf-mute-method primers, including the long history of teaching the beginning reading of alphabetic print. Only with such information can so-called functional illiteracy, the warped fruit of the “meaning” method, be properly understood and obliterated.

What makes the deaf-mute “meaning” method doubly tragic is that the “meaning” approach is also an inferior way to teach deaf children to read, instead of the lip-reading “sound” approach. Both approaches are discussed in the article in Appendix A by Dr. A. L. E. Crouter from the July 28, 1900, issue of The School Journal. Dr. Crouter’s article was based on his school’s twenty years of experience in teaching deaf children in Pennsylvania with the two methods.

The deaf-mute “meaning” method will not seem so obscure to most modern readers if they recall that first-grade teachers sometimes hang word-signs on things in the first-grade classrooms: the word “door,” over the door, and “window,” over the window. That kind of labeling to teach reading is Reverend Thomas H. Gallaudet’s deaf-mute approach, which he used to teach reading in the first permanent American school for deaf-mutes, founded in 1817. Also, instead of oral speech, he taught silent sign-language. Before Gallaudet (1787-1851) founded his school, the first time he used the sight-word reading approach was when he wrote the word “hat” on a piece of paper, and, holding the written word next to his hat, showed a little neighborhood girl who was a deaf-mute that the printed sign meant the same thing as his hat. She understood it very well, without any idea at all of what the word “hat” sounded like when it was spoken.¹

So do first-graders understand such printed sight-words, but they do it in the same way that they understand pictures, as symbols that are meaning-bearing, not sound-bearing. That is why, when their sight-word books line up a picture of a dog with the word, “dog,” the little first graders sometimes say, instead of “dog,” “puppy.” Believe it or not, that kind of error always pleases reading “experts” because it shows the child got the “meaning.”

In Gallaudet’s controlled-vocabulary approach, after students learned a stock of printed “sight-words,” the sight-words were strung together with unknown words in printed sentences, often under a picture illustrating the action in the sentence, as in his Child’s Picture Defining and Reading Book, 1830, which he said he had written for both deaf and hearing children. The children then silently guessed the meaning of these unknown connecting words from the context of known sight-words and the picture illustrating the action, thus adding these previously unknown words to their silent controlled vocabulary. An analysis of Gallaudet’s The Mother’s Primer, written in 1835 for hearing children, shows

¹ Barnard’s American Journal of Education, May, 1856, “Educational Biography - Thomas Hopkins Gallaudet,” page 420. That incident suggests that Gallaudet was familiar with the Abbe de l’Epee’s sight-word approach before Gallaudet visited the school the Abbe had founded in Paris. Otherwise, we must assume young Gallaudet brilliantly re-invented the Abbe’s sight-word approach of the eighteenth century. However, at the very beginning, the Abbe did not dispense with the manual alphabet taught to deaf-mutes from the time of the English historian-monk Bede in the eighth century. Neither did Gallaudet in the American school he founded in 1817.
that in this book he limited the introduction of such “unknown” words on the average to less than ten percent of the running total of all words in a selection, meaning that if a child missed ALL the new words, he would nevertheless score 90% in accuracy, if he had already memorized the “old” words.

Gallaudet’s 1835 The Mother’s Primer was the first sight-word controlled-vocabulary book with a “frustration level” ever published for hearing children. (The idea of a controlled vocabulary for words introduced by SOUND for beginning readers was not new: Lindley Murray had done that early in the nineteenth century. Controlling vocabulary for words introduced by SIGHT to about ten per cent of the total vocabulary for hearing children instead of the deaf children Gallaudet had been teaching for years was brand new in America.)

Presumably based on his experience in teaching deaf children, Gallaudet apparently felt that, to understand the text well enough to assure correct context guesses on new sight words, at least 90% of the context had to be composed of previously memorized sight words. This is also the apparent origin of the 90% word-accuracy “frustration” level on present individual oral reading “inventories” used in classrooms. Below that “frustration” level of 90% accuracy in reading words, the children will miss too much of the meaning of the selection to guess the meaning of the unknown words.

The high-frequency word approach to teaching reading to hearing children may also have originated with Gallaudet. The high-frequency word concept must have been fairly common knowledge in Gallaudet’s time, according to pages 22 and 23 of Joshua Leavitt’s Primer: or Little Lessons for Little Learners, Leavitt’s Reading Series - Part I, published by John P. Jewett & Co., Boston, 1851, and copyrighted in 1847. Leavitt listed eleven words presumed to form one-quarter of anything we read, and a further list of 68 words which, with the first eleven given were presumed to form half of any written material. Leavitt’s 1847 list of 79 words forming one half of written material includes many words on Leonard P. Ayres’ 1915 list of the 50 words which he found to compose half of written correspondence, as discussed in his A Measuring Scale for Ability in Spelling, pages 7 through 12, published at that time by Russell Sage Foundation, New York, and recently republished by Mott Media, Milford, Michigan. It is interesting that the nine words which Ayres’ found to comprise one-fourth of all written material are ALL on Leavitt’s list of the eleven words forming one quarter of all texts. Leavitt also included “it” and “is” in his list of those words comprising one-quarter of any text. However, Ayres lists “it” as the eleventh commonest word, and “is” as the thirteenth.

A statistical analysis of W. S. Gray’s 1914 oral reading paragraphs shows that he marked as “failing” those who scored below 90% word accuracy, so Gray, the father of the “Dick and Jane” readers, apparently was aware of the “frustration” concept as long ago as 1914. By 1915, Gray also had to know that if a child had learned the 300 commonest words in English, he could receive a score of at least 75% accuracy in reading simple material. In 1915, Leonard P. Ayres (1879-1946) wrote the following in A Measuring Scale for Ability in Spelling, (pages 10-11):

“Thus the first of these figures shows that the 50 commonest words are repeated so frequently that with their repetitions they constitute nearly half of all the words we write. The first 300 words make up more than three-fourths of all writing of this kind and the 1,000 words with their repetitions constitute more than nine-tenths of this sort of written material.”

Therefore, anyone who knows the thousand highest-frequency words as “sight words” can score at 90%, or above the frustration level, when reading almost anything orally, even if incapable of reading any other words. Since such persons often can guess the remaining unknown ten per cent of words, they are hidden illiterates, whom we call today, “functional illiterates.”
Mitford Mathews, in his book, Teaching to Read, Historically Considered, University of Chicago Press, 1966, page 155, referred to word frequency studies. His source was a 1959 article, “Spelling As A School Subject: A Brief History,” National Elementary Principal, XXXVIII (May 1959), pages 8-23, by Jean S. and Paul R. Hanna, which I have not been able to locate. Mathews said:

“From these studies there resulted a basic list of about three thousand words which comprise ninety-eight per cent of those used by children, and by adults in writing.”

This also means, astonishingly, that a functional illiterate with a visual memory of only the three thousand highest frequency written words can read aloud at about 98% accuracy! Of course, the two per cent or so of low-frequency written words which the functional illiterate may miss if he cannot guess them from his spoken vocabulary will probably be the words carrying the most meaning in the written selection. It is the functional illiterate’s inability to read these low-frequency words which accounts for his low “reading comprehension” on difficult material.

That list of the three thousand commonest words was prepared some time before 1959. It was undoubtedly at least in large part based on the work of E. L. Thorndike, who by 1921 had prepared a list of the ten thousand commonest words in children’s literature. Thorndike’s work appeared in its final expanded version as The Teachers Word Book of 30,000 Words by E. L. Thorndike and Irving Lorge, Teachers College Press, Columbia University, New York: 1944, and was not limited to children’s literature.

The fact that these three thousand highest-frequency words constitute about ninety-eight per cent of simple printed matter should be contrasted to the fact that English has perhaps half a million words, all of which, except for the three thousand most frequent, probably occupy only about two per cent of the total number of words in any ordinary spoken or written selection. However, as noted later, Thorndike’s more difficult literature count showed nine thousand high-frequency words occupying about ninety-eight per cent, but nine thousand is still a tiny proportion of the approximate half million words in English. It is the remaining two per cent of words in a selection, taken at random from the approximate half million words in English, which may carry the most meaning in a selection and which may be the most critical for understanding a selection.

The “meaning-content” of the highest frequency words is discussed by Roland G. Kent, on pages 4-5 of Language & Philology, (Longmans, Green and Co., New York: 1923, 1932):

“...fifty words, much repeated, compose half of all words written.... But these words, despite their frequency, are not half the treasures of our tongue, nor one hundredth; they are utterly empty of content.... No one could frame even the simplest letter without constantly using words not in this list. In fact, the investigators found that beyond 1000 words they could not draw up an additional list of 1000 words of common use, because the vocabularies of different persons diverged too greatly according to their interests or professions.”

The thousand commonest words comprise about ninety per cent of most materials, so those above one thousand would comprise only about ten per cent. Even allowing for that fact, Kent’s last statement could be misunderstood. Estimates of the average adult’s total vocabulary vary widely, with most believable ones showing totals far above 20,000 words. Yet the rarer words in each person’s vocabulary probably differ for every person. However, the probability is that all adult English speakers, unless mentally retarded, do not differ in sharing as common ground the 10,000 highest-frequency words occurring in written matter.
E. L. Thorndike’s and Irving Lorge’s The Teacher’s Word Book of 30,000 Words, Teachers College Press, Columbia University, New York: 1944, lists words under 10,000 frequency. Reading over such words, it is apparent no native English speaker with a normal intellect could fail to have ALL OF THEM in his base vocabulary.

Yet, even in this “common ground,” of the 10,000 highest-frequency words, the relative frequency of these shared words will differ for each person and for each topic discussed. Therefore, those words which are in the 1,000 to 2,000 most-frequent range for one group of speakers or on one topic may not be in the 1,000 to 2,000 most-frequent range for another group of speakers or on another topic. Yet the speakers nevertheless do have these common words somewhere in their vocabularies. Apparently, this is really all Kent meant: that it was impossible to make a list of words which would be equally frequent in everyone’s vocabulary and on every topic at the 1,000 to 2,000 range.

Many of the 300 very highest frequency words are only structural: they are simply the syntactical glue which ties speech together. It is the lowest frequency words which carry the heart of meaning, and which provide the rest of the half million or so words in an unabridged English dictionary. Yet, as stated, almost every individual must have a vocabulary list which, at the lowest frequency range, is peculiar to himself. If this were not true, there would not be a half-million or so words in English, every one of which, someone, somewhere, has in his own vocabulary.

Yet Thorndike’s whole concept of publishing a guide to the “most important” words was wrong, because his idea that importance is dependent on frequency was wrong. For instance, to me, as a Roman Catholic, the word, “Eucharist,” is of the highest importance, yet it only appears in Thorndike’s lowest frequency list, in the 20,000 to 30,000 group.

Furthermore, Thorndike ignored the fact that the function of the highest frequency words is frequently only a mechanical one, and that they are therefore different in their very nature from lower frequency words. High-frequency words erect the necessary syntactical structure in which to manipulate ideas. In truth, by such use, they are really syntax, and not vocabulary. It is no accident that many of the very highest frequency words are so devoid of clear meanings that they are extremely difficult to define. Some such words are “the,” “in,” “before,” etc. Yet it is only natural that the syntactical structure (the high-frequency words) should be bulkier than its contents (the low frequency words).

The use of such very high frequency words to build a clear syntax that is nevertheless totally devoid of meaning was demonstrated by Lewis Carroll in his amusing poem, “Jabberwocky,” from page 156 of Alice in Wonderland:

“‘Twas brillig, and the slithy toves,
Did gyre and gimble in the wabe;
All mimsy were the borogoves,
And the mome raths outgrabe.”

Thorndike’s four-and-one-half-million-words running count of 1921, plus later ones, turned up the 30,000 different words that he included in his 1944 book. However, since English has about a half-million different words, an incredible number would have to be counted in a running count of connected text before all of those half-million different words finally would turn up, every one of which has importance or it never would have been coined. In 1828, Noah Webster produced his dictionary which had almost three times as many words as Thorndike’s 1944 list. Yet, how many words in running text would have to be counted before even Noah Webster’s petty 80,000 words showed up? Obviously, counts of 80,000 or of a half-million words would require vastly more running text than Thorndike’s
four-and-one-half-million words of running text, which showed some “rare” words occurring only once in that four-and-a-half million.

Most were not “rare” words in the truest sense. For the most ludicrous examples of that fact, consider the numerical words (not the digit forms) from forty to forty-nine. Only forty, forty-five, forty-six, and forty-eight showed up in Thorndike’s book!

Thorndike reported his own statistics under the column marked, “T,” but he followed it with other counts: Lorge’s, Juvenile, and “S,” (miscellaneous). Forty-six had not actually appeared in Thorndike’s count, since he marked it “0,” but it showed up in the Lorge count with 19 occurrences, which is obviously why Thorndike included it. Yet it had occurred only once in the Juvenile count, and not at all in the “S” count.

Because the words, forty-one, forty-two, forty-three, forty-four, and forty-seven are not in Thorndike’s book, does that mean they are unimportant? The same pattern appeared in his book for number words for the fifties. Concerning the sixties, only sixty appeared, but seventy and seventy-five both appeared. Such scattered occurrences appeared for other number words.

Furthermore, it is obvious that words in the very lowest frequencies of Thorndike’s count very possibly might not show up at all in the lowest frequencies of someone else’s count, and vice versa. Therefore, his lowest frequency words are simply random samples of that class of words from an unabridged dictionary and cannot in any sense be used as a guide to all of the lowest frequency words in that range. Furthermore, the truth is that some of the most meaningful words, the words with which we transfer some of our most meaningful thoughts, may occur in true frequency ranges far, far below Thorndike’s 30,000 cut-off point, and therefore might not show up at all in Thorndike’s or similar counts, except by chance.

Although Thorndike listed word frequencies, his method told nothing about the portion of texts occupied by the highest frequency words, which facts Ayres had stated so clearly in 1915. Thorndike hid those facts by the way he grouped those highest frequency words. (See his discussion on his page x.) Why did Thorndike hide those facts, since something so very revealing about the nature of language is demonstrated by them? Did Thorndike’s hiding that information have anything to do with the fact that the cumulative high-frequency word concept is absolutely basic to the deaf-mute guessing method for teaching reading introduced by his ex-students, Gates and Gray, in 1930, that produced a sea of functional illiteracy?

That information did emerge with Ayres’ comments, quoted above, and it showed up again in Key Words to Literacy by J. McNally and W. Murray, published by the Schoolmaster Publishing Co., Ltd., London, in 1962 or before. W. Murray became the author of the Ladybird Key Words Reading Scheme, published by Wills & Hepworth, Ltd., Loughborough and Leicestershire, England. In its 1969 brochure, a very illuminating graph appeared which demonstrated the huge portions of an average adult’s vocabulary occupied by the highest frequency words. The graph showed that the twelve highest-frequency words occupy one-quarter of an average vocabulary, and one hundred occupy one-half, and so on. To my knowledge, that is the first time the cumulative high-frequency word effect became common knowledge again since Ayres’ spelling scale was published in 1915. Yet that information was certainly hidden by Thorndike, who just as certainly must have known those facts very well indeed.

The Ladybird material concerned the vocabulary of an average adult, but Ayres had referred instead to the vocabulary found in written texts. Ayres reported only on the thousand most common words in written texts. However, it would obviously be virtually impossible to show such a “frequency” occurrence for the total vocabulary contained in an unabridged English dictionary, because that would require a
running text count of massive proportions, enormously greater than the running text Ayres had used to produce his statistics on the thousand commonest words. Probably the entire contents of the British Library would not suffice for a count that could turn up all the words in an unabridged dictionary.

However, for purposes of illustration, assume that such a count were theoretically possible, and that a bar graph could be prepared based on such a count. At the bottom horizontal line, numbers would be shown for percentage of frequency. On the vertical line on the left would be entered the number of words occurring in each frequency.

On such a graph, the column for words at the highest frequency would be very low, for such words are few. Yet, as the frequency dropped, the numbers of words in each group and therefore the size of its column would greatly increase. The graph line that would appear drawn over the top of those columns would rise consistently and sharply.

Yet, if an adult’s vocabulary could be superimposed on such a graph prepared from an unabridged dictionary, it would not show the constantly rising line of the dictionary graph, but instead would show the typical bell curve that is revealed when any inborn ability is graphed. What is being measured by vocabulary knowledge, assuming a person has normal hearing and is truly literate, is that person’s inborn intelligence. Such an adult would know all of the very highest frequency words (the lowest part of the line underneath his on the dictionary graph) and almost all of the rest of the high frequency words (underneath his on the dictionary graph) which columns would be increasingly higher than the beginning ones. Up to that point, the adult’s graph line would exactly match the line on the dictionary graph. However, as the number of words in the rarest frequencies increased on the dictionary graph so that the dictionary graph line rose, the number of those words in those rarest frequencies that the adult knew would increasingly drop. As the words became increasingly rarer, the numbers of such words the adult knew would become increasingly smaller. The result would be that the adult’s graph would produce a typical bell curve, instead of the constantly increasing line on the dictionary graph.

The hopeless incompleteness of the Thorndike count can be seen by taking a group of words at random in his count of the 20,000 most common words (omitting the pages at the end in which he includes the ten thousand words from 20,000 to 30,000), and then comparing them to the same words in an abridged dictionary. Four words following one another in alphabetical order on the Thorndike 20,000-word count were rampant, rampart, ramrod, and Ramsay. When I compared them to the comparable page in alphabetical order in an abridged dictionary, I found that Thorndike had not included rampage, rampageous, rampancy, rampion (a plant), Ramses, Ramsgate (a seaport), ramshackle, and ramson (a plant). Some of the words he omitted are obviously very simple and well known (rampage, Ramses, ramshackle), but they appear no where on the Thorndike list of the 20,000 highest frequency words. Furthermore, the user of his list who is deluded into thinking that it does include many low-frequency words will not find such true low-frequency words on the Thorndike list as rampion and ramson. Yet these words appear even in a sharply abridged dictionary! (In Part II, Thorndike did include Rameses, with that spelling, rampage, and ramshackle, but still did not include rampageous, rampancy, rampant, Ramsgate or ramson. Yet rampageous and rampancy are commonly understood words.)

That there is something fundamentally wrong with Thorndike’s whole idea of word counts is demonstrated by the word, “economics.” Thorndike rated it “8,” meaning it occurred eight times in a million words, but his actual statistics showed it only occurred once in his own count of four and a half-million words, so by his own statistics alone it should have been in the 20,000 to 30,000 range. Yet it had occurred 119 times in the Lorge count, not at all in the Juvenile count, and 40 times in the “S” (miscellaneous) count. Its use obviously varied according to the purposes of the selections. However, it is an easily pronounceable and widely understood word, and in no sense can it be considered “rare,” or at the fringes of a normal adult’s vocabulary.
That word is truly representative of most of the words in the English language, the vast majority of which do not appear at all in Thorndike’s count. Yet they appear with frequencies that are very high in certain areas of discussion. Teachers were counseled to “teach” words at the lower frequencies in Thorndike’s text depending on their “importance.” Yet how could any teacher possibly evaluate the ultimate “importance” of a particular word for a particular child? Why not let the child sound out ALL the words he encounters in print and acquire their meaning in print just as he does in conversation: by its context or by the dictionary?

As has been mentioned, in A Measurement of Ability in Spelling in 1915, Ayres referred to the fascinating fact that only about fifty high-frequency words account for about half of any written context. (The Ladybird material assumed that 100 words accounted for half, but whether the number is fifty or a hundred, it is still extremely small.) That general fact surely had to be known by Thorndike, and yet he made no reference to it. Yet the peculiar patterns formed by word-frequencies can become obvious by extrapolating from some of the word frequency figures that Thorndike did give for words above the two thousand most common. (He obscured facts on the two thousand most common.) However, unless someone knew ahead of time that word frequencies produce such peculiar patterns, it is highly unlikely that it would occur to him to dig out those patterns from Thorndike’s frequency figures.

On page x of The Teacher’s Word Book of 30,000 Words, Thorndike said that 1,069 AA words occurred 100 times or more in every million words. The most meaningful word in that description was “more,” since it is evident from Ayres’ and others’ work that only 50 or 100 of those 1,069 words would have accounted for one half, or 500,000, of those million running words, and the entire 1,069 would have accounted for about nine-tenths, or 900,000 of those running words. Yet Thorndike did not even hint at such extremely interesting and peculiar facts.

Also on page x appeared the fact that the 952 words labeled “A” had appeared between 50 to 99 times per million. However, after the vague statistics for the 1,069 and 952 most common words, clear statistics finally appeared, because these statements were followed by a table for the number of words occurring between 49 times per million and one per million. After each entry, such as 49 times per million, appeared the number of words with that frequency. The table began with listing the number 36 for the 36 words which had appeared 49 times, and ended with 5,209, for the 5,209 words which had appeared only once in a million running words. What is most notable is the great increase of numbers of words, as the numbers of times that words occur greatly decrease. To illustrate, the first four and the last four entries were as follows:

<table>
<thead>
<tr>
<th>Number of Occurrences Per Million Words</th>
<th>Number of Words At That Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>49</td>
<td>36</td>
</tr>
<tr>
<td>48</td>
<td>35</td>
</tr>
<tr>
<td>47</td>
<td>33</td>
</tr>
<tr>
<td>46</td>
<td>38</td>
</tr>
<tr>
<td>.....</td>
<td>.....</td>
</tr>
<tr>
<td>4</td>
<td>1,064</td>
</tr>
<tr>
<td>3</td>
<td>1,442</td>
</tr>
<tr>
<td>2</td>
<td>2,503</td>
</tr>
<tr>
<td>1</td>
<td>5,209</td>
</tr>
</tbody>
</table>

Those last four entries total 10,218 words out of Thorndike’s first 20,000, or more than half. Yet, as a percentage of the running million words, they account for only 1.9 per cent of the total. A study based on the far simpler material of letters, referred to previously, found that only three thousand of the highest
frequency words accounted for all but about two percent of that simpler material. However, since Thorndike’s words were selected from the far heavier content of real literature, it is not surprising that about 9,000 plus words accounted for 98% of that heavier material, although only 3,000 words accounted for 98% of the far simpler material.

Thorndike had extended the 20,000 word list of 1931 to 30,000 words in this 1944 revision prepared with Irving Lorge, published by Teachers College Press, Teachers College, Columbia University, New York. Explaining the additional 10,000 words over the 20,000 of 1931, Thorndike stated on page x that 9,202 words had occurred less than once a million, but oftener than four times in 18 million words. That works out to between 0.2 per cent to 0.9 percent of each million words. For the sake of argument, those words might be said to occupy no more than 0.6 percent of the total million (and probably considerably less). A further 1,358 words were listed that occurred four times in 18 million words, bringing the 1944 total to 30,000 words. Those last 1,358 words would occupy .03 percent of a million words.

Therefore, Thorndike’s “literature” words from about 10,000 to about 20,000 frequency would occupy 1.9 per cent of a running selection; and the words from 20,000 to 30,000 would occupy the total of about 0.6 per cent and 0.03 percent, or about 0.63 percent. The grand total of all the words from 10,000 to 30,000 would amount to only about 2.53 per cent of any page of print. (What is most surprising about the entries from 20,000 to 30,000 is the fact that such great numbers of them are not at all unusual, but are very ordinary, well known words. Therefore, by extrapolation, so must many words above the 30,000-word-level be familiar to most people.) Yet Thorndike had sampled only 30,000 words, and an unabridged dictionary has about half a million words. It is obvious that most of the words in that dictionary, if not already listed by Thorndike, must occur somewhere at the frequency level of one or two per cent, or less, of any selection.

Despite their very infrequent use, would anyone be so mad as to assume we could function as a society without the use of those hundreds of thousands of low-frequency words, none of which appeared on the Thorndike count? Why then, should not children be taught to read all such words by themselves, and be drilled in the use of a dictionary when the context does not provide sufficient help in figuring out meanings?

Thorndike’s first tabulation in 1921 covered 10,000 words, and his final tabulation some twenty years later covered 30,000 words. Yet Thorndike’s method of grouping words totally obscured that fascinating fact about word frequencies: the higher the frequency of a word, the greater is the percentage of a person’s total spoken and written vocabulary that it occupies, and the lower the frequency of a word, the smaller is the percentage of an individual’s total spoken and written vocabulary that it occupies. Count the number of times the word “the” is used in the preceding sentence, for example, in contrast to the word “fascinating.”

Most of an educated person’s vocabulary of the rarer words is learned through reading. Yet the deaf-mute reading method has resulted in rigid control of the vocabulary in children’s books so that children’s vocabulary cannot grow normally through exposure to books. In addition, the deaf-mute method also cripples children’s decoding skills so that they will never be able to read with ease any materials which have normal, uncontrolled vocabularies. As a result, children’s vocabularies do not greatly increase even when they are exposed to pre-1930 uncontrolled-vocabulary children’s books or any adult materials which have uncontrolled vocabularies.

Children taught by the “meaning” method are crippled in their vocabulary development in the same way that a badly taught deaf-mute is crippled. They quite literally cannot easily “hear” new words when they are reading. Such artificially-deafened children never reach, and many never even remotely approach, the adult vocabulary level of which they had been potentially capable.
However, the graphs of the limited, smaller vocabularies of people taught to read by the deaf-mute method, if superimposed over the theoretical unabridged dictionary graph mentioned earlier, would still produce bell curves. Yet such curves would shift sharply leftward on the graph, toward the bell curves that would be produced by the limited vocabularies of the mentally retarded.

Concerning vocabulary growth, the following appears in the Encyclopedia of Education, Macmillan, 1971, under “Vocabulary Development:”

“Since it appears likely that we [derive] most of our words and meaning from the context, the study of how context operates is the single most productive method of instruction. The contribution of word parts is ....of serious limitation in their use.”

This authoritative, “expert” quotation seems to argue against the use of “sound” in reading, obviously endorsing “psycholinguistic guessing.” Yet it also certainly confirms that vocabulary growth is dependent on reading. Of course, no reasonable person could ever deny that figuring out the “meaning” of a new word is, indeed, done by the use of context, but to retain a clear memory of that meaning-bearing new concept so that it will be usable in the future, it has to be labeled and filed in our computer memory banks. The “sound” of a word is nothing more nor less than the label for an idea, or for “meaning.” Without a label of some kind to use as a hook to resurrect that idea from memory, that idea cannot easily be brought back into memory for re-use. Furthermore, without applying “sound” as a label for that idea, it can never be spoken, and, for the vast majority of people, it can never be easily written.

Therefore, reducing vocabulary growth for children, which is the ultimate result of the deaf-mute-method reading method, ultimately reduces functioning intelligence.

Ayres’ 1915 statistics on the thousand commonest words were based on adult written material, more than two-thirds of which were personal and business letters. By 1920, W. S. Gray’s professor, E. L. Thorndike of Columbia Teachers College, had finished his almost ten-year-long personal effort of identifying the 10,000 commonest words, but his identification was made from children’s printed literature. In 1921, Thorndike published his list of the 10,000 commonest words (which in later years was expanded to the 20,000 most common and finally to the 30,000 most common in general literature).

Thorndike’s list of the 300 commonest words of the 10,000 for children was immediately used in 1920 to prepare beginning reading materials by Nila Banton Smith (1890-1976) and Stuart A. Courtis (1874-1969). Both showed additional ties to Thorndike or to Columbia Teachers College. A standardized arithmetic test by Courtis, who came from Detroit, had been used in the 1911-1912 New York school survey, managed by Paul H. Hanus of Harvard who, unlike Courtis, appears to have had no ties with the group promoting the “deaf-mute” method. In the January, 1920, Teachers College Record, Thorndike published, with Courtis as co-author, “Correction Formulae for Addition Tests,” the same year that Courtis used Thorndike’s vocabulary materials with Nila Banton Smith. In addition to having been the first with Courtis to use Thorndike’s vocabulary materials, by 1932, Smith obtained her doctorate at Columbia Teachers College for her incredibly inept “history,” American Reading Instruction (from which she omitted any mention of the 1920 work she and Courtis wrote). Soon after, Smith became one of America’s foremost reading “experts” and an author on a deaf-mute method reading series of her own (which she did mention in her 1965 revised history) which undoubtedly was very profitable.

Only a few years after Nila Banton Smith and Stuart A. Courtis’s Picture Story Reading Lessons (a deaf-mute approach for rank beginners) was written in 1920 based on Thorndike’s list of the 300 commonest words, Thorndike’s list of the 10,000 commonest words provided the basis for the controlled-vocabulary 1930 deaf-mute-method readers written by Thorndike’s ex-students, Gates and
Gray. Such “basal readers” with rigidly controlled vocabulary were used through fourth grade, and very soon after through sixth grade.

With the 1930 arrival of these deaf-mute method controlled-vocabulary readers, the destruction of American vocabulary and syntax had begun. Obviously, a divergence in word frequency above the 1,000 level must occur even for children if they can independently read uncontrolled-vocabulary stories, but much of this divergence was to be erased when controlled-vocabulary books took over ALL of the publishing for children in the 1930’s and afterwards: not just school reading books like the Gates and Gray series, but books in all school subjects and, most meaningfully, in children’s literature! Famous children’s books were “adapted,” which means the vocabulary was diluted and the syntax was simplified.

It is the low-frequency words which are the most important because they carry the most meaning, but the great majority of American children have not been able to pronounce them, and therefore to learn them, since 1930, except for the few handfuls taught orally in class as “wholes” for “meaning” for specific lessons in science, “social studies,” and literature. Therefore, the fact that most American students today know very little science, “social studies” (geography and history), and literature, all of which are heavily dependent on low-frequency vocabulary knowledge, is exactly what we should have expected.

Something else, to which almost no attention is given, is the fact that complex syntax has almost disappeared from children’s books, along with complex vocabulary. Complex syntax is supposed to yield too-high “readability levels.” But how can children learn to read complex syntax, which is everywhere in true literature and even on every government printed form, if they are never exposed to it and drilled on it? (Failure to teach grammar properly is another cause.) As a result, in the ability to handle syntactical structure, some of our college students have been arrested at the “Oh, oh, look, Spot, look!” level. This is also why our students are so bad at written compositions. Since they have never learned to think in complex and internally consistent sentence structures, how can they be expected to reproduce them in writing?

Syntax, by its nature, is something which is completing itself - an action under way. By the 19th century in the English-speaking world, recognition of the importance of the syllable had been largely lost and attention was focused on “words.” Recognition of the real nature of syntax appears to have been largely lost along with recognition of the importance of the syllable, and it resulted in some bizarre ideas. William James spent much time writing about sentences, apparently without a clear understanding of syntax. E. B. Huey referred to James’ ideas in Huey’s 1908 book, The Psychology and Pedagogy of Reading (pages 129-130):

“To attempt cutting... a sentence in the middle to get a look at it is, in James’ figure, like catching a snow flake crystal in the warm hand. The flake is no longer a crystal, but a drop. ‘So, instead of catching the feeling of relation moving to its term, we find we have caught some substantive thing, usually the last word we were pronouncing, statically taken, and with its function, tendency, and particular meaning in the sentence quite evaporated.’

“It is like ‘seizing a spinning top to catch its motion’ or ‘trying to turn up the gas quickly enough to see how the darkness looks.’"

In April, 1923, C. T. Gray of the University of Texas wrote an article for the Elementary School Journal, “The Anticipation of Meaning as a Factor in Reading.” He said:

“...the movement of the attention is always forward.... Someone has said that successful reading consists largely in accurate guessing.”
This energy that C. T. Gray found so puzzling in 1923 was nothing except the tendency of syntax to complete itself, somewhat comparable to the psychologist’s idea of “closure.” The ultimate confusion on the nature of syntax came with the idea of “psycholinguistic guessing” as a method for teaching reading. What seems to have been lost is what was apparently taken for granted by the ancients such as Dionysius of Halicarnassus. Syntax, by its nature, presses forward; it generates words. Syntax tends to shape the basic morpheme forms very precisely according to their precise syntactical function. (Some aphasics automatically correct grammar in repeating heard sentences without understanding them.) Therefore, “words” are the end product of speech. Yet, syntax grows from a sound base, the syllable. The syllable is the raw material of speech.

It is interesting that Mario Pei, the famed linguist, was aware of this quality of syntax in French, that it is syntax, itself, which is the ultimate meaning-bearing unit. In his Getting Along in French, (Bantam Books, New York, 1958, page 8) Mario Pei, Professor of Romance Philology, Columbia University, said:

“The French speaker tends to run his words together in such a way that the phrase or sentence, rather than the word, is the unit of speech, as well as of understanding.... The syllable is of paramount importance in the sound sequence, and the tendency is for the syllable to consist of consonant-plus-vowel. But this tendency, common to all the Romance languages, is opposed in French by another tendency, that of dropping uh-sounds wherever possible, particularly at the end of words. ...there are actually two French pronunciations... one, which is heard on the stage, or when poetry is declaimed, or when an orator makes a solemn commemoration speech; and another, rapid-fire one, used in ordinary conversation, where syllables are run together and weird consonant combinations result from the dropping of uh-sounds...

“notre maison (NAW-truh meh-ZAW, in slow motion, NAWT meh-ZAW in rapid speech) our house....”

AW is nasalized. Pei’s highly usable and simple pronunciations, reminiscent of Noah Webster’s, should be noted, as well as his astonishing competence in languages. Pei has been treated with contempt by current “psycholinguists” and his great work appears to have faded into obscurity.

It should be noted that Pei made the point that it is the syllable that is of paramount importance in the sound sequence, and the real unit of speech in French is the sentence, rather than the word. In effect, this is true in English, too.

That being the case, to reduce practice by students not only on syllables but on the real unit of speech, the syntactical sentence, in its complex forms, is to stunt language growth.

If Gallaudet’s whole word “meaning” reading approach sounds very like the teacher’s guide in almost any modern reading series, it should, because most American reading series are only variations of Gallaudet’s inferior deaf-mute method of teaching reading, even though they claim they use phonics. One highly popular modern reading series which I was forced to use in first grade in the school system where I taught actually stated that it wanted children to use only as many letter sounds in a word as were necessary to confirm their context guesses.

Context-guessing is Gallaudet’s deaf-mute approach, and he added to it the visual comparison of letters in known words to new words to help in learning “new” sight words (none of which, of course, the

---

deaf children could speak but which they recognized only as pictures for their “meaning”). Gallaudet’s “visual phonics” approach, however, is comparable to the use of letter sounds in a word to help in context guessing for hearing children, which context guessing was specifically recommended by this series. Yet such letter sounds are learned only from whole sight words, and never in isolation.

“Context guesses” for little sight-word readers with normal hearing can obviously only be made for words which are already in the little “readers’” spoken vocabularies. These little sight-word readers lack enough phonic ability to sound out truly unknown words so that they can add them to their spoken vocabularies. For such readers, vocabulary knowledge therefore cannot be increased by reading, but only by listening to oral speech. By contrast, phonic readers can sound out an unknown word from all of its letters and figure out its meaning from the context. Phonic readers therefore add both the spelling and the meaning of a previously unknown printed word to their vocabularies. The effect, of course, is cumulative: phonically-trained readers reach high school with larger vocabularies, besides being able to spell better and to read automatically with ease instead of with conscious, unpleasant, “psycholinguistic,” “whole language” guessing.

However, that is what “phony phonics” is: the use of as few letter sounds as possible, learned from previously memorized whole, meaning-bearing sight words, to confirm a context-guess for a new word in print (but not new in the child’s spoken vocabulary). The “new” word is carefully embedded in a controlled collection of sight-words, to assure correct context guesses. That is also what “controlled vocabulary” means: only words previously taught as “wholes” for “meaning” are routinely used in stories. “New” words (but new only as printed words - not spoken words) are introduced so they can be guessed as whole, meaning-bearing words from the story context, using perhaps a few letter sounds from other known whole sight words, plus pictures illustrating the story, to help children with their guesses from the context of the story. Children using one first-grade series, for instance, can read the “new” word, “suitcases,” fairly easily, pleasing their parents. The parents do not see the children study the picture at the top of the page showing a family leaving on a trip with suitcases. The parents also do not know how often the children have been drilled in their dreary reading group sessions to guess words in context from some few consonants like the “s” and “t” sounds in suitcases.

Most classes have at least three such reading groups, all of which have to trudge through at different times the same tiresome lessons in the teacher’s manual. These multitudinous reading groups, which turn every classroom into an inefficient one-room schoolhouse, eat up the most of the school day without teaching any of the children really to read. By contrast, American schools before 1918 did not have such reading groups. Soviet schools and most European schools do not have them today. That means every child in their classes gets 100 per cent of the teacher’s instruction in reading, instead of perhaps 33 per cent and sometimes considerably less as in America.

At least, hearing children have the sight words they are given to read in their spoken vocabularies. Deaf children do not. Deaf children, therefore, when taught with the faulty sight-word method, can only learn printed words for meaning, without sound, by pictures and context. As a result, their reading achievement with the use of the sight-word method is terribly retarded in comparison to hearing children taught with the sight-word method. As Dr. R. Orin Cornett of Gallaudet College, Washington, D. C., said at the Reading Reform Foundation Princeton meeting in 1979, (reported in the Reading Informer, Vol. 7, No. 1, page 5, October, 1979):

“The average reading level of 19-year-olds in schools and programs for the deaf in the United States is about that of a nine-year-old hearing child. We fail the deaf in their area of greatest need.”
Dr. Cornett therefore devised a sharply improved “sound” method for teaching the deaf, but his method is very unfortunately in little, if any, use today.

Yet there have always been far better ways than Gallaudet’s sign-language and sight-word method to teach deaf-mutes language. Surprisingly, one of the best was endorsed and promoted by one of the greatest nineteenth-century geniuses: Alexander Graham Bell, the inventor of the telephone. Bell rejected the teaching of the Abbe de l’Epee of 18th century France who used silent sign-language and silent sight-words to teach the deaf, whose approach Gallaudet had imitated. Instead, Bell used a similar approach to that of Samuel Heinicke of Germany, the Abbe de l’Epee’s 18th century opponent. The 18th century Heinicke taught deaf-mutes lip-reading and true speech, not sign language, BEFORE he taught them to read phonetically, by the sound of print and not its meaning. This, of course, is a “sound first” method, and meaning is only introduced THROUGH phonics. By contrast, Gallaudet’s method is a “meaning first” method, and does not call for the teaching of sound or phonics at all. Samuel Blumenfeld uncovered this fascinating eighteenth century origin of the reading controversy, and outlined its history in one of his books, The New Illiterates, (1973, 1988, The Paradigm Co., Boise, Idaho).

Obviously, the argument in the teaching of reading for hearing children today remains precisely what the argument was between Heinecke and the Abbe de l’Epee in the eighteenth century: “sound” versus “meaning.” That argument is actually rooted in the structure of the human brain. The left side of the brain usually handles sequentially perceived, sound-bearing language, while the right side of the brain usually handles simultaneously perceived, meaning-bearing pictures.³

As reported by Itoh Sasanuma (1975, 1977), recorded on page 92 of Sid J. Segalowitz’s Two Sides of the Brain, some Japanese stroke patients with aphasia, or loss of speech, can read only the Kanji, or character meaning-bearing part of their script, having lost the ability to read the Kana, or syllable sound-bearing part of their script. From other references in available literature on the brain, it may be presumed that their loss of ability to read the Kana syllables resulted from damage in the LEFT angular gyrus area of their brains, where for over a hundred years damage has been known to cause a comparable loss of ability to read alphabetic sound-bearing print.

Logically, therefore, if the reading of Kana sound-bearing script is handled by the left angular gyrus area of the brain, the reading of Kanji meaning-bearing script should be handled by its mirrored counterpart, the RIGHT angular-gyrus area of the brain. The left angular gyrus area and the right angular gyrus area in human brains would then provide the anatomical basis for processing the only two types of visual writing which are possible for humans: sound-bearing, or meaning-bearing. (This anatomical basis for the two types of reading, which appears to be logically probable, has never been clearly spelled out, however, in any literature which I have ever seen.)

Reading is a conditioned reflex. Therefore, it should be anticipated, it appears to me, that learning to read meaning-bearing print such as Kanji, Chinese characters, or whole sight-words should establish a reflex to the angular gyrus area in the right, meaning-interpretive picture side of the brain; learning to read sound-bearing print should establish a reflex to the angular gyrus area in the left, or sound-interpretive language side of the brain. However, we now teach beginning readers in America to regard words as meaning-bearing, sight-word “wholes,” while we simultaneously drill them to sound out only some letters of those words (phony phonics) in order to help in guessing the meanings of the whole words. Children therefore are being drilled in the use of opposing reflexes on the SAME stimulus, something which occurs in no other activity. The resultant conflict is one of the causes of the disability known as “psycholinguistic guessing.”

³ Charles M. Richardson, the engineer/educator of The Literacy Council, Huntington Station, New York, points out the resemblance to computer memory: serial vs. parallel processing.
Not surprisingly, therefore, laboratory studies, such as by Davidson, Perl and Saron, reported by Daniel Goleman in the New York Times Magazine on May 12, 1985, show that young American readers today can read alphabetic print with BOTH SIDES of the brain. They are unlike the classic aphasic patients, most of whom would have been elderly and have learned to read before about 1826 or in non-English-speaking European countries teaching by “sound,” referred to in William James’ 1890 book on psychology. These patients had lost all ability to read after damage to the left side of the brain. Our modern American subjects are therefore also unlike the Japanese aphasic patients who lose all ability to read Japanese sound-bearing Kana print after damage to the left side of their brains.

Some unknown but almost certainly small proportion of children trained by the deaf-mute reading method in first grade become phonetic readers, anyway, figuring out for themselves the simple syllable/sound correspondences in English, which are specifically taught in phonic programs. Children who are taught to read alphabetic print as sound-bearing print, or who have figured out how to do so by themselves before whole-word conditioned reflexes are set, can achieve automaticity in their reading, as can Japanese readers of Kana sound-bearing and Kanji meaning-bearing characters, and as can readers of Chinese meaning-bearing characters.

However, those who learn to read alphabetic print as whole sight words can NEVER achieve automaticity as can readers of Kanji and Chinese characters, because the method relies permanently on conscious guessing. The right side of the brain which perceives things all at once like a picture is used to read whole, meaning-bearing characters like Kanji. In contrast, the left side of the brain which perceives things sequentially like a stream of language is used to read sound-bearing characters like Kana. Since Kanji and Chinese meaning-bearing characters can be seen with one fixation of the eyes, their correct meaning can be read instantly with the right, “all-at-once” side of the brain. Yet, for beginning readers, whole-sight words cannot be seen with one fixation of the eyes. Therefore, correct sight-word meanings cannot be read instantly with the right, all-at-once side of the brain. As a result, meanings must be guessed only from that part of the whole word which is picked up by the first fixation of the eyes. “Psycholinguistic guessing” is therefore the direct and inevitable result of teaching beginners to read alphabetic print with the right, “all at once” “picture” side of the brain instead of the left, “sequential” “language” side of the brain. Such a lack of automaticity in reading as conscious guessing is, by any rational definition, a disability despite Dr. Kenneth Goodman’s much-ballyhooed attempts to elevate “psycholinguistic guessing” to a cult. “Psycholinguistic guessing” makes the actual act of reading or decoding unpleasant, because it is conscious and therefore effort-filled, while reading or decoding automatically requires no conscious attention on the reading act itself, any more than conscious attention is required in the placement of our feet when we are walking.

One possible reason that an unsatisfactory deaf-mute method to teach reading was pushed into American schools in 1930 to teach hearing children was the apparent failure of most “reading experts” to realize that normal reading is an automatic conditioned reflex. Like other automatic conditioned reflexes such as walking, piano-playing or typing, it can function with or without the presence of conscious attention. To understand the “unpleasant” aspect of the conscious deaf-mute method, try walking across the room as you concentrate on placing each foot. How would you enjoy reading with that kind of concentration on the print? That is, however, how vast numbers of Americans today have to read.

On major testing programs comparing phonically trained children to sight-word trained children, phonically trained children have scored better than sight-word trained children on “reading comprehension” because they were not guessing. But since phonically trained children have formed normal automatic conditioned reflexes in reading, in more routine testing such as the annual school-administered California tests, they may score either high or low depending on whether they did or
did not choose to focus their attention on the content in that routine exercise. Widely fluctuating reading comprehension scores on such routine tests actually CONFIRM the presence of automaticity.

By contrast, children taught to read by guessing unknown words from a context of memorized sight words, which is a deaf-mute method, are incapable of reading automatically, by definition, since they use consciousness to decode words. Because the deaf-mute method guarantees forced attention, however, such “guessers” will show stable reading comprehension scores, while phonic-trained readers with true automatic conditioned reflexes may show either high or low scores, depending on their interest in taking the test. For this reason, stable reading comprehension scores for groups or individuals, wherever they occur, suggest a possible lack of automaticity and possible reading disability.

It was such stable “reading comprehension” scores, wrongly interpreted as showing the superiority of the deaf-mute guessing method, that permitted the early 20th century “experts” to promote the deaf-mute guessing method in the schools. However, they could only promote it by hiding its true nature under a false label, calling it instead the “intrinsic phonics” approach.
Chapter 1
Evidence on Present-day Disabilities From the Deaf-Mute, Guessing, “Meaning” Method

“...the generally accepted current model of word identification [is that] a possible interpretation of a word usually begins forming in the mind as soon as even partial information has been gleaned about the letters in the word... When enough evidence from the letters and the context becomes available, the possible interpretation becomes a positive identification.”

This model, using context and conscious guessing for word identification, which is based on actual tests on American readers, implies automaticity is lacking for these readers not just on unfamiliar words but almost ALL words!

For those printed alphabetic words being read by the right side of the brain as sight-word “wholes” for “meaning,” this was, however, to be anticipated. The right side of the brain handles things “all at once,” or globally and simultaneously, while the left side handles things sequentially. Since little beginning readers, when they are first forming their conditioned reflexes in reading, cannot see a whole alphabetic word “all at once,” as the much shorter Chinese and Kanji characters can be seen “all at once,” but require two or more fixations of the eyes, in no way could these beginning readers see such whole meaning-bearing sight-words “all at once” with the right “meaning” picture side of their brains. Instead, they had to guess the meaning of the whole word instantaneously but consciously from the first few letters their eyes picked up. Therefore, because of the length of whole sight words, interference with proper conditioned reflexes and automaticity in reading alphabetic print is built right into the sight-word “meaning” method, even without the teaching of “psycholinguistic guessing.”

The “model” quoted in this Government report, of course, describes readers trained with the deaf-mute approach. This is confirmed by the further statement on page 12 of Becoming a Nation of Readers, that present-day readers tested do not work out pronunciations by “letters and sounds” but by “analogy with known words.” This is a relatively slow, two-step deaf-mute skill usually done in the context of a reading selection: visual analysis of unknown words to compare their parts to remembered parts of known words. Arthur I. Gates, who wrote the 1930 Macmillan deaf-mute-method primer, coined a new name for this two-step deaf-mute skill in his paper in the June, 1925, Elementary School Journal, entitled “The Supplementary-Device Versus the Intrinsic Method of Teaching Reading.” That new name is “intrinsic” phonics.

Gates’ silent, intrinsic phonics (the silent, visual analysis of printed words done in combination with context guessing) replaced auditory phonic drill after 1930. Since the test data in Becoming a Nation of Readers shows most Americans are using such deaf-mute-method whole-word “phonics” today, Gates is still casting a long shadow over America!

---

The statement on page 11 of Becoming a Nation of Readers that current readers “with more than fourth-grade reading ability make almost no mistakes with regular pseudowords” such as “tob” and “jate” is not consoling, because the report states they have to draw on their sight-word memory bank for similar whole words in order to sound out even these simplest of sound sequences. They make no use of real, letter-based phonics. Yet most phonically-trained first-graders can handle such letter sequences synthetically with the greatest of ease before January of first grade.

I am reminded of a beginning second-grader I taught who had memorized the words in her widely-used sight-word basal reader to the beginning second grade level, but who was incapable of reading the “new” word, “cat.” She needed more workbook practice using “analogy with known words” before she would be able to handle that phonic conundrum, “cat.” (I taught her straight one-step letter-based phonics and she was on the honor roll by fifth grade.) Another little second-grade boy I taught, who loved science, had transferred from another state after using the Macmillan series in first grade. He was retested on the Macmillan test in my class and did very well. Later, he asked me to read a “hard” word for him which stumped him. That word was “frog.”

It is ridiculous to claim such children were taught phonics because of some lessons on sounds of parts of whole, known sight-words in their first-grade series. Such parts of known sight words are meant ultimately to be used in two-step “intrinsic phonics.” First, children resurrect the memories of similar whole words, and secondly they compare their parts to the unknown word.

These two children were not unusual. Almost no one in American schools really expects first and second graders to read anything, particularly aloud, other than the controlled-vocabulary sight-word books in their classrooms. Certainly most teachers never ask them to read anything else aloud. To do so would be to ask the children to read at their “frustration level” (missing more than ten percent of the words) which would be very “unprofessional.” Even the vast majority of their “library books” have controlled high-frequency vocabulary.

No reading experts today ask where such “frustration levels” came from. They were originally, of course, deaf-mute-method concepts. As mentioned, Gallaudet’s 1836 Mother’s Primer introduced, on the average, less than ten percent of “new” words to be learned in contexts of, on the average, ninety percent of memorized whole words (or, on the average, 10 unknown words for every 90 known words).

However, Arthur I. Gates concluded such a vocabulary “load” was far too heavy for thoroughly learning new words and carried out extensive studies in the 1920’s to find the optimum number of “new” words to introduce in such running texts of memorized sight-words. He included in his statistics tests on mentally defective children and deaf children. Gates “discovered,” not surprisingly, that the brighter children could memorize higher concentrations of “new” words embedded in “controlled vocabulary” than could duller children. He cited studies specifically carried out on deaf children just learning to read, the studies apparently being carried out under his direction at Columbia Teachers College. For the little deaf beginning readers, one new word was introduced for every 150 words of a story. He specifically noted on page 785 of the June, 1925, issue of The Elementary School Journal, concerning teaching deaf children under eight years old to read:

“Incidentally, study of the deaf should throw light on the values of phonetic training, since they cannot, of course, utilize this device.”

This comment of Gates and the study of beginning reading for the deaf clearly indicate that Gates understood the origin and nature of the inferior deaf-mute method he and William Scott Gray were to

---

5 Interest and Ability in Reading, by Arthur I. Gates, 1930, Chapter I (particularly page 17) and pages 210 and 211.
inflict on American children with their 1930 deaf-mute method primers. It should be stated, again and again and again: America’s functional illiteracy is no accident. It was the result of intense, hard work on the part of these “reading experts” and their coterie, and it remains in place because their successors are in firm control of the education establishment.

Virtually none of the beginning third graders I taught from 1963 to 1975 had any knowledge of the short vowel sounds, which explains the inability to sound out words like “cat” and “frog.” Estimates have been made that perhaps as many as sixty percent of English syllables contain short vowels, so the inability to read short vowels turns the “reading” of the majority of new words into pure context guesswork. The third-graders could only read new short vowel words by guessing them in sight-word contexts.

I spent the first month of third grade from 1965 to 1975 trying to get students to distinguish the vowel sounds in the short-vowel sentence, “Fat hen is not up,” from Martin D. Brennan’s and George J. Ameer’s Reading in a Nutshell, Colfax Press, Inc., Wayne, New Jersey: 1965. I was eventually successful, and, in the course of a full year, managed to teach the third graders, with great difficulty, the phonics that properly taught first graders learn with ease before Christmas of first grade. I know, therefore, from long personal experience, how hard it is for sight-word trained children to learn true phonics.

The third grade spelling book began with short vowel words such as I drilled my classes on until well into October, and another third grade teacher (otherwise extremely competent) felt at that time, because of the difficulty the third graders were having, that such spelling words were “too hard” for third graders - words like pin, lot, tub, etc.! (Not long after, however, she became an ardent proponent of the need for true phonics in grades one and two, so that such problems would not develop.)

At the time, the school was using the Scott, Foresman and Ginn readers in grades one and two. They were standard, context-guessing, sight-word texts so the children’s disabilities at third grade were understandable. Yet these intelligent third graders were doing very nicely on the meaningless Iowa silent reading comprehension tests, so the administrators, none of whom had ever taught primary grades, felt there was no problem.

Nor can sight-word trained readers properly handle vowel sounds as adults, unless they meet a teacher somewhere along the way who teaches them real phonics. The Gates- McKillop- Horowitz Reading Diagnostic Tests, copyrighted in 1981, by Teachers College Press, Columbia University, give a vowel test on ten spoken syllables containing five long and five short vowels (but not including the special vowels such as au, oi, etc). The test taker has to state only whether the vowel he had just heard pronounced in a syllable was a, e, i, o or u, and not even whether it was long or short. Since the long vowel sounds are almost self-evident (the “a” heard in “gate,” for instance) this test really only tests the ability to identify the critical five short vowels, as heard in the words cat, pet, sit, top, cup. The Gates-McKillop-Horowitz test manual states:

“Even among the most skilled readers, an error or two may be made on this test, and this should not be considered significant in itself.”

The earlier 1962 Gates-McKillop test manual said almost exactly the same thing. So, when an adult receives a score of, effectively, only 60% on the five critical short vowels (since the long vowels are self-evident), it is not considered “significant.” Yet phonically trained children before the middle of first grade make virtually no such errors on the five short vowels, and certainly do not make errors on the long vowels! Phonically trained first-graders can decode, OUT OF CONTEXT, simple short-vowel words like “cat” and “frog” with ease before Christmas of first grade, and love doing it! They also delight their
parents by beginning to read billboards and signs they pass in the family car, which, of course, have almost no “context clues” to use for guessing.

A Soviet reading approach, in sharp contrast to our deaf-mute guessing method with its analogy-with-known-words substitution for vowel sounds and phonics, is referred to in Educational Psychology in the USSR, edited by Brian and Joan Simon, (Stanford University Press, Stanford, California: 1963). In his article reproduced in their book, the Soviet psychologist D. B. Elkonin recommended that Soviet children be drilled to name vowel sounds in spoken syllables, like those short vowels in the Gates-McKillop-Horowitz tests on which “skilled” American adults can score sixty per cent or less, BEFORE reading instruction even begins in first grade! Elkonin said (page 169):

“Ability to hear the separate sounds in words, to distinguish one from another and to generalize sounds, is vitally important for succeeding stages in mastering reading and writing.”

Yet, “expert” objections are often given to the value of teaching vowel sounds, since vowels can be pronounced very differently in different localities. But a child is not commuting daily between Maine and Alabama as he learns to read: he is exposed only to consistent vowel pronunciations from his teacher, which is all that is necessary for his own reading of these vowels consistently.

So there is a great gulf separating deaf-mute-method trained readers and phonically-trained readers, and the silent reading workbook is an attempt to bridge the gap. It is hardly surprising that Gates in 1930 gave great stress to these time-consuming, expensive, boring and pernicious “reading workbooks.” Such workbooks assure that students who have managed to reach what the experts label the “fifth grade level” of reading ability can finally pronounce most syllables like jate by comparing them to their stock of memorized sight words.

Nevertheless, when the bulk of people trained in the confusing deaf-mute manner reach upper-grade books filled with unknown terms which they cannot guess from the context because they are not in their spoken vocabularies, they find it difficult to learn such terms. That is the result of the conscious effort that must be used to apply their “intrinsic phonics.” An intelligent college graduate, a middle-aged mother, told me that she usually skipped over all the “hard” words when reading. It is obvious she is not alone in doing so. Since vocabulary knowledge, obviously of low-frequency words, is considered to be the best single indicator of intelligence, by lowering American students’ ability to learn such new words, the deaf-mute method has, effectively, lowered America’s intelligence quotient when reading. Difficulty in learning new words is also why our “reading problem” is presumed to be most acute in the upper grades, but the source of the problem is really in the first grade.
Chapter 2
The American Promoters Since 1883 of the Present-day Deaf-Mute Guessing “Meaning” Method for Teaching Beginning Reading

William Scott Gray was the father of the “Dick and Jane” Scott, Foresman deaf-mute-method readers. They were published in 1930 at the same time as Arthur I. Gates’ deaf-mute-method Macmillan primer. (The rest of Gates’ Macmillan reading series was published in 1931.) Because of their scientifically controlled vocabulary, the Gates and Gray readers differed from the sight-word readers which had been in increasing use in the 1920’s, which also caused reading disability but which did use a minimal amount of supplementary phonics. In the Gates and Gray readers, real phonics was totally removed.

The introduction of “new” words in the Gates and Gray readers did not exceed the level indicated by experiments as optimum for memorizing new “whole” words for meaning without the use of sound in a context of previously memorized sight-words. This is the precise method by which some little deaf children, who might not as yet have had any spoken vocabulary at all, were being taught to read at that time. However, because hearing children, unlike the deaf children, already had most of the words the reading books used in their spoken vocabularies, printed “new” words could be introduced faster for hearing children. As with the method used for the deaf children, the “new” printed words for the hearing children were repeated a scientifically chosen number of times in the “stories” to establish strong “bonds.” At the very beginning of reading, before a basic sight-word vocabulary of about 150 words to use as running context had been built up by various kinds of drill, such repetitions could produce possible idiotic sentences like “Oh, oh! Look, Spot, look!”

But most children DID learn something from such “instruction.” They learned permanently to disregard true letter “sound” and to concentrate solely on guessing the “meaning” of unknown words from the context of what they were reading. Since their faulty conditioned reflexes acquired in first grade did not permit them truly to “sound out” an unknown word and because so-called “intrinsic phonics” was so awkward, they often searched their vocabularies for a word whose meaning approached that of the “new” word. As a result, they produced misreadings like “horse” for “pony,” and “pot” for “pan,” and far, far worse according to Helen R. Lowe’s 1951 copyrighted paper, How They Read, a copy of which I obtained a few years ago from Mrs. Bettina Rubicam of Scottsdale, Arizona, former president of the Reading Reform Foundation.

Mrs. Lowe’s paper was based on more than 10,000 reading errors she had recorded from readers aged six to twenty-six, in school and out of school. She found such misreadings as “Switzerland” for “Massachusetts,” and “absence” for “attendance.” Such misreadings do have a kind of logic to them. But the “intrinsic phonics” training reared its head when “context meaning clues” provided no help, even though “intrinsic phonics” is supposed to be done in tandem with context-guessing so that the choices are “meaningful.” Instead of “meaningful” choices, truly lunatic misreadings occurred, because an unknown printed whole word looked something like a known printed whole word. This produced the reading of “noodles” for “mill bells,” “twelve onions” for “the travelworn paper bag,” and “molasses and radishes” for “masses of reddish gold clouds.” The trouble obviously came from dealing with alphabetic print as whole sight-words, instead of as letter sounds. Mrs. Lowe’s remarkable paper has, of course, never been published since it proves the harmfulness of teaching alphabetic print for “meaning” instead of “sound.” That her shattering research in 1951 never reached the general public, the teachers’ colleges or our public schools is additional proof that censorship is alive and well in America.
The impression is given in the media that our reading problems are recent. It should be noted that Mrs. Lowe collected all her data BEFORE 1951. Her 26-year old subjects would have been in first grade about 1931. Our major reading problems started over sixty years ago, about 1930, with the deaf-mute-method Gates and Gray readers. Yet many unfortunates during the 1920’s were subjected to other sight-word readers produced by other “experts” in Gates’ and Gray’s circle, and became reading disabled despite the use by these books of minimal amounts of phonics. Nelson Rockefeller, who almost became president of the United States, acquired his “dyslexia” in a school run by such “experts” in the early 1920’s.

Although they outlawed true phonics, Gray and Gates did speak of their “intrinsic” phonics. As discussed, what they actually meant, in comparison to rapid and automatic one-step synthetic phonics, was the relatively slow and conscious two-step visual and mental comparison of one whole, meaning-bearing sight word to previously memorized meaning-bearing whole sight words. In the course of this two-step mental gymnastic exercise, in which children compared the word they were actually seeing to the whole words stored in their heads, hearing children might make some generalizations for themselves about letter sounds and the sounds of word parts, since they already had all the words in their spoken vocabularies. However, hosts of children did NOT make such generalizations, and became the vanguard of our army of functional illiterates. Just consider the three sounds of “o” in “Oh, oh! Look, Spot, look!” What kind of generalization can a beginning reader make about the sounds of “o” if it is given three different sounds in one such short sentence at the very beginning of reading instruction?

Gray unwittingly confirmed that failure to understand the real nature of reading skill was the reason for these deaf-mute-method texts. In Teaching to Read, Historically Considered, The University of Chicago Press, Chicago, Illinois: 1966, Mitford M. Mathews reported on the excellent first-grade reading at the end of the school year in a Chicago school about 1940 which was using the new phonetic Bloomfield method. Gray, then Dean at the University of Chicago, visited the class with the Press. First-grade children were picked at random to read orally from upper-grade books, and did so successfully, one boy pronouncing with ease, the word “satellite” from a sixth-grade book.

Mathews said:

“Father Stoga asked him what the word meant and the child said it meant a big object in the sky. Dean Gray found this answer unsatisfactory, showing that the child was reading, that is pronouncing, quite beyond the vocabulary appropriate to his age, and not getting the sense of what he read. He explained to the other visitors what the children were doing was in no sense remarkable. He said that reading experts had long known that children could rather quickly be taught to pronounce words with remarkable glibness, but that real reading with understanding of what was read was another matter entirely. He pointed out that these children were mere word-callers, that they were pronouncing well beyond their mental ages, and that they were heading straight for serious trouble later in their reading development.”

The child was actually demonstrating the oral reading accuracy which underlies a proper automatic conditioned reflex in reading, but Gray did not understand that. An obvious reason exists for Gray’s remarks discounting the value of correct oral reading. That reason is the arrival of the “silent reading comprehension test,” and, with it, its incorrect interpretation. The reason for that incorrect interpretation will become obvious after the deaf-mute guessing method’s history is outlined.

By 1915, William Scott Gray (1885-1960) was at the University of Chicago, working on his doctorate, which was, astonishingly, on oral reading accuracy tests, under the psychologist Charles H. Judd. Gray had obtained his master’s degree, even more astonishingly, on oral reading accuracy tests directly under the psychologist, E. L. Thorndike, at Columbia Teachers College in 1914. It was only a
year or so later that Arthur I. Gates (1890-1972) studied with Thorndike and James McKeen Cattell at Columbia, and in 1917 Gates actually lived briefly with the psychologist Cattell’s family, at the time Cattell was fired from Columbia for opposing the World War I draft. Gates lost his draft exemption, presumably because of the association, but Thorndike had it reinstated (from The Sane Positivist, Thorndike’s biography by Geraldine Joncich).

Thorndike of Columbia Teachers College and Judd of the University of Chicago were obviously old friends, as Judd said of Thorndike in Teachers College Record, Columbia University, New York: May, 1926,:

“...as students at Wesleyan University...(t)ogether we studied (the psychologist) James under our (psychologist) teacher, Professor Armstrong.”

Thorndike (1874-1949) had gone on to study personally under William James (1842-1910) at Harvard in 1895-1897, and even kept his experimental chickens in the basement of James’ home, according to Geraldine Joncich’s biography on Thorndike. Thorndike’s tie with James was very close, as was Thorndike’s later tie with James’ close friend, the psychologist Cattell (1860-1944) at Columbia, with whom Thorndike studied in 1897, after leaving Harvard.

James McKeen Cattell was Chairman of the Executive Committee of the American Association for the Advancement of Science from 1924 to at least 1941, and possibly to his death in 1944. Cattell personally owned its journal, Science, from the mid-1890’s until his death, as well as School and Society and other publications. Cattell was a co-founder of the Psychological Corporation about 1922 as well as one of its presidents and was president of the Ninth International Congress of Psychology at Yale University in 1929, attended by Pavlov and other luminaries. Cattell had visited the Soviet Union with John Dewey and others the previous year. After a brief quiet period following his firing from Columbia in 1917 for opposing the World War I draft, Cattell had resumed his many activities, as the huge files of his documents in the Manuscript Section of the Library of Congress in Washington attest. (That the Library of Congress accepted Cattell’s huge collection of personal files many years after his death was an implicit admission of the extraordinary influence Cattell exerted on American society from the 1880’s till 1944. It should be noted that formally published writings by Cattell were almost non-existent.) In the February, 1926, issue of Teachers College Record published in honor of Thorndike, Cattell spoke in his article contributed to that issue about the very close relationship he had with Thorndike over the years since 1897.

Cattell, of course, is the psychologist who presumably “proved” at Johns Hopkins in Baltimore, Maryland, in 1883 and later in Leipzig, Germany, that we read words as wholes, purportedly debunking the argument for phonics. What Cattell actually showed was that it took as long to read aloud letter names as to read aloud the same number of words in sentences. Actually, that proved nothing, because letter names ARE words.

Interestingly, the names of isolated letters, as opposed to sound-bearing syllabic print, appear to be read by the right side of the brain. Aphasics who have lost the ability to read sound-bearing syllabic print because of damage to the left side of their brains have nevertheless sometimes demonstrated the ability to distinguish the letters.6 By analogy, therefore, it appears that if “words” are taught as global wholes as letters have to be taught, such global whole words should also be read by the right side of the brain.

---

The early American psychologists were a tiny group. A fellow graduate student whom Cattell tested in 1883 in his reading experiments at Baltimore under his psychologist professor, G. Stanley Hall, was the psychologist, John Dewey (1859-1952). Fifty years later, at an Aristogenic Society dinner in Dewey’s honor, Cattell remembered, “Dewey made a notable record for quickness and understanding.” (from “John Dewey,” Cattell’s copy of his 1933 talk in the Cattell files of the Collections of the Manuscript Division, Library of Congress). The psychologists’ concern for “reading comprehension” obviously had deep roots. But, for the record, after 1883, when Cattell and Dewey were graduate students together, they did not work together again until 1904 when Cattell arranged to bring Dewey to Columbia (from the 1933 talk mentioned above). Cattell thought highly of Dewey, but Dewey and Cattell were apparently never as close personal friends as were Cattell, James and Thorndike.

Cattell’s 1880’s perception experiments, which were very scientifically done, were wrongly assumed to show that teaching words as wholes for meaning instead of sound improved speed and comprehension, so that with meaning-bearing sight-words all children could come closer to Dewey’s “quickness and understanding.” The reason for this wrong interpretation will be discussed further later. However, Cattell’s experiments provided the necessary theoretical basis for teaching whole words for “meaning” instead of isolated phonemes for “sound.” Therefore, since the end of the nineteenth century, Cattell’s experiments have been cited in footnotes as “proof” of a presumed “need” to teach beginners by “meaning” instead of by “sound.”

At the time John Dewey learned to read, in the early 1860’s, and since about 1830, sight-words were taught to beginning readers almost uniformly in the United States, despite Nila Banton Smith’s “history” which states otherwise (American Reading Instruction, original 1934 edition by Silver, Burdett and Company, the 1965 revised edition by International Reading Association, Newark, Delaware.) All that is necessary is to read journals and prefaces to reading books of the period to confirm that fact.7

One of the most astonishing blind spots in the history of American education concerns the enormous functional illiteracy problem in the nineteenth century. Not only is the existence of that problem a blind spot, but so is the history behind WHY the functional illiteracy developed in the first place. Yet the facts have been there all along, just crying out to be noticed. Original source material shows that functional illiteracy in America was the gift of two small groups of activists, one in the period 1826-1836, and the other in the period 1870-1880. Both groups worked successfully to defeat the teaching of true sound-bearing, letter-based syllabic phonics at first grade and to replace it with the teaching of meaning-bearing whole sight-words.

When these activists succeeded in replacing materials teaching syllabic phonics with materials teaching meaning-bearing sight-words at first grade, widespread functional illiteracy was the result. Among other sources confirming this fact is L’Instruction Primaire a Philadelphie, by F. Buisson, the French representative to the 1876 Philadelphia Exposition, who visited many American schools and met with school officials while in America. In a footnote on pages 232-232, Buisson referred to and quoted from American school reports concerning widespread reading failure in 1876, one of which said one third to one half of children left school before reaching fourth grade and many read very imperfectly. From a report from the News-Boys Lodging Houses in New York, where the boys had been in school two or

---

7 Among many others which can be cited are the preface to Charles W. Sanders’ spelling book of 1838 and 1845; pages iv and last paragraph, page v of Elias Longley’s Pronouncing Vocabulary of Geographical and Personal Names, 1857; pages 180-195 of James Pyle Wickersham’s Methods of Instruction, 1865; and pages 13 to 17 of Edwin Austin Sheldon’s Teacher’s Manual of Instruction in Reading; Designed to Accompany Sheldon’s Readers, 1875. As will be shown, after 1826, phonic spelling books like Sanders’ very widely used text were not normally used until about the fourth-grade level. This is confirmed by the fact that Sanders, himself, wrote a sight-word primer, followed by a sight-word book one and sight-word book two.
more years, 20% had not learned to read, and another 20% thought they could but were found to be unable to read print freely. Buisson said:

“The reports of Mr. Kiddle, Superintendent in New York, agree with those of Cleveland, Chicago, Cincinnati, St. Louis and Milwaukee: ‘A half or a third of our children stay in school only three years or less, and during this time many learn to read only imperfectly.’”

These children were obviously not being taught phonics, because with proper phonic teaching, most children can be taught to read English independently by the end of first grade, and virtually all phonically trained children learn to read English independently by the end of second grade. In the Soviet Union, where phonics is taught, the teaching of reading is finished before the end of first grade, as is the case in many other places in Europe. The Soviets have required that children be seven years old to start reading, which, of course, greatly reduces the number of children who have not matured enough to form correct reading reflexes.

However, to understand the radical change the first group of activists brought about in 1826, which will be discussed in PART 4, it is necessary to define some of the school books which were used in the English language before 1826. After 1826, the activists increasingly used the word, “primer,” but through their influence the word had come to mean something very different from that which it had meant in the past. To understand the “meaning” method promoted by the 1826, the 1870’s, and the twentieth century activists, the true primers in English must be defined. So must some publications be defined which were contemporary with the true primers: the horn books, the ABC books, the catechisms and the spelling books.

Furthermore, to have a proper understanding of all of these materials, the roots of all of them and the methods used to teach them in the past must be discussed.
Chapter 3
Reading Instruction Materials of the Different Periods

Primers

True English primers had always been religious. Originally very long prayer books, they had developed by the start of the seventeenth century into religious reading books for children, with the catechism attached.

Children, of course, then as now, had access to stories, but what we think of as “stories,” or tales told solely for their amusing content, did not begin to become part of reading instruction until the middle of the eighteenth century. A delightful account of such “story books” for use outside of real instruction is given in The Penny Histories, “A study of chapbooks for young readers over two centuries,” by Victor E. Neuburg, published by Harcourt, Brace & World, Inc., New York: 1969. His book is concerned with the true chapbooks, commonly 24-page or 32-page inexpensive printed story books, sold in great numbers by peddlers all throughout England in the eighteenth century and still sold in the nineteenth. (Obviously, there was a sizable literate public or there would not have been such a big market.) Much of their content Neuburg traced to stories in rhyme that had been told since the Middle Ages, and which showed up as ballads on printed single sheets in the seventeenth century. This kind of material certainly did not find its way into the primers, even when the later primers were meant more for children than adults.

Though originally meant as prayer books for adults, as will be shown later, primers apparently always had some use as advanced readers for children. But the confusion between primers, also called Horae or Books of Hours before the Reformation, and the ABC books which the children at that time studied first, before the primer, is long standing.

“The word Prymer has been the source of much controversy, and even the O.E.D. provides no satisfactory explanation as to its origin. The word is first found in the Latin form of Primarium in the will of Mathew of the Exchequer in 1294. From then on, with the growing use of the Book of Hours among the laity, the word becomes increasingly common, finally taking on the English form of Primmer, Prymer, or Primar. By the sixteenth century, the word was well established, but its meaning was already lost in the mists of antiquity.”

Another name for the Book of Hours which was the major part of the primers before the Reformation was the Little Office of the Blessed Virgin Mary. It is still in print in the twentieth century, and in the United States is available from Franciscan Herald Press, 1434 West 51st Street, Chicago, Illinois 60609 (10th printing: 1979).

References to the Book of Hours pop up in odd places in history, which demonstrate its widespread influence. For instance, in the fascinating book, Cortes, by William Weber Johnson (Little, Brown and Company - Boston, Toronto, 1975, page 31), he tells of a Spaniard, Jeronimo de Aguilar, shipwrecked in Yucatan, Mexico, in 1511 and enslaved by a native chief. When Aguilar was found by the explorer/conqueror Cortes eight years later, he was carrying a greatly worn Book of Hours which he had used for prayer and, unsuccessfully, to keep track of time. Some of the shipwrecked survivors, according to Johnson, were victims of sacrifices followed by cannibalism, which fate Aguilar escaped. Interestingly, as will be shown, all but one or two of the Spanish printings of the Book of Hours before 1511 were in
Latin. It is fascinating to think of the Yucatan jungles in 1511-1519 as the setting for eight years of solitary Latin prayers!

The background of this Little Office or Book of Hours is discussed in the Catholic Encyclopedia of 1913 (page 275, vol. XII), in the article “Popular Devotions:”

“Historically speaking, our best known devotions have nearly all originated from the imitation of some practices peculiar to the religious orders or to a specially privileged class.... The Rosary, for instance, is admitted by all to have been known in its earliest form as ‘Our Lady’s Psalter.’ At a time when the recitation of the whole hundred and fifty Psalms was a practice inculcated upon the religious orders and upon persons of education, simpler folk, unable to read, or wanting the necessary leisure, recited instead of the Psalms a hundred and fifty Pater Nosters or supplied their place more expeditiously still by a hundred and fifty Hail Marys said as salutations of Our Lady. The Rosary is thus a miniature Psalter.... Or again, those who coveted the merits attaching to the recitation of the day and night hours of the clergy and the monks supplied their place by various miniature Offices of devotion, of which the Little Office of the Blessed Virgin and the Hours of the Passion were the most familiar....”

Further historical background is given in the article “Little Office of Our Lady” on page 294 of Volume IX, of the 1913 Catholic Encyclopedia. The Little Office which formed the greater part of the pre-Reformation primers is described as:

“...a liturgical devotion to the Blessed Virgin, in imitation of, and in addition to the Divine Office. It is first heard of in the middle of the eighth century at Monte Cassino (Italy).... it is probable that the Little Office, as a part of the liturgy, did not come into general use before the tenth century; and it is not unlikely that its diffusion is largely due to the marked devotion to the Blessed Virgin which is characteristic of the Church in England under the guidance of St. Dunstan and St. Ethelwold. Certainly, during the tenth century, an Office of the Blessed Virgin is mentioned at Augsburg, at Verdun, and at Einsiedel; while already in the following century there were at least two versions of her ‘Hours’ extant in England.... By the fourteenth century the recital of the Little Office had come to be an almost universal practice and was regarded as obligatory on all the clergy. This obligation remained until St. Pius V removed it by the Bull ‘Quod a nobis’ of 1568.... Down to the Reformation it formed a large part of the ‘Primer or Lay-folk’s Prayer-book,’ and was customarily recited by the devout laity, by whom the practice was continued for long afterwards among the persecuted Catholics.”

It should be evident from this history that the original primer had nothing whatever to do with teaching beginning reading but was the laity’s prayer book. However, like the Psalms for so many centuries before, which formed a large part of the Book of Hours or primer, it might very well have been given to children for practice in reading. Once they had finally memorized the sounds of Latin syllables in the letter-based syllabary in their ABC books, children were able to recite these syllables when they saw them in the Latin prayers in the ABC books and in the Latin primer. In modern terms, the primer prayer-book material for practice in reading was used by children to pass from stumbling reading of the newly memorized syllable sounds to automaticity in reading them.

A major source for information on early primers is Charles C. Butterworth’s The English Primers (1529-1543), copyrighted and published by the University of Pennsylvania Press in 1953, and reprinted by Octagon Books in 1971. Butterworth records that adult primers were enormously popular before 1560. This would indicate they ceased to be popular during the Elizabethan period, as another authority, who will be quoted later, confirms. As Butterworth points out, adult primers were in effect later replaced in the Anglican Church by the Book of Common Prayer. Butterworth said:
“For the primers enjoyed an extensive popularity: more than 180 editions of them appeared during the crucial years from 1525 to 1560... some in Latin, some in English together with the Latin and many in English alone. No wonder the printers took interest in a product that could absorb an average of five new editions a year!

“The Primer contained, along with other devotional matter, a significant amount of Scripture... some forty psalms in their entirety as well as familiar pages from the New Testament and occasional excerpts from the Old....

“The Primer was thus a religious handbook.... There appears to have been originally no strict regulation of its exact contents. It was from the beginning a compilation, but it always centered about the Book of Hours.”

The pre-Reformation primers in England, those before 1534, and the ones immediately afterward were composed for adult lay people. With such huge editions of a publication meant for a market only of lay people, it is difficult to understand how some writers can claim the English had a low literacy rate at the time of the English Reformation in 1534. The many pre-Reformation chantry schools endowed by wills to teach poor children and the ABC schools in the parish churches had apparently done quite a good job of teaching reading, or these primer sales would not have been possible. Because of the structure of written Latin, when the ABC letter-based syllable method was used to teach reading in Latin instead of English, teaching children to read was actually a relatively easy job (unless children were too young - under six years.) Yet St. Thomas More himself was concerned by what he surprisingly considered low literacy in England in the beginning sixteenth century, estimating that only about sixty percent of the population was literate.

In his book, Teaching Reading in Early England, (Pitman Publishing Company, London, England: 1973, page 157), W. J. Frank Davies reported the estimate of St. Thomas More, which had been given in More’s text, Apology. More wrote that the number of people in England who were able to read was more than half the population, and the population at that time was about four or five million.

That More is reported to have expected something better tells a lot about the positive attitude of the times to lay literacy. Yet his estimate compares very favorably with honest estimates of functional illiteracy in America today.

An excellent description of the adult primers and their use before and immediately after the English Reformation in 1534 is given in Edwyn Birchenough’s 1937 paper, “The Prymer in English,” reprinted in the English journal, The Library, London, Series 4 - volume 18, pages 178-181. In it, he mentions the Paston family, whose surviving correspondence provides a remarkable historical window on the fifteenth century. The John Dorne whom he mentions was a bookseller whose 1520 sales records have survived, which is another remarkable historical source:

“The beautifully illuminated Latin Horae or Prymers that one sees in the show cases of museums are the prototypes of the printed Prymers which form the subject of this paper. They contained a calendar, an almanack for finding the date of Easter and other movable feasts over a period of years, the Little Office of Our Lady, the Seven Penetential Psalms, the Fifteen Gradual Psalms, the Litany of the Saints, the Office of the Dead, and the Commendations of Souls. To this basic structure were added other devotions both liturgical and popular... Without going into the history of the Little Office of Our Lady, one may say that it was a miniature of the Divine Office or Canonical Hours, which were sung at various times throughout the day in the great cathedral and monastic churches. It was divided like them into seven hours, Matins with Lauds, Prime,
Tierce, Sext, None, Vespers, and Compline, each having its proper hymns, psalms, lections, collects, antiphons, versicles, and responses, but differing from those of the Canonical Hours in being constant throughout the year. The same psalms were sung at the same hour instead of varying from day to day, there were no long lections.... The Office of the Dead.... was composed largely of Psalms and lections from the Book of Job. The Commendations which went with it were nothing more nor less than Psalm 119 A.V.

“In 1447 the Pastons bought a Prymer for 2s. - say L2 in modern money - which as books went in those days was not expensive. With the introduction of printing the price fell rapidly, and in the Day Book of John Dorne, who was perhaps the Blackwell of the 1520’s, the average price ranges from 3d. to 6d.... Another point of importance to the social historian, is that one probably knows more about the owners of Prymers than of any other class of books. During the fourteenth and fifteenth centuries the literate classes were nearly all conversant with Latin, because if one went to school at all Latin was the one subject which was sure to be taught, and the Prymer was the book one had to read before one was admitted to the mysteries of grammar. Many grammar schools seem to have expected this to have been done before admission. As human nature does not change, and boys will always scribble in books, many Primers contain their signatures often repeated, comments on their schoolfellows, drawings and even what look suspiciously like ‘cribs.’ Their parents also wrote in the books, for before the Reformation the Primer occupied the place of the family Bible, and births, deaths, and marriages were duly recorded in the calendar.... Primarily, however, the Prymer was a book of a liturgical nature for private use, and it was customary for the laity to say the office either at home or in church as a private devotion. Even Thomas Cromwell is recorded to have said his ‘Hours,’ and an Italian visitor to England tells how English women who could read would go to church and recite the Little Office verse by verse with a companion in a low voice, in the manner of a religious....”

Birchenough cited A Relation, or rather a True Account, of the Island of England, 1847, Camden Society, No. 367, p. 23, as his source for the Italian’s comment. He continued:

“How common the practice was may be judged not only from the well-used condition of the extant copies, but from pictures in which men and women are shown with their Prymers. Quite common is the picture of Saint Anne teaching Our Lady to read from a Prymer, or of Our Lady reading the Little Office with the Child Jesus on her knee, a scene that the artist doubtless took from his own home. In the light of this, it is rather surprising that Prymers in English are rather rare before 1535. Only 15 manuscript ones and no printed ones are extant before that date. One would have imagined there would have been a demand for a vernacular version, because wills show us that the ordinary user was the well-to-do shopkeeper or country gentleman, whose Latin was probably pretty rusty.... In Germany and the Netherlands vernacular books of Hours are extremely common and do not appear to have been censored by the ecclesiastical authorities. The French editions began to appear at the end of the fifteenth century and survived the attempt of the Sorbonne to suppress them in 1525. One or two were even printed in Spanish and Italian, but none in English. The 15 extant manuscript Prymers may be dated between 1381 and 1450 at the latest, after which there follows an inexplicable gap of eighty years in which no single English Prymer is to be found, though there are plenty of Latin ones. The whole thing is shrouded in mystery. There is no document known in which the use of vernacular Prymers is condemned.”

For the purpose of this history, Birchenough’s comments establish that little children practicing the sounds of their newly learned syllables were shielded from the vagaries of English spelling not only in the ABC books, as will be shown, but in the primers until some time after the Reformation in England in 1534. It is no accident that the move to reform English spelling came shortly after the switch to English in the primers and ABC books, and in the hornbook material copied from the ABC book. It is also no
accident that the first English spelling reformer was a teacher who taught beginning reading, John Hart. He wrote his first manuscript in 1551, which will be discussed later. Hart said the thing which prompted his work was his difficulty in teaching children to read in English. Previous to Hart’s day, when children learned to read first in Latin, there is no record of any difficulty in the transferring of skills learned in the reading of Latin to the reading of English, probably because all print had become firmly identified in the readers’ minds as “sound.” After having learned Latin, children could apparently absorb the sound irregularities of the spelling of English syllables simply by sufficient exposure to them. Yet teaching children to read first in English is inefficient by the syllable method and causes problems. Therefore, English spelling irregularities must be dealt with immediately, at the very least by analytic phonics, and Hart clearly recognized the problem. Failing to deal with the problem of sound irregularities in English when children are taught to read in English may result in children’s reading of print as meaning-bearing whole words rather than sound-bearing syllables.

T. W. Baldwin provides background on the switch from Latin to English, in his William Shakspeare’s Petty School, The University of Illinois Press, Urbana: 1943, starting on page 34 and following. Citing the Victoria County Histories, Berkshire, Vol. II, p. 175, Baldwin quotes the July 10, 1526, instructions for the chaplain-schoolmaster at the chantry school of Childrey. Without using the terms, ABC Book or catechism, his excerpt describes the content of each of those books in 1526, eight years before the English Reformation. It states the boys should be taught, “in English,” the 14 articles of the faith (in effect, the Apostles’ Creed), the:

“10 Commandments of God, the 7 mortal sins, the 7 sacraments of the church, the 7 gifts of the Holy Spirit, the 7 works of mercy, as well corporal as spiritual, the 5 bodily senses, and the manner of confession.”

This standard European catechism content was customarily taught orally and not from books, as pointed out in Histoire du Catechisme, “Preface”, page I, by M. Le Chanoine Honoraire Hezard, Cure de St. Pierre de Sens, Paris, published by Victor-Retaux. Paris, 1900. While Baldwin’s excerpt specifically ordered that the former materials were to be taught in the vernacular, “in English,” it made no mention of language for the following, but from other sources they are known to have been taught in Latin in 1526:

“In the first place he should teach the boys the alphabet, the Lord’s Prayer, the Salutation of the Angel, and the Apostles’s Creed, and all other things necessary for serving the priest at mass, together with the psalm De Profundis and the collects together with the prayers customary for the dead, also he should teach them to say grace as well at dinner as at supper.”

As Baldwin pointed out:

“Most of the materials... are to be found in the ABC printed by Thomas Petyt in the next decade.”

The remainder would be primer materials. These 1526 chantry directions show the beginning curriculum: catechism in English (presumably oral), and prayers in Latin (obviously written, since it specifically mentioned “the alphabet”).

In 1536, King Henry VIII changed this ancient practice of reciting prayers in Latin. Baldwin quoted Henry’s 1536 “Injunction;”

“...diligently admonishe the fathers and mothers, maisters, and gouernours of youth beynge within theyr cure, to teche or cause to be taught theyr children and seruantes, euen from theyr
infancy, theyr Pater noster, tharticles of our fayth, and the tenne commandementes in theyr mother tongue....”

“Tharticles of our fayth” was the Apostle’s Creed, formerly learned both in Latin in the ABC book and in English, separated into 14 or so articles, in the oral catechism.

The 1538 injunction of Archbishop Edward Lee of York commanded that the former Latin prayers had to be memorized in English by everyone during church services and said curates “must give Warninge to thaire Parochians, that none of them be absent at such Times as any of the Saide Three shall be rehersed” (the “Three” being the Pater Noster plus the Ave Maria, the Creed, and the Ten Commandments). The coercion also concerned the written prayers:

“All Curates muste cause one Booke, comprisinge the Pater Noster and Ave Maria in Englishe, the Crede and the Tenne Commandements in Englishe, to be set upon a Table in the Churche openlie, that all Men may reasorte to learne them, at all such Tymes as they woll... They must charge all the Faders and Moders, and Heades of Howseholdes, and Gode - Fatheres, and Gode - Motheres, and Scoole-Maystres, accordinge to the King’s Highnes Injunctions, to see theire Children, Servantes and Scoleres, well instructe in the Pater Noster, Ave Maria, Crede, and Tenne Commandments in Englishe, and all oder Thinges comprmprised in theis Injunctions.”

It should be noted that, in 1538, the first words of these prayers still had to be given in Latin (“Pater Noster,” “Ave Maria,” but significantly not the name, the “Tenne Commandments”) even when ordering that the prayers had to be memorized in English. No English words for the beginning part of these prayers (“Our Father,” “Hail Mary”) were as yet in use. It should also be noted that York in 1538 must have had a considerable degree of lay literacy, or no such “booke” would have been placed in the churches.

At the other end of England in that same year of 1538, the Bishop of Exeter wrote:

“All that all chantry priests, soul priests, and other stipendiaries within my said diocese, in the avoiding of idleness, the nourisher of all vice, from henceforth diligently endeavor themselves to instruct the children of the parishes, where they dwell, in virtue, teaching them especially their Pater noster, Ave Maria, and Creed, the Ten Commandments, with the seven works of mercy, in the English tongue, or in the Cornish, where the English tongue is not used.”

After quoting the above on page 39, Baldwin went on to say:

“The petty teachers within the church itself are now ordered to teach these fundamental materials in the vernacular.

“At the refoundation of Canterbury in 1541, it was provided that ‘No one shall be admitted into the school who cannot read readily, or does not know by heart in the vernacular the Lord’s Prayer, the Angelic Salutation, the Apostles’ Creed and the Ten Commandments.’ ....It was the prime business of petty school to inculcate these official elements of the faith, and the boy must have them before he could enter grammar school.”

Baldwin continued, on page 40:

“The translation of the Creed, the Ten Commandments, and the Lord’s Prayer so printed in 1543 passed into King Henry’s Primer, 1545, and its dependents. Thus the authorized and required ABC would now supply these materials in the official translation, and so by 1545 the
whole lower school system through ABC, Primer, and grammar had been brought to the official uniformity which was begun long before. The process was in fact complete by 1543.”

In 1545, Henry VIII issued his authorized primer, which the scholar C. C. Butterworth in The English Primers, 1529-1545 called “a direct forerunner of the Book of Common Prayer.” Henry VIII’s decree stated:

“...for avoiding of the diversity of primer books that are now abroad whereof are almost innumerable sorts... to have one uniform order of all such books throughout all of our dominions.... Every school master and bringer-up of young beginners in learning next after their ABC now by us also set forth do teach this primer or book of ordinary prayers unto them in English....”

That statement of Henry VIII makes it absolutely certain that the first book meant for children in 1545 was the ABC book, and not the primer. From that time forth, the use of Latin to teach beginning reading was apparently illegal. Henry VIII can truly be called the father of English reading disabilities.

Concerning Henry’s 1545 primer, Birchenough wrote (page 191):

“On 29 May 1545 Grafton published THE PRI=MERSET FOORTH || by the Kynges maiestie and || his Clergie, to be taught || lerned, & read: and none || other to be vsed || throughout || all his || dominions. || M.D.XLV. || by which all existing Prymers were superseded.... To judge from the number of editions printed by Grafton and Whitchurch, with whom he shared the monopoly, the suppression of the Sarum Prymer must have been very efficiently carried out, and the Customs seem to have managed to prevent the smuggling of Prymers from France.... The public did not take kindly to the measure, for in October, 1546, when an order was issued for the burning of Popish books, an agent reported to London, that the injunction had been wilfully misinterpreted, and that the populace cheerfully burnt those set forth by authority: ‘and his primers which be now utterly despised and not used nor taught the youth, contrary to his most godly meaning and commandment. They teach the old Latin with the old ignorance and would that printers should print them again and promise them good utterance.’“

As stated, after a transition period, the Book of Common Prayer eventually appeared as the true adult replacement for the earlier adult Latin primer. However, versions of English religious primers hung on into the nineteenth century, and these primers in English were used as reading books from the Elizabethan period onwards for children who were past the beginner stage. Their content, of course, differed greatly from the earlier Sarum primers. (A Sarum primer meant a Salisbury-type primer as opposed to a York-type primer.) Birchenough concluded (page 194):

“...the real Elizabethan Prymer was a shortened edition of Seres’ A Primmer or boke of private prayer - c. 1553. This was nothing more nor less than a school edition of Morning and Evening Prayer from the Prayer Book, with the Catechism. To this was added an A.B.C., the Litany, the Seven Penentential Psalms, with sundry graces drawn from Henry VIII’s Prymer, with the title of The Primer, and Catechisme. This was the book that was used down to July 1651, when it was finally abolished by the Commonwealth.

“Although the Prymer trade in 1651 was flourishing enough for a deputation of Prymer binders to complain that they had been deprived of their livelihood, there is not a trace of a Prymer between 1580 and 1660, when Charles II restored to the Stationers’ Company the monopoly they claimed to have enjoyed during the reign of James I and Charles I. It seems probable that the Prymer, either in Henry VIII’s version, or according to the Book of Common
Prayer, was rarely printed after 1585. The Prymer printed in the following years was merely a glorified ABC book containing certain elements drawn from the Prymer, and bound cheaply in paper or vellum wrappers for school use. There seems no doubt that the popular prayer book of the period for adults was the Psalter, usually in one of the metrical versions. This seems to be borne out by the fact that the Catholic minority who still used the Prymer, but could only obtain it through underground channels, have preserved and handed down a fairly representative selection of editions of Prymers according to the revised Roman Use issued during this period. Had such a thing as an Anglican Prymer existed except as a cheap school text-book it is inconceivable that none should have survived."

These sources make it clear that the original Latin primer in England was superseded for adult use in the Church of England by the Book of Common Prayer. Yet a version using some of the content of Henry VIII’s primer, and still retaining its religious nature, did remain, but largely for school use, and in English, not Latin. Because of the difficulty in learning to read in English, the alphabet and syllables which appear to have been limited solely to the ABC books when children learned to read in Latin were now regularly shown at the beginning of the primers. It was a mute kind of testimony to the increase in reading problems with the transfer to English for beginning readers. The Elizabethan school version presumably inspired the New England Primer and other largely religious primers which were primarily composed for children.

Notwithstanding the fact that Dr. Samuel Johnson, the lexicographer, as late as 1773, (quoted in The Catholic Encyclopedia, 1913, Volume XII, page 425, “Primers”) defined a primer “as a small prayer book in which children are taught to read,” the primer was not the book in which children before and after the Reformation were taught to read, but the book in which they practiced reading once they had learned to read. This obviously was the case as long ago as the fourteenth century. Butterworth states concerning even the relatively few English language manuscript primers dating from the time of Chaucer, when the vast majority of manuscript primers were in Latin:

“Yet we do find as early as the time of Chaucer and Wycliffe - that is, the latter half of the fourteenth century - regular Books of Hours in manuscript form translated into the English vernacular. Several of these have been edited and made available in print to modern readers. They were full-scale Primers after the use of Sarum (Salisbury). So far as one can judge, they were not specially designed for the instruction of children.”

Nevertheless, often cited as proof that the primer was used for teaching reading as long ago as the fourteenth century are the lines from Geoffrey Chaucer’s “Prioress’s Tale” from his Canterbury Tales (1386) about the “litel clergeon seven years of age:"

“This litel child, his litel book lerninge,
As he sat in the scole at his prymer.”

Yet, in no sense could any true primer before the Reformation be called “litel” as it contained before that time as a standard item the Little Office of the Blessed Virgin Mary, or the “Hours,” which, as shown previously, were many prayers - mostly Psalms - to be said at different liturgical hours during the day. As C. C. Butterworth remarks in The English Primers (1529-1545), Chaucer’s child was most probably using:

“...some simple manual of instruction in the rudiments of religion, beginning with an alphabet.”
At that point, at the end of the fourteenth century, the “simple manual” would have been an ABC book instead of the wax tablets that had been used to teach little children to read since ancient times. However, the age at which he was starting school should be noted: a reasonable seven years, not an immature three or four years as in the seventeenth century.

The ABC Book, and the Hornbook, Which Was the ABC Book’s First Page

In the twelfth and thirteenth centuries, the standard curriculum for beginners was the “first letters,” song and the psalter. W. J. Frank Davies’ commented (on page 22 of Teaching Reading in Early England, Pitman Publishing, London, England, 1973):

“Pope Gregory IX (1227-41), decreed: ‘Let every priest who presides over a people...have a man to keep school (the gloss has ‘for teaching the Psalter and singing’) and admonish his parishioners that they send their sons to church to learn the Faith and that the priests may chastely educate them.’ This was repeated in 1280, and others of similar intent were promulgated in the ensuing centuries....”

Whatever the meaning of the word, “sons” in the original Latin quotation which Davies translated, (more commonly the word “children” appears in similar quotations), the fact is that both boys and girls received this primary education (but not Latin public grammar school education), as will be obvious from quotations which follow.

Concerning the 14th and 15th centuries in England, Davies stated on page 34:

“Disputes about the status of the various types of schools were rife. A famous one took place in Warwick in 1315

‘between the Master and the Music Schoolmaster over the Donatists (i.e., grammarians) and the little ones learning their first letters and the psalter.... That undue encroachment of scholars on one side and the other may cease for the future,’

it was decreed

‘that the present Grammar Master and his successors shall have the Donatists, and thenceforward have, keep and teach scholars in grammar and the art of dialectic if he shall be expert in that art, while the Music Master shall keep and teach those learning their first letters, the psalter, music and song.”

No mention is made in this of any “book,” but just that children should learn their first letters and psalter, which is exactly how little Irish beginners had learned in the sixth century, with the use of wax tablets, as will be shown.

But, on page 93, Davies wrote (and note the literacy of the abbess who acted as teacher):

“Piers Plowman remarked that Abstinence the Abbess had taught him the ‘ABC’...he could have been referring to either the letters of the alphabet or the skill of continuous reading itself. When in 1389, Philippa and the seven-year-old Blanche, the two daughters of Henry IV, were given two books ‘of ABC’ for two pence, the term had also come to signify the actual book itself.”
The Piers Plowman tales are placed shortly after the middle of the 14th century. I suspect the Piers Plowman reference is to an ABC book, just as with the king’s daughters in 1389. That latter quotation, of course, clearly establishes that the ABC book had arrived by 1389. It also establishes that ABC books were being produced (obviously by professional scribes) and sold as a marketable commodity with a distinct price, so there must have been a market!

In the Piers Plowman tales, the abbess - a literate woman - taught the plowman in the tale - a laborer. The anonymous tales originally date from about 1362, with additions by unknown authors to 1395 (source: Encyclopedia Britannica, 1963 edition, Vol. 13, p. 690-691: Langland, William - The Vision of Piers Plowman). Since the Piers Plowman ABC remark had to be made between these dates, it could hardly be said to confirm widespread illiteracy in England in the late Middle Ages, if it were not startling that either women or laborers should be literate. By contrast, (from W. J. Frank Davies, page 54) in the seventeenth century, and though it concerns only writing and not reading, Shakespeare’s daughter Susanna could barely write, and his daughter Judith had to rely on her mark!

The English upper classes of the period, particularly after the massive population loss from the Bubonic plague of the mid-fourteenth century, (not that of the sixteenth century) tried very hard to keep the English boys like Piers Plowman “down on the farm.”

Davies wrote (page 45):

“In 1391 the Commons prayed Richard II that ‘no serf or villein henceforward put his children to school in order to procure their advancement by clergy.’”

“Advancement by clergy” did not usually mean at that point in time becoming a priest. It is actually the source for the ordinary meaning today for the word, “clerk.”

Davies continued:

“It was like trying to stem the waves of the sea, and the failure to prevent the migration to the towns and into trades and for schooling was finally admitted by the Statute of Artificers in the reign of Henry IV (1406) which allowed, among other things, ‘every man or woman, whatever their estate, (to be) free to set their son or daughter to learn letters at any school which may please them in this realm.’”

Note the even-handed reference to women and girls, on the same footing as men and boys, and to the implied existence of many schools then in existence to teach “letters.”

By the end of the fourteenth century, the schools in the realm were no longer moving from the alphabet and syllables and prayers, by way of wax writing tablets, to the Psalms, but were teaching the alphabet, syllables, and prayers in manuscript ABC books. The content of the late 14th century child’s manuscript ABC book was most probably like the usual content known from the printed ABC books in Europe in the 16th century: the alphabet, syllabary, Pater Noster, Ave, and Creed, all in Latin.

Gregory Reisch’s Margarita Philosophica, Heidelberg, 1486, carried an allegorical picture of a child being presented with a tablet showing the alphabet, as a woman (obviously meant to be a mythological person whom Ellwood P. Cubberley labeled, “Wisdom,”) turned the key to the door to the tower of learning. The various levels in the tower of the traditional learning of the period were labeled. An original copy of the book carrying the full illustration showing those medieval levels of learning is in the rare book collection of the New York Public Library. One of the many places in which at least a part of the picture has been reproduced is the frontispiece to W. J. Frank Davies’ Teaching Reading in Early
England, Pitman Publishing, London: 1973, but the Davies’ reproduction omitted the tower and the levels of learning. A copy is included in Appendix A of the full illustration, from page 154 of The History of Education by Ellwood P. Cubberley, Houghton, Mifflin Company, Boston-New York-Chicago-Dallas-San Francisco: 1920. The Cubberley reproduction was taken from the 1508 Basel edition of Margarita Philosophica. The illustration certainly implies that sixteenth century beginners were no longer using wax tablets as the first step but instead were being given an ABC tablet or book. (Very probably the ABC tablet being handed to the child in the picture was meant to precede the standard European Latin ABC of the sixteenth century.)

The ABC book and the hornbook which was a part of the ABC book were considered to be something separate from primers. In Chapter XIV of A Volume of Vocabularies... from the Tenth Century to the Fifteenth, published in 1857, by Thomas Wright (1810-1877), Wright gave the Latin words for the following fifteenth century English words (as cited by Andrew W. Tuer in his History of the Horn Book):

a myssale, a calendar, a ymner (hymner), a antyphonere (or) letony [litany], a nabse (an abc),
a grace, a primer, a sawtyr (a psalter), a brevyar, a processyonar, a mertillage (martyrs) a bybulle [Bible], a manuelle and others

History of the Horn Book by Andrew W. Tuer, (1897, 1968, 1979 - Arno Press, Inc., New York, New York) is a wildly disorganized book, from which an enormous amount of useful data may nevertheless be culled, like raisins from a cake. On page 374 of the History of the Horn Book, Andrew W. Tuer mentioned the above references by Wright, and stated that Wright had recorded the words, “Hoc Alphabetum, a nabse” on his list which showed Latin words followed by the above fifteenth-century English equivalents. Wright’s list makes it clear that by the fifteenth century the ABC book had arrived and was NOT considered identical to the primer, since the primer was also on the same list. However, both books possibly were sometimes bound together in the days of manuscripts, which, in the late Middle Ages, were produced commercially by professional scribes.

The Use of Catechisms and ABC Books in England and France

The child’s “prymer” to which Chaucer referred in the fourteenth century was probably a manuscript ABC book in Latin, (“a nabse”) and not like the 14th century manuscript book in English which George A. Plimpton owned. Plimpton referred to this manuscript in his book, The Education of Chaucer. Plimpton’s material could have been a catechism meant for children who could already read. It was also very likely a non-conformist Lollard catechism. Before the Reformation, the ABC books, with which children learned to read and which were in Latin, did not normally include the catechism. The catechism was, of course, taught in the vernacular, but it was normally taught orally and not from pupils’ books (as outlined in Histoire du Catechisme, “Preface”, page I, by M. Le Chanoine Honoraire Hezard, Cure de St. Pierre de Sens, Paris, published by Victor-Retaux. Paris, 1900).

Despite the fact the catechism before the Reformation usually had been taught orally and not from books, at least some printed catechisms in the vernacular appear about 1500, probably because of the easier availability of printed books. Colet’s appeared in the early 1500’s. Another book which appears to be a catechism but which is apparently wrongly listed as an ABC book appeared in the Catalogue des Livres of Baron James de Rothschild (1884 - page 177-179), with the name La Croix de Par Dieu, the French expression for the English equivalent “Christ’s cross.” Before the Reformation, alphabets were preceded by a cross and in reciting the alphabet the child might say, as Tuer recorded (page 81) from Morley’s Introduction to Music (1597):

“Christ’s crosse be my spede,
In all vertue to proceed.”
Tuer recorded (page 80):

“The complete alphabet was at times cast on English church bells, some examples being preceded by the (cross).”

It is in this symbolic sense of the alphabet, not as something to be used to teach reading to beginning readers, that Rothschild’s La Croix de Par Dieu was apparently named, as it has the standard content of the catechism in the French vernacular. It contained the Ten Commandments, the lists of the corporal and spiritual works of mercy, the seven capital virtues, the seven capital sins, and so forth, as well as the Creed in French rhyme. These were standard in the catechism. It also included the Our Father and Hail Mary in French prose from the Latin ABC book, which were not translated in England at that time, possibly because of the Lollard history. It is true that, on the back of the first leaf of the Rothschild copy, the alphabet was shown in red, but it was obviously catechetical in intent, as following each letter was a word for a religious concept: A = Amytie, B = Benivolence, C = Crainte, D = Doulceur, etc.

If beginning reading were taught by Rothschild’s catechism, it would probably have meant teaching reading for “meaning” and not for “sound,” as no syllabary was included. Yet the following clear records exist on the teaching of beginning reading in France in the seventeenth century, only a hundred years or so after the Rothschild text was produced. The records confirm that the teaching of beginning reading in France at that time followed the pattern of the standard Latin ABC book, not Rothschild’s catechism, and the teaching of beginning reading included heavy drill on the syllabary. Since the methods in France in the seventeenth century were very like the ancient Latin ABC book, it is therefore only reasonable to assume that the Rothschild ABC printed about a hundred years or so before should more properly be called the Rothschild catechism.

Buisson’s 1887 Dictionnaire de Pedagogie quoted Pere Charles Demia, who ran schools and a normal school in Lyons, France, in 1672. The children in his school first learned the regularly formed syllabary and then learned to read their prayers in Latin, before they learned to read in French. After having learned to read, for instance, “In nomine patris” (In the name of the Father,) the first words of their Latin prayers, the children in Demia’s class then read them again, each child reading one syllable: the first would read “in,” the second “no,” the third “mi,” the fourth “ne,” the fifth “Pa,” and the sixth “tris.” Children practiced their letters and beginning syllables with dice, as Locke had suggested and as was suggested earlier in England in 1653 in a book by Sir Hugh Plat. Pere Demia said concerning such dice:

“where should be printed the letters or the syllables, with which the children will play, being given a pupil more capable to settle their differences....”

This, of course, was also an early use of the monitorial school idea, the founding of which is wrongly attributed to Bell and Lancaster about the beginning of the 19th century.

That two different kinds of readers were being produced then, too, by the relative beginning emphasis on “sound” or “meaning” is clearly seen from the comment of another 17th century author quoted by Buisson, “L. D. B., Priest,” who wrote The Parish School in 1654, apparently in Paris. The author warned concerning the teaching of beginning readers:

“Not to undertake to make them fly in reading before they know how to spell the letters because, wishing to advance them teaching them so many things at one time, one makes their reading so confused that further they are a long time learning; (and) they never know to read well, neither in Latin or in French.
“To proceed, therefore, by order, it is necessary (1) to teach the little children to know the letters (2) to assemble them to make syllables, (3) to spell the syllables to make some words, and afterwards to read....”

Obviously, Pere L. D. B. recognized two types of readers and thought they were permanent, since he said considering the poorly taught who had not received heavy training in “sound:” “they never know to read well, neither in Latin or in French.”

The famous ancient Roman educator, Quintilian, also recognized the need for heavy emphasis on the sounds of the syllables in teaching beginning reading, and saw the existence of different types of readers from faulty teaching back in the first century A. D. He said in his Instititio Oratoria written around 50 A. D.:

“For learning syllables there is no short way; they must all be learned throughout, nor are the most difficult of them, as is the general practice, to be postponed, that children may be at at a loss, forsooth, in writing words. Moreover, we must not even trust to the first learning by heart; it will be better to have syllables repeated, and to impress them long upon the memory; and in reading, too, not to hurry on, in order to make it continuous or quick, until the clear and certain connection of the letters become familiar, without at least any necessity to stop for recollection. Let the pupil then begin to form words from syllables, and to join phrases together from words. It is incredible how much retardation is caused to reading by haste; for hence arise hesitation, interruption, and repetition, as children attempt more than they can manage, and then, after making mistakes, they become distrustful even of what they know. Let reading, therefore, be at first sure, then continuous, and for a long time slow, until by exercise a correct quickness is gained.”

It is obvious that Quintilian was recommending objective “sound” teaching and was emphatically opposed to “speed reading” for beginners. However, from his comment that the general practice was to postpone the learning of the most difficult syllables and his further comment, “It is incredible how much retardation is caused to reading by haste,” it seems fairly certain that Ancient Rome also was turning up some psycholinguistically “guessing” readers who read more by “meaning” than by “sound.”

The priests in France whose teaching practice has just been quoted obviously agreed with Quintilian.

The record before the eighteenth century therefore indicates that the catechism was not used to teach beginning reading in France, just as it was not used in Great Britain. Both Rothschild’s text and Plimpton’s manuscript were almost certainly catechisms, and were not used to teach beginning reading. What was used was the ABC book with its syllabary, which emphasized “sound” and not “meaning.”

Hornbooks

In Andrew W. Tuer’s History of the Horn Book, (1897, 1979, Arno Press, Inc., New York, New York) on page 281, he referred to a late 14th century manuscript, of Chaucer’s time, (Harl. MS 3954, British Museum) which read:

“Quan a chyld to scotle xal set be
A bok hym is brouth
Naylyd on a brede of tre
That men callyt an abece...
Red letter in parchemyn
Makyth a chyld good and fyn
Lettrys to loke & se”

That “chyld” who was the contemporary of Chaucer’s student in the last half of the fourteenth century started with “an abece” and so must have Chaucer’s little clergeon. The content of its first page, which would contain the alphabet and syllabary and require much practice and time, was apparently saved from wear by being “nailed on a board of a tree,” (the most likely translation), just as the content of the first page of the printed ABC books was later mounted on horn-covered wooden paddles called hornbooks.

The earliest specific reference Tuer could find to a hornbook he gave on page 285, citing The Prose Works of the Rev. R. S. Hawker, Vicar of Morwenstow (London: Blackwood and Sons, 1893) as his source. Tuer obviously quoted directly from Hawker, and Hawker had obviously partially quoted directly from a sixteenth century will. Yet Hawker had not, unfortunately, shown exactly which words were a direct quotation from that sixteenth century will and which were his own. Citing that material from Hawker, Tuer wrote:

“The Will of Dame Thomasine Perceval, dated the Vigil of the Feast of Christmas, 1510 A.D., directs ‘that a chantry with cloisters, should be built near the church of Wike St. Marie, Cornwall, which she endowed with thirty marks a year, and further directs that there shall be established therein a schole for young children born in the parish of Wike St. Marie; and such to be always preferred as are friendless and poor. They are to be taught to read with their fescue (pointer) from a boke of horn, and also to write, and both as the manner was in that country when I was young.’ The age of the Dame we do not know, but we learn from Hawker that John Bunsley took her to London in 1463. Say she was eighteen in that year, and that she was taught the A B C when five years old, then we have the date 1450 when the horn-book was in use.”

Such wills founding free chantry schools (chantry schools being run by a priest who also prayed for the soul of the dead benefactor) were very common in England in the 14th and 15th century, the wills often stating such schools were to favor the poor. Since leaving such legacies to teach poor children to read was considered a commendable act of mercy in the fourteenth and fifteenth centuries, it is, again, hard to accept statements of historians who claim lay illiteracy was widespread in fifteenth-century England, particularly among women, and that literacy was little valued except for the religious. After all, this was a lay woman’s will and she was apparently literate, and had apparently learned to read as a little girl in rural Cornwall in the mid-fifteenth century. She specifically referred to the teaching of reading in the “manner” “in that country when I was young,” so she was probably not the only little girl, and possibly a commoner at that time, who was getting such instruction about 1450 in Cornwall. It is interesting that, unlike the Paston women, however, she had apparently been taught to write.

What makes her will of interest for this history is its reference to the horn book in use about 1450. Yet it appears clear from the 14th century poem referred to previously that the practice was common about one hundred years earlier, shortly after 1350. The ABC book and the contents of its first page mounted as a horn book, therefore, in the 14th century, as in the 15th, preceded the primer.

What is also of interest is her reference to a fescue or pointer which replaced the stylus used to write on the wax tablets when the wax tablets were replaced by the ABC books. The horn book pointer was obviously not only used to point to the syllables being read, but must have been put to a further heavy use in the first stage, when the child was learning the syllables. Since the horn book normally only showed syllables through “da, de, di, do, du; ad, ed, id, od, ud,” the rest of the consonants and vowels had to be pointed to in the alphabet at the top of the page as the child constructed for himself the rest of the syllables: “fa, fe, fi, fo…” etc. (the probable source of the fe, fi, fo, fum of the nursery rhyme).
Yet, one of the cardinal laws of the present-day sight-word method is that children must NEVER point at the print when they are reading in the way that old Dame Perceval mandated in her will. Such pointing is assumed to interfere with smooth reading for “meaning.” As mentioned earlier, the formal teaching of reading in Soviet schools is finished in first grade. However, children are given pointers at first grade just like the fifteenth-century fescues Dame Perceval remembered, and are expected to use them when they read their school texts for several years afterwards. Apparently, the Soviet psychologists believe that left-to-right movements in reading, and, most particularly, the moving from the end of one line to the beginning of another are automatisms that take longer to establish than do phonic skills. After its editors visited Soviet schools, the American magazine, The Instructor, reported in its January, 1959 issue:

“Each child has a small wooden pointer that he uses to point to the syllables as he reads. This is used through the first three grades and higher if the child requires it.”

The Soviets, hardly surprisingly, have no “functional illiteracy” problem.

The record indicates, therefore, that the ABC book apparently appeared for the first time about the 14th century, and, with it, its first page mounted as a horn book. The ABC book and horn book displaced the wax writing tablets for beginners on which children since ancient times had practiced the alphabet and syllabary from models written by their teachers, at the same time that they were learning to read the alphabet and syllabary.

The History of Wax Tablets for Reading Instruction, Which Preceded the ABC Books and Horn Books, and The Use of Such Wax Tablets for Recitation

A wax tablet from as long ago as 600 B. C. and a syllabary from the same period have survived. They are referred to in H. I. Marrou’s A History of Education in Antiquity, published in France in 1948 and in America by Sheed and Ward in 1956 and Mentor Books in 1964.

Marrou wrote (pages 335-336) that the Latins took their alphabet from the Etruscans, and, by great good fortune, materials have been found which demonstrate something about the way the Etruscans handled primary education. Marrou said that direct evidence about the Etruscan methods comes from materials which are older than anything of the kind that survives from Greece. He said an ivory writing table from Marsigliana d’Albegna has been dated to about 600 B. C. On the top of its frame is a complete alphabet, and, as he said, it is obvious that the alphabet was supposed to be copied by a pupil on the soft wax surface that would have been surrounded by that frame. Marrou said that seven more examples survive of such model Etruscan alphabets, all dated to the 600’s, and that one of them even includes a syllabary. He commented:

“Clearly, Etruscan teaching went through the same stages as Greek, and there can be no doubt that the Etruscans took their teaching methods, as well as the secret of writing, from their first Greek masters.”

The Gueraud-Jouguet material shown above that Marrou cited as one of his sources reports on a third-century-B.C. Greek papyrus on which was written a long syllabary. It was found in the sands of North Africa just before World War II. However, Marrou considered the elaborate material to be a teacher’s guide, and not just a book (livre) of a student (ecoliere) which was what Gueraud and Jouguet had concluded.

Wax tablets like those of the Etruscans were also used in the Hellenistic period about 300 B.C. in Greek-language schools. Marrou cited as his sources for information on writing tablets B. P. Grenfell, A. S. Hunt, H. E. Bell, etc., The Oxyrhynchus Papryi, p. 736; Journal of Hellenic Studies, 1893 XIII, p. 293 seq.; and Amtliche Berichte aus den koniglichen Kunstsammlungen, monatlich erscheinendes Beiblatt zum Jahrbuch der kgl. preuszischen Kunstsammlungen, Berlin, XXXIV, p. 211 seq.

Marrou wrote (page 216):

“The materials the children used were of various kinds. Their first writing-tools, equivalent to our slates, were single, double or multiple wooden boards; when there was more than one, the various parts were joined together either by hinges or by a single piece of string passed through a hole. Each board had a waxed surface inside a hollow frame, and the pupil wrote on this with a pricker whose other end was rounded and was used as a rubber.”

Marrou’s description of Hellenistic bound wax tablets from about 300 B.C. matches exactly the Springmount wax-tablet “book”, pulled from a bog in Ireland early in this century, and which is dated to the sixth century A.D., and which will be discussed later in this history. Wax tablets were also mentioned in a thirteenth-century French romance, referred to later, in which story children were learning French and Latin and being taught to write on a wax tablet with a gold stylus.

The wax tablet approach for beginning readers, therefore, lasted at least from about 600 B.C. to about 1350 A.D., or almost 2,000 years, while the ABC book, dating from about 1350 to 1750, lasted only about 400 years. But almost no one today knows about the almost 2,000-year-long use of wax tablets for teaching not only beginning reading but writing, and the obvious superiority of the wax tablets to the ABC books.

The earlier wax tablets which were displaced by the ABC books during the 1300’s are discussed by W. J. Frank Davies in his book, Teaching Reading in Early England, Pitman Publishing Company: 1973, London, England, pages 68-69. Concerning practices from the time of the ancient Greeks, as long ago as Plato’s day, Davies wrote that it was thought at the time that writing had a connection with learning to read, so that one was used to help with the other. Wax-covered tablets were used for writing and had a sample alphabet written at the top. Students used styluses to form the letters on the wax below the sample alphabet. Davies commented that Plato, in his work, Protagoras, suggested that lines be provided for helping the learner. Davies also mentioned that in the Epistles (xciv) of the Roman, Seneca, (c. 4 B.C.), learning to write was discussed. Seneca said that:

“when children are taught to write letters, [their] fingers are held and their hands grasped and guided to help...’ [copy the letters].

Davies wrote that Seneca said that children should then be told to copy the sample letters themselves and to correct their own writing, by comparing it to the samples.
Davies referred to the suggestion of St. Jerome, that a mother’s hand be used to guide her little girl’s hand when learning to trace the letters on a wax tablet. That suggestion was one of many in a letter that St. Jerome wrote to Laeta, the mother of the little girl, Pacatula, before 400 A.D (which correspondence is discussed again later). Note that, with the advent of Christianity, one of the few surviving references from that early period on teaching beginning reading is in a letter written to a mother, counseling her how to teach her daughter to read and write by the use of wax writing tablets.

Nevertheless, evidence exists confirming the fact that some pagan women in Europe were taught to read. One such source concerns the use of a different kind of writing material than wax tablets by a particular pagan woman. The material was a wafer-thin piece of wood, not a waxed sheet. The reference occurs in a fascinating article written by William Least Heat-Moon, appearing on pages 222 and following of the December, 1993, edition of the catalog of Lands’ End Direct Merchants, Dodgeville, Wisconsin. The article, “Lost Letters Found,” was Part Two of a highly entertaining travelog Least Heat-Moon had written, The Best of Britain.

While traveling in the British Isles, he and his wife visited Hadrian’s Wall, built by the Roman Emperor Hadrian about 1,900 years ago, between what is now Scotland from what is now England. Least Heat-Moon wrote that the archeologist Robin Birley had uncovered 1,257 wafer-thin wooden sheets since 1973, when digging at the site of officers’ quarters pre-dating the wall.

William Least-Heat Moon wrote that Birley first found a wet, sticky square. When pulled apart, it revealed unpunctuated characters in a language Birley did not know. By the time Birley got the square to a university for translation, it had blackened so much that the letters were no longer visible.

Yet the presence of a non-Latin language was not surprising. “Romans” in the Roman army about the time of Christ, the apparent period of the officers’ quarters near the wall, came from all over the Roman Empire. Probably very few actually came from the city of Rome. For instance, St. Paul was obviously proud of being a Roman citizen, and he was a Jew from Jerusalem. So were great numbers of other Roman citizens who came from other parts of the Roman empire proud of their citizenship although they retained part of their ethnic roots. In one very real sense, the Roman Empire was like the United States of America. It was full of citizens who came from all over the world but who greatly valued their citizenship.

Nevertheless, Robin Birley soon found sheets written in Latin. William Least Heat-Moon wrote that the use of infrared photography made it possible to read Birley’s growing collection. The sheets were mostly personal letters, which had been:

“...written on thin wafers of birch and alder incredibly preserved for two millenia because, as Roman soldiers leveled old buildings for new construction, they covered the debris with clay to make a smooth surface, thereby sealing off oxygen from whatever was underneath. ... [The sheets were]... the oldest hand-written Latin material by ordinary people anywhere in Europe.

“He found a letter from Claudia Severa inviting the wife of a Vindolanda commander to come to her birthday party; a scribe wrote the invitation, but at the bottom is Claudia’s own scribble: ‘Farewell dear sister.’ ...”

Least Heat-Moon commented that Claudia Severa’s short message is the oldest surviving example in the world of a woman’s writing. It confirms, of course, the literacy of a probably pagan woman. He continued:
“Letters from soldiers don’t speak of religion or the Emperor... [but] complain about money, bad roads, pinkeye, and ‘wretched Britons.’ ... a schoolchild copied out a line from Vergil and beside it is his teacher’s evaluation: ‘Sloppy.’

“Birley said, ‘The people living here on the northern edge of the Roman Empire get their spelling and declensions wrong - which doesn’t help us - but we have to remember they wrote as they spoke, with no thought to style and no idea their humble words would reach people this far from their time.’“

William Least Heat-Moon wrote that less than ten per cent of the site had been examined, so more such wafers must still be there - and also in places like London and York, wherever the physical circumstances were similar.

Birley’s work certainly seems to suggest the probability of the widespread use of wafer-thin wooden sheets for disposable messages in other areas of the Roman empire, as well. Papyrus would not have been so easily available since it came from Egypt, and it certainly would have been more expensive. (Discussed later is the use in Ireland and Scandinavia of wooden sticks for recording very short messages in Ogham or in runic lettering.) However, in contrast to the use of such materials as wooden sheets (or sticks) or papyrus for sending messages, waxed tablets were used all over the ancient world for recycled personal use.

In Andrew W. Tuer’s History of the Horn Book (page 2), quoted in part elsewhere, Tuer wrote:

“In Gaelic, spalag, which also means a piece of dried bark, is the hornbook itself, while brad and brod apply only to the letters written or printed on its surface. In his English-Irish Dictionary (1732) Hugh Mac-Curtin, who devoted himself to the study of the early history of Ireland, gives Clairin, lit. a little board or tablet, as the equivalent for horn-book.”

Tuer did not cite his source for the Gaelic words he gave, but it presumably was also Mac-Curtin’s 1732 English-Irish dictionary, which included words from the “early history of Ireland,” to the study of which Mac-Curtin reputedly had devoted himself. That early historical period would presumably be from about the time of St. Patrick until the advent of the Viking invasions (roughly 450 to 800 A.D.). However, Tuer’s hornbook definitions contradict each other (a piece of dried bark vs. a little board or tablet), which suggests that Tuer was wrong in stating that one of the meanings for the Gaelic word, “spalag,” besides “a piece of dried bark,” was “hornbook.” However, Tuer was probably right that “spalag” meant a piece of dried bark and that it could have “letters written or printed on its surface.” If so, then “spalag” bark writing sheets certainly sound a great deal like the kind of first-century wafer-thin wooden writing materials which Birley has been finding near Hadrian’s wall.

The use of cheap, conveniently available and easily disposable writing materials made from wood or bark might well have been widespread in ancient times in the British Isles, including Ireland, and all over Europe where forests were still widespread. If such a use had not at one time been common, the word, “spalag,” is not likely to have eventually have found its way into Mac-Curtin’s 1732 English-Irish dictionary. Yet, because materials such as Birley’s thin wooden sheets and Mac-Curtin’s “spalags” were so fragile, they would long since have crumbled away, unless they were enclosed in the same sort of time capsule that developed in the accidentally weather-proofed soil that the builders unknowingly put in place near Hadrian’s wall.
Marrou told (pages 212-218) of Greek primary schools in the Hellenistic period about 300 B. C. which taught reading at the same time that they taught writing. The Greek language schools began by teaching a thorough syllabary and followed it with words which were difficult to pronounce. The Greek emphasis about 300 B. C. for beginners obviously was on “sound” rather than “meaning.”

Yet, writing in 1948, Marrou, who undoubtedly never taught beginning reading, deplored this old syllable method as unsuited to children’s needs and unlike the modern humane “global” sight-word method that had been promoted in France increasingly after 1920 and sharply so after World War II. By the early 1950’s in France and in the 1960’s in Germany, this global method met enormous opposition from the public because of its failures. Yet Marrou in France in 1948, like so many of our intellectuals in America today, believed the propaganda of the “reading instruction community.”

One such example of later propaganda is Au Seuil de la Culture, Les Editions du Scarabee, Paris, 1965. It was written by Robert Dottrens, who had previously taught in Geneva, Switzerland, before the global method was banned there. Consisting of an imaginary conversation between a mother and a school principal, his book was an attempt to justify the banned global method. The mother said of her daughter’s first grade teacher:

“...her teacher uses this global method that all the world knows is worth nothing.” (Page 7: “...son institutrice emploie cette methode globale dont tout le monde sait qu’elle ne vaut rien.”)

Dottrens therefore unwittingly recorded for posterity the outrage French-speaking parents felt for the global “meaning” method and the fact that “all the world” did not include the intellectuals. The failure of the sight-word, global, “meaning” method in Europe and South America will be discussed at the end of this history.

Marrou found fault not only with the syllable method. He obviously also thought little of memorization, or recitation, in the ancient schools. Such memorization of texts has almost disappeared from modern education. Whether it is an improvement or not is a matter of opinion. But memorization, or recitation, was definitely a part of the wax-tablet approach. Marrou wrote concerning recitation (page 215) in the Hellenistic schools:

“Closely associated with reading was recitation: the selected passages were not only read aloud but also learnt by heart, and it seems that beginners at least used to recite in a sing-song manner, syllable by syllable: “com-ing through, ray by ray, A-pol-lo, the mor-ning sun...”

Concerning Marrou’s comments on recitation, he cited as sources Callimachus, Epigrams, 48, and Herondas, The Schoolmaster (Mime III), 30-36.

The ancient practice of oral recitation of material to be learned was still around when Lewis Carroll wrote of such recitations in Alice in Wonderland, but it is rarely to be seen in classrooms today in the English-speaking world. However, a watercolor drawing from a UNESCO calendar from a few years ago, “The Recitation,” by Tonje Strom Aas of Norway, showing a class of children reciting in unison, demonstrates that recitations are still alive in at least one European country.

A surprisingly worthwhile study on such recitations was carried out by, of all people, Arthur I. Gates. It was apparently prepared for his doctorate. (His doctorate was not prepared on spelling, as I had believed. His work on spelling, Psychology of Reading and Spelling with Special Reference to Disability, Contributions to Education, No. 129, Teachers College, Columbia University, New York, came later, in 1922).
The date of the publication of Gates’ doctoral thesis at Columbia (September, 1917), suggests Cattell’s input since, as stated by Geraldine S. Joncich in her biography of Thorndike, The Sane Positivist, Wesleyan University Press, Middletown, Connecticut: 1968, page 379. Gates was living with the Cattell family and working with Cattell in the summer of 1917. Gates’ (and possibly Cattell) may very well have chosen the topic of recitations because of comments made over a century before by Dugald Stewart of Scotland, the philosopher/psychologist, who wrote Elements of the Philosophy of the Human Mind. In a footnote on page 219, Chapter VI, of Volume II of Stewart’s work, which was published first in Great Britain in 1814 and in 1821 in Boston by Wells and Lilly, Stewart said the following concerning oral recitation as a help in learning material:

“It seems to be owing to this dependence of memory on attention, that it is easier to get by heart a composition, after a very few readings, with an attempt to repeat it at the end of each, than after a hundred readings without such an effort. The effort rouses the attention from that languid state in which it remains, while the mind is giving a passive reception to foreign ideas. The fact is remarked by Lord Bacon....”

An idea of Gates’ curious and forgotten 1917 work, as forgotten as Dugald Stewart’s is today, is given by the excerpts below:

“Preface: The present investigation was begun in the Psychological Laboratory of the University of California in the spring of 1916. The experiments in which children served as subjects were conducted in a public school in Oakland, California, while those upon adults were, for the most part, carried out in the Psychological Laboratory of Columbia University....

“To Mr. N. Ricciardi, Principal of the school visited, I am indebted for the privilege of conducting the experiments upon his charges.... My debt of gratitude to Professors G. M. Stratton and Warner Brown of the University of California and to Professors J. McKeen Cattell, R. S. Woodworth, E. L. Thorndike, H. L. Hollingsworth, and Dr. A. T. Poffenberger of Columbia University is very great....”

These names are rarely associated in the literature today: Cattell, Thorndike, and Gates. Therefore, it is interesting to read in the above quotation that Gates himself confirmed the close tie in September, 1917.

(page l) “.... It is at once obvious that the solution of such questions is of tremendous import for the work of the school. It is imperative that recall or recitation, as a factor in learning, should be analyzed and its quantitative importance determined.... Earlier investigations have found in the case of many adults that the optimum combination of recitation and reading may lead to the mastery of a given lesson in one-half the time required to learn it by reading alone. If such findings should hold for children, and if it is generally true, as Miss Baldwin found, that twenty-five per cent.or more of the pupils in the schools rely entirely upon reading in their learning, the loss of time and energy is appalling.

“The present study presents the results of an effort to answer a practical problem of the school-room - namely, What are the relative values of learning by reading as compared to learning by recitation in the case of school children working under school conditions and with the ordinary school-room methods of attack?
(On page 7, referring to previous studies) “The general result is that for all materials recitation is a more effective method of learning than reading only.

(On page 85) “It is clear that the children strongly preferred the methods in which recitation was included.

“The reasons for their preferences are varied and not very specific. Such statements as, “It isn’t such hard work,” “I learn better that way,” were common. Some explained their preferences as follows: “I knew I was learning them when I recited”....

(Page 93) “Recitation, in brief, differs from reading physiologically by the fact that it selects and exercises the bonds upon which the established habit depends, while reading calls into action some bonds that are not strictly needed for recall, omits some that are requisite, and does not so well exercise the remaining few, needed for recall. Recitation is for memorizing what practice is for other habits. The physiological basis is the same.”

Having written a worthwhile defense of “recitation” in learning with astonishing clarity in comparison to his muddy writings in later years, Gates made no further reference, to my knowledge, to this worthwhile material, nor, apparently, did almost anyone else. Nor, apparently, has much been written on the fact that “recitation” is a form of “recall,” and is therefore a stronger and more usable kind of learning than is “recognition.” Recognition is the weaker kind of learning which can pass multiple choice tests. It is about all that is required of most students today. The only reference I have ever seen to the topic of recitations is in The Cumulative Book Index, 1928-1932 where an entry appeared under “Skaggs, E. B. and others. Further studies of the reading-recitation process in learning. 80 cents. ‘30. Archives of Psychology.”

Instead of building on Gates’ interesting 1917 work on oral recitation, Gates and Gray fostered “silent reading” in classrooms and protested against oral reading exercises, as they were supposed to interfere with “comprehension.” Of course, oral reading is not the same as recitation from memory, but, since it is oral, it is one step closer to recitation than silent reading is. Nila Banton Smith wrote in American Reading Instruction, (1934, 1965, pages 158-159):

“The Transition from Oral to Silent Reading - What Brought About the Change?

“From the beginning of reading instruction, oral reading had maintained its supreme and undisputed claim over classroom methods. In marked contrast to this traditional practice, we find a period of years, let us say approximately between 1918 and 1925, marked with an exaggerated and, in some cases, almost exclusive emphasis upon silent reading procedures. What brought about this sharp reversal of practice?”

Indeed, what did? Her suggestion that it came from “the ever-increasing attention directed towards meanings in all phases of education” is not satisfactory. One thing is certain: with only silent reading, no one could hear children stumbling over words they could not read. (Of course, Smith was wrong on another point: oral reading had ceased being “undisputed” after 1870, as will be shown.)

Marrou also made the following comments (page 215) concerning the Hellenistic schools:

“Thus were children taught to read: when one compares the school manual dating from the end of the third century B. C. that has been edited by Guerard and Jouguet with any of the Coptic schoolbooks of the fourth century A.D., one is struck by the extraordinary similarity of the
methods employed: with more than five centuries between them, the procedure is the same in both cases."

Coptic books were Egyptian books, and the record strongly suggests that the methods used to teach beginning reading in the ancient world persisted not only in Coptic Egypt in the fourth century A.D. but were introduced into Ireland in the fifth century A.D.

It is pertinent to give some evidence concerning the routes by which these ancient methods might have been transferred to ancient Ireland, which in turn had a great influence on both England and the Continent through its seventh century missionaries. Wandering Irish missionaries starting from the seventh century and the newly-converted Anglo-Saxon missionaries who joined them shortly afterwards brought culture as well as faith back to the European mainland. This was a few centuries after the fall of Rome and the resultant widespread destruction of culture on the European mainland as the barbarians took over. The Irish and Anglo-Saxon missionary monks were apparently using the same methods for teaching beginning reading which had been used since antiquity, except that the material to be memorized was no longer pagan classics but the Psalms. Since these missionaries were "insular," and descended from the Irish and the Anglo-Saxons who were outside the influence of ancient Rome, some explanation for how they acquired knowledge of such ancient methods is obviously in order. One such source were the post-Roman era schools such as Illtud's in Britain. Another such source was almost certainly Egypt, and a third was almost certainly the Isles of Lerins.

Morris discussed the fifth-century Christian schools in Britain after the fall of the Roman Empire. During the Roman era, of course, Roman schools had existed in Roman-occupied Britain. However, the post-Roman British schools were largely only in Cornwall and Wales, and from them grew the sixth-century Irish schools of the recently converted Irish. Then, in the seventh century, Irish missionaries brought their educational practices and Christianity to what is now northern England (by that time, Anglo-Saxon, not British), and then to western Europe. By the eighth century, the Irish were joined in Europe by English (Anglo-Saxon) Christian missionaries. Morris stated that the English and Irish missionaries continued their work in later centuries in eastern Europe. The long cultural development, from the 400's until several centuries after 800, is described beautifully by Morris (particularly from page 409). Morris wrote:

"The schools of late Roman Britain resembled those of the rest of the empire, and are described by the Sicilian Briton.... The boys' boarding school, divided into forms, was normal, though most of the students lived out in lodgings.... In the early empire, Westerners of breeding had been reared to fluency in Greek as well as Latin. In the 4th century Greek was still taught in the greater cities, Carthage, Trier, and doubtless also London, but the wide scholarship of Jerome was a rarity; most boys left school with one language only, like Augustine, to whom Greek remained a foreign language.... Britain was exceptional; Augustine complained that Pelagius prevailed in debate in Jerusalem by reason of his fluent Greek...."

Pelagius in the fourth century who was fluent in Greek is presumed to have been Irish. About 200 years later, another Irishman, St. Columbanus, was also competent in Greek. In the first century before Christ, Julius Caesar wrote that the Celts in what is now France preferred memorization of texts to writing them but did use Greek letters, not Latin, when writing was necessary. The Ogham alphabet, devised by the Irish pagan Celts about 300 A.D. shows a greater resemblance to the Greek alphabet than to the
Roman. Considering that fact about the Irish Celts about 300 A. D. in combination with Julius Caesar’s remark about the Continental Celts about 40 B. C. using Greek letters, the claim that is sometimes made that the early Irish were fluent in Greek may well be true. The pagan Irish, if schooled in Ireland in the famous pagan Celtic Druidic schools that dated back many centuries before Christ may well have learned Greek letters (and possibly Greek texts) in such schools. Therefore, the competence of any Irishmen in Greek may not have resulted from studying in British schools, as Morris assumed.

However, in late Roman times, some Irish were certainly visiting Britain in search of a Roman education. For instance, Morris referred to an Irishman, Coelestius, who had been educated in a monastery, presumed to have been in Britain, and who was a practicing lawyer in Rome in the early 400’s.

One such famous but post-Roman monastic British school in the 400’s was that of Illtud. Morris wrote:

“Illtud in the later 5th century inherited and developed the experience of Europe and of Britain. Like Paulinus of Nola, Cassiodorus and other Roman noblemen, he withdrew to live a personal monastic life on his own estates; but unlike them, he maintained a school, whose pupils boarded with him. As in Martin’s school, the pupils were sons of laymen, whose parents expected most of them to return to the world after a long schooling. Illtud’s teaching techniques were ancient, for five year old infants learned their alphabet from twenty pieces, termed eleae and tesserae, as the great Roman educationalist Quintilian had prescribed four centuries earlier, insisting that primary schooling must begin with the handling of physical letters, cut from ivory, bone or wood.”

Morris said that an account of Illtud’s school is to be found in the early biographies, Lives of Samson and Paul Aurelian, and said that the material which demonstrated Illtud’s gentle competence was based on first-hand stories.

Illtud’s school was known best, but other early schools also existed. Morris wrote that two other men, Paulinus and Docco, were also considered to be fine teachers. Another school that was well regarded was in Caerwent, run by a man named Tatheus. The schools were sometimes referred to in the early “Lives” as Gimnasia, and Morris said that Winwaloe’s was labeled a scolasticorum collegium, a college of scholars. Yet Morris said that in the later biographies, or “Lives,” such detail is uncommon.

Morris wrote that “Cadoc” taught the infant “Malo” to write his letters on a wax tablet. He said that many “Lives” made it clear that the schools taught both religious and non-religious texts, “both disciplines,” or “liberal studies.” Although Demetia, The Life of Teilo made a point of denouncing the “figments of the poets,” and the “history of antiquity,” Morris wrote that, by contrast, David’s Life “remembers that in his youth he learned rudimenta as well as the scriptures....”

Morris pointed out that the first Irish monks came to Britain for Christian learning, since the ages-old secular Irish schools were pagan. Morris wrote that:

“...the first influential school in Ireland was that of the British-born Mocteus at Louth. Like Cassiodorus in Italy, but unlike Illtud, he exempted his pupils from agricultural work; but the exemption seemed odd, even improper, to the Irish, and most of the early monks were proud to grow their own food. The first great native Irish school was founded at Clonard in the 530’s by Finnian, who had previously gone for some years to ‘study with the elders of Britain’. He was universally regarded as the ‘teacher of the Irish saints’, as well loved as Illtud in Britain; and from
the middle of the century new monastic schools multiplied, many of them founded by Finnian’s pupils.”

The position of women in pagan Celtic Ireland was high. Presumably that accounts for a difference between British and Irish schools about which Morris commented. Morris wrote:

“The Irish schools differed from the British in that they were coeducational from the start.... In later 5th-century Ireland the houses of Brigit, Darerca, Faencha and other women were more prominent than monasteries for men; and several early monks, like Enda, had been obliged at first to live with a minority of men attached to a community of women. The claims of women of equal monastic right were well established when the first schools opened, and Finnian of Clonard and his pupil Ciaran of Clonmacnoise are reported to have attached houses for girls to their monastic schools; though there was opposition, coeducation prevailed, stoutly defended by Dagaeus, the father of the art and craftsmansip of the Irish schools, who taught in turn at a number of the major monasteries....”

Morris referred to the monasteries housing both women and men as “double monasteries.” Whether the term is his, or was used at the time is unknown. However, Morris wrote that such monasteries, and the schools attached to them, multiplied. In the schools, many children are recorded as having completed a ten-year course, starting at the ages of 5 or 7. Boys intending to become priests were schooled longer, until they were 19 or 20. Morris wrote further concerning the curriculum:

“In the monastic schools, in contrast with Patrick’s secular education, spoken and written Latin began in infancy, so that children grew up fully bilingual.... most of the major monasteries had land and manpower enough to feed their pupils, and their status grew when the Convention of Drumceat incorporated the old learning within the Christian framework. Their influence encouraged the monastic studies, so that the hostility to profane letters, advocated with success in Britain by David and Teilo, found fewer adherents in Ireland.

“Educational opportunity made the Irish rather than the British houses the main centres of Christian learning. In the 7th century, students from Britain and Gaul began to frequent the Irish schools. Early in the century Agilbert, later bishop of the West Saxons and of Paris, left his native Gaul to spend a long time in Ireland ‘in order to read Divinity’, for Ireland offered an advanced education that he could not find at home. Bede was amazed at the open-handed ease of the Irish educational system in the middle of the century, remarking that

“‘...there were many Englishmen in Ireland, both noble and plebeian, who left their homeland in the time of bishops Finan and Colman either to read Divinity or to live more continently. Some soon bound themselves to a monastic vow, but others preferred to travel around the cells of different teachers for the joy of reading. The Irish welcomed them all, gave them food and lodging without charge, lent them their books to read and taught them without fee.’

Morris commented on the rarity of such schools in history which offered free education to anyone desiring it, whether they were countrymen or not, and with all expenses paid. He said that Ireland was prosperous for several hundreds of years because of these excellent schools, and men trained in these schools were sought all over Europe.

Morris remarked that such truly free, and truly good, education is not a luxury but is, instead, a good investment. Morris wrote:
“The freedom and the vigour of the schools was designed for learning, but it also brought material reward.... Advances in mechanical engineering, in plant and animal biology, and above all in the cheap application of technological knowledge, rapidly increased agricultural and manufacturing production; the sudden widespread exploitation of waterpower, by devices long known and long unused, and the intensification of arable farming, were initiated by the same monasteries whose skills illuminated manuscripts and worked beautiful metal objects; both were the direct consequence of the educational system....”

St. Columba and his Irish monks emigrated to Iona in Scotland in the sixth century. The Irish were then called “Scots,” but it is little known today that Irish immigrants brought the name, “Scot,” to Scotland. Yet almost everyone today does know about a native resident whom St. Columba reported seeing almost 1,500 years ago: St. Columba is the first to have recorded sighting the Loch Ness Monster!

It was St. Columba’s Irish variety of monasticism which spread in northern England. However, the Canterbury foundation in southern England, with its Italian roots, was in competition with the prospering English monasteries to the north which had an Irish origin. Morris wrote:

“...Among the English, double monasteries multiplied from the 660s onward; Benedict Biscop and others encouraged houses of purely English foundation and traveled to Italy to bring back books, that their scriptoria copied and circulated; Aldhelm tried without success to persuade English students that they could find at Canterbury in Theodore’s time a Greek and Latin education as good as any to be had in Ireland.”

It was St. Columba who founded the Iona monastery in Scotland. Another monk, whose name is often confused with St. Columba, was St. Columbanus, living at about the same time. St. Colambanus left Ireland, where Bangor was one of its most famous monastic schools, and founded monasteries on the European continent. Morris stated (pages 400 to 405):

“Columban was the first of the insular monks to make a weighty impact on Europe. For a quarter of a century he had served his abbot, Comgall, Columba’s close friend. When he landed in Gaul in 590, he had behind him their experience, and the teachings of Finnian, David and Gildas [Ed.: Finnian was from Ireland, the other two from Britain]; he quoted Gildas with respect, and may have known him personally. His stern simplicity shattered the conventions of Frankish Christianity. When he strode into the court of one Merovingian king and denounced his lechery and misgovernment to his face; when he adjured another to forswear his earthly crown for the greater glory of a tonsure; when he publicly rebuked their formidable grandmother Brunhilde for crimes that all men knew but did not mention, then he sharply and openly expressed a disgust that their subjects had harboured in silent resignation.... The Merovingian government deported him, but they could not suppress the monasteries he had founded, nor prevent him from founding Bobbio among the Lombards of Italy.

When Columban was deported, he was placed on a ship on the Loire headed for Ireland, but left it and went on to stay a while in Switzerland where later a great and famous monastery, St. Gall, arose, named after Columban’s companion, St. Gall, who remained in Switzerland. However, Columban crossed the Alps to Italy, where he founded the Bobbio monastery, and where he died. Morris said, concerning Columban’s ultimate influence:

“In Gaul, Columban brought the learning of Comgall’s Irish Bangor to the Vosges at the end of the 6th century. The movement that he began swept Gaul in and after the 640’s, as the original monastic reform had swept Britain and Ireland a hundred years earlier. Large numbers of monasteries founded by the Irish and English and by their native Frankish adherents also
established libraries and copied books; if Agilbert had been thirty years younger, he would have had no need to go to Ireland to advance his education. Some Franks and many Englishmen still studied in Ireland, for the Irish libraries and learning were older than their own, and a journey to the land whence their monastic Christianity had come was in itself a pilgrimage. But the substance of Irish education had already spread abroad, and was in the next century carried to Germany.”

Concerning that continuing spread of religion and culture, from fourth century post-Roman western Britain, to fifth century Ireland, to sixth century northern England, and then back to the continent in the seventh century, Morris wrote:

“Monastic fervour swept eastern Gaul in the middle of the seventh century as intensely as in contemporary England or as in Ireland and Britain a century before. Merovingian society was in decay and ready for inspiration; the inspiration came almost entirely from the Irish and Anglo-Irish monks, with some contribution from the British, but with hardly a trace of influence from the earlier monasteries of Gaul or Italy.

The energy was not dissipated in the seventh century. Morris recounted that the English and Irish monks continued their spread as evangelists in Eastern Europe, but served as scholars in Western Europe:

“The force of the movement west of the Rhine was expended during the seventh century. Beyond the Rhine it was constantly renewed for many centuries. In the eighth century the English and Irish began to evangelise the heathen German[s] and their further neighbours. Boniface of Devon became archbishop of Mainz and apostle of Germany. Many of the bishops and abbots whom he directed were Irish; the most remarkable among them was Virgilius of Salzburg, who outraged orthodox opinion by teaching that other worlds besides our own exist in the universe. From Austria, later generations reached eastward. An Irish Colman became the patron saint of Hungary; others preached in Poland; and Brandenburg in Prussia perhaps owes its name to an Irish Brendan....

Morris then commented on the fine character of these emigrant Irish and English monks, whose sudden appearance on the scene certainly appeared providential. If these monks had not been superior men, they could never have achieved what they did. Some writers have remarked on the curious fact that these monks “conquered” the European continent for the causes of both religion and culture, but managed to do so without ANY warfare whatsoever. However, ugly force certainly appeared again under Charlemagne who used swords to “convert” his heathen opponents.

Morris wrote:

“The quality of the Irish monks in Europe was as remarkable as their expansion in time and space, from North America to the Ukraine. Though evangelists continued to convert remote heathens, many of the Irish in western Europe transferred their emphasis from preaching to learning. From the seventh century to the eleventh the terms Irishman and scholar were virtually interchangeable; and until the Norse invasions, the English fully shared their scholarship....

“The greater part of the early monasteries of Europe north of the Alps were founded by Irish, English or British monks, or by their native converts; to them most of the peoples beyond the Rhine and Danube frontiers of Rome, save for the eastern Slavs, owed their first conversion to Christianity. In the second and third generations the undisciplined enthusiasm of Irish founders no longer sufficed, and these houses sought an orderly rule; most of them ultimately observed the Rule of Benedict of Nursia, to form the nucleus of what was later termed the ‘Benedictine Order’.
However, Morris had traced the historical roots of the Irish and English monasteries which brought classical Roman learning back to the European continent after the centuries of cultural upheaval that followed the fall of Rome. Morris wrote:

“The monasteries of medieval Europe owe their being to Arthurian Britain.... The tenuous ancestry of British monasticism reaches back through Illtud and Docco [in fifth-century Britain] to the teachings of.... Martin [of Tours, in fourth-century France].

Morris commented that the new education, coming out of the new Irish and English monasteries, had appeared on the Continental scene at precisely the right time, because the old Roman system had disappeared only shortly before. He then produced a quotation from Gregory of Tours who wrote about fifty years before the spread of the monasteries, with their new learning and with their monks who loved books and the skillful copying of books. Gregory was in despair, because he had no idea that the culture that Tours had sent abroad in Martin’s fourth-century time was going to be returning to Tours and to Gaul itself in the very near future - like so much symbolic bread on the waters. Gregory of Tours wrote:

“‘Culture and education are dying out, perishing throughout the cities of Gaul.... there is no grammarian to be found, skilful enough in dialectic to depict the present age in prose or verse. You often hear people complaining, ‘Alas for our times; literacy is dying among us, and no man can be found among our peoples who is capable of setting down the deeds of the present on paper’.”

Morris commented:

“The monks came just in time to replace the dying education of antiquity with a new learning, alert to seize upon what suited the needs of its own day.”

As John Morris made very clear, the post-Roman British schools such as Illud’s were certainly a primary source for educational practices in Ireland, and, then, from Ireland, to northern England and to all of post-Roman Europe.

However, a second but rarely mentioned source of educational practices, besides the post-Roman British schools, was Egypt. Considerable contact between Ireland and Egypt about the fifth and sixth centuries appears probable, despite the fact that some modern authors discount it (such as Lloyd and Jennifer Laing (Celtic Britain and Ireland - The Myth of the Dark Ages, St. Martin’s Press, New York: 1990, pages 176-177). Concerning concrete knowledge of Egypt in Ireland, which concrete knowledge implies that cultural exchange in such areas as education was possible, the geographical poem from the Book of Leinster, attributed to the schoolmaster at Ros Ailithir in Cork, Ireland, about 975, and assumed to be the school geography, reads in Verse XXI:

“Egypt of famous deeds,
Most fertile of all lands,
Along by the River Nile southward
It is neighbor to Africa.”

———

It is assumed the author of the geographical poem was drawing from later classical authors such as Pliny who considered Africa to begin on the western side of the Nile. The point is that the existence and location of Egypt were part of a schoolroom exercise in Ireland which was to be memorized only 400 years after the date when any contact between Ireland and Egypt is considered unlikely by some scholars.

It is true that geographical knowledge deteriorated in the late Roman empire, as shown by George H. T. Kimble in Geography in the Middle Ages (New York: Russell & Russell), and the geographical texts most widely studied in the Middle Ages were often compiled from these later inferior classical geographical writings. Yet the earlier classical knowledge that the world is a sphere, and even the almost precise knowledge of its circumference, persisted in the less popular but still studied writings. For instance, St. Vergilius of Salzburg, Austria, an Irish monk of the 8th century, had a famous confrontation with St. Boniface of England, then in Germany, defending the idea that men existed in the “antipodes,” or on the other side of the earth, and in the 9th century Bede of England, writing from his monastery, acknowledged that the earth is a sphere. The “progress” fallacy is probably the cause today of the frequent unwillingness to grant that past ages also possessed much knowledge. According to Kimble (pages 20-21), Orosius, a Spanish priest of the fifth century, had lived for several years with St. Augustine at Hippo in Africa, and later wrote an encyclopedia, including a geography. Kimble said Orosius drew on earlier classical sources:

“The Western Ocean forms the boundary of Europe in Spain at... the Pillars of Hercules.... Africa begins with the land of Egypt and the city of Alexandria... that great Sea (Mediterranean)... which touch(es) all the continents and the lands in the centre of the earth... Lower Egypt is bounded by Syria and Palestine on the East, by Libya on the West, by Mare Nostrum on the North and on the South, by the mountain which is called Climax, together with Upper Egypt and the Nile.... Britain, an island in the Ocean, extends a long distance to the north: to its south are the Gauls (i.e., France). The city called Portus Rutupi (Richborough in Kent) affords the nearest landing place for those who cross the water.... This island is 800 miles long and 200 miles wide.... Ireland is quite close to Britain and smaller in area. It is, however, richer, on account of the favourable character of its climate and soil.”

Kimble added:

“For all its limitations (Orosius’) Historia proved to be very popular during the centuries that followed.... To study history was to read Orosius and he was quoted by almost every Christian encyclopaedist down to about A. D. 1300. Among those who made use of the whole text were Alfred the Great and Isidore of Seville. But even as late as c. 1410, we find Pierre d’Ailly referring to it with the utmost respect.”

Not only did clear knowledge of Egypt’s location persist in the so-called Dark Ages, but records of contact with Egypt also exist, such as of papyrus imports into France about 600 A. D.. It is impossible to doubt this. The Encyclopaedia Britannica, Vol. 17, page 246 (1963) states that some French deeds written on papyrus and dating from the seventh century are still in existence, although papyrus was not used by Charlemagne and those who came after him. Since papyrus in the seventh century came only from Egypt, the existence of these French deeds dating to the seventh century is proof of continuing Egyptian dealings with the continent, at least until the Moslem conquest later in the seventh century.

Saint Columbanus of Ireland founded Bobbio monastery in northern Italy about 600 A. D., and since evidence exists of a continued two-way communication between Bobbio in Italy and Ireland about 600 A. D. requiring foot-travel over the Alps, it is difficult to understand why contact between Egypt and Ireland about that time, which would have been by relatively easier water travel, should be considered so improbable.
The Irish monks in those early centuries carried leather satchels to hold their books as they traveled across the roads and Alps of Europe. It was undoubtedly in one of these that the Antiphonary of Bangor, written in Ireland between 680 and 691, found its way to Bobbio, Italy, where it or a copy of it by an Irish scribe turned up almost a thousand years later.

The attitude of those highly educated old monks in the sixth and seventh centuries towards their demanding rule which included manual work, study, and prayer, is shown in Latin verses from The Antiphonary of Bangor. A translation is given in a footnote on page 56 of Religion and the Rise of Western Culture, Gifford Lectures Delivered in the University of Edinburgh 1948-1949, by Christopher Dawson, Sheed & Ward, Inc. 1950, Image Books, Doubleday: New York, 1958:

“...the rule of Bangor is good, righteous, divine, severe, holy, zealous, just and wondrous.

“A ship that is never troubled though tossed by the waves: a bride adorned for the marriage of her lord and king.

“Truly it is a stronghold, secure and well defended - the city set on a hill, glorious and comely.”

In The Catholic Encyclopedia (1913), Vol. II, page 249, that copy is referred to as “A MS. from the monastery of Bangor in Down, written or copied from a MS. written during the time of Abbot Cronan (680-691). It is now in the Ambrosian Library at Milan.”

Note the reference in that Irish manuscript from the 600’s to “A ship that is never troubled though tossed by the waves....” obviously the ocean waves. The reference must have been to an ocean-going ship, because it is hardly likely that a scholar like Dawson could have accepted the translation, “ship,” for a little boat like the Irish curragh. It seems apparent that those old monks from the 600’s must have found ocean travel a familiar enough topic so that they used it for a metaphor.

It is a matter of record that when the then-reigning king in what is now France threw St. Columbanus out of the country for rebuking the king for his unsavory “life style,” (the king had multiple concubines, all of whose offspring he wanted baptized,) Columbanus boarded a ship on the Loire bound for Ireland (as recorded in St. Columbanus’ biography written shortly after his death by Jonas). Obviously, there was such a thing as available commercial water travel about 600 A. D., as an alternative to foot travel for those old monks. That fact supports the probability of direct contact between Ireland and Egypt at that time.

The leather satchels carrying such books as those of St. Columbanus are referred to in Six Months in the Appenines, by Margaret Stokes, London: 1892, Geo. Bell & Sons, on pages 14 and 110:

(Columbanus’) “bell, chalice and knife are shown at Bobbio, and his crosier or wooden staff was removed to St. Gall... He is represented on his tomb carrying his book satchel as he stands watching the transport of the wood from which his oratory is to be built at Bobbio. Examples of such a satchel may be seen in the museum of the Royal Irish Academy and the Library of Trinity College, Dublin and Corpus Christi, Oxford.

“(His) biographer, Jonas, makes much of his study of grammar, rhetoric, geometry, poetry and the Sacred Scriptures.”
Jonas’ biography is considered highly reliable. That Italian monk arrived at Bobbio in 618, only three years after St. Columbanus died. Jonas based his biography written between 640 and 643 on information he obtained from those who knew St. Columbanus. Jonas also wrote of Eustace, Attala and Bertulf, whom he knew personally, and Bede “incorporated these lives into his ecclesiastical history,” according to The Catholic Encyclopedia, 1913, Vol. VIII, page 498. Bobbio a thousand years later in the so-called “Renaissance” was found to be a treasure house of classics, which would have been copied, however, long after St. Columbanus’ death in the early seventh century. Papyrus, still being imported from Egypt during St. Columbanus’ lifetime and probably in wider use than more expensive parchment, deteriorated relatively rapidly in the moist climate of Europe. The papyrus of St. Columbanus’ day would have disappeared in a few hundred years. After it became difficult to get papyrus because of the Moslem conquest of North Africa, texts were instead copied on long-lasting parchment made from animal hides.

The most telling evidence of contact between Egypt and the Continent, including Ireland, about 600 A.D., is the spread of the bubonic plague in the sixth century A.D. John Morris, in The Age of Arthur, wrote (Charles Scribner’s Sons: New York, 1973, pages 222 and following) that it was the plague that was the principal disaster of the Mediterranean and of Europe in the middle of the sixth century, and the plague had originated in Egypt:

“...It began in Egypt in 541 or 542, and reached Constantinople in 543, whence it ravaged ‘the whole Roman empire.’ Gregory of Tours, then a child in the Auvergne, narrowly escaped infection in November, probably of 544; he records its sweep through central and southern Gaul in 544 and 545, naming places that lie along the trade routes to the upper and middle Rhine, or to northern or north western Gaul. The Irish Annals put the first outbreak in Ireland in 544....”

Morris said it was possible to trace the route of the plague, as it spread to Britain from its origin in Egypt. He wrote:

“Contemporary notices tell incidental stories of sea-borne trade between western Britain and Europe and the eastern Mediterranean in the sixth century. An Egyptian Saint’s Life concerns the voyage of a merchantman that imported lead from Britain, presumably from Cornwall or the Severn estuary; central Ireland imported wine, and a ship of Gaul brought news of Italy to Kintyre, vessels of Nantes were regularly ‘engaged in the Irish trade’; though many of the saints who sailed abroad are made to float on leaves and stones, others are prosaically recorded to have paid their fares to commercial shipowners.”

Morris stated that the content of these old texts is supported by archaeological findings. Pottery from Egypt and southern Gaul has turned up in diggings in old monasteries and royal sites in Ireland, southwestern Britain and southwestern Scotland. He commented that the ships bringing in the pottery and wine obviously also brought in rats carrying the plague.

Curiously, while the Irish and the British were victims of the sixth-century plague, the English (Anglo-Saxons) were not. Morris commented that the English immunity can also be understood by studying the texts and archaeology of the period:

“The English escaped from infection from the British, because the British refused to have contact with them. They escaped infection from Europe because they did not import from plague-infected areas. What trade they had is indicated by their grave goods; their imports were the ornaments and weapons of northern and north-eastern Gaul, and of the Franks of the lower Rhine. These are the regions which Gregory omits from his account of when and where the plague was rampant.”

58
However, what Morris called the “geography” of the plague certainly confirms Irish contact with the Continent - and even with Egypt - of that period. The Egyptian Saint’s Life to which Morris referred, concerning a merchantman in contact with Britain, provides further confirmation, as does the citation mentioned below, about Egyptian monks of the period who were buried in Ireland.

In Proceedings of the Royal Irish Academy, Second Series, Volume II, Dublin: 1879-1888, a May 12, 1884, letter is printed from the Right Reverend Charles Graves, Lord Bishop of Limerick. On pages 280 and 281, Graves said:

“In times of persecution, Egyptian monks fled to Ireland, bringing with them their speech, their art, their ecclesiastical usages. In the Litany of Aengus, mention is made of seven Egyptian monks buried in one place.... In Upper Egypt I have recognized several forms of cross which we regard as Irish and Ancient Irish.... by far the most interesting of the results... will be deduced from a comparison of the methods of ornamentation exhibited in the Coptic Gospels and service-books with those of which we have such fine examples in our Ecclesiastical MSS.”

Graves did not say how the Egyptian monks came to know that far-off Ireland would provide a Christian refuge for monks, so much so that the Egyptian monks bypassed the far closer and Christian Italy, France and Spain. However, Ireland at that time was a far more peaceful haven than the Continent as it was unaffected by the barbarian migrations. However, obviously, Irish monks must have gone to Egypt first. Irish monks were famous for their wanderings.

A recent television program on Ireland discussed its wildlife, and properly noted that cats were not native to Ireland. The suggestion was made that early Irish references to cats were really references to stoats, the native European weasel which in winter turns white. I believe specific mention was made of the famous poem in Gaelic from some time (and perhaps some appreciable time) before about 750. The poem concerned a white cat, Pangur Ban, owned by an Irish monk.

However, rather than doubt the presence of true cats in Ireland by 750 or so, it is reasonable to assume that the poetic reference to a white cat, Pangur Ban, is just one more confirmation of contact between Egypt and Ireland. Such contact was apparently strong among the monks, not only because of the fact that monasticism itself originated in Egypt. Since early Irish records actually refer to the presence of a group of Egyptian monks in Ireland, because they were buried there, it is very possible that such Egyptian monks brought their Egyptian cats with them. If that were the case, Irish monks could then easily have acquired pet cats from the Egyptians. (Cats are prolific!) Therefore, “Pangur Ban,” owned by an Irish monk some time (and perhaps some appreciable time) before 750 or so, and made famous by that monk’s poem, probably was a true cat, and not a stoat, or weasel.

In keeping pet cats while in the religious life, Irish monks certainly had two continental monks to imitate who had became well known Italian popes before 750 A. D. and who could have made such a practice not only well-known but respectable. Saint Gregory the Great (540-604) was the pope from 590 to 604, and Saint Gregory III was the pope from 731 to 741. On page 77 of his book, The Cat Who Came for Christmas (Little, Brown and Company, Boston and Toronto: 1987), Cleveland Amory wrote:

“Popes such as Gregory the Great and Gregory III, Leo XII, and Leo XIII, not to mention Pius VII and the late John Paul, were all pro-cat, and there are many stories of their affection for the animal. When Gregory the Great and Gregory III, for example, renounced all their worldly possessions, each refused to renounce one thing - his cat....”

No one doubts the presence of cats in Italy in the sixth and eighth centuries, and it is a matter of record that these two “Gregories” owned their pet cats while still laymen, as did other Italian laymen of
the times. Yet Irish laymen in those times apparently did not own pet cats because cats were not established in Ireland. Yet, since Irish monks of the general period were in contact with Egyptian monks, it seems highly significant that the reference to a true cat was made by an Irish monk instead of an Irish layman.

Pangur Ban’s presence in a monastery some time before about 750 A. D. might have been acceptable because of the example given by the “Gregories.” The presence of pet cats, not barn cats, in European monasteries might even have become very common, and very possibly even have grown from the influences of Egyptian monasticism, since Egypt is where Christian monasteries originated. The point is that ancient Ireland, where true cats were unknown, is known to have had a particular white cat in a monastery before about 750 A. D. The forebears of that Irish cat would have had to be immigrants. Also in Ireland, ancient sources state that a group of Egyptian monks had been buried there. The existence of Pangur Ban in Ireland before about 750 appears to provide further confirmation of Egyptian contact between Egypt and Ireland before that date.

The ancient poem about Pangur Ban is discussed on page 39, A First Book of Irish Literature, by Aodh de Blacam, (1934, Kennikat Press Scholarly Reprints, Port Washington, New York: 1970). He said the poem occurred in:

“... the late eighth century Carinthian MS.- a ‘commonplace’ book kept by an Irish student, in which notes on Greek declensions, etc., are interspersed with Gaelic verses.... In one of these Carinthian poems a monk compares himself to his cat, Pangur Ban, who hunts mice while his master hunts words. No more pleasant humour, delicate wit, could be found in any cultured age than in this ancient Irish poem. The metre is that peculiar Celtic metre named deibhidhe, in which an accented syllable rhymes with an unaccented syllable....

“It is instructive to observe that an Irish scholar in a far land was familiar with poems in a finished prosody. They must be fragments of an extensive vernacular literature then in being, which has all but perished....”

“Whatever fragments of verse survive from the early times have been preserved thanks to the monks who transcribed them and who were demonstrably the authors in many cases. There are many echoes of the peace and quiet in the secluded monastery of these times between A. D. 600 and A. D. 800. One poem comes to mind particularly in this regard. It is known to Gaelic scholars as Messe ocus Pangur ban (I and Pangur the white) from the first line, as is the Gaelic custom. This little piece of verse is cast as a comparison between the studies of the scholar and the activities of the white pet-cat who hunts patiently for mice in the cell while his master hunts knowledge. There is a little hint of the preference the scholar has for the cat because the animal is not jealous of his master’s success, unlike other scholars:

“‘I love better than all fame
At my note-book to take pains,
Not jealous is Pangur Bawn,
He loves too his own calling.’

“Others, the poet seems to infer, may be jealous of my success, but not Pangur!”
The “Gregories” and their pet cats, and the Irish monk and his Pangur Ban, lived in the period dubbed the “Dark Ages.” The human warmth and compassion of such men form a grim contrast to the lack of compassion in the so-called “advanced” Middle Ages period after about 1300. Read of the wedding festivities of the Catholic Henry VIII when he married his poor first wife, Catherine, in the early 1500’s. Some ugly animal abuse was actually part of the official public celebration! Also, Cleveland Amory referred briefly to horrors visited on cats in the so-called “advanced” period of the later Middle Ages, which horrors would have nauseated the two canonized Pope Gregories eight hundred years or so before. It is a marvel that the later Middle Ages are not more widely recognized as morally degenerate in comparison to the pre-1000 A. D. period, at least in those Christian places that happened to be currently free from the barbarian turmoil of that time. Most notable among such places, for several hundred years, from about 500 to about 800, were England and Ireland. It was precisely that peace which may have drawn Egyptian monks to visit there.

Heavy cultural contacts between the Mediterranean and Ireland by way of Spain in the seventh century are discussed at length in J. N. Hillgarth’s Visigothic Spain, Byzantium and the Irish, Variorum Reprints, London, 1985. The following is from the section, “Visigothic Spain and Early Christian Ireland,” page 177:

“From Carthage, ships coming originally from Alexandria or Constantinople could gain the south of Spain, sail up the Guadalquiver to Seville or up the Guadiana to Merida or continue round into the Atlantic to reach Braga and the North. There seems no doubt that some of the Eastern ships that had reached Northern Spain continued on their way to the British Isles.

“Our strongest archaeological evidence for these voyages consists of the Eastern Mediterranean pottery, much of it evidently intended to provide for Celtic liturgical needs, recently found in the West of England, especially North Cornwall, South Wales, and Southern Ireland.... Almost all the sites where it has been found are on the coast. It is not found north of a line from Dublin to Anglesey and it has been suggested that this may indicate the distance which Mediterranean traders were prepared to sail. The... date of this pottery is not yet fixed but pottery very similar in type is dated c. 425-600.”

The Hillgarth text pointed out obvious cultural ties between the Spain of Isidore of Seville in the seventh century and Ireland, and also pointed out that the numerous grammatical writings on Latin in seventh century Ireland show a Spanish influence. (Seventh century Latin grammars written by the Irish are discussed by Professor Louis Holtz in his book, Donat et La Tradition de l’Enseignement Grammatical, Centre National de la Recherche Scientifique, Paris, 1981.) Spain was heavily influenced by Mediterranean trade, and Ireland was heavily influenced by Spain. The cultural link with Egypt and the Mediterranean is clear, and was both indirect and direct.

Therefore, much material evidence such as on art work and on imports suggests contact, both direct and indirect, between the Coptic world (Christian Egypt) and Ireland not only as early as the sixth century A. D., but even earlier. Marrou was “struck by the extraordinary similarity of the methods employed” in teaching in Coptic Egypt in the fourth century A. D. to ancient Greek methods. Yet that similarity to ancient Greek methods also exists in beginning teaching methods described in the ancient saints’ written “lives” from Ireland for the period from about 500 to about 800. Just as in the ancient Greek writings, both the Coptic and the Irish writings describe the use of wax tablets, the use of standard texts (the Psalms in Ireland), the use of memorizing and the practice of reading aloud - and, almost certainly, the use of the same syllabary. One likely explanation for the similarity of the ancient Greek and old Irish methods is that those methods came first from Greece to Coptic Egypt, and then from Coptic Egypt to Ireland.
A third source for practices in the teaching of beginning reading is almost certainly the Isles of Lerins in the Mediterranean. By the influence of St. Patrick, those methods reached Ireland, and, from Ireland, England. It is true that practices in England, after its conversion to Christianity, were influenced from two cathedral sources: Canterbury (seventh-century Italian) influences and York (seventh-century Irish) influences, but the original influence on the English monasteries from which the Anglo-Saxon missionaries came was Irish. St. Patrick is recorded as having taught many “alphabets,” but since he is considered to have been born from Celtic British stock in what is now southwest England after the fall of Rome (in the same general area as Illtud’s school), and since he studied as an adult in France, also after Roman influence there had declined, the question needs to be answered: From what sources did St. Patrick acquire his knowledge of how to teach “alphabets” as they had been taught in ancient Rome? One source obviously was the post-Roman schools in southwest Britain, such as Illtud’s, in which ancient Roman practices survived. But another source also existed, and it was located in the Isles of Lerins.

The Isles de Lerins off the coast of France in the Mediterranean are probably one of the connecting links to the educational practices that had been used in the ancient world. The religious trained there spread through fifth century France, and Patrick may have been in contact with them or may have studied there himself. The Isles de Lerins are two islands in the Mediterranean off the south-eastern coast of France, near Cannes, now called Sainte Marguerite (Lera) and Saint Honorat (Lerina). “Lerins,” possibly only the latter island, has been famous as a source of early Western monasticism. The islands were well within the boundaries of the old Roman empire and close to the boot of Italy. They obviously would still have been heavily influenced by Roman cultural practices, such as how to teach beginning reading, shortly after the fall of Rome in the 400’s. It was at that time that St. Patrick was studying in France (Gaul).

The historian, Christopher Dawson, had no doubt about the important place of Lerins in monastic development, as he described it in his book, Religion and the Rise of Western Culture (1950 Sheed & Ward, 1958 New York: Image-Doubleday). Dawson discussed the rise of monasticism in Britain and Ireland and its relationship to Lerins. He commented that, in the Mediterranean, the old monasticism was disappearing because of the collapse of the Roman empire, but that in the North a new monasticism was establishing a new Christian world. Dawson wrote (page 49):

“It was among the Celtic peoples that this aspect of monasticism was first developed. We know, indeed, practically nothing of monastic origins in Britain apart from the foundation by St. Ninian of the monastery of Candida Casa in Galloway in 397, which became a centre of Christian influence first among the Picts and later in Ireland. But in the fourth and fifth centuries the famous Pelagius was a monk from Britain, while his chief disciple Caelestius was, apparently, of Irish origin. Moreover Faustus of Riez, the greatest and most learned of the early abbots of Lerins, was himself a Briton, and there is little doubt that it was from Lerins that the main tradition of Celtic monasticism and liturgy was derived.”

Dawson pointed out that, with the end of Roman influence in Britain and the collapse of the church organization that had existed during the Roman period, monasteries became the dominant influence in the British church, as monasticism was the dominant influence from the beginning in Ireland. Dawson commented that, while St. Patrick may not have been a monk, he was strongly influenced by monasticism. Dawson believed that St. Patrick had been in direct contact with Lerins, and cited St. Patrick’s remark, in his “Confession,” that he so much wanted to go back to Gaul to “visit the brethren and to behold the faces of the Saints of the Lord.” He commented further that Irish monasticism had to be as old as St. Patrick’s time, since Patrick wrote of the “countless sons of the Scots [Ed.: Irish] and the daughters of chieftains, who had become monks and virgins of Christ.”

Dawson remarked:
“In Ireland the Roman tradition of city life and the city episcopate were non-existent, and so it was natural that the Irish Church should have found its natural centres in the monasteries which rapidly became very numerous and very populous.”

Dawson spoke on page 60 of the continuing influence of Lerins on England at a later period, incidentally confirming widespread traveling at that time:

“Benedict Biscop, above all, devoted himself to the development of religious art and learning. He had served his novitiate at Lerins, the ancient capital of Western monasticism, and on his repeated journeys to Rome and Gaul he brought back to England a wealth of manuscripts, paintings, relics and vestments, as well as masons and glaziers and singers for the adornment and service of the church. Finally, in 678, he brought with him from Rome the arch-chanter of St. Peter’s, and the abbot of one of the Basilican monasteries at Rome who acted as Papal legate at the Council of Heathfield in 680, and who spent two or three years instructing the monks of Northumbria in the music of the Roman chant and the annual order of the Roman liturgy......”

Dawson told of the final end in the eighth century of the Lerins monastery which had been so influential for three hundred years, from the time of St. Patrick in the fifth century (page 61):

“...the victorious tide of Moslem invasion was sweeping over the Christian lands of the Western Mediterranean and Northern Africa. By 720 the Saracens had penetrated as far as Narbonne, and in the following years all the old centres of monastic culture in Southern Gaul, such as Lerins, were sacked, and even Luxeuil, the centre of the tradition of St. Columban in Burgundy, fell a victim to Arab raiders. At the same time Charles Martel, the leader who checked the Moslem advance at Poitiers in 732, was hardly less of a danger to the church, owing to his wholesale exploitation and expropriation of bishoprics and monasteries to provide benefices or fiefs for his warriors.”

But neither St. Patrick nor the Isles de Lerins were the sole sources for Irish monastic teaching practices in the fifth and sixth century. Nor were the post-Roman schools in Britain the only other source. Other sources were the many contacts previously discussed that existed between Ireland and Egypt. It appears self-evident that such contacts must also have existed to some degree between Ireland and other parts of that ancient world for a very long time. After all, the infamous Pelagius, active as long ago as St. Augustine’s day in the fourth century, is assumed to have come from Ireland. Therefore, contact must have existed to some degree long before St. Patrick’s arrival in the fifth century.

The ancient Greek and Roman methods for teaching beginning reading discussed by Marrou therefore probably reached Ireland through all of these sources. The result was the use of what was called the “alphabet” (undoubtedly the syllabary), wax tablets, and the idea that standard texts should be memorized aloud by beginners, which texts were the Psalms in Ireland. As a result of the memorization, done orally, of these Latin written texts at a very young age and the close teacher contact needed with wax tablets which would assure that the meaning of the written texts was understood, these little students became bilingual in Gaelic and Latin, equally fluent in both languages.

Yet the ancient wax tablets⁹, with their wonderful benefits for beginners, died out for beginners in the later Middle Ages, being replaced by the ABC book, although wax tablets hung on for older students and

adults. Yet this is the same period in which we have been conditioned to think “progress” was making everything better. The idea of “progress” when applied to culture instead of technology can be a terrible superstition.

The ABC book of the fourteenth century was probably short and provided little material for reading, memorization and recitation. The appearance of the ABC book for beginners instead of wax tablets which commonly contained the Psalms for children to memorize (“recite”) was a distinctly degenerate step in the teaching of reading. The quality of Latin learning itself declined because little children were no longer writing and memorizing the Psalms in Latin by reciting them orally, though they did learn at least to read them later, after the ABC book, if they continued in school. The ABC book also abolished the copying of letters and syllables which the beginner had obviously done on his wax tablets from his own personally tailored model provided by the teacher. The child therefore no longer learned to write simultaneously with learning to read. The ABC book also reduced the need for a close teaching and correcting relationship between instructor and child. The instructor no longer had to write out specific material for each child to memorize and to copy and then to correct the child’s work. Now the instructor could simply hand out, probably to large classes, ABC books which could be used over and over. The ABC book was probably shorter in manuscript form than in the later printed pamphlet, which appears to have been commonly sixteen pages in its printed form in England and to have included “graces” or additional prayers.

Children with such ABC-book instruction sometimes never learned to write, as appears to have been the case with the women in the Paston family in England in the 15th century, who could read but found writing difficult. The famous Paston family correspondence tells much about that period. With the disappearance of the wax tablets for beginners, writing had become a separate subject from reading, and the Paston women presumably never had writing classes. As late as the post-Revolutionary period in America, writing classes were housed and taught apart from reading classes.

However, as mentioned, Davies showed (page 32) that wax tablets were apparently still in use at least in France in the thirteenth century to teach children to write (and probably to read, though they may have had manuscript texts also). Davies said that the earliest known record in medieval writings of a song school turned up in a thirteenth-century French romance which had been translated into English. In it, the children attended school to learn Latin and French, and how to write on a wax tablet with a gold stylus. Davies remarked that it is obvious the school was for both boys and girls, since one pupil broke down and cried as he said:

‘I cannot sing or read in any school without Blanchefleur.’

Davies also referred to a reading curriculum (page 345) in Warwick, England, in 1315, when the dispute mentioned earlier took place in which it was recorded that it was:

“between the Master and the Music Schoolmaster over the Donatists (i.e. grammarians) and the little ones learning their first letters and the psalter....”

The sequence in 1315, therefore, for English beginners, was still “their first letters” (probably meaning the alphabet and syllabary) and the Latin Psalter, just as it had been 800 years before in Ireland. No mention was made of an ABC book, although the phrase, “their first letters” does not rule it out.

Yet, when Geoffrey Chaucer wrote about his little “clergeon” in “The Prioress’s Tale” around 1380, a short 65 years after 1315, the ages-old sequence of “first letters” and Psalter was gone. So was any mention of the ages-old wax tablets for rank beginners to learn to write, the use of which dated back to ancient Greece, and which turned up as late as the 13th century in that French tale quoted earlier. All of those ancient methods for beginners had been replaced by the hornbook cited earlier and what is conceded
to have been only an ABC book, not an adult primer. The ABC book would have included only the alphabet, syllabary, and simple prayers.

Davies gives a modernized version of the beginning of Chaucer’s “The Prioress’s Tale”:

“At the far end of the street there had been established a small school where a number of Christian children received each year the kind of instruction that was normally prescribed for youngsters in that country, that is, learning to read and sing... As this little child was learning his primer, he heard the others singing “Alma Redemptoris Mater” just as children who have learnt their hymn-books are wont to do. As much as he dared, he drew closer and closer, listening intently all the time to the words and the tune till he knew the whole verse off by heart. As he was so young, he had no idea what the Latin meant, so one day he begged one of his friends to tell him the meaning of the song in simple language. His older companion then confessed, “Yes, I am learning to sing but I don’t know much Latin.”

Following is an English translation of the Latin verses beginning the Alma Redemptoris Mater. It is these verses which must have been sung by Chaucer’s slightly older boy, and the content is obviously not difficult. (“Thou,” “thy,” and “thee” would obviously not appear in the Latin version.) The translation is given on pages 101 and 106, The Little Office of the Blessed Virgin Mary In English, published by Franciscan Herald Press, Chicago, Illinois, 10th printing, 1979, with an Imprimatur of September 8, 1944:

“Mother of Christ, hear thou the people’s cry,
Star of the deep, and portal of the sky.
Mother of Him who thee from nothing made,
Sinking, we strive and call to thee for aid.
Oh, by that joy which Gabriel brought to thee,
Thou Virgin first and last, let us thy mercy see.”

It is obvious that education standards had taken a sharp drop by about 1380, when Chaucer wrote the “Prioress’s Tale,” which was one of his Canterbury Tales. The Psalms that had still been in use in England in 1315 for rank beginners like Chaucer’s “clergeon” immediately after their “letters” had been replaced by a simple ABC book. For Chaucer’s slightly older boy, the Psalms had been replaced by a hymn book. The ages-old wax tablets for beginners had also disappeared, and, with their disappearance, the teaching of writing to beginning readers. Furthermore, the quality of Latin learning was dropping also, as shown by that older boy’s remark, since he could not even understand what was the relatively simple Latin of a song he had memorized. The fact that it was relatively simple is shown by the above translation.

The age at which a language is learned has a great influence on fluency. Irish children from about 500 to 800 A. D. learned to read and write Latin as a series of sounded syllables at the age of seven, and almost simultaneously learned the meaning of what they were pronouncing aloud as those syllables formed syntax and then words in the Psalms which they were reading aloud, writing and memorizing. As a result, they learned Latin almost like their mother tongue. That initial teaching method, the memorizing of meaningful syntactic wholes by reading their syllables aloud, was the probable cause of the bilingualism of the educated Irish which John Morris cited in The Age of Arthur (Charles Scribner’s Sons, 1973)....

On page 409, Morris described that bilingualism in early Ireland among the educated Irish. Since Ireland had never been occupied by Rome as England and Wales had been, Latin had never been used by the general Irish population. However, the use of Latin had been dropped by the general population in what is now England and Wales following the collapse of the Roman Empire. Morris wrote:
“The population ceased to speak Latin after Roman civilisation was destroyed; British turned into Welsh in the same years in which the Irish, British and English languages were first written, in the decades on either side of 600. Vernacular literacy gave a new orientation to education and literature, lowering the barriers between the learned and the unlettered. The earlier Irish annalists wrote sentences half in Irish and half in Latin with no more embarrassment than any other fully bilingual people, and continued to do so into the 11th century. They wrote as they spoke, and some schools sought to preserve Latin from contamination by forbidding their pupils to talk Irish to one another, or to converse with the local Latinless population.”

When the learning of Latin meanings was delayed in the fourteenth century until children were older, as with Chaucer’s little song school companion singing a Latin hymn without knowing its meaning, the quality of Latin learning declined.

“And there are many of our craft of brewers who have the knowledge of writing and reading in the same English idiom, but not others, to wit, the Latin and French before these times used....”

The English Spellers, Which Replaced Most English ABC Books

Spelling books were invented in the last half of the 1500’s, about fifty years after the switch from Latin to English for teaching beginning reading, and spelling books were originally meant only for the teaching of beginning reading. The need for spelling books arose because beginners had great trouble learning to read in the English ABC books since, unlike Latin, English sometimes has variant spellings for a single syllable, and sometimes variant syllable pronunciations for a single spelling. The old Latin ABC book had been able to teach children successfully to read Latin syllables, while Latin (and later English) whole-word spellings were learned only incidentally, not formally. In contrast, the function of the new English spelling books was to teach beginning readers to read, not just the confusing English syllables, but English whole words correctly since English whole words had to use those confusing variantly-spelled and sometimes variantly-pronounced English syllables.

Before the switch to teaching beginners to read in English instead of Latin, there had been no such thing as a uniformly agreed-upon spelling of whole words in English. The variant English spellings for syllable sounds had been used interchangeably in English words, as the mood happened to strike the writer. Highly educated people sometimes spelled an English word several different ways in the same text, which was acceptable as long as the letters made the right syllable sounds. At that time, no one could look up English “spellings” in the “dictionary” because there was no English dictionary.

All that changed with the invention of the spelling books because spelling books effectively standardized the spellings of most English words, and froze specific syllable spellings into each of those words. Therefore, the idea that there is such a thing as a “correct” spelling of an English word was born at the same time as the spelling books themselves, in the last half of the 1500’s.

The spelling books rapidly eclipsed the English syllabic ABC book. The content of its first page nevertheless hung on for many beginners as the syllabic horn book until the late eighteenth century, and for some relatively fewer beginners until about 1826. Largely in Britain, the hornbook also continued until about 1826 in a folding cardboard version with pictures for each letter (as “a” for apple, and so on).
This was known as the battledore, invented just before the mid-eighteenth century, and it also contained the syllabary. After about 1826, the “sound”-approach battledores were replaced by the “meaning”-approach picture ABC books of the nineteenth century which lacked the syllabary, whose purpose was only to amuse children while introducing them to the alphabet at home before they entered school.

The syllable method continued as the introductory step in the teaching of reading at the beginning of the new spelling books all through the eighteenth century and until about 1826, both in America and Great Britain. The History of Little Goody Two Shoes of 1765 is very specific in its references to teaching reading by the syllable method in the dame school spelling-book approach. The authorship of the anonymous Goody Two Shoes was attributed to Oliver Goldsmith by Washington Irving, William Godwin and the engraver Bewick, according to “Notes” on pages 165-166, of The Heart of Oak Books, Edited by Charles Eliot Norton, Second Book, D.C. Heath & Co., Boston: 1895 (1902).

In the article, “Syllabaire,” on pages 713-715 of the “S” volume of Encyclopedie ou Dictionnaire Raisonne des Sciences, des Arts, et des Metiers, by Denis Diderot et al, published in 28 volumes from 1751 to 1772 in Paris, France, a description is given of beginning reading materials then in use in the French language. From the dates of the encyclopedia, the article may be considered to be describing reading materials available in France perhaps at least from 1740. (For those who wish to check further, a very complete description of eighteenth and nineteenth century approaches in teaching reading in France is given in the article, “Lecture,” in F. Buisson’s Dictionnaire de Pedagogie et d’Instruction Primaire, Librairie Hachette et Cie., Paris, 1887.) The Encyclopedie article stated:

“Syllabaire...(is the common name for) the little book that contains the first elements of reading in any language. Abecedaire books are not at all rare, good ones are not common, and the best are not without faults.... But what material (is offered) for these first efforts? It seems to me that until now scarcely any discernment or attention has been applied in the choosing of them.

“In some Syllabaires are the Lord’s Prayer, the Angelic Salutation, The Apostles Creed, the Confiteor, the commandments of God and of the church, and sometimes the penitential Psalms..... Some other syllabaires contain only useless things, out of place, or above the level of the children: I have seen in one principles of grammar, and what principles! in another, Aesop’s fables each reduced to four lines of French poetry, sometimes difficult to be understood by the most adequate of readers.”

The most common French 18th century “syllabaire” he described was obviously a blend of the old ABC book and catechism, just like those in use in Protestant countries, but it is interesting that he told of the arrival in France by mid-18th century of other beginning reading books, even though he found them inadequate. He recommended instead a “story book” approach, after the syllabary was learned, with the Old Testament story of Joseph being printed so that on the left the words were divided into syllables, and on the right, the same material would be printed without the words so divided. This emphasizes, of course, the conviction that the learning of printed syllables is the fundamental step in reading.

By the end of the eighteenth century, the old ABC-book approach in other European countries than Great Britain was replaced by many different beginning reading materials. The syllabary survived in beginning reading materials in Latin-language countries. Latin languages have many open syllables which are solely “sound-bearing” (as ve - lo in French). But in the nineteenth century the word method (usually with phonics in languages other than English) displaced the syllable method in Germanic languages. Germanic languages have many closed syllables which are “meaning-bearing” (as hund in German and dog in English). As mentioned above, the article, “Lecture,” by J. Guillaume, in Dictionnaire de Pedagogie, compiled by F. Buisson in Paris, France, 1887, is a superb historical source concerning these later trends in France and to some degree elsewhere. (However, I believe the article makes no reference to
the open-vs.-closed- syllable differences in these languages. Yet I suspect it is these differences which
probably account for the move in Germanic languages to whole words instead of syllables in the teaching
of beginning reading, even when using phonic “sound” methods)

From the time English spellers were invented, they were also used in place of or following the
hornbooks. The function of the ABC page used on hornbooks in England, (the alphabet, an abbreviated
syllabarium, and Pater Noster or Our Father), and the apparent function of its abbreviated syllabarium
will be discussed later. England appears to be the only European country which treated the first page of an
ABC book in this fashion, as a hornbook. Other countries did have paddles with print like the hornbook
but they showed only the alphabet, as discussed by Andrew W. Tuer in his History of the Horn Book.

After 1596, the English spellers consisted of the alphabet, the syllabary, and lists of words to be
learned by spelling their syllables, with occasional short paragraphs inserted on which to practice the
learned words.

One of the first published spelling books, however, was F. Clement’s 1576 The Petie Schole, “With
an English Orthographie, wherin by rules lately prescribed is taught a method to enable both a childe to
reade perfectly within one moneth (sic), & also the unperfect to write English aright.” Clement’s book
contained lists of rules illustrated by certain words, and was not a “dictionary” word-list approach.

Two other books, one published in 1576, and one in 1561, may also be among the earliest English
spelling books, and will be mentioned later, when R. C. Alston’s bibliography of spelling books in
English is discussed.

In 1596, Edmund Coote of England published The First Book of the English Schoole-maister, and
The Second Book of the English School-maister, followed by a catechism, all three bound together as one
book. Coote’s was the model for the spelling books which were to follow, and was enormously popular,
being produced in a vast number of editions for over a century. It contained not just systematic rules, but
systematic spellings, and inserted short paragraphs for reading practice, and it had many imitators. One
may have been the “spelling book” which was published in the Massachusetts colony 47 years later by
Steven Daye in 1643. That book has not survived, but only the record in the Dunster manuscripts of
Harvard of its having been published.

Work on phonetics and opposition to irrational English spelling had taken place in the mid-16th
century shortly after the switch from Latin to English. These innovations and their authors are discussed
by Mitford Mathews on pages 23-29 of Teaching to Read - Historically Considered (1966). Sir Thomas
Smith wrote the first published treatise on English phonetics in 1568 (De recta & emendata...
Scripitione....) The second to publish works on English phonetics (An Orthography.... in 1569 and A
Method.... in 1570) was the school teacher, John Hart, but, as mentioned, he was the first to have worked
on the problem, producing a manuscript on it in 1551. Hart recommended true analytic phonics. Though
not the first to publish, he was apparently the first English phonetician, since his unpublished manuscript
on the problem is dated to 1551.

In Charles C. Fries’ article, “Linguistics and Teaching of Reading,” page 594 and following of The
Reading Teacher May, 1964, Fries said:

“The discussions in English concerning the methods and materials for the teaching of reading
began at least four hundred years ago. John Hart finished the writing of his The Opening of the
Unreasonable Writing of Our Inglish Toung in 1551.
‘For even so I have opened the vices and faultes of our writing: which cause it to be tedious, and long in learnynge: and I learned hard, and evill to read... And then have I sought the meanes (herin writen) by the which we may use a certayne, good and easi writing, onli following our pronunciation; and keping the letters in their auncient, Simple and Singular powers.’

“Hart’s Orthographie of 1569 developed much more completely the principles set forth in his manuscript of 1551 and proposed the use of an ‘augmented’ Roman alphabet as a consistent spelling of the ‘sounds.’“

Note Hart’s decided inference that he had learned to read in English and not Latin, and had found it “hard.” If he were perhaps 22 in 1551 when he wrote the above, he would have been five years old and learning to read in 1534, the year Henry VIII broke with Rome. By that year, the switch from Latin to English for some beginners was apparently in place. Actually, as mentioned later, the obscure and unlocatable ABC by Thorpes was cited in a 1531 trial, and that ABC was almost certainly in English. Yet such English ABC’s were probably little used before the critical year of 1534.

Charles C. Fries wrote the following on page 9 of Linguistics and Reading, Holt Rinehart and Winston, Inc., N. Y. 1962:

“Hart’s method... provides certain special symbols... each symbol having only one sound....”

On page 8, Fries referred to Hart’s 1570 book, “A Methode or Comfortable Beginning for All vnlearned whereby they may bee taught to read English, in a very short time with pleasure.....” Fries said that John Hart wrote in the preface:

“This maner of teaching is after the councell of the excellent Latine rhetorician Quintilian who died above xiC yeres past.”

Fries also referred on page 8 to Hart’s 1551 The Opening of the Unreasonable Writing of Our English Toung, and to Hart’s 1569 “An Othographie conteyning the due order and reason how to write or paint thimmage of manne’s voice, most like to the life Of nature.” Note the sixteenth century English parallel in “thimmage” to the practice in French. In French, when the article, “le” (the) is followed by a noun beginning with a vowel, the two words are contracted, as in “l’ecole” (the school).

Attempts were made in some of the earliest spellers to teach children, by analytic phonics, the variant sounds letters could have in English syllables. The concern for irrational English spelling and phonetics continued into the next century. Mitford Mathews showed on pages 27-28 that a schoolmaster named Richard Hodges published in 1644 The English Primrose, in which Hodges taught children to pronounce English words by diacritical marks on words, again presumably by the use of analytic and not synthetic phonics.

Analytic phonics means to analyze whole syllables to become aware of their separate sounds, as the German Valentin Ickelsamer had done in his 1527 book, The Shortest Way to Reading, when he had children analyze the sounds in the word “Ot - to.” He also had them concentrate on the position of their mouths in forming consonants.

W. J. Frank Davies in his 1973 book, Teaching Reading in Early England, (pages 126-129), gives the best explanation in English which I have ever seen on Ickelsamer’s book on analytic phonics. Ickelsamer’s book has never been translated into English. (Why has not our massive, tax-supported “reading instruction community” done this long ago?) Ickelsamer did not teach isolated letter sounds and thn how to blend these isolated letter sounds together to form syllables, which is synthetic phonics, an
invention uniformly attributed to Blaise Pascal in France in 1655. I have not seen a copy of Richard Hodges’ book but it is interesting that it predates Blaise Pascal’s invention of synthetic, sounding-and-blending phonics by only eleven years.

Yet most spellers in England from the seventeenth century to the nineteenth century showed little or no concern with that kind of analytic phonics but relied on the syllable method as a guide to the sound in words. Spelling books in England often also used the kind of analytic phonics which results from grouping together words which rhyme (“band, hand, land,” “eight, weight, freight”). However, since the syllable method is a reliable guide to the sound of Latin words but unreliable on English words, it became more difficult to learn to read in English after the switch to the vernacular for beginners.

Dating from the mid-17th century in England, some spellers did include the word “primer” in their titles, and sometimes both words, “primer” and “speller.” Yet the content of such books shows that they were clearly meant as spellers as they were sharply different from the true religious primers in the English language, which, as discussed, began appearing during the reign of Henry VIII, as replacements for the adult Latin primer or Book of Hours.

Information on Specific ABC Books and Hornbooks

After printing arrived in the last half of the fifteenth century, ABC books were often sixteen pages long. They were cut from one large sheet of paper printed on both sides, called a “signature,” which was cut up into eight small sheets. With printing on each side, that produced a sixteen-page booklet from one large sheet of paper. Because of wear on the first sheet, however, which took the longest time for the child to learn because it had the alphabet and syllabarium, it was the practice after printing arrived (as before, to judge from the poem previously quoted) to mount most of the contents of the first sheet under a transparent piece of horn on a wooden paddle. Undoubtedly, the content of the first page was often printed solely for that purpose. Covered with horn, that sheet on a paddle was called the hornbook.

Tuer reproduced and discussed on pages 126-130 of History of the Horn Book an uncut printed sheet, printed only on one side, dated to about 1622. That was the era when the hornbook was produced in vast quantities. The circa 1622 sheet has four different varieties of horn-book pages printed on it, which were obviously meant to satisfy differences in purchasers’ tastes. Two of the hornbook pages have the syllabarium, but two do not. However, those which are alike concerning the syllabarium differ in their endings: one of each ending “amen” and the other “so be it.” These circa 1622 hornbook pages are presumed to have been printed in Aberdeen, Scotland. Since none of the alphabets begin with the “Christ’s cross” which was standard on Catholic and Anglican primers, they were obviously meant for the Scottish Protestant market.

The versions without the syllabarium show that some people, as early as the seventeenth century, had probably dropped the use of the syllabarium and switched to teaching by whole words (moving from “sound” to “meaning.”)

Tuer reported (pages 197-19) that John Bunyan, the author of Pilgrim’s Progress, also wrote A Book for Boys and Girls, published in London in 1686, in which he said:

“Nor let them fall under Discouragement,  
Who at their Horn-book stick, and time hath spent  
Upon that A, B, C, while others do  
Into their Primer, or their Psalter go.”
Bunyan followed this with appalling advice on teaching children to read. After children had learned their vowels and consonants:

“...then set your Child to spel-ling. Thus T-o, to, T-h-e, the, O-r, or, I- f, if, I-n, in, M-e, me, y-o-u, you; f-i-n-d, find, S-i-n, sin: In C-h-r-i-s-t, Christ, i-s, is, R-i-g h-t-e-o u s-n-e-s-s, Righ-te-ous-ness.

“And ob-serve that e-ve-ry word or syl-la-ble (tho ne-ver so small) must have one vow-el or more right-ly pla ced in it.”

The Scottish hornbooks printed without the syllabarium apparently met the requirements of incompetent instructors like Bunyan, who skipped the syllable “sound” step and went straight to spelling “meaning”-bearing whole words after the alphabet. His students, as a result of not having learned the syllabarium sounds, “at their Horn-book stick... while others do into their Primer...go.” What Bunyan proposed is exactly what caused reading problems in mid-nineteenth century America: spelling whole meaning-bearing “words” without any reference at all to the sounds produced by their letters. His comments on vowels would not have been much help because, by itself, it would have told the child nothing about sounds. Reports of reading and spelling problems which are sometimes heard in the seventeenth century are understandable for children who got this kind of misinstruction.

But it was not the norm. Tuer reproduced on page 216-217 a poem, Horn-book, by William Hornebye, London, in 1622, which reads in part:

“...Sweet Lad, come, and thy Horn-booke con.
And so the A B C he first is taught;
And from that to spelling, he is after brought;
And being right instructed for to spell,
He learns his Sillables and Vowells well.
Then, with due teaching he doth well consider
By’s Master’s rule how he may put together.
The Horn-booke having at his fingers end,
Vnto the Primer he doth next ascend.”

Note the sequence in Hornebye’s 1622 poem: the hornbook to the primer, with no mention of the ABC book. By that time, its use was fading.

Unlike Bunyan’s student, Horneby’s student memorized the sounds of syllables by spelling them orally and then pronouncing them, (b-a, ba, etc.) and then “put together” the sounds of these spelled syllables with “due teaching” to make words. Such a student could eventually learn to read, despite the vagaries of English spelling. The student continued, of course, to be drilled on the syllables in words in his primer, or spelling book, to whichever he moved next.

The confusion between the ABC books, of which the hornbook was a part, and the primers is, however, widespread and goes back very far in time. The Catholic Encyclopedia (1913, Vol. XII, page 426) in its article on primers assumed that true Latin primers were printed for English children as early as 1520, because of an English bookseller’s entry about selling primers “pro pueris” or for children:

“...the day book of John Dorne (Oxford Hist. Soc. 1888), bookseller in Oxford in 1520, preserves many entries of the sale of books called ‘primarium pro pueris,’ with indications that make it certain they contained the Little Office of the Blessed Virgin... though none of these now survive....”
Very likely, the following reference is to the same material. In Charles C. Butterworth’s The English Primers (1529-1545), he referred on page 6 to a 1514 French edition which might be Dorne’s 1520 “primarium pro pueris.” France exported many books for sale in England at that period.

“In... 1514, we have also a Primer published in Paris particularly for the use of children (S.T.C. 156916) and so designated in the Latin title, which begins: “Hore beate marie virginis ad vsum Sarum pro pueris.” This is one of the first primers in print to contain the alphabet....”

Butterworth’s (S.T.C. 15916) reference and Dorne’s 1520 entry may both refer to the book in the following bibliographical entry shown by H. Anders in his article, “The Elizabethan ABC with the Catechism”:

“Horae beatae Mariae Virginis ad usum Sarum (i.e. Salisbury) pro pueris. Paris 1514 for Francis Bryckman (London). Contents: The ABC, Pater noster, Ave Maria, Credo, Confiteor, and other prayers.”

Anders’ description, however, shows that a 1514 Paris edition, (most likely the same as Butterworth’s) was called an “Horae,” a synonym for primer, and was printed for sale in London, but only contained the standard material of the ABC books except that some prayers may have been taken from the very long Little Office of the Blessed Virgin, (called also the Book of Hours, Horae or Primer). Yet the Paris printer in 1514 did not call it an ABC book as he possibly should have done. He gave it the lofty title of Horae beatae Mariae Virginis ad usum Sarum, the same as many adult primers. That undoubtedly pleased the little ones who were given the book, to have a “book” just like their parents’ prayer book.

Six years later in London, Dorne recorded that he was selling a “primarium pro pueris” which contained “The Little Office of the Blessed Virgin.” That title is the English translation of the Latin title of the 1514 Paris edition, and Dorne may very well have been selling the same book at that period when England imported many books. The Paris edition certainly sounds like an ABC book, so it is not surprising that Dorne would have many entries for sales because ABC books always sold well. If Butterworth’s reference is also to the same 1514 Paris book to which Anders refers (as seems likely), then that book was probably not “one of the first primers in print to contain an alphabet” but just another ABC book. If the 1514 book and Dorne’s 1520 reference are to ABC books, that would mean it was only after Henry VIII’s break with Rome in 1534 that some true primers printed in England are known definitely to have included the alphabet and syllabarium. The 1514 edition is presumably extant, but I have no further information on it.

Testimony is given concerning the sequence of school books in the early 16th century, in St. Thomas More’s Confulacyon of Tyndales answere written in 1532. More wrote this work in opposition to non-conformist books. Just after discussing “Barns boke” mentioned again below, More compared a...

---

11 Anders’ article is printed in The Library, the publication of the Bibliographical Society, Oxford University Press, London, 1936, Fourth Series, Volume XVI, page 38. Presumably Anders got this description from what Butterworth refers to as Edgar Hoskins’ 1901 “monumental catalogue covering the entire field from 1478 to 1897” of English primers, Horae Beatae Mariae Virginis or Sarum and York Primers with Kindred Books and Primers of the Reformed and Roman Use. I have not seen this catalog, nor have I seen the 1514 primer, which I assume is extant.
non-conformist sequence of books which were most probably in English to the accepted, prevalent sequence of books in Latin for children:

“Then have we ferther yet besyde Barns boke, the a b c for chyldren. And bycause there is no grace therein/ lest we should lakke prayours, we haue the prymer, and the ploughmанс prayour, and a boke of other small deuocyons, and then the hole psalter to. After the Psalter, chyldren were wont to go to theyr Donat & theyr Accyidence but now they go strayte to Scripture....”

No record exists of the ABC book mentioned by More. However, Butterworth shows (page l4) that in 1563 John Foxe published “Actes and Monuments of these latter and perillous dayes” in which he printed a list of non-conformist books, both in Latin and English. These books were produced at the trial of Richard Bayfield on November 20, 1531, the year before More’s paper. The list included:

The resemblance less than a year before More wrote to More’s list is striking. Very possibly the non-conformist ABC, which was probably in English, to which More referred was the “ABC of Thorpes” of which no copy survives, which was also most probably in English. It is clear from More’s comment, “...there is no grace therein” that the book lacked the standard graces and prayers of the printed ABC books of the period, two surviving copies of which will be discussed.

More’s comments show the textbook sequence at that time in England was the ABC book, obviously preceded by the hornbook, its first page, and then the primer and psalter (but all in Latin, as he criticized the English translations of the non-conformists). Next in the standard curriculum came the Latin grammars known as the Donat and accidence, all in Latin.

Concerning the catechism, the normal practice at that time was for a teacher to teach it directly to the children without books for the children (as described in Histoire du Catechisme, “Preface,” page I, by Canon Hezard, Paris, 1900) although there were exceptions. Even as early as 1470, shortly after the invention of printing, a German catechism was printed, Christenspiegel, or the Christian’s Mirror, written by Dederich, which became very popular and which was followed by two other German catechisms written by others which also were issued in many editions (The Catholic Encyclopedia, Volume 5, article “Doctrine,” page 79, edition of 1913, Encyclopedia Press, Inc., New York).

Before the Reformation in England, beginners learned to read in Latin. As The Catholic Encyclopedia (1913) states in its article, Prayer-Books (Volume XII, page 352):

“One point may be noted as of some importance, and it is: that down to the breach with Rome Latin predominated, even in those books published for the use of the laity. The Pater, Ave and Creed, and the Psalms were commonly said by the people in Latin and no printed edition of the Office of the Blessed Virgin, or in other words no entirely English Primer, is known to have been issued before 1534. But the books of the last fifteen years of Henry’s reign accustomed the people to pray in English, and under Mary we have printed Catholic primers both in Latin and English, and in English alone. It may probably be said that from this time forth the uneducated laity, even though Catholics, prayed almost exclusively in English.”

They also now learned to read in English instead of in Latin, practicing their beginning syllables now on the Ôur Father instead of the Pater Noster, and on the other prayers and the Psalms in English. This switch from Latin to English for beginning readers caused great problems initially, as Hart pointed out. It
resulted in the writing of “spelling books” before the end of the sixteenth century, since irregular English spelling does not adapt well to the Latin syllable method. In English, several different syllable spellings are sometimes used for one single syllable sound, while at other times one single syllable spelling can stand for more than one syllable sound.

Beginning soon after the Reformation in England in the early sixteenth century, some true primers in English did begin with the alphabet and syllabarium just as the ABC books had always done. Then that practice became the norm in primers after the mid-sixteenth century. Furthermore, the oral vernacular catechism was often printed and added to English-language ABC books and to English-language primers after the sixteenth century. Nevertheless, even the new primers in English with the alphabet and syllabarium were never meant for rank beginners, any more than the old Latin primers had been. It was the ABC book or its first-page content on the hornbook that was still meant for beginners, until the speller finally displaced both of them. That is made clear by the decree from Henry VIII, cited by Butterworth, which has already been quoted.

The ABC book was still clearly understood as something apart from a primer as shown by a definition given shortly after the Reformation. Tuer records (page 390):

“John Florio, born of Italian parents in London, was partly educated in Germany, and settled at Oxford, where he taught French and Italian, and was appointed by James I tutor to Prince Henry. In his World of Words, which appeared in 1598, he gives ‘Horne-Book, Abecedario, and A-bee-cee’ book as synonymous.”

The first surviving printed ABC book for use in England most probably is the one described by H. Anders in his article “The Elizabethan ABC with the Catechism, published in The Library, A Quarterly Review of Bibliography, Fourth Series, Volume XVI, Oxford University Press, 1936. He recorded, on page 38 “(An early sixteenth-century ABC in Latin after the use of Sarum.)” and described it as follows:

“Contents: The ABC. In nomine patris...ab, eb, ob, ub...&c. Pater noster. Ave Maria. Credo....”

Anders followed this by listing the beginning words of numerous graces and prayers in Latin which completed the booklet but he did not list the Ten Commandments which were part of the oral vernacular catechism in Catholic countries, and not part of the ABC books. Anders referred to the fact that W. H. Allnutt reproduced this Latin ABC in 1891, and that it was probably printed in the reign of Henry VIII. Anders said it lacks a title but stated it was “imprinted at London.”

The first printed ABC book in English (or at least partly in English) which has actually survived is a sixteen-page post-Reformation copy from about 1538. Anders gave this description:

“The BAC (sic) bothe in latyn and in Englysshe... Col.: Thus endeth the ABC translated out of Laten to to (sic) Englysshe with other deuote Prayers. Imprynted at London in Paules Chyrche yarde at the sygne of the maydens heed by thomas Petyt. (c. 1538), 8 leaves.

“Contents: ABC and syllables, Pater noster, Ave Maria, Credo (the preceding, from Pater noster, are given both in Latin and English), Confiteor. Then follow nine pages containing graces and a short prayer, all in English, the book concluding with the Ten Commandments much abbreviated and rhymed, and a few short precepts in the form of prayers, ‘God Giue me grace the sicke to visit and giue them mete that be hungry’, &c. The Commandments and precepts are not in the Latin text reprinted by Allnutt. The first grace is the same as the first in the Latin text quoted above, which was evidently a
general favorite, has remained so through the ages, and almost invariably occupies the first place in any collection of graces. (ii) Petyt’s second grace also follows the Latin version fairly closely, though ending on a post-Reformation note....

“(This, which closely follows the ABC in Latin just referred to, probably appeared c. 1538. It was reproduced in facsimile by Shuckburgh in 1884 from a copy in the library of Emmanuel College, Cambridge.)”

Tuer reproduced the first page of the Shuckburgh c. 1538 “BAC” ABC book on page 378 of his text, and a copy is in Appendix A of this book. On page 380, Tuer reproduced the first page of the probably slightly earlier and probably pre-Reformation Alnutt ABC which was all in Latin, which is also in Appendix A. Tuer also discussed on page 383 of his book Allnutt’s paper concerning this earlier ABC. Only 25 copies of Allnutt’s June, 1891, paper were printed which included “many valuable notes on the ABC and its history by Mr. W. H. Allnutt of the Bodleian Library, Oxford...” Tuer said the ABC reproduced by Allnutt is “treasured in Lord Robartes’s library at Lanhydrock. It is printed on four leaves of vellum, with rubricated capitals, and was found imprisoned as binder’s waste in the covers of an old book, where it had remained undisturbed for something like three and a half centuries....” If Tuer is correct in his description, Allnutt’s ABC reproduction of what is probably a pre-1534 edition is only eight pages long, not sixteen like Shuckburgh’s c. 1538 reproduction.

Foster Watson saw and read Allnutt’s rare 1891 paper, which he reported was titled “An early 16th century A B C in Latin after the Use of Sarum. Reproduced from the original in the Library of Lanhydrock. With a few Introductory Notes on the A B C and its History. Privately printed for Lord Robartes (1891)”. Watson reported on it in his book, The English Grammar School to 1660 (First edition 1908; Frank Cass & Co., Ltd., London, 1968). Watson made the following remarks in Chapter IX, “The A B C and the Horn-Book A B C” (pages 161 and 162). He reported that Allnutt also described a manuscript ABC from the 14th century, from the Hunterian Museum, Glasgow.

“14TH CENTURY MS. ABC.

“(cross) A a b c d e f g h i k l m n o p q r (plus script r) long s [and plain] s, t u v x y z & : est amen? Paternoster with Lord’s Prayer in English, the Ave, Credo, Confiteor, Misereatur, and Graces and list of Seven Sacraments.

“Allnutt’s Note. ‘In old time they used three prickes at the latter end of the Crosse-row, and at the end of their booke which they caused children to call tittle, tittle, signifying that as there were three prickes, and those three made but one stop, even so there were three persons and yet but one God.’ ‘A new Booke of new Conceits. By Thomas Johnson, 1630.’”

The “three prickes” that made “but one stop” sound very like the printer’s mark known as the asterism, in which three asterisks form a triangle. Possibly the asterism is descended from the Crosse-row.

The lack of a written syllabary in that fourteenth-century (probably Scottish) manuscript ABC did not mean the syllabary was not to be practiced. The hornbook syllabary only went as far usually as the letter “d.” Nevertheless, children were obviously expected to construct all the syllables after “d” for themselves, as in fe, fi, fo, etc.. Yet little children must have found it very difficult and lingered at that first do-it-yourself “fe-fi-fo” step for a very long time. Their lingering at the fe-fi-fo step is the probable source of the chant, “Fe, fi, fo, fum, I smell the blood of an Englishman,” in the fairy tale, Jack, the Giant Killer. However, before the hornbook was in use, the invention of which was an obvious attempt to simplify matters for children, children would still have had to use a copy of the alphabet to construct the syllabary.
for themselves, using their fescue, or pointer, to point to the letters as they were used in building syllables.

Watson continued:

“Copies of a printed A B C in England so early as 1520 are not extant, yet they are known to have existed, and to have been on sale by booksellers, at any rate at York in 1510 and Oxford in 1520.

“The ABC fore to lern red’ we know from Dorne’s Daybook was sold at ld. The A B C was published in two forms, on paper and on parchment. In papiro, copies were ordinarily sold at ld. and there are 18 entries of A B C’s in paper sold by Dorne. There are also 18 entries of the sale of the parchment A B C. The usual price was 2d.”

Watson’s footnotes for these 1510 and 1520 references and for Dorne’s records are:

“2. John Dorne was an Oxford bookseller. His Day-book was written in 1520 and contains the names of the books sold by him, together with the prices, in his shop from day to day. His MSS. has been edited, indexed and annotated by Mr. Madan, and published by the Oxford Historical Society. Collectanea Ist series. It is most valuable as showing the books in circulation at the time.

“3. The 18 entries represent the sale of 54 copies. The price apparently was not quite fixed. On one occasion 24 paper A B C’s are sold for l0d. Again, at one time, 3 A B C’s are sold for 2d.; at another 2 for 2d.

“4. Representing the sale of 33 copies. 12 were sold at ls. 2d., sometimes 2 were sold together for 3d., sometimes 4d.”

This establishes that a single bookstore in the town of Oxford sold at least 87 ABC books in a single year, at a time when there was a free market in books and no licensing. It should be remembered that many English books were printed in France at the time, because the English printers could not supply the market demand. Merchants like Dorne kept most of their records in Latin, apparently because they found it easy to do. Pre-Reformation England must have been a fairly literate place.

Watson, writing in the early twentieth century, listed on page 164 and following some very early licenses for ABC books, some of which are not mentioned elsewhere, Yet, he may be assumed to be correct, since he stated his data is taken from the Transcript of Registers of Stationers’ Company by Arber.

“The first mention of the licensing of the A B C is in 1557-8, when was licensed to John Waly: An abc for children in englysshe with syllables. A Latin A B C was licensed to John Tysdale in 1558-9, and an English A B C in the same year to Richard Lant. In this same year 1558-9, John Tysdale was fined for printing an edition without license. In 1561-2 Thomas Purfoot took out a licence to print an A B C for children.

“In 1553 John Daye obtained a licence to print the Catechism in English ‘with a brief of the A B C thereunto annexed.’ This was confirmed to John Daye and his son Richard in 1577. In
1582 Roger Warde was proceeded against in the Star-chamber for infringing the Patent and confessed that he had printed off 10,000 copies. In 1585 another case was brought into the Star-chamber against Thomas Dunne and Robert Robinson for printing ‘Tenn Thousand of the bookes called the A B C with the lyttel Catechisme in Englishe.’ From John Daye and Richard Daye, the Patent for printing the A B C passed in 1591 to Verney Alley. By Alley’s administrators it was assigned with other books in trust for the Company of Stationers. This assignment was eventually confirmed by King James I, March 8th, 1616. In 1620, the Company of Stationers had in their hands the monopoly of the A B C with the Catechism, the Horn A B C, the Spelling A B C, the English Schoolmaster and Primers.

“...Editions of the A B C were issued by the Company of Stationers at various dates until, as Mr. Allnutt says, 1777. These have the short catechism printed with them.”

The recorded increase in reading difficulties in England coincided with the arrival of the monopoly ABC’s and spellers of the Company of Stationers; it disappeared just about the time licensing of printing was dropped in England at the end of the seventeenth century.

Watson also discussed the printing of the hornbook, which was, in effect, the first page of the ABC (page 171):

“In the course of time, in England, the Horn-book trade became sufficiently important to be worth getting a Patent for it. Accordingly, the entry in the Stationers Register (Arber, H. p. 477) is interesting:

“1587, Nov. 6. John Wolfe. Allowed unto him for his copy the horn A B C.

“In 1605, Alice Wolfe, probably the widow of John Wolfe, was granted three pounds a year during her lifetime for relinquishing her claim to the A B C Horn-book. The monopoly thus passed into the hands of the Stationers’ Company. It is to be found in their List of School-books for 1620, along with the A B C with the Catechism, and with the Spelling A B C.”

A distinction had arisen by 1620 between the ABC (which had syllable tables) and the Spelling A B C (which had syllable tables plus word lists). By 1620, the spelling book as a separate book had clearly arrived. Yet by the mid-seventeenth century attempts to revise English spelling and complaints of reading difficulties which had briefly surfaced in the mid-sixteenth century had also returned. As will be shown, in the troubled seventeenth century, the syllable tables and spelling books for children were too often being glossed over, with resultant disabilities. Yet, by the eighteenth century, the spelling book with its syllable tables was again in wide use, and complaints of reading difficulties have not turned up in the literature.

In Chapter X, Foster Watson discussed “The Teaching of Reading.” He referred on page 179 to Thomas Johnson’s The Pathway to Reading, or the newest Spelling A B C of 1590 which he said preceded Edward Coote’s The English Schoolemaister of 1596 and which he thought might have been the Spelling A B C in the list of school books owned by the Stationer’s Company in 1620. Coote’s speller was praised by John Brinsley, a grammar school teacher who wrote Ludus Literarius in 1612.

Brinsley was complaining that children were coming into grammar school without knowing how to read, and using up large amounts of grammar school time. This, of course, was an admission of increasing reading difficulties, because a hundred years earlier, when children had learned to read in Latin instead of English, it was customary to require that children knew how to read before reaching grammar school.
Brinsley did recommend the analytic phonic method used by Coote, and, as Watson recorded (page 180), expected it to produce real readers.

Watson said that Brinsley, who only worked with older children, expected to have a pre-grammar school child, taking about a year, by the age of six, learn in English the alphabet, the ABC including spelling (a la Coote’s), the primer read twice, the psalms in metre, and the New Testament, plus the School of Virtue and the School of Good Manners. Brinsley then thought that children would be ready for the Latin accidence but was concerned because parents felt children later forgot how to read English. Obviously, the six-year-olds “forgot” because they had never really learned to read English with his indigestible curriculum in English.

Watson said W. C. Hazlitt, who wrote Schools, School Books and Schoolmasters saw a 1610 copy of A New Book of Spelling with Syllables, and said it included “a series of alphabets, alphabetical arrangements of syllables, and remarks on vowels and diphthongs.... The writer then presents his readers with the Lord’s Prayer, the Creed, the Dialogue, etc., as orthographical theses.” Obviously, this was a misprint: “Dialogue” must have meant the Decalogue, or the Ten Commandments.

Watson quoted (page 181) from an autobiography of the time, which came closer than Brinsley to describing what really happened in homes of that time for pre-grammar-school children. It should be noted, however, that the child described was obviously not an average child. Watson quoted from Adam Martindale’s Autobiography, published by the Chetham Society. Martindale was born in 1623.

“When I was near six years old, one Anne Simpkin, who was one of my sureties at the font, being grown low in the world, but not in goodness, out of a real principle of conscience to perform her promises and engagements for me at my baptism (as I verily believe), bestowed an A B C upon me; a gift in itself exceeding small and contemptible, but, in respect of the design and event, worth more than its weight in gold. For till that time I was all for childish play, and never thought of learning. But then I was frequently importunate with my mother that had laid it up (thinking I would only pull it in pieces) to give it into mine own hands, which, being so small a trifle, she accordingly did; and I, by the help of my brethren and sisters that could read, and a young man that came to court my sister, had quickly learned it and the primer also after it. Then of mine own accord I fell to reading the Bible and any other English book, and such great delight I took in it, and the praises I got by it from my parents, which preferred my reading before any other in the family, that I think I could almost have read a day together without play or meat, if breath and strength would have held out; and thus it continued to the end of the first seven years of my life.”

Watson discussed (pages 182-183) Charles Hoole’s “primer,” written before 1660 but published in 1660, which had as its intent the arousing of children’s interest. Hoole’s comments show why reading difficulties were multiplying in the mid-seventeenth century: the syllabary and the spelling book were largely being ignored. Hoole said of his New Primer:

“In the first leaf whereof I have set the Roman capitals... and have joined therewith the pictures or images of some things whose names begin with that letter, by which a child’s memory may be helped to remember how to call his letters, as A for an ape, B for a bear....

“The ordinary way to teach children to read is, after they have got some knowledge of their letters, and a smattering of some syllables and words in the hornbook, to turn them into the A B C or Primer, and therein to make them name the letters and spell the words, till by often use they can pronounce (at least) the shortest words at the first sight.
“...the A B C being now (I may say) generally thrown aside, and the ordinary primer not printed, and the very fundamentals of Christian religion (which were wont to be contained in those books, and were commonly taught children by heart before they went to school) with sundry people (almost in all places) slighted, the matter which is taught in most books now in use is not so familiar to them, and therefore not so easy for children to learn.”

Watson said Hoole accordingly included in his primer the Lord’s Prayer, the Creed, and the Ten Commandments. For practice in early reading he suggested The Single Psalter, the Psalms in Metre and The School of Good Manners. Once children could read well, Hoole wanted them encouraged to continue reading English and not to begin the Latin Accidence too early.

Another seventeenth century text to which Watson referred approvingly (page 183-184) was The Schoole-masters Auxiliaries.... by Richard Lloyd, London, 1654. Lloyd taught letters by comparing them to objects, and:

“He then shows the powers of the letters. This he bases on a phonetic system and bewails the ineffectiveness of the English Alphabet to express the sounds. He observes ‘it were an easy matter by coining a new figure for every letter to make their shape as well as sound suitable to their names.’ But such hieroglyphics would conduce rather to enthral than to enlarge knowledge....

“He follows a phonetic method so as to help the pupils to read and spell...

“Thus a just account is given of every letter in the right sound thereof; and when the same is silent, or doth vary from the proper sound, which the vulgar Alphabet cannot perform, wanting convenient principles, whence the common people versed onely thereunto ever failed in Orthography; for when they write their own affairs, after much racking of their wits, it were easier to uncipher characters, than to read their riddles.”

Lloyd added his testimony to others on the preponderance of reading and spelling difficulties in mid-seventeenth century England, and the resultant great activism for a reform in English spelling.

Watson listed and also described other books which came out in the mid-seventeenth century to teach reading more effectively, such as Richard Hodges The English Primrose...., 1644, (also cited by Mathews who reproduced a page), Learning’s Foundation, by Thomas Maxey, 1651, and The English School.... by Tobias Ellis, 1680.

It is altogether possible that the preponderance of Latin in pre-Reformation England was in response to a problem already existing in England: the impossibility of the spelling which had developed. Use of vernaculars spread far more quickly on the Continent.

Although there is testimony that ABC books were falling into disuse in the seventeenth century in England, during the sixteenth century in England printed ABC books had been in wide use and were highly profitable for printers, so much so that much litigation resulted to protect printing privileges. The records from these litigations tell a great deal about the widespread use of these books, as recorded by H. Anders in his excellent article, “The Elizabethan ABC with the Catechism.”

In Anders’ article, in addition to discussing the two surviving oldest printed ABC books in England, one probably from shortly before 1534 and one from about 1538, (both discussed elsewhere in this history), he reproduced for the first time the fragments of the Elizabethan The ABC with the Catechism,
which were found as binding material in a book and which are dated to about 1584. This third ABC book, therefore, is roughly fifty years younger than the other two described.

By 1584, the catechism was part of the ABC in England. It can be seen in Anders’ reproduction that the 1584 ABC contained alphabets in various letters, the syllabary at least as far as “I,” the catechism, the Commandments and the Lord’s Prayer, and Anders assumed it contained some graces (prayers) since the very much later 1683 version, very much like it, did contain graces. In 1603, Anders records that King James granted to the Stationers’ Company a patent to publish the ABC with the little Catechisme. The last copy Anders mentions their publishing is the one printed in 1683, still sixteen pages long like many others, and showing the inside of a schoolroom very like that on the 1584 fragment. A Dutch 18th century ABC to be referred to below also had a picture of a schoolroom, which may have been common on European Protestant printed ABC books from the sixteenth century onwards. Anders refers to the Stationers’ Company post-Elizabethan primer of 1670, but it seems certain their later primer would have had a better market than their later ABC books. Long before the last ABC he referred to from the Stationers’ Company, in 1683, ABC books in English must have largely fallen into disuse, replaced largely by the spelling books, though Tuer recorded (pages 373-374) that editions with the catechism attached were published in English as late as 1771 and 1859!

It is no accident that John Locke never mentioned ABC books in 1691, when he spoke of the usual sequence for beginners in reading as the horn book, primer and psalter. It is also possible Locke considered “primer” to be a synonym for “speller.” To judge from the enormous success of Coote’s speller, the ABC books in England must have begun to fall into disuse just about 1600 as the use of Coote’s speller began to spread. The Anglican catechism which had been attached to the ABC and to primers was sometimes printed separately from the mid-sixteenth century on.

ABC books continued to be printed on the continent long after the Reformation. Tuer stated (apparently referring to the eighteenth century):

“A common and later form of the Dutch primer or hane-bock is a sixteen-page small octavo. The title page is faced with a woodcut illustration of children being taught in school; then on a page to itself - presumably that it may crow to its heart’s content without disturbing anybody - is the effigy of the wakeful cock, which is commonly found in children’s books published on the Continent. Sometimes the cock is displaced by a little bantam vignetted on the title-page. The alphabet and spelling exercises follow, and towards the end are the Lord’s Prayer, the Articles, and the Commandments, the primer finishing with a series of alphabetically-arranged moral aphorisms.

“The German fibel or child’s first lesson book is probably a dialectic variation of bibel. Luther’s fibel, printed in 1525, has, besides the alphabet, the Paternoster, Credo and a selection of prayers. The first really German fibel was published by Valentine Ickensamer [sic] of Rothenburg, and was printed at Nuremberg, 1537.”

Tuer was wrong in stating that Ickelsamer’s was the first. However, note the close resemblance of Luther’s early 1525 fibel to the standard pre-Reformation Latin ABC book of England before the Reformation, except for the omission of the Ave Maria. Its make-up was probably the pre-Reformation European norm.

“In fact, the German word for primer - Fibel - which first appeared in a “Kolner Glossar” in 1419, signifies a little Bible.”

Schoolbooks were very commercial materials in the Europe of the fifteenth century. Theo. L. De Vinne wrote the following concerning some concrete examples, on page 187 of his book, The Invention of Printing, New York: Francis Hart & Co., 1876. Da Vinne referred to material from:

“a school... in Saxony dated 1418, [which] gives the names and the prices of some of these books. For an ABC and Pater Noster etc. one groschen, for a... Donatus or child’s grammar, 10 groschen, for a complete Doctrinal, one-half mark, for the first part, 8 groschen. There has also been preserved the advertisement of one Dypold Lauber, teacher and copyist of books at Hagenau in Germany, who left (a catalog)... of the fifteenth century from which we may gather a clear notion of the books that were most salable among the people....”

Da Vinne said the copyist’s advertisement mentioned some sixty works and cited as his apparent source, “Van der Linde, Haarlem, p. 23.”

The later Dutch ABC book carried a picture of a school room, just as the Elizabethan ABC from 1584 did, and so were the contents of the Dutch ABC similar to the English 1584 ABC, but quite different from the pre-Reformation ABC’s. This suggests a kind of European standardization for the Protestant vernacular versions of the ABC books, as opposed to the pre-Reformation Latin versions. Therefore, the Protestant versions were not different from the pre-Reformation ABC books solely because they were in the vernacular instead of Latin, but also because of a change in content. But the English post-Reformation, vernacular ABC book, unlike those on the Continent, appears to have been largely eclipsed by the English spelling book after about 1600.

Probably the first ABC book for beginners to learn in English instead of Latin appeared around 1530, since an ABC book in English was referred to in a 1531 trial. The first printed primer in English is known to have been printed in 1529 and the first post-Reformation primer in English appeared in 1534 (The English Primers (1529-1545), by Charles C. Butterworth, Octagon Books, New York, 1971). The ABC book printed in English which has been described appeared about 1538, so probably one was available in 1534 at the same time the first post-Reformation primer in English appeared.

Therefore, many average little beginners could have been taught to read in English after 1534, but after 1545 all children were effectively forbidden to be taught to read initially in anything but English by Henry VIII’s proclamation demanding that beginners be taught their prayers in English - which prayers were the content of the ABC books. If Hart, who said he had trouble learning to read himself, had learned to read at five years of age in 1534, he would have been 22 years old when he wrote his first manuscript in 1551 on phonics. Hart is known to have been a teacher. That shows that the difficulty in the switch to English from Latin for beginners appeared IMMEDIATELY: when Hart learned to read, probably about 1534, and when he tried to teach others to learn to read, probably from about 1545. It is no accident that the first work on phonetics in the English language was written by a primary grades teacher!

Nor is it any accident that “spelling books” appeared shortly after Henry VIII’s new law which, in effect, required teaching beginning reading in English, instead of Latin. Not only did spelling books in English not exist before Henry VIII’s reign, but the very concept of “spelling books” in English had apparently never even occurred to anyone!
True primers, defined as having been originally largely prayer books which came to have the catechism attached, were not normally the beginning reading book for children in America before 1826. True primers were not the beginning book under Henry VIII in England in the sixteenth century when he mandated that the ABC was to be the beginning book, spellers having not yet been invented. Nor were they the beginning book in the seventeenth century, as shown by the quotations from William Hornebye (1622), John Bunyan (1686), and John Locke (1691). Nor were true primers the beginning book in the eighteenth or nineteenth centuries, except for those Protestant primers specifically printed for American Indians in their own languages.

Before about 1750 in both England and America, beginning reading was not taught by the primer, but by the syllabic horn book (the ABC book’s first page) or by the syllabic spelling book. That shows children before 1750 were taught to read by “sound” and not by “meaning.” The fact that very large numbers of spellers were printed before 1750 is demonstrated by an entry in Volume Four, Spelling Books, of the twelve-volume series, A Bibliography of the English Language from the Invention of Printing to the Year 1800, Bradford, England, by R. C. Alston. Alston had an entry for Thomas Dyche’s A Guide to the English Tongue of 1707. Alston stated that the printing ledgers of Charles Ackers had recorded that between December 4, 1733, and February 1, 1748, 275,000 copies of that speller had been printed. Yet Dyche’s speller was only one of a great many spellers available at the time.

From about 1750 to 1826, the spelling book became far more commonly the first step and far more common in general. However, horn books and their variant, the battledores, persisted in wide use until the turn of the next century and did not finally almost die out in both Great Britain and America until about 1830.

John Newbery published the popular variant of the hornbook in 1745, The Royal Battledore, or First Book for Children. That famous English publisher, Newbery, also published The Royal Primer, or Second Book for Children. Their very names described the sequence at that time.

“The battledore... came into use...about 1746. The honor of its invention is given to Benjamin Collins. The battledores contained spirited engravings of assorted objects whose names began with the various letters of the alphabet and must have helped fix the letters firmly in the minds of children.”

The actual date of the invention of the battledore is unclear, however. Newbery is given credit for having published his Royal Battledore in 1745, but according to Tuer the date of Collins’ “invention” of the battledore was 1746. (Collins was Newbery’s partner.) What appears certain is that the battledore came into use about 1746. Tuer stated concerning Collins, (page 405):

“The honour of inventing the folding cardboard battledore is claimed for Benjamin Collins, and the date 1746 is fixed by his still preserved account books. He speaks of it as “my own invention”... In ten years - that is, between 1770 and 1780 when they had become popular - Collins sold considerably over a hundred thousand...”

Except for the fact that it was a folded cardboard card instead of a horn-covered paddle, and that it had the pictures described above as helps in remembering letter sounds, it was essentially the same as the
old horn book, including the alphabet, the syllabary and the Lord’s Prayer. (A copy is reproduced in Appendix A.)

Concerning definite records on The Royal Primer, which followed The Royal Battledore as the second book for children, it was advertised for sale in England on September 10, 1751, and the earliest surviving Newbery copy is dated to 1755, according to S. Roscoe’s John Newbery and his Successors 1740-1814, Five Owls Press Ltd., Wormley, England, 1973 (pages 237 and 403).

The first American copy of The Royal Primer was made in 1753, according to American Primers - Indian Primers - Royal Primers... Prior to 1830, by Charles F. Heartman, 1935, “Printed for Harry B. Weiss, Highland, Park, New Jersey.” Heartman’s statement agrees with Merritt’s statement, given later. Isaiah Thomas was among those who reprinted The Royal Primer, Thomas’s editions being in 1784 and later, along with his copies of other Newbery books. Heartman showed a 1750 date for the first appearance of imported Royal Primers in American records, predating Roscoe’s 1751 reference but agreeing with the information given by Merritt.

The New York Library has a copy of The Royal Primer, dated “176?” which carries the note it was “Printed for John Newbery.” Its title reads, The Royal Primer, or an Easy and Pleasant Guide to the Art of Reading. Authorized by His Majesty King George II To Be Used Throughout his Majesty’s Dominions. Opposite the title page appeared a picture of a boy and a girl at their books, and the verses:

“He who ne’er learns his ABC, forever will a Blockhead be, but he who to his Book’s inclined, will soon Golden Treasure find.”

The same verse appeared on the 1818 Dublin revision also in the New York Public Library, but the content of the book itself had changed. Although the early edition was also in the general form of a “spelling book” with syllabary, word lists and reading selections, the 1818 edition was more decidedly in the form of the contemporary spelling books.

The change seemed to be confirmed by the appearance on the 1818 edition of the words, The Royal Primer, or First Book for Children. In the eighteenth century, Newbury had advertised his primer right under the title printed on his battledore, which read: The Royal Battledore, being the First Introductory Part of the Circle of the Sciences, &c..... Also The Royal Primer, or Second Book for Children, Price 3d. Things had obviously changed by 1818 from about 1750 or so, when the primer first appeared. Its material had moved closer to the standard spelling book form, which also appeared to be confirmed by the title of the 1818 material: The Royal Primer: Or, The First Book for Children, Adapted to their tender Capacities. Authorized By His Majesty George III, To Be Used Throughout His Majesty’s Dominions.

As Heartman explained on page 112 of his American Primers, Indian Primers, Royal Primers..., “Authoriz’d by His Majesty King George II...” had merely been “a simple form of copyright.” The listing of George III referred obviously to a new edition, because the contents had greatly changed.

King Henry VIII’s official adult prayer-book primer of the sixteenth century had resulted in school primer-catechism versions. Such school book versions were in use for many years and, as official school books, must have been very familiar to the purchasing public in the mid-eighteenth century when Newbery first published The Royal Primer. It was the primer-catechism of the Church of England which Newbery imitated, or parodied might be a better word! Newbery was certainly not imitating the New England Primer because no record exists of it in England at that date.
It should be mentioned in passing that Newbery is generally and wrongly credited as having been the first publisher of children’s books. As Mary Thwaite’s book, From Primer to Pleasure in Reading, makes clear, that is simply not true for books published in English. Neither is it true for other languages.

John Locke may possibly have meant the Church of England primer-catechism when Locke referred in 1691 to the ordinary road of the horn book and primer. Yet Locke may also have meant one of the many primer-speller types of that period, which were not true primers, and which were very different in purpose from the primer-catechisms. Locke certainly did not mean the New England Primer Enlarged, since no record exists of it before 1691, the year of Locke’s comment. Although Benjamin Harris advertised the New England Primer Enlarged in Boston in 1691 and although a copy of his almost unknown Protestant Tutor of 1685 survives (originally published in London in 1679), the earliest surviving copy of the New England Primer Enlarged is dated 1727. Furthermore, Harris’ advertisement of 1691 is the only reference to the existence of any New England Primer Enlarged before that 1727 copy.

The Williamsburg Foundation Library in Virginia has bound copies of the Williamsburg Gazette from before the American Revolution. (Those issues were one of the few places in which I found some spotty use of the printer’s mark known as the asterism. As described later, the asterism turned up on two unusual materials about 1830.) In the 1760’s, the Williamsburg Gazette advertised for sale “new” arrivals of books by ship, reading “Alex. Purdie and John Dixon, at the Post Office. ...we have imported the following books.” Sometimes a list read, “for the use of schools, viz.,” followed by a long list of titles. The general list of books for sale in the February 25, 1768, edition included Dilworth’s spelling book, Dyche’s spelling book, Fenning’s spelling book, Philip Sproson’s spelling book, Johnson’s spelling dictionary and Johnson’s dictionary, Sheridan on education, and Sheridan on elocution. A separate section showed books for children and 37 were listed, including “Primmers” with no title, Horn Books, Infant Tutor, Lilliput Magazine, Pretty Plaything, Pretty Pocketbook, Robinson Crusoe, Royal Battledores, Tom Thumb’s Folio, Goody Two Shoes, etc. The children’s books were apparently almost all Newbery’s, plus Exposition of the Book of Common Prayer, History of England, and Lives of the Apostles.

It is obvious that a lively book market existed in Virginia, and it was dealing in Newbery’s books, such as his Royal Battledore. The imported “Primmers” almost certainly, therefore, in 1768 included The Royal Primer and the Church of England primer-catechism but not the New England Primer, since the rest of the list was apparently English in origin.

In 1924, (Edward) Percival Merritt wrote a history of The Royal Primer as a contribution to the volume, Bibliographical Essays, A Tribute to Wilberforce Eames, Harvard University Press, Cambridge, Massachusetts. Merritt’s essay was reprinted separately in 1925 by Harvard University Press as The Royal Primer, Reprinted with Added Illustrations from Bibliographical Essays, A Tribute to Wilberforce Eames. It was the 1925 illustrated volume that I saw in 1988, and, unfortunately, my shorthand notes on Merritt’s essay, from the rare book collections of the New York Public Library which may not be photocopied by users, are not too clear and may have some inaccuracies.

Concerning The Royal Primer’s origin, Merritt said:

“Now, as a matter of fact, The Royal Primer made its first appearance among the earlier publications of that indefatigable purveyor of books for children, John Newbery of London. The year of its publication cannot be exactly determined at the present time but it was not earlier than 1744 after he had removed from Reading [Ed. where his first material was published in 1740] to London and opened a warehouse at the Bible and Crown near Devereaux Court Without Temple Bar, with a branch at the Royal Exchange, nor later than 1750 when the first advertisement of The Royal Primer is found in the public press in this country. In 1745, Newbery combined both
branches and removed to the Bible and Sun at St. Paul’s Churchyard where most of his famous publications were issued, and where he remained until his death in 1767.

“Newbery’s biographer, Charles Welsh, implies, although his statement is not very clear, that ‘The Royal Battledore or First Book for Children was publicly advertised in 1745.’ The Royal Primer evidently followed the Royal Battledore in due course of time. An advertisement of the Battledore in 1750 is accompanied by the statement: ‘[after which the next proper Book for Children is] The Royal Primer’ which seems to establish the publication period of the primer as between 1745 and 1750.

“What was Newbery’s intent and desire in his long series of children’s books can best be shown by quoting what are probably his own words in the preface to the long list of ‘Books published for the Instruction and Amusement of Children,’ annexed to one of his little books: ‘THE NEWTONIAN SYSTEM OF PHILOSOPHY Adapted to the Capacities of young GENTLEMEN and LADIES, and familiarized and made entertaining by Objects with which they are intimately acquainted, BEING The Substance of SIX LECTURES read to the LILLIPUTIAN SOCIETY, by TOM TELESCOPE, A.M., 1761.’ This list comprised 20 titles of books published for the instruction and amusement of children in which The Royal Battledore and Royal Primer were Nos. 3 and 4. The preface read, ‘It has been said and said wisely that the only way to remedy these Evils is to begin with the rising Generation, and to take the Mind in its infant State, when it is uncorrupted and susceptible of any impression; to represent their [Desire] and future Interest in a Manner that shall seem rather intended to amuse than instruct, to [excite] their Desire with Images and Pictures that are familiar and pleasing; To warm their Affections with such little Histories as are capable of giving them [Delight] and of impressing on their tender minds also Sentiments of Religion, Justice, Honor, and Virtue.”

“Given his intent as indicated in this preface, [it] is well manifested in the execution of The Royal Primer; which shows all the Newbery characteristics.

“It has been found above that the Royal Primer reflected the Anglican background as contrasted with the Puritan.... [after citing other material from the Anglican background, Merritt said:] the Jubilate and third goal of morning prayer are taken almost verbatim from the Prayer Book... but the most marked difference between the two primers [Ed.: the Royal and the New England] from a theological standpoint is the fact that the youthful readers of the Royal Primer are promised as a result of the practice of virtue a mundane and not celestial reward.

“And this is quite characteristic of the Newbery juvenile books in general. (p. 9) [The] Newbery system of philosophy with regard to the reasons and rewards for youthful study is set forth in those verses which appear on the frontispiece of the Royal Primer. The page is headed, ‘A good boy and girl at their books’ and above and below a cut intended to represent a boy and girl at study in a library, are the following lines, ‘He who ne’er learns his A,B,C, forever will a Blockhead be. But he who to his Book’s inclin’d, will soon a golden Treasure find.’

“Under the picture [was] ‘Children like tender Oziers take the Bow, And as they first are fashion’d always grow, for what we learn in Youth to that alone, in age we are by second Nature prone.’

“The first set of these verses had already been used in 1745 in the Royal Battledore in a slightly different form but with an equally material reward as the price for youth’s study: ‘He that n’er learns his A,B,C, forever will a Blockhead be. But he that learns these Letters fair, shall have a Coach to take the Air.’ (...Tuer’s A History of the Horn Book, ii, 234)
Referring to these verses, Mr. Ford wrote, ‘Worst of all was the insertion of a short poem which would have made the true Puritan turn in his grave for questioning in [its] teaching that letters were to be learned, that the Bible might be read, and that figures were acquired for the purpose of finding a chapter and verse in that work. It said ‘He who ne’er learns his ABC’ etc. (Ford, The New England Primer, 1897, p. 47). The first couplet of the second set of verses, ‘Children, like tender Oziars, take the Bow’ had also been employed as early as 1744, when it appeared in an advertisement of the Little Pretty Pocket Book... of June 18, 1744 (Booksellers of the Last Century p. 117, Welsh, 1885, New York). Thus it will be seen that, at the very beginning of his career as a publisher of children’s books, Newbery had proclaimed the standards which he constantly maintained thereafter.

“The Royal Primer begins with the customary alphabet in roman and italic letters and the syllabaries, but the vocabulary is made up of words of a varying number of letters instead of syllables.”

Newbery therefore had made a pronounced move from “sound” to “meaning.” Arranging word lists by the numbers of letters in words has nothing whatever to do with “sound.” It was a move toward silent “visual analysis” which is a sight-word method used for deaf-mutes. To demonstrate: compare the ease of sounding out the phonically regular five-letter word, “blunt,” to the difficulty for beginners of remembering the phonically irregular and senseless pronunciations of the three-letter words, “one,” “two,” “you,” and “the,” or the two-letter words, “of” and “to.”

The publication date of Newbery’s The Royal Primer was estimated by Merritt to have been between 1745 and 1750. However, although Newbery first began to publish about 1740, he had apparently been preceded in arranging words into tables based on their numbers of letters by Dilworth. Dilworth’s speller which was first published in 1740 was later massively used. In his Preface, Dilworth had said:

“In the several Praxes or Lessons of Monosyllables hitherto published in our Mother Tongue, instead of rising Step by Step, Children are taught to jump before they can go; and if they prove uncapable to take such long Strides, as reach sometimes from Monosyllables of two, to others of seven or eight letters, before they are informed of those that come between, they must be thump’d and lugg’d forward....

“Again: If it be reasonable, in the order of Words, to begin with those of one Syllable, as all Spelling authors agree; it must be also granted as reasonable, that Monosyllables, which consist of various Quantities of Letters, should be taught in the same order, proceeding gradually from Words of two Letters, to Words of three, four, five &c. Letters, as exemplified in the following Tables....

“I have first collected only Words of two Letters; then Words of three Letters; after that Words of four Letters, &c.. with short easy Lessons between each Table of Words, adapted in such a Manner, that no Lesson contains any one Word which does not belong to a preceding Table....

“Again, it must be acknowledged that the first Six Lessons do but just make English; yet, I hope, whoever considers the Difficulty of composing Sentences to be read in Lessons, wherein each Word is confined to three Letters, will readily overlook the baseness of the Language.... and all my Tables are filled with the easiest Words in our Language; even such as a Child may have some Idea of at the first Pronunciation....
"...I have consulted the Method of Spelling or dividing syllables in long Words, both according to their Sound, and to the Rules of Grammar.... you will find that whenever a word occurs that may be divided one way by Sound, and another by Grammar, the Scholar is directed both to understand the doubtful Division by this Mark (") over the right side of the Vowel, which according to the Sound, ought to be joined with the following Consonant, which is nevertheless contrary to the Rules of Grammar...."

Like so many other authors of beginning reading materials, Dilworth had probably never taught beginners himself, or he would never have called short but phonically irregular words like “the”, “you,” “one” and “two” the “easiest Words in our Language.” However, unlike Noah Webster in 1783, Dilworth in 1740 still divided words by the old Latin “grammar” method, and that made it possible for children to pronounce phonically regular syllables by themselves. Dilworth did acknowledge that such a division did not match many English pronunciations, which is the obvious reason that Noah Webster dropped the old Latin method.

Edmund Coote in his 1597 spelling book, which was massively used for over a hundred years, arranged his syllable tables largely by numbers of letters. This was was not unreasonable, because most of the two- and three-letter syllables were not solely meaning-bearing high frequency words as in Dilworth’s book but were instead only the phonically regular word parts of multi-syllable words (like ab, eb, ib, ob, ub), which memorized syllables the children would later use to work out actual words. Most of Coote’s short syllables therefore made the “sound” which they actually spelled. However, Dilworth appears to have been the first to have used the number of letters in words, instead of the number of syllables in words, as the basis for compiling his spelling lists.

Dilworth’s widely used speller, when analyzed, proves to have been a critical step downward in the move from “sound” to “meaning.” It was not only his arrangement of spelling words in tables of two-letters, three-letters, four-letters, etc., so many of which were phonically irregular (one, the, to, etc.) It was in his deliberate use of high frequency words and in his controlled vocabulary reading selections. Those selections were composed at the beginning only of unnatural two-letter word collections, and two-letter plus three-letter words collections, and so on. These most unnatural “stories” whose vocabularies were based solely on word length found their ultimate end in the silly, empty “stories” of Mrs. Barbauld and her kind at the end of the eighteenth century. Later Reading-Made-Easies also used the extremely harmful word-length approach that had been originated by Dilworth. Although it has apparently never been recognized before, it is obvious that Dilworth’s tables arranged by word length were a giant step toward training beginning readers to make a visual analysis of meaning-bearing whole words, instead of training them to make a proper sound analysis.

The Royal Primer of Newbery, published only about five years or so after Dilworth’s 1740 speller, followed Dilworth’s lead in arranging word tables by the number of letters and probably also followed Dilworth’s use of high frequency words and controlled vocabulary. It therefore clearly represented a move away from “sound” and towards “meaning.”

Merritt continued his account:

“Here the closest similarity to the New England Primer ceases. Two complete alphabets are given, one in verse beginning ‘A stands for Apple and Awl’; the other a pictorial one, ‘a Apple, b Ball,’ etc., with rather crude cuts intended to represent the objects employed. The Scripture Catechism is a brief one, simply intended to explain to the children many of the ‘principal Persons contained in the Scripture.’ The Old Testament portion contains a characteristic Newbery touch in his method of combining instruction and advertisement of his own wares. Thus: ‘Q. Who
Was David? A. The man after God’s own Heart, who was raised from Shepherd to King. ‘See his life in the Royal Psalter, following a hymn by Dr. Watts....’

That comment shows that Newbery’s “Psalter” was not a true collection of the Bible’s Psalms, as its name implied, but included other matter like hymns and biographies, presumably in place of some of the Psalms. Therefore, the horn book and primer were not the only traditional school materials being altered away from Biblical texts and in a more “worldly” direction by Newbery, even though such alterations might not seem “worldly” by today’s standards. Merritt said further:

“In about the middle of the book comes the most essential characteristic, a series of cuts of some twelve animals, birds and insects, each followed by a couplet or couplets of verse with a moral lesson in prose attached. The description of the Parrot is brief and sufficiently indicative of the whole series: ‘The Parrot prates he knows not what, for all he says is got by rote.’

“The primer ends with the Lord’s Prayer, prayers for morning and evening, and grace before and after meat.”

Because Newbery’s books are wholesome, charming and innocuous in our time does not mean they were necessarily wholesome, charming and innocuous in their time or in their purpose, particularly since Newbery specifically stated - beyond any reasonable doubt - that he was trying to shape the minds of children. That was an extraordinary and unprecedented statement from a publisher, particularly since his emphasis was, as Ford pointed out, away from celestial and toward earthly rewards in a time when such an emphasis was revolutionary.

After his arrival in London, Newbery became enormously successful, and certainly his books were often delightful. Some, as in all probability Goody Two Shoes, were written by that genius, Oliver Goldsmith. Goldsmith worked as one of Newbery’s paid hacks, just as the brilliantly gifted Nathaniel Hawthorne later worked as a hack for Samuel Goodrich in America. Goodrich’s later enormous publishing success with children’s books paralleled Newbery’s remarkably, with Goodrich’s books in heavy demand on both sides of the Atlantic, just as Newbery’s had been.

Newbery, appearing on the publishing scene in London after four quiet years publishing elsewhere, may reasonably be numbered among the promoters of eighteenth-century “Enlightenment.” A picture in Roscoe’s book of an undated cover of Newbery’s Lilliputian magazine for children even suggests that fact, with the following appearing under the title:

“...being the attempt to amend the World, to render the Society of Man more Amiable, and to establish the Plainness, Simplicity, Virtue & Wisdom of the GOLDEN AGE so much celebrated by the Poets and Historians, ‘Man in that Age no Rule but Reason Knew, and with a native bent did Good pursue....’“

Newbery gave no source for the poem which elevated “Reason” but ignored Revelation as the source for a “Rule.” Yet that message in the poem agreed with the eighteenth-century French “philosophers” like Voltaire. The magazine was published in 1751-1752, which issues Newbery later sold in bound volumes. Therefore, its saying in addition that man has a “native bent” for “Good” anticipated by ten years the same message in Rousseau’s Émile. Rousseau’s fame largely rested on his denial of the Biblical teaching that mankind is not naturally “good” but instead has a fallen nature which inclines it towards evil as well as towards good.

Merritt continued:
“Small wonder when the opportunity came to the American child as it did in 1750, the humanity, interest and [diversity] of The Royal Primer as contrasted with the austerity of the New England Primer must have made a strong appeal to normal and healthy minded children....”

Merritt said on pages 12-13:

“It is not surprising that when the Royal Primer was transplanted to this country, it first took root in the more fertile soil from a theological standpoint of Philadelphia. Miss Rosalie V. Halsey made the discovery that a long list of Newbery publications was advertised in the Pennsylvania Gazette of November 15, 1750, and reproduced the advertisement in her delightful book, Forgotten Books of the American Nursery, Boston, 1911....”

The high quality of Newbery’s work (apart from what appears to have been his unfortunate aim) certainly accounts for its popularity. Nevertheless, it is remarkable that Newbery could have advertised and sold his wares so widely and so successfully in such a short time. The relative speed of his success is particularly surprising since the publishing market reportedly had been already overflowing with the popular and cheap chapbooks long before Newbery arrived. The chapbooks were reportedly also widely bought for and read by children. It was the children’s market, already heavily supplied, at which Newbery clearly was aiming. Yet, only six years after arriving in London in 1744 and beginning to publish children’s books in a large way, and only ten years after Newbery first began in business elsewhere in a small way, he was consigning shipments to America of a long list of children’s books which he himself had published.

Merritt added:

“The list comprises [several] titles including The Royal Battledore and the Royal Primer.... The conclusion then would seem rather to be that Franklin and Hall (or more probably David Hall himself since Franklin by this time had given up bookselling) had imported the books on their own account or had accepted them on consignment and placed them on sale in Philadelphia. Franklin’s custom appears to have been to have his orders for books in London filled through his friend and correspondent William Strahan, and there is no indication in his published writings or letters that he ever had any direct dealings with Newbery. He may have had some acquaintance with John Newbery for in a letter to Strahan under date of November 27, 1755, he wrote, ‘My respects to Mr. Newbery of whom you give so amiable a character.’... In the issue of the Pennsylvania Gazette of December 11, 1750, there appeared ... the list of Newbery publications.... exactly as in the issue of the Gazette of November 15. Apparently the Newbery books met with favor and a ready sale in Philadelphia.”

Merritt cited another advertisement on June 13, 1756, including “Royal Primmers and Battledores” and one for December 10, 1751, citing “useful children’s books.” On May 17, 1753, Hall was still advertising that he had for sale spelling books and “primmers.” Another bookseller, Tench Francis, Jr., advertised on July 18, 1754, that he had for sale, just imported from London, “doz. royal primers. doz. battledores.” As was made clear by an advertisement which will be referred to again later, that meant Francis was selling them by the dozen: in Boston in 1769, Fowle offered books “by the gross or dozen” including The Royal Primer.

Merritt stated:

“But to Philadelphia credit is due, not only of first offering the Royal Primer for sale in this country, but also of publishing the first American edition of it, which was issued by the Quaker bookseller, James Chatten, with the date of 1753 on the title page.”
Merritt said that in Chatten’s 1753 Philadelphia edition the syllabaries, words composed of various letters, and “Easy Lessons” were “very much expanded.” That certainly suggests that the original Royal Primer was defective in its emphasis on “sound” in reading.

Merrit continued:

“In Boston, the earliest known reprint of the Royal Primer is that of William McAlpine in 1768... The files of the Boston News-Letter contain various advertisements of primers beginning as early as 1752, commonly referred to as imported either from London or Scotland, but no definite conclusions can be drawn as to whether they were Royal Primers or New England Primers. In the case of the Scotch importations, however, it seems more than probable that they would be the latter.”

Yet, since Heartman turned up NO London or Scottish examples anywhere in the world before 1767, it is apparent they were not New England Primers. Furthermore, it would have been a case of carrying coals to New Castle, since the New England Primer was regularly published in Boston by 1752.

The News-Letter of July 3, 1753, had an advertisement from John and Thomas Leverett “opposite to the Stationer’s Arms in Cornhill,” Boston, announcing that they had imported and were offering for sale a long list of books, including “Psalters, Primers, Spelling Books, &c.” Merritt wrote that on July 16, 1752, William McAlpen also advertised books: “‘lately imported from Scotland’ among which were Psalters, Psalm Books, and primers. Another advertised on May 22, 1755, ‘just imported from London - Psalters and Primers.’”

On June 10, 1756:

“Joshua Blanchard gave notice that he had just imported Primers. Thomas Leverett, June 8, 1758, offered Primers which he had imported and [on] January 17, 1760 and January 29, 1761, John Leverett had imported Primers for sale. July 1, 1762, Philip Freeman offered Primers and on the same day William Lang announced an offering of primers imported from Glasgow.”

On November 21, 1768, McAlpin advertised New England Primers and Royal Primers. The Royal Primer was specifically mentioned in an advertisement from Zechariah Fowle in the Boston News Letter of August 24, 1769. (It was Fowle to whom Isaiah Thomas was apprenticed.) Fowle offered books “by the gross or dozen” including The Royal Primer but the advertisement apparently made no mention of the New England Primer. Another edition of The Royal Primer was published in Boston by John Boyle in 1770. Boyle had also published several editions of the New England Primer.

Merritt wrote:

“In 1772, [McAlpin?] published another edition of The Royal Primer.”

In 1787, Isaiah Thomas produced another Royal Primer with American changes and in 1796 one was printed and sold by Samuel Hall in Boston.

In a footnote on page 26, Merritt cited page 382 of Welsh’s biography of Newbery. Welsh had stated that sales of the Newbery primer alone must have run into hundreds of thousands. Welsh gave a statement from B. Collins’ Account Book that ‘20,000 of these were sold from October, 1771 to October, 1772’ and this was over 20 years after its first appearance.”
Merritt stated on page 29:

“The Huntington library has a copy of The Royal Primer published by D. Wogen, Dublin, 1813, which probably contains nineteenth century additions.... There are several copies known of The Royal Primer: Or, The First Book For Children. Adapted to their Tender Capacities. Authorized By His Majesty King George III. To be Used Throughout his Majesty’s Dominions..., Dublin, printed by William Jones, 75 Thomas Street, 1818. This edition has ninety-six pages and while it contains some of the features of the Newbery primer it is much changed....”

Jonathan Swift’s name was associated with a 1770 Dublin edition of a Royal Primer, presumably a variant of Newbery’s, to judge from the following entry from Banbury Chap Books and Nursery Toy Literature of the 18th and Early 19th Century, With Impressions from Several Hundred Original Woodcut Blocks, by Edward Pearson. Pearson’s book had first been published in 1890 and was republished in Burt Franklin Research and Source Works Series, No. 98, Burt Franklin, New York, a copy of which is now in the Williamsburg foundation library in Virginia.

The following appears on page 17:

“That quaint divine, Dean Swift of St. Patrick’s Dublin, had some curious poetry for A Royal Primer... published in the Seven Dials, of Dublin (Rainbow Court)....”

Pearson then quoted a portion of a poem which began “Ech, Ech, my deary, and Ach, Ach, my love.” Pearson said:

“This is long and curious and was greatly altered and abbreviated in early nineteenth century editions.”

On page 19 of Pearson’s book appeared prints “from Dean Swift’s Royal Primer, Dublin, circa 1770.” Therefore, some time after Sheridan first began promoting his elocutionary material, the name of his father’s friend, Swift, whose biography Sheridan had written, was associated in some fashion with a Dublin edition of The Royal Primer. The Dublin edition of about 1770 was presumably a variant of Newbery’s which had first been published by 1750 or before. Dublin editions of 1813 and 1818 have survived. The Royal Primer had been reprinted for some forty years in America, at least from the 1753 Philadelphia edition to the 1796 Boston edition by Samuel Hall which survives and which was mentioned by Merritt. Therefore, The Royal Primer might have been reprinted for many years in Ireland as well, dating from before the puzzling “circa 1770” to the known 1818 edition. The Swift-Royal Primer reference might well only mean that the Dublin circa 1770 edition, which Pearson apparently saw, or on which he saw photographs of portions, had included Swift’s poem.

As mentioned elsewhere, Dean Jonathan Swift had also written a short poem on the vowels which did suggest some interest on Swift’s part in the topic of teaching beginning reading. Swift, born in 1667, wrote Gulliver’s Travels in 1726, died in 1745 and was insane in the last years of his life. Therefore, it appears impossible that Swift could have had anything to do with writing The Royal Primer or even a Dublin version of The Royal Primer, since Newbery did not publish the original edition until about 1750 or not more than about five years before 1750. Yet The Royal Primer, at least in its early Dublin edition, may very well have drawn on some earlier work of Swift’s in addition to his poem.

In other countries in Europe in the 17th and 18th centuries, the ABC book continued to be the beginning book. ABC books were used by Pennsylvania Germans to teach their children to read in German, and the story of their extensive work and numerous ABC books already fills an excellent book written by Walter Klinefelter, The ABC Books of the Pennsylvania Germans, Publications of the
Klinefelter’s article/book is a superb piece of work and demonstrates the great care that the Pennsylvania Germans of many religious denominations took to teach their children to read. Klinefelter’s material describes religious schooling from the seventeenth century to the nineteenth century, until the government schools finally succeeded in replacing the remarkably good education given by the churches of the Pennsylvania Germans. However, the emphasis of the German ABC books in the teaching of beginning reading was clearly on “sound” and not on “meaning.”

In the eighteenth century, books in English were published to perfect children in “the art of reading,” but these apparently were meant to develop fluency, not to be used as beginning books.

Starting about the time the Newbery books appeared, the religious content in books for children began to diminish sharply. The English spelling books, however, with lists of words for syllabic spelling, also contained practice paragraphs for reading, so that children could begin to develop fluency, and this material was sometimes religious.

The true primers in English before 1826, such as the New England Primer, were only incidentally spelling books. They remained largely prayer or devotional books and included the catechism. Although after the sixteenth century such true primers had also started with the alphabet, syllabarium and spelling lists like the spelling books, the evidence indicates that true English primers were not the first book given to children but the second book, if, indeed, they were given at all.

Comments on the New England Primer appear in The Franklin Family Primer published in Boston in 1807, and first issued in 1802, which will be discussed at length later. The 1807 copy is in the Library of Congress. That primer said in its introduction:

“Considering it of primary importance in the education of Children, to endeavor to inculcate upon their tender minds a sense of morality and piety... but above all their duty to their Creator; has induced the compiler to issue this publication as a substitute for the old Primer, which has of late almost become obsolete.”

Yet, despite that curious statement, the true primer was not obsolete in New England until long, long after 1803. What the statement does confirm is that the true primers at that time were used primarily as catechisms. Note that the Primer’s purpose is described by its imitator as being solely religious, even though the imitator also included syllable tables and spelling in his own book.

The New England Primer Enlarged is never referred to in any sources of the period as being in actual use as a school reading text. Significantly, Noah Webster himself prepared a version of the New England Primer Enlarged after 1800 in an attempt to make it suitable for school use, which is a clear admission that the New England Primer Enlarged was not being used in schools! Heartman’s checklist of New England Primer Enlarged editions lists Webster’s edition.

Heartman shows in his bibliographical check list the widespread (and undoubtedly vast) printing of the New England Primer Enlarged after the mid-eighteenth century. It even turned up in editions in England and Scotland in the later eighteenth century. A man of the stature of President John Adams, according to R. R. Reeder in his history of reading, always carried a copy of the New England Primer Enlarged with him, but obviously as a devout practice because of its catechism, since John Adams certainly was not using it as a beginning reading book!

Although no edition of the New England Primer Enlarged even survives from before 1727, actual copies of George Fox’s and Ellis Hooke’s Quaker materials from long before that date have survived. The
1670 London edition of Fox’s and Hooke’s “A primer and catechism for children; or a plain and easie way for children to learn to spell and read...”. is still in existence as are other seventeenth century English editions of the Fox materials. An American edition printed in Philadelphia in 1702 survives. Even Benjamin Franklin printed a Fox speller in Philadelphia in 1737 which survives, and a 1726 copy survives which was printed in Dublin, Ireland.

Yet no one today has ever heard of the vast use of these still-surviving Fox spellers, from the late seventeenth century. Instead, we hear of the presumed massive use before 1740 or so of the elusive New England Primer Enlarged, even though no copy survived until the 1727 copy, only six more survived between 1735 and 1749, and only nine from the decade of the 1750’s. However, twenty copies survived from the decade of the 1760’s, showing its use began greatly to increase in that decade. Yet the twenty copies that survived from the ten years of the 1760’s exceeded the sixteen copies that survived from the entire previous sixty-eight-years history of The New England Primer Enlarged.

Benjamin Harris advertised an edition in the almanac entitled News from the Stars, published in Boston in 1691. His advertisement is the only surviving American reference to the New England Primer before the 1727 copy which is now in the New York Public Library, which surfaced about a century ago. The New England Primer Enlarged advertised by Harris in 1691 is presumed to have been put together by him while he was in Boston for about ten years before he returned to England. Harris’s Boston imprints of other books are dutifully reported in Evans’ American bibliography, since records of Harris’ other work here survives, but no record exists of his presumed American edition of his advertised New England Primer Enlarged. Harris is presumed to have written The Protestant Tutor, printed in Boston in 1685, which was never widely used, and yet a copy nevertheless survives in the American Antiquarian Society collections in Worcester, Massachusetts.

In her book, American Reading Instruction, on page 18, Nila Banton Smith described the 1685 The Protestant Tutor:

“The principal contents were the ‘Roman Small Letters,’ the Syllabarium, the Lord’s Prayer, the Creed, the Ten Commandments, John Rogers’s biography and verses, words of from two to seven syllables, the ‘Proper Names’ (from Scripture), a catechism, and other religious selections.”

Yet, as discussed in Appendix B under the entry for The Protestant Tutor, that in no way describes the 1685 book, which is only a very peculiar “catechism” plus the verses of “Mr. Rogers.” As Alston shows, Harris had printed a spelling book also called “The Protestant Tutor Instructing children to spel and read English...” in London in 1679 (which was not the same as the Boston text with the name of The Protestant Tutor) and then, after having obviously returned to London, printed in 1707 another version of that 1679 speller, “ The Protestant Tutor Enlarg’d: or, a new school-book...”. Harris reprinted the speller again in London in 1716 and two other editions appeared in London in 1716 and 1720 (?). All of these London editions of Harris’s speller (1679, 1707, 1716, 1720 (?)) have surviving copies, as does the 1685 Boston catechism version, and relatively large numbers of pre-1720 Fox spellers have survived. Yet the EARLIEST surviving copy of the elusive New England Primer Enlarged dates only from 1727, and the only record anywhere of its existence in America prior to that is the 1691 Boston advertisement. Since the beginning of this century, and despite vast publicity on the New England Primer, no one has ever found a New England Primer of any kind earlier than 1727. It seems abundantly clear that the New England Primer Enlarged was massively popular only from about 1760. The New England Primer Enlarged does not have surviving copies before 1727 apparently because it was little used at that time, if at all.

The huge popularity of the New England Primer Enlarged after about 1760 most probably resulted from the great religious revival promoted from about 1740 and until his death in 1770 by the English preacher, Mr. Whitefield, who traveled to America and Scotland over a period of years. It was the
catechism content of the New England Primer Enlarged which was important in a religious sense, and it was not normally used as a beginning school book. Clear confirmation on the kind of use it received, as a catechism for children since it contained the Westminster Assembly’s Shorter Catechism, and as a religious manual for adults, appears on the 1843 Hartford, Connecticut, reprint of a 1770 edition, which reprint is currently in the library of the Department of Education in Washington, D. C. A page headed “Advertisement” before the actual reproduction of this 1770 edition reads:

“A society of ladies was formed in Boston, in the time of Mr. Whitefield, for improvement in personal piety, and to pray for extension of the Redeemer’s Kingdom. The Society met weekly for prayer, ‘reading some sound and serious book,’ singing, and other exercises adapted to ‘spiritual edification.’ ‘We also agree,’ say they, ‘once a quarter... the exercises shall be so shortened, as to have room to ask ourselves the Assembly’s Shorter Catechism, that so we may keep in our minds that excellent form of sound words.’ This edition of the New England Primer, is a reprint and fac-simile of one of those owned and used by that Society.... N.B. This statement is from a lady who was a member of the above Society, and from the documents of the Society in her possession.”

Heartman’s well-known checklist on the New England Primer was done with the greatest care, in three editions: 1916, 1922, and 1934. Over that eighteen-year period, when the New England Primer Enlarged was famous and copies were often worth a great deal of money, no one in Europe or America located ANY editions published outside America before 1767. An edition is known to have been published in London in that year. Clearly, it is therefore unlikely that the New England Primer Enlarged was published abroad much before 1767. On page 14, Nila Banton Smith quoted a New York advertisement from 1744 advertising Bibles, Testaments, Psalters and Primers imported from London. Those primers obviously could not have been the New England Primer Enlarged, and the names of the other books being sold with them powerfully suggest the “Primers” being sold were primarily religious books and not beginning reading texts.

Heartman’s final 1934 checklist is of copies of New England Primers whose existence has been documented. When his entries are listed chronologically, they produce an interesting summary:

The decade of the 1790’s produced even more surviving copies, as did the early part of the nineteenth century. Other surviving copies demonstrate that The New England Primer Enlarged continued to be widely printed into the 1820’s and did not die out generally until about 1830. It died out, curiously, at the same time that the government schools began to spread, although the record clearly establishes that the New England Primer was not normally used as a school book. Its dying out apparently reflected a cultural change.

What is absolutely astonishing is that Heartman’s highly reliable checklist has been interpreted by Heartman and others as supporting the New England Primer myth, instead of demolishing it. Heartman began his checklist about 1916, almost two hundred years after the printing of the earliest surviving copy of the New England Primer, dated to 1727. The New England Primer had been well known before Heartman’s first check list in 1916, and even before that date its fame had been assured by Paul Leicester Ford’s very faulty account, The New-England Primer, A History of Its Origin and Development, New York: Dodd, Mead and Company, 1897. However, as the fame of the Primer increased after Heartman’s 1916 checklist, more copies turned up for the second edition of his checklist in 1922 and more turned up for the third in 1934. Yet those newly discovered copies were not scattered over all the decades in the
eighteenth century and the first few decades of the nineteenth century, as chance should have dictated if
the primer had been widely popular in America and Great Britain, since its first mention in Harris’s 1691
advertisement until the first few decades of the nineteenth century. Instead, the newly-found copies were
largely after the decade of the 1760’s, just like the previously found copies.

If the myth of the widespread use of the primer in both Great Britain and America from about 1691
were true, there should not have been only three copies surviving for the decade of the 1740’s which were
all printed in Boston, while for the decade of the 1780’s, only forty years later, 48 copies survived which
were printed in 18 different cities including two and possibly three cities in Great Britain. If the Primer
had been printed in Great Britain in the first half of the eighteenth century, which is implied in so many
reference works, why then were all the seven surviving copies before 1750 printed in Boston? Furthemore, in the next decade of the 1750’s, why did two-thirds of the surviving nine copies originate
in Boston, with no foreign editions at all? Also, why should that single decade, the 1750’s, have nine
surviving copies, when for all the previous 60 years or so of the Primer’s reported existence only seven
copies survived? In the decade of the 1760’s, surviving copies increased again, but three-quarters of those
twenty surviving copies still originated in Boston. Benjamin Franklin and his partner, D. Hall, finally
printed a copy in Philadelphia in 1764, obviously capitalizing on increasing market demand, but it was
not until the date of 1767 that the first foreign copy appeared with a London imprint. The decade of the
1760’s produced 20 copies printed in four cities, one foreign, but the decade of the 1770’s produced 33
copies from eight cities, two foreign, and the decade of the 1780’s produced 48 copies from eighteen
cities, with two and possibly three or more foreign.

Something is demonstrated beyond any reasonable doubts by the dates and the places of printing on
the surviving copies of Primers. What is demonstrated is that a use of the Primers occurred in Boston
about 1727. An increased but moderate and regular use occurred in the Boston area through the 1730’s
and 1740’s, each decade producing exactly three surviving copies. In the 1750’s, coinciding with
Whitefield’s widespread preaching, usage began to increase and spread. By the decade of the 1760’s,
usage greatly increased and so did the numbers of printers outside Boston, with a London edition finally
appearing in 1767. By the 1770’s, almost half of the surviving 33 copies came from cities other than
Boston, and by the 1780’s, three-quarters of the surviving copies of Primers came from cities other than
Boston. The trend intensified in the decade of the 1790’s, which figures are not shown above. The New
England Primer, therefore, began to be a publishing wonder, with widespread use in America and Great
Britain, only AFTER 1760, and it became a a publishing wonder because it was a religious catechism. It
was not normally a schoolbook. Therefore, the myth that The New England Primer was the book by
which American children learned to read before 1760 should be permanently removed from reference
works.

The New England Primer Enlarged was not the first book for children in the last half of the eighteenth
century, nor were other true religious primer-catechisms used as beginning reading books. The speller, or
at least the horn book, was the first book, as Noah Webster’s comments confirm. On March 10, 1840,
Noah Webster (1758-1843) wrote a letter to Henry B. Barnard, publisher of the American Journal of
Education, in which he said:

“When I was young, the books used were chiefly or wholly Dilworth’s Spelling Books, the
Psalter, Testament and Bible.”

Noah Webster would have been a five-year-old beginning school in 1763, so his testimony can
reasonably be said to cover practices in New England, or at least Connecticut, in the 1760’s.

Reviewing records of books actually published by the Puritans in New England in the seventeenth
century does a great deal to clarify the background of the famous New England Primer Enlarged and to
account for its popularity in New England as a catechism. It also suggests that the original New England Primer was itself only one of the numerous catechisms printed before 1683 by the Puritans. In that year the title showed up in England, as discussed in Appendix B, and it most likely represented the licensing of a book for sale in England which had been imported from Boston. That reference from England is the only reference to a New England Primer before the enigmatic advertisement by Harris in 1691, claiming he had “enlarged” it. The third occurrence is the still-existing 1727 copy of The New England Primer Enlarged now in the New York Public Library.

Books were published in New England in the seventeenth century by the Puritans’ printing press. It was the second printing press in North America and began its publishing work in 1639.

The first printing press in North America had started operation exactly a hundred years before in 1539 in Mexico City, according to Annals of Printing by W. Turner Berry and H. Edmund Poole, London: Blandford Press, 1966. The history of the Mexican press was given on page 86:

“1539... Juan Pablos (or Giovanni Paoli) set up a press in Mexico City. It is generally agreed that he was the first printer in the New World....

“Juan Cromberger, the leading printer in Seville (Spain), had been asked by the Spanish Archbishop in Mexico, Zumarraga, to print a catechism in the language of the Nahuatl. Work on the project started in Seville, but Cromberger felt that it would be better done by a printer in immediate contact with the people who spoke the language.

“As a result, he entered into a contract (12 June 1539) with Juan Pablos, an Italian printer... to go to Mexico and set up a press. A contract was made also with Gil Barbero ... as pressman. Pablos’s wife [was] to do the housekeeping, a Negro was to be recruited as an assistant. Among the many stringent requirements of the contract Pablos was bound to turn out 3,000 sheets daily.

“Pablos arrived in September, and it is generally accepted that the first productions of his press were primers, though none has survived.

Berry and Poole said that before the year ended Pablos had printed in both the Mexican language and Spanish a text with the name Breve y mas compendiosa doctrina christiana (obviously a catechism). It was paid for by Archbishop Zumarraga.

However, the “primer” which was printed first in 1539 was obviously an ABC book, and then followed in 1539 by what was obviously a catechism. Considering the printing of 3,000 sheets a day, the output must have been prodigious, resulting in many ABC books and catechisms in the Indian language. What is noteworthy, however, is that the first material printed was a simple book for teaching Indians to read, so that they would be able to read the catechism when it was printed.

Information on the products of that Mexican press is also given in John Clyde Oswald’s Printing in the Americas. On page 529, Oswald lists a 1544 edition of Doctrina Cristiana, crediting Juan Zumarraga as the author, and stating the 1544 copy is in the New York Public Library, along with Tripartito by Jean Gerson (“Sr. Juan Gerson”). Oswald stated that Doctrina is the first complete volume published in the Western World (presumably because the Mexican ABC, mentioned above, was begun in Spain). Oswald said Tripartito contains a picture, “Adoration of the Virgin,” which makes it the first American illustrated book. Oswald also listed a work published in Mexico in 1557 on physical science, Physica Speculatio by Alonso de la Vera Cruz.
Susan Steinfirst, in her interesting unpublished dissertation, The Origin and Development of the ABC Book in English from the Middle Ages through the Nineteenth Century, University of Pittsburgh, 1976, referred to an article in 1916 which is of interest, concerning the products of that first Mexican press. She said that the Proceedings of the Antiquarian Society for 1916 included this material: “The Marks of Merit, with an Article by G. A. Plimpton on Hornbooks and Their Use in America.” That reference reportedly made the claim that G. A. Plimpton owned “an early 16th century Mexican hornbook, believed to be the first on this continent.” If Plimpton were correct in his identification of that material, perhaps it was from the output of the first Mexican press.

Like the Spanish in Mexico in the sixteenth century, the Puritans in Massachusetts in the seventeenth century showed their high regard for literacy by their importation of a printing press and paper into the American wilderness, and by its active use, and not long after by their teaching reading and a catechism to the Indians just as Archbishop Zumarraga had done. The initial product of their printing press appeared in 1639, which was, relatively speaking, only a very short time after the Puritans’ arrival in 1620. The Puritans were only a tiny colony and their printed materials were apparently initially only for their own use, which suggests they were almost all literate.

The record of the products of that press, the first in what is now the United States, and of later American presses, are given in American Bibliography by Charles Evans, New York: Peter Smith, 1941. Volume I - 1639-1729 begins with the historical evidence for the products of the Puritans’ press.

The Dunster manuscripts at Harvard provide the documentation for the thirteenth item, printed in 1643. It was A Spelling Book, Cambridge, printed by Stephen Day, providing mute testimony to the Puritans’ regard for literacy. However, its nature is unknown. It may have been meant primarily as a “dictionary” to provide help for adults, at that period when true English dictionaries did not yet exist, or it may have been meant primarily as a book to teach children reading like Edward Coote’s 1596 The English Schoole-maister speller and catechism which was so popular in England for well over a hundred years. It could, of course, have been used for both children and adults, but that any kind of spelling book was produced only 23 years after the immigrants had set foot in the wilderness is extraordinary. This is particularly so since it is obvious that they could easily have imported a few copies of spelling books from England, if a few copies were all they wanted.

John Clyde Oswald’s Printing in the Americas states on pages 57 and 58 that Samuel Green was the successor to Mathew Day, who was the actual operator of the press, when Mathew Day died, apparently in May, 1649. (Mathew Day was the son of Stephen Day who owned the press but apparently did not operate it). Green had been born in England and had come to America with Governor Winthrop in June, 1630. Green, who died at the age of 87, was the founder of a family of printers, operating in the colonies and later in the states for almost 200 years, a record surpassed by only one other family, the Didot family of France. Samuel Green had 19 children [from two wives], and three of his sons, Samuel Jr., Bartholomew, and Timothy learned the printing trade in America.

As cited elsewhere, records exist which prove the Puritans did import horn books in the seventeenth century, and quotations cited earlier proved the horn books were used by the Puritans to teach beginning reading.

Evans’ Item 36 was astonishing. It had been written by John Eliot and was entitled A Primer or Catechism, in the Massachusetts Indian Language, printed in 1654 by Samuel Green who had taken over from Stephen Day. The Evans comment reads:

“Of an edition of five hundred, or a thousand copies, printed, no copy is known to exist.”
The Indian Primer or Catechism had been preceded by the printing of three catechisms in English in Cambridge, copies of which no longer exist. One was A Catechism by Edward Norris printed by Stephen Day in 1648. One was by Richard Mathew, A Catechism..., printed by Samuel Green in 1650. One was A Catechism by Samuel Danforth, printed by Samuel Green in 1651. Other catechisms appeared after the Indian primer. Presumably, they were all in accord with the Westminster Assembly’s catechism of 1648 in its Shorter Version, the one in general use with the Presbyterians and Puritans. Therefore, catechisms and a spelling book had been printed in Cambridge before the first “primer.”

When the first “primer” appeared in 1654, it was for Indians in the Indian language and was called A Primer or Catechism. The use of the word, “or,” obviously meant the two words could be considered synonymous in Cambridge in 1654. (The same “primer or catechism” wording appeared on the Church of England material.) That the words “primer” and “catechism” were synonymous is suggested further by the fact the Primer or Catechism for the Indians was preceded by the three catechisms for the settlers themselves, and they certainly would have provided as complete material for their own children as they provided for the Indians. The large numbers printed in 1654 for the Indians (500 or a thousand) suggest that large numbers had also previously been printed of the three English catechisms for the use of the settlers, and possibly relatively large numbers of the speller had been printed. In 1662, Evans entry No. 70 shows that another fifteen hundred copies were printed of John Eliot’s A Primer or Catechism in the Massachusetts Indian Language, and it was reprinted again in 1669.

Astonishingly, in 1663, even the Bible was printed in the Indian language in an edition of one thousand or fifteen hundred copies. Many of these Indian Bibles still exist, but no copies of the 1654 and 1662 Indian primers have survived. However, Evans noted on page 12 that John Small reproduced the 1669 edition of Eliot’s Indian primer at Edinburgh in 1880, so that survived. Actually, a John Small reproduction under the date of 1877 is in the New York Public Library. It shows that Eliot preceded his catechism not only with the alphabet in capital and small letters, but with elaborate syllabary materials. It was obviously Eliot’s intent to teach the Indians to read their language by “sound.”

The Puritans’ publishing work and their educational work with the Indians in the seventeenth century were monumental achievements. Thirty-four years after arriving in the forbidding Massachusetts wilderness, and after initially almost dying out from disease, the winter cold, and starvation, the settlers not only had a functioning press but were distributing relatively massive copies of religious literature to the Indians. (However, much of the financial cost was borne by supporters in England.) Yet Indians were the settlers’ potentially implacable enemies as “King Philip’s” bloody war soon demonstrated.

A great deal has been written about the priggishness of the Pilgrims, but I have seen nothing remarking on this extraordinary and charitable concern for the eternal well-being of their potential enemies, just as I have seen nothing remarking on Archbishop Zumarraga’s extraordinary catechetical work for the Indians in their own language in Mexico. Nor have I seen any reference to Evans’ documentation of the Puritan settlers’ concern for the basic literacy of the Indians (nor the obvious concern of Archbishop Zumarraga for the literacy of the Indians).

If the Puritans printed 2,000 to 2,500 copies of the Primer or Catechism in the Indian Language, they obviously were attempting and possibly succeeding in teaching at least 2,000 or 2,500 Indians to read their own language, obviously with the fe, fi, fo, fum sound-method syllabary. Logically, the syllabary (probably plus lists of the word spelling patterns necessary to read English) must also have been included in the three earlier Puritan English-language catechisms since they almost certainly had been used as models for the Indian-language version. (The Puritans are recorded to have imported horn books, with which their children would have initially learned to read.) That the Puritan catechisms also included syllabaries (and word lists like those on the New England Primer Enlarged) appears particularly likely since the catechism titles appear to be synonymous in meaning to the title for the Indian text.
The effort involved in translating and printing one of their earlier English catechisms in the Indian language was great and impressive. However, that the Puritans translated and then printed their entire English Bible in the Indian language is nothing short of a monumental achievement, given their tiny resources.

These seventeenth century Puritan catechisms, and the fe, fi, fum syllabaries in the Indian primer-catechism, are unacknowledged roots of the New England Primer Enlarged, the first surviving copy of which was printed in 1727 and which included the Westminster Assembly’s Shorter Catechism. The only earlier record of a New England Primer Enlarged is Benjamin Harris’s advertisement in 1691, but that 1691 copy is not recorded as having included a “catechism” but only the earlier so-called “primer.” The 1691 material as advertised by Harris appears only to have been an amalgamation of the “Mr. Rogers” material from The Protestant Tutor of 1685 by Benjamin Harris and of an earlier, unlocatable New England Primer which Harris claimed to have “enlarged,” presumably the one registered in England in 1683, which will be described shortly. Yet that earlier material was probably only a catechism itself, since the words “primer” and “catechism” were apparently synonymous in New England at the time.

In Nila Banton Smith’s American Reading Instruction, 1934, International Reading Association, Newark, Delaware, 1965, pages 18-25, she discussed The New England Primer. She said the following on pages 18 and 19, citing Heartman’s 1922 checklist, which she referred to only as: “Heartman, Charles F. A pamphlet on The New England Primer, Metuchen, N. J., 1922.” She failed to give the proper title to Heartman’s book or to refer to the fact that it had appeared in three editions of 1916, 1922 and 1934. Her treatment certainly deflated the importance of Heartman’s extraordinary work, but she nevertheless conveniently drew upon its research establishing a 1683 reference:

“...the first edition of this book was probably printed in England. In the Stationer’s Register in London under the date of October 5, 1683, a certain John Gaine entered a title in accordance with the statute requiring the registration of all books for sale. This entry reads:

“Mr. John Gaine
Eodem Die et Anno. Entred then for his Book or coppy Entituled the New England Primer or Milk for Babes with Wm. Scoresby.

Jno. Gaine”

All that this establishes is that two men in England named John Gaine and William Scoresby were selling a book in England in the year 1683 called “New England Primer or Milk for Babes.” There is no indication that they either wrote it or printed it. Furthermore, it would have been very odd indeed for someone in England to put the title “New England” on his own work. The copies they were registering for sale in England might very well have come over by ship from Boston, since copies of the Indian texts are known to have done so even earlier! Furthermore, “Milk for Babes” was a term for catechism - and so was “primer!” Of course, the two men may also have reprinted a New England original for the English market. Therefore, instead of this entry’s suggesting an English origin, it instead tends to confirm the American origin of the New England Primer and to suggest strongly that it was only a simple catechism, or “Milk for Babes.”

However, the possibility must be considered that one of the “catechisms” listed by Evans may have been the forerunner of the 1691 “New England” “primer”-catechism advertised by Harris, but carrying a different name. Harris had The Protestant Tutor published in America apparently as soon as he arrived in 1685, and a copy is still in existence. Evans showed under No. 387 The Protestant Tutor, by “Benjamin Keach,” printed by Samuel Green in 1685, and added, “Benjamin Harris, the printer of the first London
Evans recorded under No. 573 the following concerning the 1691 advertisement for The New England Primer Enlarged of which no copy has ever been located.

No copy of that primer or of any New England Primer earlier than 1727 has ever been located. That is not too surprising, but what is surprising is that no RECORD has appeared ANYWHERE that it was ever printed after 1691, until a copy turned up which had been printed in 1727 and which contained the Westminster Assembly’s Shorter Catechism. That powerfully suggests a great publishing hiatus between Harris’s conceiving of an “enlarged” primer and the primer’s actual arrival in 1727.

It was the Westminster Assembly’s Shorter Catechism which gave the New England Primer Enlarged its importance after 1727. It is therefore possible that the unlocatable “First Impression” of the New England Primer which Harris “enlarged,” presumably the one registered in England, may well have been only a catechism itself. Harris would have felt no need to mention the word, “catechism,” in his 1691 advertisement, since the words “catechism” and “primer” had become synonymous in New England, as in the “Primer or Catechism” for the Indians. Therefore, could the origin of the “New England Primer” to which Harris referred have been in those earlier New England catechisms listed by Evans? Evans did not apparently show complete titles for those catechisms, and probably did not have them. Could one of these earlier and unlocatable catechisms have also included the words, “New England Primer” or even New England Primer Enlarged” in its complete title, just as the Indian work included the word, “primer,” in its title?

Benjamin Harris produced books in America only until 1695, when he returned to England and printed books there, for which a clear record exists. Yet Harris apparently never printed The New England Primer Enlarged in England, so America was not importing any primers from him. The fact that Harris apparently did not even bother to reprint The New England Primer Enlarged when he got back to England suggests he thought it was of no great importance or was not very marketable.

A copy of the 1727 edition survives, and the “primer” began to grow in fame after 1750 until it finally resulted in a publishing flood in the last half of the eighteenth century. Yet the real source of the primer’s fame was the Shorter Catechism, and not the beginning portions which receive so much attention today. It should be a simple thing to prove that the important material was the catechism. Just ask any group of highly conservative Protestant Christians, the group most like the old New Englanders, to review the New England Primer Enlarged and to mark those pages which they feel are most worth reprinting. Those pages will turn out to be the Westminster Assembly’s Shorter Catechism.

Therefore, the real roots of that late eighteenth-century publishing wonder, The New England Primer Enlarged, very possibly lay in the seventeenth-century “catechisms” that were published by and for the Puritans. (Considerably more historical background on The New England Primer is given in related entries in Appendix B under the dates of 1679, 1683, 1691 and 1727.)

Concerning the seventeenth-century Swedish settlers in America, there can be no doubt that they also valued literacy highly, just as the Puritans and the Pennsylvania Germans did. In James Pyle Wickersham’s History of Education in Pennsylvania... From the Time the Swedish Settled on the
Delaware to the Present Day, Inquirer Publishing Company, 1886, he told of the Swedish colonists requesting books from Sweden and being willing to pay for them even if they were lost in transit. The settler’s request was for 12 Bibles, 200 catechisms and 200 ABC books. In 1690, they were sent 400 “primers” and 500 catechisms. However, it is evident that whoever Wickersham was quoting was confusing ABC books and primers, since the word, “primer,” and its application to children’s books is purely an English-language usage. The settlers had requested Swedish ABC books, and obviously what they got were Swedish ABC books, not English “primers.” Wickersham quoted a further statement, citing “Hazard’s Register,” but giving no date:

“There seems to have been a great need of books as the missionaries on their arrival found only three in the whole colony, but yet so anxious were the people for the improvement of their children that these had been lent from one to another so that all could read.”

It seems probable with the reference to “the improvement of their children” that the “only three” books were ABC books. This is particularly so since it is inconceivable that almost all those old Lutheran settlers could have left Sweden for the unknown dangers of the far-away American wilderness of the seventeenth century without having carried their beloved Bibles for comfort!

With this as a background, it seems reasonable that the settlers had asked for 200 catechisms and 200 ABC books because they had, or expected soon to have, 200 to 400 school-age children. That seems reasonable, because, with perhaps about four children in each family by that time, there would have been from about fifty to a hundred families of settlers. There also would have been close to fifty or a hundred Bibles already with them along the Delaware River by the 1690’s, and not just three, or the settlers would hardly have requested only twelve Bibles from Sweden at the same time that they requested 200 catechisms!

Concerning literacy among the English in Pennsylvania, presumably the English Quakers, Wickersham also quoted a legal document from 1678 awarding payment to a man who had taught another man’s children to read the Bible in one year. If even one such instance of tutoring for pay ended up in the Pennsylvania courts in 1678, it implies there were many other such cases of tutoring for pay in Pennsylvania which did not need to reach the courts. That suggests a widespread concern for literacy among the seventeenth century English settlers in Pennsylvania, just as records so clearly show was the case in New England.

Wickersham gave concrete testimony on beginning reading methods used by the Episcopal English in Pennsylvania about 1730, quoting from a letter by Rowland Jones, who Wickersham said was most likely either Welsh or English. Wickersham said:

“He taught the schools connected with the Episcopal churches at Chester and Radner about 1730.... In a letter to Rev. Dr. David Humphrey, he gave the following account of his method of teaching: ‘Sir, you required an account of my method of instruction in school. I endeavor for beginners to get Primers with syllables, viz., from one to 2, 3, 4, 5, 6, 7, or 8.... when they get the Primer pretty well I serve them so in the Psalter, and we have some Psalters with the Proverbs at the latter end.... Then I move them into such places as I judge they are fit for, either in the New or Old Testament....’”

Jones was writing only about forty years after John Locke, and gave the same textbook sequence that Locke did but omitting the horn book: from the primer to the Psalter. Yet Rowland Jones obviously was not limited to just one “primer” but was selecting from a list of possible primers. However, since he specified “syllables,” it is possible he was really referring to a spelling book and not a true primer, and so
very likely was John Locke. The fact that Jones used a “primer” first certainly suggests it was only a speller.

Henry VIII’s sixteenth century Church of England or Episcopal primer had obviously been superseded by newer official Church of England primers, and some were published in America. The reference below to the Book of Common Prayer, which was not prepared until after Henry VIII’s death, is proof that these primers were newer. Evans showed the two American reprints listed below for 1746 and 1749. They were apparently the same version, since an edition from England referred to later used all the wording given in both titles:

“1746 - The Primer or Catechism, England, Church of, Containing Goodly Prayers and Graces, Authorized by the King to be Used Throughout His Dominions”

This authorized “Primer or Catechism” version continued to be printed in England after the advent of The Royal Primer, as shown by the following entry No. 143 by Heartman:

“The Primer, or Catechism, Set forth agreeable to the Book of Common Prayer, Authorized by the King; to be used throughout his Dominions. Containing goodly Prayers and Graces London: Printed for the Company of Stationers, 1777.”

Evans has two entries for primers printed by Benjamin Franklin in Philadelphia between 1749 and 1767. The primer is unnamed, and the entries suggest a declining use from 1765 to 1767, so it could not have been the New England Primer Enlarged, since it was increasing in use. Nor is it likely to have been Newbery’s Royal Primer, whose history is discussed elsewhere. Since the Primer or Catechism of the Church of England had been reprinted elsewhere in America in 1746 and 1749 as shown by the entries by Evans, it may have been that book that Franklin was printing, or it may have been like one of the many primer-spellers Alston listed which were available in England before 1749. However, considering the fact that Franklin’s primer was printed in Philadelphia and that its editions showed a declining usage with the passage of time, it most probably was a reprint of the 1670 Quaker primer-speller by Fox and Hooke, A Primmer and Catechism for Children; or a Plain and Easie Way for Children to Learn to Spell and Read. An American edition of the Fox speller printed in Philadelphia in 1702 still survives, and so does one known to be printed by Franklin in Philadelphia in 1737. Therefore, particularly since the title begins the same way, “A Primer,” and not “The Primer,” the Evans entries for Franklin given below probably refer to a Fox speller.

9801 - 1764 A Primer, Philadelphia, printed by B. Franklin and D. Hall. “Over 35,000 copies of the primer were printed between the years 1749 and 1765.”

10147 - A Primer, B. Franklin and D. Hall, Between March 1765 and February, 1767, 2,000 copies

Further concerning high American standards of literacy in the eighteenth century and materials to teach beginning reading, Wickerson told on page 216 of the work of Anthony Benezet who had spent nearly half a century in Pennsylvania in the work of teaching.

“Benezet was born in France but having joined the Society of Friends [Ed.: Quakers] in England he came to Philadelphia in 1731, aged 18. In 1739 he taught school in Germantown. In 1742 he became English tutor in the Friends public school, Philadelphia. In 1755 he established a
school for girls which, owing to its literary and moral excellence was largely patronized by the
best class of citizens for many years. About 1750 he began to give in the evenings in addition ...
in connection with his own school gratuitous instruction to negroes. He continued these self
sacrificing efforts in behalf of a downtrodden people until the Friends in good measure through
his influence established their free school for colored people. Of this school he took charge .... the
last years of his life giving instruction in it and dying bequeathed to it his little fortune.”

Concerning Benezet’s work teaching Blacks and Caucasians in his Quaker school for so very many
years, he testified that he had found no difference between the groups as both learned very well, but he
added some bitter words concerning slave-owners. However, Benezet, who wrote and used a “sound”
speller to teach beginning reading, had effectively testified that it was possible for both Blacks and
women to receive a real education in the Pennsylvania of the eighteenth century. Yet Puritan New
England, like Scotland and England but unlike France, was very remiss in the education of women
beyond simple literacy until the nineteenth century.

Wickersham cited an American edition of Dilworth’s speller printed by Francis Bailey at Lancaster,
Pennsylvania, in 1778. Wickersham said, “This was at the darkest period of the Revolutionary War....”
and he quoted from the publisher’s preface:

“At the beginning of the contest between the Tyrant and the States, it was boasted by our
[unnatural?] enemy that if nothing more they could at least shut up our ports by their navy and
prevent the importation of Books and Paper so that, in a few years after, [we] sink down into
barbarity and ignorance, and be fit companions for the Indians, our neighbors to the westward.”

This is evidence of the high regard for literacy in America in the 1770’s, which high regard was
recognized by its then-enemy, Great Britain. Curiously, however, it also reflected a belief that had been
prevalent among the “elite” in Great Britain for over a hundred years: the desirability of withholding
literacy from subject groups in order to dominate them. For instance, the purpose of the penal laws in
place throughout the eighteenth century in Ireland which outlawed not only Catholic priests but Catholic
schoolmasters was to subjugate the Catholic Irish. Knowledge is, indeed, power, and that fact was clearly
recognized in the eighteenth century.

Quotations cited by Professor Lawrence Stone of Princeton testify to the long-standing existence of a
motive to repress literacy in Great Britain. However, in many other respects, Stone’s article was highly
inadequate. It was entitled “Literacy and Education in England 1640-1900” and appeared in Past and
Present, Number 42, 1969, the periodical of the Past and Present Society, Oxford, England. Its content
made it obvious that Stone had either never heard of or never read the 1920 work of Albert William Parry,
Principal of the Training College at Carmarthen, entitled Education in England in the Middle Ages,
published by University Tutorial Press, Ltd., W. B. Clive, London. Stone had apparently also never heard
of earlier authorities on whom Parry drew, such as Brother Azarius in his many works, including Essays
L’Instruction Primaire en France Avant la Revolution, Paris: 1881; Armand Ravelet, who wrote
L’Instruction Primaire Dans les Campagnes Avant 1789, Troyes: 1875; and Babeau who wrote
L’Instruction Primaire, 1875. Others Azarius cited were listed on page 172 in his chapter, “Primary
School.”

Stone had obviously never read any of those works concerning pre-Reformation education, because his
misstatements concerning pre-Reformation education were positively astonishing. Stone also wasted ink
quoting on pages 83 and 84 a disgusting statement by Claude Levi-Strauss, Tristes Tropiques, New York,
1965, pages 292-3:
“...the primary function of writing, as a means of communication, is to facilitate the enslavement of other human beings.... The struggle against illiteracy is indistinguishable, at times, from the increased power exerted over the individual citizen by the central authority.”

Yet Stone’s article does contain considerable factual material concerning the eighteenth and nineteenth centuries, including the following on page 84 on which he cited John McFarlan, Inquiries Concerning the Poor, Edinburgh, 1782, page 245, and S. M. Elkins, Slavery, New York 1963, p. 60. Stone noted that literacy was sometimes forbidden by law for some groups of people, recording the horrendous fact that it was illegal in the eighteenth and early nineteenth century in some places in America to teach slaves how to read and write. Stone quoted this comment from the period:

“...teaching slaves to read and write tends to dissatisfaction in their minds, and to produce insurrection and rebellion.”

Stone said that, after the Civil War in England, Hobbes and those with property placed the blame for the war on the fact that education had been widespread before it. Stone said that, between the years of 1660 and 1790, the belief was widespread that to give the poor a little learning was very dangerous, since it made them want to improve their lot. That threatened the control by the elite.

Stone cited Christopher Wase, who wrote Considerations Concerning Free Schools, Oxford, 1678, as the source for this appalling statement:

“Ignorance is the Mother of Devotion and Obedience.”

Stone commented that the 1678 viewpoint was long-lived, and cited the fact that, in the early 1700’s, Bernard Mandeville remarked:

“...should a Horse know as much as a Man, I should not like to be his Rider.”

Stone cited a 1757 comment of Soane Jenyn concerning ignorance among the poor, Jenyn calling it:

“...a cordial administered by the gracious hand of providence.”

Stone said that Bishop Beilby Porteous of London, as late as 1803, had remarked that:

“...men of considerable ability say that it is safest for both the Government and the religion of the country to let the lower classes remain in that state of ignorance in which nature has originally placed them.”

Yet the hostility to the education of the poor in England existed in a period when large numbers of the poorer classes were surprisingly literate. Stone quoted on page 85 a comment of a continental visitor to England in 1726, who said:

“All Englishmen are great newsmongers. Workmen habitually begin the day by going to coffee-rooms in order to read the latest news. I have often seen shoe-blacks and persons of that class club together to purchase a farthing newspaper.”

Widespread literacy also existed in Scotland, as mentioned by Stone, although he also stated that the manufacturing areas in England did not do so well as other English regions.
Stone wrote that toward the end of the eighteenth century the literate working class was reading texts from the political radical, Tom Paine (which obviously required very high “reading comprehension”), and he cited the following two remarks. Apparently both were made by Dr. Currie of Liverpool:

“Our peasantry now read the Rights of Man on mountains and moorside and by the wayside.”

“The cause why Paine takes so much in Scotland is simply because the bodies can all read. Among the manufacturers of Manchester and Birmingham, not one in a hundred of whom know their alphabet, Paine has hitherto done little harm, though I am told he now begins to operate.”

Then he quoted Professor Plumb:

“...the terrible spectre of a literate, politically minded, working class began to stalk the land.”

Stone commented that the French Revolution, like the earlier English Revolution, only tended to confirm the belief of the propertied classes that education of the poor was undesirable. The bishop of Rochester in 1800 actually called the Charity Schools and the Sunday Schools which taught the poor to read:

“...schools of Jacobinical rebellion”

Therefore, Stone had produced historical proof of the desire of “elites” to control others by withholding literacy, and he had produced concrete proof of it as late as 1803. That was not long before the “meaning” method in teaching beginning reading in English began to replace “sound.” The “meaning” method first surfaced in England in the monitorial schools, and those monitorial schools had been the special enthusiasm of the “elite.” In 1818 in Parliament, Brougham first sought government funds for the support of the so-called infant schools, which were nursery schools run on the monitorial principle. The monitorial schools, after a convoluted history, eventually resulted in the establishment of government-controlled schools in England and contributed to their establishment in America. However, the idea of government-controlled schools, just like the “meaning” method itself, both of which were being promoted in England and America in the early nineteenth century, had originated in eighteenth-century France, as will be discussed.

Except from about 1900-1930 in America and from about 1900-1940 in England, most government schools have consistently taught children to read English by “meaning.” Historically speaking, the “meaning” method has been the siamese twin to the idea of government-controlled schools. The “meaning” method after about 1818 in Andrew Bell’s monitorial schools and after about 1826 elsewhere began to produce that brand-new disease known as functional illiteracy. No matter how much time functionally illiterate children spend in school, they can never be really educated because they are essentially limited to reading only a few hundred or a thousand or so whole words out of the half million or so in English. Therefore, functional illiterates can never read with the “comprehension” of ordinary English boot-blacks in 1726, whose minds in 1726 were not safely under the control of their “betters.”

The “elite” whom Stone cited from the eighteenth century might have considered twentieth century “functional illiteracy” in its various gradations of disability to be proof of enormous success, rather than proof of enormous failure. That is because true literacy has finally and successfully been withheld from the majority of the population, just as the “elite” had so futilely desired in eighteenth-century England when the dame schools were producing such a disturbingly (to the “elite”) high degree of true literacy among the poor. At that time, the poor were the bulk of the English population, and yet it was acknowledged (with distress, by the “elite”) that the poor were capable of reading the heavy philosophy
of Tom Paine with great ease. That is the same kind of ease that today, for most people, is limited to the reading of the comic strips.

Charles F. Heartman, a bookman and a prolific writer on books, published in America in 1934 his third edition of his Bibliographical Check List of the New England Primer. Soon after, in 1935, he had 300 copies printed for Harry B. Weiss of his American Primers, Indian Primers, Royal Primers and 37 Other Types of Non-New England Primers Issued Prior to 1830. (His very title demonstrates that the New England Primer was not dominant!) Heartman made the interesting remark in his preface to this very limited edition:

“This is my second attempt to compile a bibliographical check list of Non-New England Primers. The first was in 1922 but I gave up in disgust. However, after the appearance of the last edition of my Bibliographical Checklist of the New England Primer, published by the R. R. Bowker Company in New York last fall, something seemed to be pulling at my sleeves constantly, trying to tell me: ‘Go ahead now. It has to be done.’ Here it is.”

That Heartman saved many titles from oblivion is obvious, as almost none of his titles show up on the U. S. Department of Education publications on early American textbooks, Fifteenth to Eighteenth Century Rare Books on Education, and Early American Textbooks - 1775-1900. Many are not in the Harvard textbook collection which is the most extensive in America. In addition, Heartman’s tiny edition of only 300 copies, reproduced from a typewritten original and not even type-set and which he felt nagged to publish, has for the past fifty-five years provided the ONLY reference in America to non-New England primers before 1830.

As a professional bookman and authority on rare books, Heartman was puzzled by such a lack of material on primers. Heartman commented that very little had been written about primers in books concerning children’s literature. He noted, as exceptions, material by Clifton Johnson, Alice Morse Earle and Miss Halsey, but he said they only repeated what had been said by Paul Leicester or slightly increased what he said. Heartman also noted that primers are only mentioned in passing in education histories. Heartman cited as a possible exception material by D. G. E. Littlefield, but he still felt that Littlefield did not adequately emphasize what Heartman believed was the importance of primers. Heartman commented that many collectors did not, however, think that primers were children’s books. Heartman then said:

“At any rate, there is a wide field of research open.”

He was certainly correct about that.

Heartman’s American Primers, Indian Primers, Royal Primers... contains an unhappy fact, although he made no comment about it. His check list showed that some very rare and very old primers, some dating back to the eighteenth century, are at present in the Library of Congress with only their title pages remaining, the rest of the books having been removed. They were all printed in Pennsylvania, or else
showed no place of origin. Some carried notes that suggested they were editions that had been filed for copyright, which was at that time done through offices in each state. The latest was 1830, the cut-off date for Heartman’s list. Therefore, it is obvious that someone in Pennsylvania who had charge of the collection of official copyright copies filed in Pennsylvania, at some point in time after 1830 threw away all or most of the primer-spellers and sent only their title pages to Washington as some lunatic kind of record! For instance, Heartman showed the following:

“YOUNG CHILD’S PRIMER

“No copy of this title has been preserved. It is therefore, useless to speculate about the contents or the individuality of this Primer.

“185

“The Young Child’s Primer, or Introductory Spelling Book. No place, No date. Copies: LC [Library of Congress]. Title page only. Writing on verso: Filed March 12, 1819.”

This was apparently the original copy filed for official copyright, and yet all of the book except its title page has been thrown away. Heartman lists many other primers apparently all originating in Pennsylvania on which only the title page survived at the Library of Congress, including the following:

“The American Primer; or; an easy introduction to Spelling and Reading. Philadelphia: Printed for Mathew Carey, No. 118, High Street, 1800”

According to Alston, only two copies survive in the world of Mathew Carey’s The Columbian Spelling and Reading Book, tentatively dated to 1798. Yet Alston stated that no copy exists anywhere in the world of Carey’s 1800 edition of The American Primer; or an Easy Introduction to Spelling and Reading. Alston had canvassed libraries all over the world to find spelling books from 1800 and before but none had a copy of Carey’s 1800 American Primer although later editions are available. It is obvious that someone in Pennsylvania, at some point in time almost certainly after 1830, probably to make room on bookshelves, threw away all of Carey’s rare 1800 speller except its title page!

Another title on which there is no other record makes it clear that the mangled texts must all have been copyright deposits, up to at least 1830:

“An Easy Primer... By Charles C. Guenther. No place. 1830. “Title page only with Mss. entry on verso: 1830, Oct. 7. Deposited by Chas. C. Guenther as author.”

As Heartman had never been concerned with methods of teaching in the primary grades and the history of teaching reading, Heartman does not seem to have realized that many of the books he was labeling “primers” were only spellers. Nor, possibly, did Alston realize the same thing, perhaps omitting many spellers from his list from 1800 and before because they were titled, “primers.” But Heartman very possibly realized something critical: that the cut-off date he chose of 1830 did separate the old kind of true primer, the prayer book/catechism version meant as a second book for children, from something that was new and completely different. Actually, the cut-off date was 1826, and not 1830.

At that critical point, because of work by activists, primers ceased to be largely religious materials meant as children’s SECOND book, if used as school books at all, and became, instead, non-religious material, meant to be children’s FIRST book. The new kind of primer was meant to displace the spellers as the beginning book and was meant to be the book from which children would be initially taught to read. Children would learn to read by memorizing meaning-bearing whole words with the aid of context
guessing and with little or no reference to letter sounds, instead of learning to read by the sounds of syllables as they had done in the old spellers, horn books and battledores.

The horn books and battledores became extinct and the spelling books were moved ahead to be used by older children long after the children’s conditioned reflexes in reading had been firmly formed by the new so-called “primers.” By that time, the children would have become permanent Kanji-type readers of “meaning-bearing” whole words and would have become largely immune to the “sound” effect of the spellers.
Chapter 4
The Methods Used to Teach Reading From These Materials in the Past, Why
The Methods and Materials Developed as They Did, and Some General
History as a a Framework

In the late seventeenth century, primers in English were still in use as the second book for teaching
children to read, but whether what were called “primers” in the sources from that period were true primers
or only spelling books is very uncertain. John Locke referred in his Some Thoughts on Education, in
1691, to practices then prevalent in England in teaching reading, as the “ordinary road of the horn book,
primer, psalter, Testament and Bible.”

Most hornbooks, of course, like the ABC book, whose first page was its model, gave practice on a
sample syllabarium, and Locke testified that the hornbook preceded the English primers in the 17th
century. So did the true primers at that point include a syllabarium, and, of course, so did the spellers. It
is, of course, highly possible that Locke’s reference to a “primer” was really a reference to a speller and
not to a true primer.

The printed syllabarium on the English hornbook page was a very unsatisfactory thing. In contrast,
copies of a TABULAE ABCDARIAE (shown in Appendix A) were found in a German cellar dated to
about 1530, one copy of which is presently available in the New York Public Library. On this single
sheet, the syllable table precedes the Pater Noster, as on the hornbook, but the Latin prayer is divided into
syllables for ease of pronunciation. Also, unlike the syllable table on the English hornbook, the syllable
table on the German copy is set up to give every possible letter combination with which to form Latin
syllables. The column on the left shows all the consonants and their possible blends, the center column
shows all the vowels and diphthongs, and the column on the right shows again all possible consonants
and blends.

It is obvious that a child worked his way down the columns, obviously under an adult’s direction,
pronouncing the syllables aloud, by combining each consonant with every possible vowel and consonant
in turn, almost certainly with a fescue or pointer. When he finished, he would have probably pronounced
aloud every possible Latin syllable. After the child had worked his way through that syllable table and
memorized the sounds of the syllables, he obviously later picked out and pronounced in the Latin Pater
Noster the sounds of the syllables he had just learned.

That arrangement - combining each item in the first column in turn with each item in the center and
then the final columns - is strangely reminiscent of the Descartes multiplication “pairs” that appeared in
an Addison Wesley third-grade text which my school system used when I was teaching third grade. The
material ran roughly like this: ABC lined up on one side was to be matched to DEF on the other. Nine (3
x 3) distinctly different pairs were therefore systematically produced - AD, AE, AF; BD, BE, BF; CD,
CE, CF. Is it possible that Descartes in the seventeenth century produced the mathematical concept of
numbers of unique multiplication pairs, each one different from every other one, because he had as a little
child been taught by some syllabary like the sixteenth-century German one, in which a child was
supposed to work his way down the columns and produce all possible different items? Could that rough
framework have remained buried in Descartes’ memory, to surface later for his creative use in
mathematics?

Yet all that the abbreviated English hornbook syllabary showed as a pattern was “ab, eb, ib, ob, ub -
ba, be, bi, bo, bu” - followed by “ac,” etc., “ad,” etc., and sometimes “af”, etc. English fairy tales
apparently used “fe, fi, fo, fum,” because “f” is about where the printed syllables often ended on the English hornbook (with fu instead of fum, of course). That stage must have been burned into the consciousness of little English children, who were usually being taught to read in the seventeenth and eighteenth centuries at the ridiculous young age of three. Many little children must have been stalled at the “f” step for a long time, finding it difficult to construct the next series of syllables for themselves without a printed copy as a guide.

Without seeing the actual syllables in front of him in print after the “f” series (af, ef, if, of, uf - fa, fe, fi, fo, fu), it is obvious that the English child was supposed to point with his fescue to the consonants in the complete alphabet after “f” at the top of the hornbook and then to combine them to construct syllables with each of the vowels which were also listed apart from the complete alphabet at the top of the hornbook. He combined and pronounced aloud each of the rest of the consonants to form open syllables with long vowels (ga, ge, gi, go, gu) and closed syllables with short vowels (ag, eg, ig, og, ug).

Although the vowels a, e, i, o and u were shown at the top of the hornbook page again under the complete alphabet, obviously for use in constructing syllables, the diphthongs oi, au, ou, and special vowels oo, etc., were not shown, and that obviously was an enormous omission.

However, the English spelling books like Coote’s after 1596 were widespread and often included complete syllabaries and vowel lists. For those English children unfortunate enough in the 17th and 18th centuries to be given the hornbook instead of a spelling book, however, the primers into which they moved next did normally have complete syllabaries.

Apparently, ABC books, probably some with syllable tables, were prevalent in Europe in large numbers not long before the printing press arrived. An eight-page Abecedarium from the fifteenth century was discovered by Johann Enschede in 1751. It was obviously printed to meet a pre-existing demand and may be the earliest printed ABC book. It is referred to as the Enschede Abecedarium in The Invention of Printing by Theo. L. De Vinne, New York: Francis Hart & Co., 1876. De Vinne estimated its date as the last quarter of the fifteenth century, although others suggested an earlier date. De Vinne said on page 289:

“It is described by some as an Horarium, or little book of prayers; by others as an abecedarium or a child’s primer. It contains the alphabet (all the small letters but not the capitals), the Lord’s Prayer, the Ave Maria, the Apostles’ Creed, and two prayers.... the types seem to have been made for the Dutch language.... This little tract was discovered in 1751 by the celebrated founder, Enschede, of Haarlem in a manuscript breviary of the fifteenth century, among the books of the descendants of John Van Zwan, printer of Haarlem, 1561....”

De Vinne described its first page, crediting “Holtrop” as his source. The alphabet in lower case letters was preceded with a capital A. The Lord’s Prayer followed in Latin, as far as “Fiat voluntas” at the bottom of that first page, and obviously the prayer continued on the second page. If the printed syllabary were not included (though the fact it was included is sometimes omitted when “alphabets” are reported on such materials), then the probability is that the child would use a “fescue” to construct the syllabary for himself. He would point to the vowels, a, e, i, o, and u, and then join them with each letter in turn, producing such combinations as ab, eb, ib, ob, ub for closed syllables, and ba, be bi, bo, bu, for open syllables.

Paul Leicester Ford also referred to the Enschede Abecedarium on page 4 of his The New England Primer, citing his information source as De Vinne’s Invention of Printing, page 290:

“The Enschede Abecedarium, which has even been claimed to be the first specimen of printing with type, and which certainly was printed in the fifteenth century, contained besides the
alphabet, the Pater Noster, the Ave Maria, the Credo and two prayers, being the (elemental)
book."

These ABC books with prayers in Latin (the Pater Noster, Ave Maria, and Credo) undoubtedly used
the same teaching technique for forming phonetically regular open and closed syllables (such as ba, be,
bi, bo, bu and ab, eb, ob, ub) as were to be found on the Papyrus Gueraud-Jouguet, the third century,
B. C. teacher’s guide in Greek found in the sands of North Africa in 1939, which Marrou cited, as
discussed previously. That the method surfaced almost two thousand years later, essentially unchanged,
testifies that the syllable “fe, fi, fo, fum” approach was considered for two thousand years to be so simple
and so self-evident that it did not require any more formal, written discussion than how to spin flax or
how to cut hay. It most probably was the gradual decline in the use of wax writing tablets which had been
in wide use all through antiquity and until about the fourteenth century, and the emergence of cheap paper
which resulted in the proliferation of ABC books with syllabariums in Europe at the time printing arrived.
With wax tablets, no ABC books or syllabarium had been needed, but only a teacher who, himself, knew
how to form the phonetically regular syllables of the syllabarium from the alphabet, the look and sounds
of which written syllables the child then had to associate and memorize as the teacher demonstrated them.

It is known from the ancient stories of Irish saints, in the period roughly from 500 to 800 A.D., from
the sparse references to beginning reading methods, that the first written texts little children were given to
read at that time were the Latin Psalms, and that they were written on wax tablets to be studied and
memorized. The first step for the children before being given the Psalms obviously would have been an
instructor’s writing out the alphabet and then the syllabarium on those same wax tablets.

In Andrew W. Tuer’s History of the Horn Book, he wrote on page 2:

“In his English-Irish Dictionary (1732) Hugh Mac-Curtin, who devoted himself to the study
of the early history of Ireland, gives Clairin, lit. a little board or tablet, as the equivalent for horn-
book.”

Mac-Curtin’s “little board or tablet” certainly agrees in part with descriptions from early Irish
sources, but the boards or tablets were multiple and tied together with leather thongs. However, his
definition omits the very pertinent fact that the little boards or tablets were covered with re-usable wax.
That made them very different teaching instruments from the horn book, with its already written-upon
sheet covered with horn so that nothing else could ever be demonstrated on its surface.

Evidence of Beginning Reading Methods and
Curriculum in Ancient Ireland, from Texts of Saints Lives

An article appeared in the Royal Society of Antiquaries of Ireland, Vol. 50, 1920, page 160,
concerning the Springmount tablets found in the Springmount Bog, Country Antrim, on which waxed
tables some Psalms had been written, obviously by an adult. These tablets have been dated to the sixth
century. The article stated on page 166, as an explanation for the tablets and their contents:

“From various references in the lives of Saints it would appear that the Psalms were the first
text-book studied by ecclesiastical students. These were written on waxen tablets by their
instructors.”

The article further referred to a legend in the life of one Irish saint in which the boy wrote from
dictation which was then corrected, so the tablets obviously had a dual purpose for children: reading and
writing.
Only a few of the saints’ lives were written during the lifetimes of those who knew them. Most of the content of these earliest biographies has been shown to be true. Yet, the later the authorship of the lives, the greater the exaggeration becomes. This late authorship accounts for the mythical elements in so many of the biographies. The marvelous has obviously been inserted for dramatic effect because no one from the period when the saint was living was still surviving to argue about it. Occasional sardonic comments are found elsewhere in early writings which suggest that these tall tales were not always believed. This is amusingly shown in an early Irish poem quoted at length by John Morris in The Age of Arthur.

It is also entirely possible that no one in that period of time really expected such “marvelous elements” to be taken very seriously, as they may have been considered a kind of poet’s license. This is supported by the fact that the Irish Annals, kept in the same period of time and meant to be historical documents, were scrupulously precise about factual details.

It is supported further by an amusing comment made by an Irish monk about 700 A.D. when transcribing outlandish pagan Celtic stories and myths, which by then were many centuries old. A delightful sidewalk pocket park and plaza is presently in Dublin, with two walls decorated by mosaic murals. On one wall is a colorful impressionist mosaic picture of such pagan Celtic myths, and on the other wall in large mosaic lettering are the ancient Christian monk’s comments about those pagan tales. The sun was in my eyes when I took a picture of that wall, so I missed the first two or three lines, but those remaining read:

“Do not credit the details of the story or fantasy. Some things in it are devilish lies or some poetical figments. Some seem possible and others not. Some are for the enjoyment of idiots.”

That ancient monk’s comments could have been written today! The same matter-of-fact realism that he applied to the Celtic myths about 700 A.D. was undoubtedly also applied to the mythic lives of saints written in the same general period. The poem Morris quoted, written about the same time, is proof that realism was sometimes applied to the some of the outlandish tales written in the early Christian era.

However, the background data in all of these tales of the saints concerning the ordinary routines of daily life can be considered to be accidental but reliable indicators of ordinary practices. Such factual background elements are to be found in all folk stories and are very reliable historical sources. This fact makes the few passing references in the tales to methods used in the teaching of reading highly reliable.

The following transcriptions are from rough pencil notes I took on two relatively rare volumes from 1890 and 1914 in the New York Public Library. As a result, there may be some errors in transcription. The material is of interest, however, because it shows the sequence followed by students in Ireland in the period roughly from 500 A.D. to 800 A.D. It should be remembered that the Irish missionaries carried their practices first to England and then to the Continent after 600 A.D. Then both the English and the Irish missionaries carried their practices to the Continent after about 700 A.D., teaching barbarians who had become Christians in some parts of the Continent, and lapsed Christians in other parts of the Continent. The methods described in these early Irish saints’ lives, then, can be assumed to have been similar to those used in Great Britain and on the Continent until the period when the wax tablets went out of general use for beginners some time after 1300.

These early Irish saints’ lives show that first the alphabet (which must have included the syllabarium) was written on wax tablets by a tutor for an individual child who might have been a boy or a girl. The child was also taught to write, obviously on the wax tablets. The next step was the writing of the Psalms on the same tablets, in Latin, which were first read aloud by the tutor and then practiced aloud by the student (obviously in a very loud voice, and chanted.) The Psalms were memorized, which was an extraordinary achievement! All of this would have been done before the student was about twelve years
old. The individual tutor/pupil relationship, and the wax tablets, were then dropped and the student joined a large class of other students, who were using books, not wax tablets, under an instructor. The book they were studying was the New Testament, in Latin. Apparently the whole Bible was eventually studied. All of these facts can be picked out from the following excerpts.

These notes are from Lives of the Saints from the Book of Lismore, edited with a translation, notes and index by Whitley Stokes, Oxford, at the Clarendon Press: 1890.

Columb Cille (page 172-173) “Not long thereafter, Columb Cille and his fosterer went at Christmas to... the ramparts of Enna, in Ti Enda. It was entrusted to his fosterer, the cleric, to perform a priest’s duties in that place at the hightide. But bashfulness seized him, so that he was unable to chant the Psalm that came to him; Misericordias Dei was that Psalm. Howbeit... Colomb Cille, chanted the Psalm in his behalf, and yet he had not read till then aught save an alphabet. God’s name and Colomb Cille’s were magnified by that miracle... At another time he and his fosterer went to visit a sick person. As they were winding through a wood, the cleric’s foot slips on the rock so that he fell and died suddenly. Colomb Cille put his cowl under the cleric’s head for he knew not that he was not asleep, and he began rehearsing his lessons so that certain nuns heard his reading aloud as far as their chapel....”

Note the phrase, “...he had not read till then aught save an alphabet.” Yet no one “reads” an alphabet. One “recites” it. One does “read” a syllabarium. The choice of the word, “read,” if accurate in the translation, certainly suggests that the meaning for “alphabet” was “syllabarium.”

Life of Brennan (page 249) “At the end of a year the Bishop Eirc took him with him to his own foster mother, even Ita, and Brennan remained five years with Ita.... Thereafter to the end of five years, he constantly read his Psalms with Bishop Eirc and it seemed long to Ita to be apart from him... On a certain day Bishop Eirc went to preach the word of God. Brennan who was then aged ten years went with him into the chariot... Brennan sat down in the cave and therein he began his Psalms and his hymns of praise to the Lord.... Now the sound of Brennan’s voice singing his Psalms was heard a thousand paces at each side. The sound of the voice of Columb Cille was heard to the same distance when he was chanting his Psalms and his hymns.... Now after Brennan had learned the Canon and the Old Law and the New Testament, he desired... to learn the Rules of the saints of Ireland. So Bishop Eirc consented that he should go and learn those rules....”

The Life of Ciaran of Clonmacnois (page 266) “After that there came to pass something marvelous at Rath Cremthainn in Magh Ai while he was keeping the cattle of his foster father, Deacon Justin at Fidarta, and there was a long distance between them. Howbeit, he used to hear what his tutor had to say as if they had been side by side. Then came a fox to Ciaran out of the wood and Ciaran dealt gently with it and it used to visit him often, until at last he enjoined upon it to do him a service, namely, to carry his Psalter between him and his tutor, Deacon Justin. For when it was said at Fidarta “Say this in the name of the Father and of the Son and of the Holy Ghost, Amen,” Ciaran at Rath Cremthainn used to hear from that to the end of the lesson. And the fox used to be humbly attending the lesson till the writing of it on wax came to an end, and he then did take it with him to Ciaran. But once his natural malice broke through the fox and he began to eat the book for he was greedy about the leathern bands that were about it on the outside. While he was eating the book, then came Oengus, son of Cremthainn to him with a band of men and with greyhounds. And they hunted him and he found not shelter in any place till he came under Ciaran’s cowl. God’s name and Ciaran’s were magnified by saving the book from the fox, and by saving the fox from the hounds. And that book is today called Ciaran’s tablets.”
“After these things then it was time for Ciaran to go as a scholar to Findian of Clonard to learn wisdom ... ...the king of Cualann’s daughter was brought to Findian to read her Psalms after having dedicated her maidenhood to God. Findian entrusted the girl to Ciaran and with him she used to read her Psalms. Now so long as they remained together, Ciaran saw nothing of the girl’s body save only her feet.... In this school, moreover, a stag used to visit Ciaran and he used to put his book on the deer’s horns.”

“Into that school then came Nennid Slant Eye of Locha Eirne to read with Findian and he had no book. ‘Ask for a book,’ saith Findian. Nennid made the round of the school, and got no book from any of the scholars. ‘Hast thou gone to the tender youth who is in the north of the green?’ saith Findian. ‘I will go now,’ saith Nennid. So when Nennid came, Ciaran had arrived at the middle text of Mathew’s Gospel, Omnia quaecumque nultis ut faciant homines nobis ita et nos faciatis illas. ‘I have come to borrow a book,’ says Nennid. ‘Mercy come to you!’ saith Ciaran, ‘It is for this I read and this the text saith to me: that I should do unto everyone what I desire to be done to me. Take the book,’ saith Ciaran. His companions asked him on the morrow while doing the lesson where was his book? ‘He gave it to me,’ saith Nennid. Saith one of the school: ‘Let “Ciaran Half Mathew” be his name.’ ‘Nay,’ saith Findian, but “Ciaran Half Ireland,” for half of Ireland will be his, and ours will be the other half.”

“Another time Maeda and an immature young child were by a cross which then was in the monastery at Ferns....Presently, Maeda wrote a Psalm for the child. The child saw him mount a golden ladder which reached from earth to heaven and when he descended later, the child could not look in his face for the great brilliance.” (The text said Maeda had seen St. Colum Cille, who had just died, enter heaven).

“...and then Barre read his Psalms... and then came a heavy fall of snow so that there was a hood of snow around the hut in which Barre was doing his lesson. Barre said to his tutor, ‘I should like this hood to remain across my hut till I shall be finished my Psalms.’ God did so; for the snow melted from the earth but the hood of snow remained round the hut till Barre had finished his Psalms.”

An excellent general bibliography which includes references to ancient texts of saints’ lives is given in the fine text, Education in Ancient and Medieval Ireland, by Fergal McGrath, S. J., Studies “Special Publications” Dublin, Ireland: 1979. Although the book was out of print when I tried to buy it, I found a copy in the Library of Congress in Washington, D. C. John Morris’s superb The Age of Arthur, A History of the British Isles from 350 to 650, Charles Scribner’s Sons, New York: 1973, is a gold mine of information on the period and has a priceless bibliography including sources for ancient writings on saints’ lives. Another fine source is Ireland, Harbinger of the Middle Ages, by Ludwig Bieler, Oxford University Press, London: 1963 (first published in German by Urs Graf Verlag Olten, Lausanne and Freiburg I. Br., 1961)

However, H. I. Marrou’s 1948 A History of Education in Antiquity, first published in France, is not only slight for the period after 350 A. D. but is actually misleading, probably reflecting the anti-clerical and anti-religious bias of French intellectuals of the period. Furthermore, Marrou had the audacity to belittle (page 578) the conclusions of Father Paul Grosjean of Belgium, who was writing in Analecta Bollandia, Vol. LXIV (1946), page 323, concerning the period after 350 A. D. Grosjean was a major researcher and authority on the manuscripts of ancient Ireland. Marrou’s otherwise generally useful work, however, appears largely to be a cut-and-paste rearrangement and retelling of earlier original research done by Germans concerning education in classical times.

As mentioned previously, a curious by-product of intensive early study of the Latin Psalms was bilingualism (defined as equal proficiency in the use of two languages). The Gaelic glosses, or marginal notes, written on the Latin manuscripts of the Priscian grammar from St. Gall monastery in Switzerland, and on other manuscripts in Latin, which date roughly to the period before the Viking invasions began about 800 A. D., suggest that the Irish monks writing the glosses were equally fluent in Latin and Gaelic. Written in Gaelic in the margin of these Latin parchments from St. Gall monastery dating back to the 700’s are such comments as, “I am very cold,” “The parchment is rough and the writing,” “Oh, my hand!” and “Night fall and time for supper.”

The German, Zeuss, author of Grammatica Celtica, 1853, is referred to in Joyce’s Short History of Ireland. Joyce said (page 3) that Zeuss:

“...labored incessantly visiting the libraries of St. Gall, Wurzburg, Milan, Carlsruhe, Cambrai and several other cities in all of which there are manuscript books in the Celtic dialects.... He found the Irish glosses the most ancient, extensive and important of all. Most of them belonged to the eighth century.”

The Priscian grammars in Latin on which many of these glosses appeared followed the Donat in the study of Latin in the curriculum sequence in those early days, and, since the Priscian grammars had vast numbers of Latin quotations from classical authors to demonstrate grammatical teaching, the effect was to acquaint students with many of the Latin classics. The Priscian grammars are discussed in Volume 18, Encyclopedia Britannica, 1963 (page 513).

The article stated that Priscian’s full name was Priscianus Caesariensis, and that he lived about 500 A.D. That he lived so late is rather surprising, but he is considered to be the most known of the Latin grammarians. His work, the Institutiones grammaticae, along with that of Aelius Donatus, were enormously influential on the teaching of grammar, and of Latin, in Europe until the Renaissance. Priscian’s birthplace was Caesarea in Mauretania, which is known today as Cherchel, Algeria. However, he did not teach there but in Constantinople.

His Institutiones grammaticae, which can be translated as Grammatical Foundations, is a series of 18 books, which systematically treat the grammar of Latin. It is certainly interesting that the first 16 are
concerned for the most part with sounds and the formation and inflexion of words. That certainly puts “sound” in teaching in its proper place. It certainly demotes the “meaning” approach to the teaching of reading that is propounded by current “experts” like Kenneth Goodman. However, almost one-third of the total material is contained in the last two of Priscian’s books, and they concern syntax.

The Encyclopedia Britannica article said that, as much as possible, Priscian had used the Greek grammar written by Apollonius Dyscolus as a guide, and that he used as illustrations many quotations from earlier Latin authors. The happy accidental effect of his having done so saved many Latin quotations which otherwise would have vanished. Priscian’s work was highly respected by Christian authors from the 7th to the 9th century and later. It was quoted by Aldhelm, Bede, Alcuin, and Rabanus Maurus and was a standard textbook used to teach grammar in medieval schools. The article stated that perhaps 1,000 Priscian manuscripts survive, most with only books i-xvi, Priscianus major, but some with books xvii and xviii, Priscianus minor, although a few contain all 18 books. Other than fragments, the oldest are from the 9th century, and the first printed work was produced in Venice, in 1470.

As already mentioned, the massively used Priscian grammars contained numerous excerpts from classical Latin authors, and students at that time studied those excerpts. Concerning the presumed cultural darkness of that period in comparison to ours, how many students today have a real grasp of grammar, as the Priscian students did, and how many today can quote, verbatim, in Latin, from classical authors, as ordinary students of Priscian in the “Dark Ages” did?

Yet the influence of writings in the so-called “Dark Ages” lingers on in ways rarely acknowledged. The evidence even suggests that some “Dark Age” authors provided the literary material on which later authors built famous works. For instance, the Irish monk, “St. Fursa of the Visions” who died in 648 in Peronne, France, and whose writings were enormously popular after his death, is the purported source for Dante’s Divine Comedy. Another early and highly successful author, mentioned in Bede’s Ecclesiastical History which was written in the eighth century, was the poet Caedmon, whose Celtic name has been assumed to suggest he was a British Celt and not an Anglo-Saxon, even though his poetry was in Anglo-Saxon. Caedmon died at Whitby about 678, according to the Age of Arthur, only about fifty years before Bede wrote. The Catholic Encyclopedia p. 131 vol. III, stated that according to Bede’s Hist. Eccles. Bk. IV ch xxiv, Caedmon:

“was at first attached as a laborer to the double monastery of Whitby (Streoneshalh) founded in 657 by St. Hilda, a friend of St. Aidan.”

Caedmon refused the harp being passed around the table and left embarrassed because he could not sing. In a dream while sleeping in the stables, he was told to sing. He began to sing in praise of God verses he had never heard before.

“In the morning Caedmon recited his story and his verses to Hilda and the learned men of the monastery, and all agreed that he had received a Divine gift.”

Caedmon’s poetry is possibly the earliest in English, and has been cited as the source for Milton’s Paradise Lost.

Fursa and Caedmon’s work survived because they composed it in a literate period: the so-called “Dark Ages.”

A brief encyclopedia biography on a seventh century saint sheds a great deal of light on those times, even mentioning the brothers of St. Fursa. This brief entry from the Catholic Encyclopedia (1913) is inserted here as background material, including a reference to one of the double monasteries of the time,
to the literacy of monks and nuns who were students of Holy Scripture, and to the widespread travel of the time, which certainly suggests a considerably higher level of culture than the words, “Dark Ages.”

“Gertrude of Nivelles, Saint, Virgin, and Abbess of the Benedictine monastery of Nivelles near Brussels, b. in 626; d. 17 March, 659. She was a daughter of Pepin I of Landen, and a younger sister of St. Begga, Abbess of Andenne.... After the death of her father in 639, her mother Itta, following the advice of St. Amandus, Bishop of Maestricht, erected a double monastery, one for men, the other for women, at Nivelles. She appointed her daughter Gertrude as its first abbess, while she herself lived there as a nun, assisting the young abbess by her advice. Among the numerous pilgrims that visited the monastery of Nivelles, there were the two brothers St. Foillan and St. Ultan, both of whom were Irish monks and were on their way from Rome to Peronne, where their brother, St. Furseus, lay buried. Gertrude and her mother gave them a tract of land called Fosse on which they built a monastery. Ultan was made superior of the new house, while Foillan remained at Nivelles, instructing the monks and nuns in Holy Scripture. After the death of Itta in 652. Gertrude entrusted the interior management of her monastery to a few pious nuns, and appointed some capable monks to attend to the other affairs, in order that she might gain more time for the study of Holy Scripture, which she almost knew by heart. The large property left by her mother she used for building churches, monasteries and hospices....”

Evidence on beginning reading practices in that period, by which practices these old monks and nuns became so literate, is given by the Springmount tablets, referred to previously. They are in the form of a leather-bound folding book of wax tablets and are in the National Museum of Ireland in Dublin.

These tablets are exhibited in the same museum room with a fascinating collection of other ancient Irish materials. Some are pure gold items from Ireland’s Celtic pagan past such as ornamental neck torques. Pure gold pieces from almost four thousand years ago are also exhibited, predating the arrival of the Celts in Ireland.

Yet even those are known to be preceded by Newgrange, the large solar monument on the banks of the Boyne River, which is dated to about 3,000 B. C., and, like Stonehenge in England is assumed to have had a religious connection, since the sun on the shortest day of the year reaches directly to its inmost stones. The beehive stone construction of Newgrange about 3,000 B. C. was duplicated in the beehive stone huts of the Irish monks in the sixth century A. D., and the intricate geometric designs on the Newgrange stonework are suggestive of the interlacings on the Book of Kells, exhibited at Trinity College, Dublin. The fact that the sun reached to the depths of the Newgrange monument on the shortest day of the year was written down by the early Irish monks as an old oral legend, over three thousand years after Newgrange had been built. It is only recently that excavations proved that ancient oral legend to be true. Such a persistence of cultural knowledge in a spoken, and not written, tradition is an astonishing thing. The “beehive” constructions of the monks, as well as the geometric designs that they used may have been part of that over-three-thousand-years-old oral tradition.

The museum also has examples of the elaborate metal work of Ireland’s early Christian era such as on bell shrines. Those shrines have the same kind of designs as on the Book of Kells from the eighth century. What is pertinent to this history is that the museum also contains the elaborately worked container, a “shrine,” for the famous Cathach of St. Columba. The Cathach was the copy written by St. Columba of the St. Jerome translation of the Psalms when they first reached Ireland in the sixth century. It was kept in his family for over twelve hundred years before it was donated for museum use in the last century. That demonstrates that the St. Jerome translation of the Psalms had reached Ireland by the end of the sixth century. It also demonstrates that the Springmount tablets probably could not be any newer since they contain the Psalms in the Old Latin which was in use in Ireland before the spread of the St. Jerome’s “new” Vulgate translation of the Bible, from a portion of which St. Columba made what was perhaps the
The Springmount tablets have been officially dated to the sixth century, the century in which St. Columba lived. The Psalms on the Springmount tablets were obviously written by a literate adult, so were presumably for study.

The waxen, wooden, originally leather-bound “book,” with the leather portions long gone, was retrieved from the Springmount bog in County Antrim, Ireland, near the very ancient monastery of Drumakeely. The wooden “book” of wax tablets with the writing on the wax still legible was found in or before 1914 by W. Gregg who sold it in 1914 to the National Museum.

The child who was presumably supposed to be studying and probably memorizing the Psalms on that book of wax tablets written by an adult, before the child dropped it into the lake which since turned into a bog, most probably had the alphabet and syllables previously written on those same wax tablets to study as his first step. Therefore, he - or she - would have had no need of an ABC book.

Among the sparse references to beginning reading practices in those ancient Irish stories of saints’ lives are references to girls being taught to read. Literacy among women in religious life was the norm in the so-called Dark Ages before the eleventh century, just as it had been for the religious women in St. Jerome’s circle in the fourth century A.D. For instance, on page 12 of Christian Education in the Dark Ages, which was written by Rev. Eugene Magevney. S. J., and published in New York in 1892, Father Magevney stated:

“It is noteworthy that some of the most proficient Greek scholars of the medieval times were women.”

Magevney was referring to the early period, the so-called “Dark Ages.”

Earlier Christian concern for the education of women is apparent from St. Jerome’s matter-of-fact correspondence with a Christian woman concerning teaching reading to her little girl. On page 71 of Davies’ book, he wrote that very little evidence exists from early times on the teaching of reading. He said that some such evidence does appear in the letter that St. Jerome wrote to the little girl, Pacatula (obviously under cover of a letter to her mother, Laeta), some time before 400 A.D.

St. Jerome told the little girl, Pacatula, that before she could read she had to learn her alphabet, spelling and grammar. “Spelling” originally meant what we mean today when we say a child is learning to read. After memorizing the syllabary by spelling the syllables aloud, beginners then “spelled” (recited) the syllables in any text they were trying to read, naming the letters in each syllable before they pronounced it. Aided by their new-found knowledge of “grammar” (nouns, verbs, adjectives, etc.) they were able to pronounce aloud the texts of that period which were run together, with no separation between words, and with no capitals and punctuation to define where sentences began and ended. With their new-found knowledge of “spelling” and “grammar,” beginners like Pacatula could then recreate the “whole language” that had been recorded in the run-together text. That method, of course, is the antithesis of what is today called the “whole language” method!

In another letter to Pacatula’s mother, Laeta, St. Jerome suggested that the child initially be given boxwood or ivory letters to help her to learn the alphabet.

Davies said that St. Jerome’s comments in the fourth century about teaching beginning reading differed very little from the comments made about the subject by Quintilian in the first century. Like Quintilian, St. Jerome suggested rewarding the student with a little gift. St. Jerome thought that suitable items would be a honey cake, a flower, a toy, or a pretty doll.
Since there were no such things as “word lists” except for proper names at that time, the “spelling” obviously had to be of the syllables, which Quintilian had said earlier must be learned in their entirety, including the most difficult ones.

In Christian Schools and Scholars, Volume 1, by Augusta Theodosia Drane, London, 1867, on page 61, she quoted from the ancient writings of Nennius (Nenn. Camb. Msc. 57), concerning the life of St. Patrick, in which Nennius referred to Mochoe, to whom Patrick also taught the Roman alphabet. She said,

“Nennius indeed affirms that (Patrick) wrote no less than 365 alphabets, but, as Bishop Lloyd quaintly remarks, the writers of those times, when they were upon the pin of multiplying, used generally to say that things were as many as the days of the year. It is quite certain, however, that this teaching of the Roman alphabet, the first step necessary for acquiring a knowledge of Latin, formed a very common item in the instruction of Irish converts.”

In the ancient manuscript from Nennius, from which she quoted, the alphabet was referred to as “scripsit Abegetoria.” In Noah Webster’s 1828 dictionary, he defined “abecedary” as “pertaining to, or formed by the letters of the alphabet.” By this definition, “pertaining to... the alphabet,” St. Patrick’s numerous alphabetic writings could have been syllabaries, like that of the Etruscans in the 6th century B. C. referred to by H. I. Marrou in A History of Education in Antiquity (page 136, Paris, 1948, New York, 1964). But the Etruscans, like the Romans who took their alphabet from the Etruscans, would have written “abecedaria” (ABC) or conceivably “abecetoria,” since the third letter in their alphabet was “C,” not “G,” gamma, as in the Greek alphabet. Nennius obviously knew of more than one alphabet. His term, “abegetoria,” (ABG) tells us that the other alphabet of which he knew was Greek.

Concerning Celtic use of Greek, W. J. Frank Davies, in Teaching Reading in Early England, quoted from Julius Caesar’s Gallic Wars (VI. 13, 14) concerning the Celts and their Druids in what is now France. Julius Caesar said the Druids:

“are concerned with sacred matters. They look after the public and private sacrifices and expound points of religion. A large number of young men gather around them for the purposes of education, and they hold the Druids in great esteem.... Many come to them for such instruction of their own accord or are sent there by their parents and relatives. Once there, they are said to learn off by heart a great number of verses, and some pursue this training for twenty years. They do not consider it proper to commit these particular subjects to writing, although for most other affairs, both of a public and private nature, they use Greek letters.... It often happens that when a person begins to place reliance on writing, he grows slack about the necessity of learning a thing thoroughly for the purposes of memorization.”

It might seem more probable that instead of Greek the Celtic Gauls would have used the Germanic runes of their neighbors, which runes had already been in use for perhaps two hundred years by the time Caesar wrote. Yet, in his reporting Celtic use of Greek letters, Caesar certainly could not have been wrongly identifying Germanic runes as Greek letters. After all, as educated Romans, Caesar and his whole administrative staff undoubtedly were proficient in Greek. Furthermore, as the head of the whole Roman Empire, Caesar must also have been acquainted with Germanic runes since occasional reports must have come in that had been written in the widespread Germanic runes of the north.

The schools Caesar described from Celtic Gaul about 40 B.C. persisted in Christian Celtic Ireland in highly organized fashion as lay schools, apart from the clerical schools, until after the Viking invasions starting about 800 A. D. and in a varied form as lay schools into the 1600’s. The Englishman, St. Edmund Campion, in his largely hostile 1571 Historie of Ireland, described what he saw in such schools in 1571:
“...they speake Latin like a vulgar language learned in their common schooles of leach-craft and law where they begin children and hold on sixteen or twentie years.”

Those lay schools of medicine and law still in operation in the sixteenth century dated back to long before Julius Caesar’s day.

The fascinating Hisperica Famina from about 650 A. D., translated with a commentary by Michael Herren\(^\text{12}\), was composed so as to use a very heavy concentration of low-frequency, elegant Latin words and is assumed to have been used as a text-book to demonstrate how to write elegant Latin in lay schools. (That book was, of course, the exact antithesis of the Gates and Gray controlled-vocabulary, high-frequency word readers of 1930!) The content of the Hisperica Famina described the everyday activities of lay schools in Ireland in the seventh century. Since these highly organized schools survived for at least a thousand years, from before Julius Caesar’s day to the Viking invasions, and in a revised form for more than another five hundred years, it is only reasonable to assume that the knowledge of Greek also may have survived in the Irish Celtic culture until Latin letters arrived with St. Patrick in the fifth century, A. D. St. Patrick apparently found it necessary to replace the Greek with the Latin alphabet so the Irish could read the Scriptures he brought with him.

As stated, Greek letters, not runes or the Latin alphabet, are known to have been used to a considerable extent for practical purposes by the pagan Celtic Gauls in the first century B. C., by the testimony of Julius Caesar himself. Celtic culture appears to have been remarkably uniform from Gaul on the continent to Ireland. It is probable that ogham writing invented in pagan Celtic Ireland in the third century A. D. preceded St. Patrick’s arrival by about two centuries. One of the more reliable facts concerning St. Patrick’s activities when he arrived in Ireland in the fifth century A. D. is that he was very busy writing out Latin alphabets for the Irish pagans because they did not know the Latin alphabet. It is therefore certain that knowledge of the Latin alphabet was woefully lacking in Ireland in the fifth century A. D. Because of these documented facts concerning Celtic knowledge of Greek and Latin, it is puzzling indeed that the pagan Irish ogham alphabet of the third century A. D. is considered to have been derived from Latin instead of from Greek letters.

Ogham writing consisting of various straight and slanted lines survived in Ireland for many years after its invention and was used to write Gaelic on numerous tomb stones. The ogham alphabet was clearly partially inspired by runic writing but matches the Greek more than the Latin alphabet. In illustrations of various alphabets, as in the Encyclopedia Britannica (1963), a reader can study the resemblances among the Latin, runic, Greek, and ogham alphabets.

However, some of the explanations given in the Encyclopedia Britannica to account for the origin of their different letters may well be questioned. For instance, the Latin, runic, and Greek alphabets do not contain “V” although it is present in today’s alphabet. Yet the Encyclopedia Britannica interpreter of the ancient ogham code claimed that one of the ogham letters was meant to stand for “V,” which seems hardly likely. (What looks like a “V” in the Latin alphabet actually stands for the vowel, “U”.) More probably, the ogham mark credited as standing for “V” actually stands for “F,” and the mark credited as standing for “F” actually stands for “Z.” The record shows a confusion of “F” and “V” sounds for the Irish, as with the names of Fergal and Virgil.

Also, the third letter in the Greek alphabet is gamma and might reasonably be equated with “G.” If that is done, then the Greek alphabet would not show “G” altogether missing, as indicated in the

\(^{12}\) The Hisperica Famina: I. The A-Text, by Michael W. Herren, Associate Professor of Humanities and Classics, Atkinson College, York University, Toronto, published by Pontifical Institute of Mediaeval Studies, Toronto, 1974.
tabulation, and the presence of “G” in the ogham writing might be assumed to have come from the third letter of the Greek alphabet, gamma, and not from the “G” of the Latin alphabet.

The twenty-four runes are arranged in three groups of eight; the twenty ogham characters in four groups of five. The Latin and Greek alphabets have no pattern, despite claims to the contrary. The ogham system apparently was inspired by runes to the degree that it dropped the common ABC order and collected its letters in equal groups. Yet its choice of letters was not the same as the runic alphabet, since it included “a”, not in the runes but in the Greek alphabet. It also included “ng,” not in the Latin but in both the Greek and the runic alphabets.

Many alphabets which descended from the Phoenician, including the Greek and the Latin, appear to have followed the seemingly meaningless ABC order, but the runic and the ogham alphabets did not. No convincing evidence exists that there had ever been any meaningful pattern in that common ABC order, nor was there a pattern apart from equal numerical groups in the runic order. However, a very meaningful pattern apart from the arrangement in equal groups did exist in the ogham order, as will be shown.

“It had long ago been noticed by Lepsius, Donaldson and Taylor that, embedded in the Phoenician, Greek and Italian alphabets there is a sequence of letters, - vowel, labial, gutteral and dental. What has, however, been ignored is that this system is extended a whole series further in the Greek than in the Phoenician alphabet, forming a fifth row [Ed.: under those column headings] and the beginning of a sixth. The liquids and sibilants were added later and form no part of such a scheme.”

Petrie then attempted to reconstruct those patterned columns, vowel, labial, gutteral and dental, but he had an appreciable portion of blank spaces in his grid, and he had four left-over Greek letters. Petrie’s highly speculative conclusion is very unconvincing. This is particularly so because it assumed the existence of “vowels” as part of the pattern in the ancient Phoenician alphabet, even though it is a fact that, although it began with a letter shaped like A, the Phoenician alphabet had no vowels.

The intriguing, long-lasting and unexplainable abc (or abg) order that is seen as long ago as in the Phoenician alphabet disappeared with the advent of Germanic runic writing about 250 B. C., although the runic order apart from the arrangement in equal groups was also apparently meaningless. The ABC order also disappeared with the advent of the pagan Celtic Irish ogham writing about 200 A. D., which it has been suggested had been partially inspired by runic writing. Yet the order of the ogham letters is decidedly not meaningless, because a highly sophisticated order emerged.

In contrast to the runes, there can be absolutely no doubt that the sequential pattern of ogham letters was based on different sound categories. In the abbreviated ogham alphabet of 20 letters, ten are consonants, and they appear in in two groups of five, written in one kind of pattern. A different pattern is then used for two additional groups of five letters each. In that different pattern, the first five letters were obviously considered semi-vowels, and only one of them is not today a semi-vowel. The second group of five letters in that different pattern are the five true vowels.

Whoever the pagan Irishman was who composed this ogham sequence for his 20-letter alphabet some two hundred years before Patrick arrived in Ireland, bringing the Latin alphabet with him, that old pagan (very likely a Druid) had a clear and astonishing understanding of the nature of speech sounds. He was able not only to distinguish vowels from consonants, which obviously must have been ancient knowledge,
as we know from the existence of written syllabaries. He was also able to distinguish semi-vowels from
letters normally considered consonants, and that is startling indeed! The fact that he was able to do so
certainly suggests he was associated with the highly educated bardic class, who were charged with
entertaining others in pagan Ireland by reciting aloud poetry and sagas. Certainly some kind of elocution
must have entered into that bardic training, and perhaps that is what gave rise to a clearer understanding
on how speech sounds are formed.

Available references on runes and ogham writing demonstrate that both were more important and
more widespread than has normally been recognized. In the article “Druidism” in the Catholic
Encyclopedia (1913), Volume V, p. 162-164, this appears:

“...information concerning the druids of Ireland... can be gathered from the casual references
to them in the epic literature of Ireland... it is clear that there were the most striking resemblances
between the druids of Ireland and those of Gaul. In both lands they appear as magicians, diviners,
physicians and teachers, and not as the representatives of a certain religion. In the saga tales of
Ireland they are most often found in the service of kings, who employed them as advisers because
of their power in magic. In the exercise of this they made use of wands of yew, upon which they
wrote in a secret character called ogham. This was called their ‘keys of wisdom’. In Ireland, as in
Gaul, they enjoyed a high reputation for learning...”

That article confirming the wide use of ogham inscribed on sticks was written by Joseph Dunn, Ph.
D., Professor of Celtic Languages and Literature at the Catholic University of America in Washington.
Dunn certainly qualifies as a reliable source. While such sticks would normally long since have rotted, it
is of interest to read the following in an August 8, 1993, newspaper article reporting comments of Marit
Ahlen, a rune expert at Stockholm’s Historical Museum in Sweden, which article will be referred to again
shortly:

“Most of the early wooden runes have perished, but at Bergen, on Norway’s west coast,
hundreds of message sticks were dug out of the clay where they lay preserved for hundreds of
years after a wooden jetty collapsed. ‘One of them was from an inland trader saying he had not
managed to get ale and also failed to obtain fish. But he said he shouldn’t complain and was
worried about how his wife was getting on back home,’ said Ahlen.”

That certainly establishes that runes were also written on sticks, and even that they constituted a
Norwegian version of the U. S. Mail. That also tends to confirm the ancient reports that ogham characters
were also written on sticks, which were far more easy to obtain than parchment, even though none of the
ogham sticks have survived.

In Volume VIII of the Catholic Encyclopedia (1913), in the article “Irish Literature,” pages 116 and
following, this appears on page 116:

“...This ogham script, as it is called, consists of lines, straight or slanting, long or short, drawn
either over, under, or through a given straight line, which straight line is in lapidary inscriptions
usually formed by the angular edge of a rectangular upright stone.... None even of the oldest Irish
manuscripts preserved to us is anything like as ancient as these lapidary inscriptions. The
language of the ogham stones is in fact centuries older than that of the very oldest vellums....
Early Irish literature and the sagas relating to the pre-Christian period of Irish history abound with
references to ogham writing, which was almost certainly of pagan origin, and which continued to
be employed until the Christianization of the island... but isolated ogham inscriptions exist on
grave stones erected as late as the year 600. When the script was introduced into Ireland is
uncertain, but it was probably about the second century.... it was too cumbersome an invention for
the facile creation of a literature, though a professional poet may well have carried about with him on his ‘tablet-staves’, as the manuscripts call them, the catchwords of many poems, sagas, and genealogies. Over a couple of hundred inscribed ogham stones still exist, mostly in the south-west of Ireland, but... sporadically... in Scotland, Wales, Devonshire and even farther east.”

The article, “Ireland,” in Volume 12, page 596, of the Encyclopedia Britannica stated that ancient Ogham writings demonstrate some early usages in the Irish language, even though the Ogham writings are very brief. The article said further that Ogham is actually a code, an abbreviated alphabet. However, it also stated that the alphabet on which Ogham was based was the Roman alphabet. Yet, as commented previously, that conclusion must be in error. One of the reasons for concluding that the alphabet on which Ogham was based was the Greek alphabet, and not the Roman alphabet, is the fact that the pagan Celts are known to have used the Greek alphabet. That fact is based on the testimony of Julius Caesar, himself.

The authors of the Encyclopedia Britannica article were convinced that Ogham had originated as a secret finger code, and had not been meant initially for writing. They pointed out that the Ogham marks can represent the fingers, since they are composed of series of lines from one to five. The article was written by true authorities: Robert Alexander Stewart Macalister, Professor of Celtic Archaeology, University College, Dublin, 1909-1943, and Anthony Thomas Lucas, Director (presumably about 1963) of the National Museum of Ireland in Dublin.

According to the Catholic Encyclopedia (1913), Volume V, page 316 in the article, “Education of the Deaf and Dumb”:

“... Venerable Bede... in his ‘De Loquela per gestum digitorum’ describes a manual alphabet.”

It is surprising to find that the testimony of the twentieth century scholars quoted above, concerning the use of a finger alphabet in the British Isles in the third century A. D., provides confirmation for Bede’s testimony concerning people manually signing the alphabet in the British Isles in the eighth century A. D. Perhaps the use of alphabetic hand signs as Bede saw it originated with the Ogham alphabet.

Other alphabets have more than twenty letters, but the five fingers can most easily produce only twenty combinations of lines. That is the best explanation for the peculiarly abbreviated 20-letter Ogham finger alphabet. Since the written Ogham was arranged in varying straight lines in groups of fives, it might well have been meant originally to represent finger positions, as implied by the scholars quoted. Perhaps straight vertical lines on one side of the dividing horizontal line meant the five fingers on the left hand, and those on the other side of the horizontal line meant the five fingers on the right hand. The written ogham vowels and semi-vowels were shown with lines on both sides of the horizontal dividing line, and that might have meant the use of the fingers on both hands. The slanted lines for the semi-vowels on both sides of the horizontal dividing line might have meant showing those letters by slanting the positions of both hands.

Ogham writing was indeed an abbreviated 20-letter code, but it presupposed the existance of an alphabet on which it was based. The historical record suggests that the alphabet on which it was based was the Greek alphabet, and not the Latin alphabet, as is usually assumed. The historical record also suggests that ogham writing dropped the customary the ABC order because it had been influenced by the already-existing runic alphabet.

Changes in the Irish language over the years produced four distinct forms of that language, according to the Encyclopedia Britannica, 1963, Volume 12, in the article, “Irish Language.” The first period ran
from 300 to 500 A.D., the time of the Ogham inscriptions. The other periods were Old Irish, 600-900, Middle Irish, 900-1200, and Modern Irish, 1200 to the present.

By the time the Old Irish period began, the Latin alphabet had become the norm, but it is curious that reports on the occasional use of Greek in Ireland for many centuries afterwards occasionally turn up in the literature. Perhaps there is more truth to those reports than is normally credited. However, concerning the use of the Latin alphabet, Volume V of Encyclopedia Britannica, 1963, in the article, “Celtic Languages - Irish,” stated that it was in the 400’s that the Latin alphabet arrived in Ireland, and by the 500’s the Latin alphabet was used for writing, not just Latin, but the Irish language as well. Ogham writing appears to have been displaced by the use of Latin, which fact appears to be additional evidence that the Ogham alphabet was not based on the Latin alphabet.

Although the history of Ogham writing is obscured today, the history of the runic alphabet is obscured even more, despite the fact that runes were in widespread use in pagan Europe for well over a thousand years. With such an acknowledged massive and widespread use, it is astonishing that so little attention has been paid to their history. In Volume 1 of Encyclopedia Britannica, 1963, in the article, “Alphabet,” on page 668, appeared Figure 5, “Comparison of Latin, Greek, Slavonic, and Runic Alphabets”. A comparison of those alphabets demonstrates that the runic alphabet, which had various forms, has similarities to both the Latin and the Greek. The article, “Rune,” in Volume 19, of the Encyclopedia Britannica (1963), said that the runes originated perhaps about 250 B. C. from an Etruscan alphabet from the eastern Alps. The article cited the 1928 work of the Norwegian, C. J. S. Marstrander, as its authority.

The existence of the sophisticated Ogham and runic alphabets in pagan Europe raises grave doubts concerning the presumed illiteracy of ancient times, including ancient pagan times. The pagan users of the runic and Ogham scripts were not even members of the Roman Empire, and yet they clearly knew how to communicate by writing. Ogham writing may have been limited to the bardic classes, but we have no way of knowing that. The only surviving Ogham writing is on long-lasting grave stones. Yet Ogham was not invented to write grave stones! Ogham was used, as mentioned elsewhere, on portable sticks, and it may well have been used also on such things as thin board sheets or bark. Such sticks with Ogham writing (or such thin board sheets or bark) would have disappeared long ago, just as runic writings (or Celtic use of Greek?) on such materials would have disappeared long ago. (However, as discussed earlier, some wafer-thin wooden sheets from the first century, A.D., containing messages in Latin in the Latin alphabet, have been found at the site of Hadrian’s Wall in Britain.)

Although we do not know how widespread literacy was among the pagan Irish, we know that runic literacy was widespread among the pagan Vikings. Accounts of wandering Vikings report their writing runic graffiti all over Europe, from Scandinavia to the Mediterranean. Writing is supposed to be a skill that was largely limited in the ancient world to the upper classes, and to the “intellectuals.” Are we supposed to believe that those wild old Vikings who rampaged all over Europe, often leaving written messages after them, were at heart really “intellectual” types?

Thousands of rough-hewn giant granite slabs in Sweden carry runes, telling stories of the Vikings, according to an article in The Star-Ledger of Newark, New Jersey, on Sunday, August 8, 1993, Section 8, Page 8. The article drew on information from the Reuters news agency. The article told of Vikings spreading the runic alphabet from the British Isles to the Bosphorus. Stockholm’s Historical Museum now organizes day trips to Swedish runestones, about 3,000 of which are in central and southern Sweden. Another 300 are in Denmark and 50 are in Norway. The runic monuments date from about 500 A. D. to 1000 A. D.

Marit Ahlen, a rune expert at the Museum, said:
“The runestones are Sweden’s oldest written documents. They give us poetry, names, places and events, but they are also works of art. And the stones stand in some of the most beautiful countryside.”

The article stated:

“Proud relatives of Viking seafarers erected many runestones to record their adventures and deaths far from home. Sven’s five brothers erected a stone in Uppland to report he had been about to raid England but died in Jutland first, adding with a curious twist, ‘May God and God’s mother help his spirit and soul better than he deserved.’ Viking adventurers etched their runic messages in stone as far afield as Athens and Istanbul, and one crew shipwrecked or delayed in Orkney spent the time carving their names and boasting of their attractiveness to women. ‘The runes were like the graffiti of the Viking age,’ Ahlen said. ‘But it was also a living language in use as recently as 100 years ago in parts of rural Sweden.’

“The Viking culture died out as Christianity spread northwards after 900 A.D., but northerners hedged their bets by raising runestones with Christian symbols to the memory of dead kinsmen, often testifying to deathbed conversions.

“Ahlen says the museum’s runestone trips have been a sellout, even in bad weather.... ‘It stimulates the imagination to look at these huge monuments and think of the Vikings crouched there with hammer and chisel.’"

All those Vikings with their hammers and chisels from Scandinavia to the Mediterranean and beyond were not members of some intellectual aristocracy, any more than the readers of the many millions of cheap chapbooks in eighteenth century England were members of an intellectual aristocracy. Why, then, is there the constantly recurring fable of enormous illiteracy in the Western world from ancient times almost until the twentieth century, when the facts so often disprove the fable, as with the Vikings? It is not hard to find a source for the fable. Government schools really began to spread in the Western world starting about the mid-nineteenth century, and government schools only came into existence to cure “illiteracy.” Yet if there had been no massive disease called “illiteracy” in the Western world, there never would have been any excuse for starting those government schools.

New writing systems to rival the Ogham and runic approaches are still being invented when the need calls for them and when clever men are able to meet that need. A remarkable example is described in When Hell Was in Session, Traditional Press, Mobile, Alabama, 1982, by Jeremiah A. Denton, Jr., a United States Senator in 1982. Denton had been a Naval pilot and flight leader when he was shot down and became a prisoner of war in North Vietnam. Denton’s imprisonment lasted from 1965 to 1973, during which long years he was usually in solitary confinement and was subjected to horrible tortures.

In a staged television interview which the North Vietnamese were trying to use for propaganda, Denton managed to use the already existing Morse code to outwit his captors and to communicate a message to the whole world. Looking directly at the television camera, Denton blinked the letters for the single word, “Torture.”

But the Morse code was not the method usually used for communication between the prisoners in the North Vietnam prison camps where men were usually held in solitary confinement for years. On page 21 of Denton’s harrowing but inspiring book, he said:
“Communications remained the heart of our existence. Without that slender and infrequent link with the others, I think I would have lost my mind.”

Within the prison camp, the isolated prisoners developed a superior code, a simple tap code for 25 letters of the alphabet, omitting K. It presumed a chart with a vertical line numbered going down from one to five and a horizontal line going across the top numbered from one to five. When the alphabet was inserted in the boxed grid that resulted, it produced letter names with two digits. Some examples are A as 1-1, M as 3-2, and Z as 5-5. The prisoners used the code by tapping on the walls between their solitary cells.

Denton said in his Preface:

“The numbers could be tapped, waved, scraped, swept, or whatever. The prisoners standardized numerous abbreviations, and with practice, they could send messages quite rapidly.”

That is certainly a tribute to the remarkable human brain. Under the most adverse conditions, these men were approaching “automaticity” in their use of their new “writing” system! It is only reasonable to assume that those who were sending and receiving Ogham and runic messages over a thousand years before had also approached or reached automaticity, because the human brain has not changed.

Irish children in the sixth century using wax tablets such as the Springmount tablets to write in the Latin alphabet were undoubtedly still learning to read as the ancient Romans and Greeks learned to read: by syllables. The ancient Greek Dionysius of Halicarnassus writing about 20 B.C. is quoted by Mitford Mathews, pages 6 and 7 of Teaching to Read, Historically Considered, The University of Chicago Press, Chicago, 1966. Mathews took the quotation by Dionysius of Halicarnassus, from W. Rhys Roberts, book, Dionysius of Halicarnassus, London, 1910, page 269:

“When we are taught to read, first we learn off the names of the letters, then their forms and their values, then in due course syllables and their modifications, and finally words and their properties, viz. lengthenings and shortenings, accents, and the like. After acquiring the knowledge of these things, we begin to write and read, syllable by syllable and slowly at first. And when the lapse of a considerable time has implanted the forms of words firmly in our minds, then we deal with them without the least difficulty, and whenever any book is placed in our hands we go through it without stumbling and with incredible facility and speed.”

Much has been written recently concerning the literacy levels in the ancient world. The assumption is generally made that only a thin layer at the top of society was literate. This is hard to reconcile with the fact that Pontius Pilate had “The King of the Jews,” written in Hebrew, Greek and Latin on the cross on which Jesus Christ was crucified. Pilate obviously expected the words to be read in all three languages by numbers of ordinary people. It is generally acknowledged that the Jews were highly literate in their own languages because of their intense devotion to the Sacred Scriptures. Yet, since Pilate also used Greek and Latin, Pilate must have known there were appreciable numbers of people around Jerusalem who were not Jews but who were nevertheless literate in either Greek or Latin.

The elaborately written-out Greek syllabary found in the sands of Egypt shortly before World War II (the Papyrus Gueraud Jouguet discussed by Marrou, mentioned previously) dated from the third century B.C. and proved that children were taught by the syllabary method at that time. It should be emphasized again that learning to read by the syllabary in Latin and Greek (or in any alphabet containing vowels) is a relatively easy and rapid process. Since literacy was so easily attainable, it was not beyond the reach of even simple and poor people, who were capable of teaching others, once they themselves knew how to read.
The syllabary method showed up again on a Greek papyrus in the third century A.D., essentially unchanged, which Tuer mentioned on page 387:

“In the State Museum of Antiquities at Leyden there is a Greek Abecedarium of about the third century A.D. on papyrus, in which the vowels and their combinations with consonants in horn-book fashion are in columns....”

Tuer reproduced the papyrus from the third century A.D. (Cut 173, page 388). The copy is badly scrawled, which suggests it is a learner’s copy, but it is clearly the beginning part of the syllabarium in Greek.

Neither did the ancient practice of beginners’ dividing texts into syllables disappear. It showed up on a seventh century A.D. text.

Tuer stated, on page 388:

“In part of an interesting papyrus fragment of the Greek Psalter, probably of the seventh century, lately acquired by the British Museum, the syllables are marked off by dots for the purpose of teaching scholars to read.”

The fact that the papyrus was divided into syllables, not words, is clear proof that “sound” and not “meaning” was the method used in teaching reading in Greek in the seventh century A.D. Yet, before the advent of the vowels, which first appeared about 800 B.C. in Greece, as discussed elsewhere in this text, it was not possible to read alphabetic scripts by syllables as “sound” but only by words as “meaning.”

The alphabet used by the ancient Jews lacked vowels and so could not construct sound-bearing syllables but only whole meaning-bearing words. As discussed elsewhere, that meant that the right, global-picture side of the brain was probably used instead of the left, sequential-sound side. Scripts lacking vowels correspondingly might be expected to run from right to left, since, as discussed elsewhere, eye movements controlled by the right side of the brain move from right to left, while those controlled by the left side move from left to right.

An article in the New York Times of November 16, 1993 (page 9), implicitly confirmed that ancient alphabets which lacked vowels, such as the one used by the ancient Jews, did produce “word” readers, and not “syllable” readers, and that such alphabets were read by the right, global-picture side of the brain. The article concerned the finding of a foot-high piece of stone, apparently in Israel, dated to the ninth century, B.C., in which phonetic letters spelled “House of David.” Yet those phonetic letters were not written from left to right, as might be expected if they were to be read by the left, sequential-sound side of the brain which produces eye movements from the left to the right. Instead the letters from written from the right to the left. Furthermore, dots were used to separate the words, further confirming that the script was perceived as a series of meaning-bearing words, and not as a stream of sound.

Therefore, the Jewish alphabet without vowels in about the ninth century B.C. produced a script which ran from right to left, to be read by whole-word “meaning,” even though that meaning had to be derived from the sounds of consonants. (A modern example is, “Th cw jmop vhr tmn.”) Yet, shortly after the vowels were invented as additions to the developing Greek alphabet about 800 B.C., the direction of script changed, running from left to right which apparently had never happened before with any script. That is obviously because the addition of the vowels made it possible to read script as a stream of syllable sounds, and streams of syllable sounds are obviously to be read by the left, sequential-sound side of the
brain which produces eye movements that go from the left to the right. In changing the direction of their
script, the ancient Greeks were simply reacting to that totally unsuspected “pull” from their own brains.

In obvious contrast to the ancient Jewish text which was divided between words, the ancient Greek
Dionysius of Halicarnassus writing about 20 B. C. and the Roman, Quintilian, in the first century A. D.
dated that children in those times were taught to separate texts into syllables, not words. The fact that
children were taught to separate Greek texts into syllables as late as the seventh century A. D., is shown
by the surviving fragment of the Greek Psalter from the seventh century A. D., cited by Andrew Tuer,
which was mentioned previously.

Children in the ancient world had been taught by simple rules how to divide written texts into
syllables, to make them pronounceable. Written texts were run together in the ancient world, with no
division between either words or syllables. The same practice showed up on that Greek text of the seventh
century A. D., which would also have been run-together, because texts at that time were still not divided
into words. Yet the seventh century A. D. Greek children were working with the Psalms, and not the
classics. Irish children are known also to have learned to read with the Psalms, but in Latin, from the fifth
century. It is obvious that the Irish children also had to learn how to divide the Psalms into syllables, to
make them pronounceable, which was actually a very easy thing to do in Latin or Greek.

It should be apparent, however, that there would have been no point to divide a text into syllables if
the sounds of the syllables had not been learned first. Certainly, therefore, the seventh century A. D.
Greek children must have been given the syllable tables first, just as the third century A. D. children had
been, or the exercise of dividing their run-together text into syllables would have been futile. So must the
Irish children have been taught the syllable tables first from the fifth century onwards. The first step for
these third, fifth, and seventh century A. D. children would therefore have been identical to the first step
for the north African children in 300 B.C., who were taught from that papyrus roll from 300 B. C. that
was found found in the sands of north Africa just before World War II. The ancient Greek syllabary was
outlined in full on that papyrus roll from about 300 B. C. Marrou presumed it had been a teacher’s guide,
and not a pupil’s text (Un Livre d’Ecolier), which had been the interpretation given by the 1938 title of
the book by O. Gueraud and P. Jouguet, Un Livre d’Ecolier du IIIe Siecle Avant Jesus Christ.

The fact that the Greek remnant from the third century A. D. is the latest surviving sample of an
ancient syllabary is not surprising. Such practice sheets had no value in themselves, as texts did, and most
practice would obviously have been on reusable wax tablets, and not on expensive papyrus, particularly
as papyrus became harder to get, before its use effectively died out in Europe after the Moslem conquests.
Teaching of poor children was also very probably commonly done on sand. Andrew Bell’s great
eighteenth century “discovery” was the use of sand trays for teaching in India. Yet writing on sand was
probably widespread in the ancient world, from the Mediterranean to Asia. The writing on sand even
showed up in the New Testament. In the Gospel telling of the woman taken in adultery whom the
self-righteous men were going to stone, Jesus said that the man among them who was without sin should
cast the first stone. Jesus then wrote on the sand in front of him, and, as he did so, the men all drifted
away and the woman was spared. It seems apparent Jesus was writing for a literate audience.

In any event, except for names, neither Greek nor Irish children in those centuries could have been
given “words” first because almost no texts were divided into “words” (which are actually parts of
speech) until the ninth century.

Tuer stated on page 389:
“In a very old work, Higden’s (died 1364) Polychronicon, Lanfranc shrewdly suspects from a man’s first utterance that he is almost ignorant, and places before him a copy of the Abecedarium (alphabet) to be explained."

It should be noted Lanfranc did not say “recite,” as in reciting the alphabet, but “explain,” most likely the use of letters in forming syllables:

“Tunc Lanfrancus ex prima hominis collocutione perpendens quod prope nihil sciret, abecedarium litterarum illi apposuit expediendum.”

Lanfranc lived in the eleventh century, and Higden in the thirteenth and fourteenth. The syllable tables were still most probably the introduction to reading, just as they had clearly continued to be in Greek in the third and seventh centuries A.D., and most probably continued to be in Latin in the fifth century and later. However, that Lanfranc presented an alphabet to be “explained” in the eleventh century suggests the whole syllable tables themselves were not written out, but that the learner was shown how to construct them from the alphabet table.

What Lanfranc probably expected to hear from the man, if he were truly literate, as an “explanation” of the alphabet, would be something like this:

“The vowels are a, e, i, o, and u, and the rest of the letters are the consonants. The first consonant is taken and put after each vowel in turn and makes these closed syllable sounds: ab, eb, ib, ob, ub. It is then put before each vowel in turn and makes these open syllable sounds: ba, be, bi, bo, bu. The same thing is done with all the consonants. To divide a text into these syllables, if one consonant comes after a vowel, it goes with the next syllable. If more than one consonant comes after a vowel, the first consonant stays with the first syllable.”

That is about all there was to teaching children to read in Latin in those days, except for the fact that some consonant blends, instead of single consonants, can be used before and after the vowels (such as bla, ble, bli, blo, blu, ... ant, ent, int, ont, unt, etc.). Even after explaining about the existence of consonant blends, it certainly made a very short “teacher’s guide.”

Learning the “fine points” of words that were irregular (which means they did not produce the sound they actually spelled) would come later as the children read the Psalms out loud.

The apparent reason that the later English horn book only included the syllables up to about “fe, fi, fo... “ was that these first few syllables were written out to demonstrate to the children the nature of their task. That “visual aid” of sample syllables, already constructed, on the hornbook (the first page of the ABC book) was apparently not present in Lanfranc’s day in England, since the ABC book had not arrived. In Lanfranc’s day, the instructor must have demonstrated how to construct syllables by writing them on a wax tablet. Yet, with the hornbook, children were obviously taught how to construct syllables from the sample examples. They were obviously expected to complete the syllabarium by using the vowel row at the top of the hornbook, picking out each consonant in turn from the whole alphabet which was also written at the top of the hornbook. They were obviously expected to use their fescue as a pointer when doing so.

The Beginning of the Shift from Sound to Meaning in the Latin Alphabet

Children in the ancient world practiced manually dividing up written matter into syllables until the ability to do so when reading orally became automatic. Word divisions were not normally used in Greece and Rome except on such things as monuments. The ability to syllabicate run-together print
automatically, however, is an ability which we lack today, since we have been trained on word-separated print. Lacking most of the ability to syllabicate automatically, we commonly slow down when meeting a new, multi-syllable word. Our script is divided into words and has by that fact moved closer to a meaning-bearing instead of a sound-bearing system. When word divisions became common about the ninth century, the first shift had been made in our writing system from “sound” to “meaning” and it resulted in our no longer being able to read run-together print “with incredible facility and speed” as was done in Dionysius’ day.

To understand that shift from “sound” to “meaning,” it is necessary to consider the nature of visual writing systems. Only two possible visual writing systems can exist: one in which symbols are made to stand for ideas, as in the Chinese character system, and one in which symbols stand for sound, as in syllabic systems (and in music notation). The alphabet, when used to produce sound, is actually a variant syllabic system.

As discussed elsewhere, the two types of writing systems are based on the structure of the human brain: one side of the brain normally is able to handle simultaneously perceived pictures, and the other side is normally able to handle sequentially perceived sound. Both writing systems can be read automatically, as can be shown by the fact that both can be handled by computers. It is only conscious “reading” based on “psycholinguistic guessing” which cannot be handled by computers. That proves, of course, that “psycholinguistic guessing” is actually a crippling disability and is the result of mixed and pathetically incomplete conditioned reflexes. Unlike “psycholinguistic guessing,” unimpaired conditioned reflexes do not require consciousness to operate and are apparently essentially the same in the human brain and in computers.

The Russian psychologist, D. B. Elkonin, obviously recognized this, when he said:

“Understanding, which is often considered as the basic content of the process of reading arises as a result of correct recreation of the sound forms of words. He who, independently of the level of understanding of words, can correctly recreate their sound forms is able to read.”

This quotation is from page 165 of Brian and Joan Simon’s Educational Psychology in the USSR, 1963, which reproduces Elkonin’s article.

Speech is a series of sequentially uttered syllables which automatically generate syntax, which syntax then automatically generates meaning-bearing parts-of-speech (words). In many languages, morphemes are modified according to their use in syntax, which clearly shows the resultant words are the PRODUCTS instead of the building-blocks of syntax. But words in English have largely been stripped of most of these additions, so English syntax is instead shown by word order. (“Dog bites dog,” is different in meaning in English from “Man bites dog,” but not in many other languages, where the subject, “dog,” would terminate with one word ending, and the object, “man,” would terminate with a different one so that changing the word order would not change the meaning.) As a result, we have lost the awareness the ancients obviously had that words are the END-PRODUCT of language: syllables/syntax/words.

The ancient peoples in the Near East learned that language could be recorded either by syllables (the building block of language) or by words (the end product of language). No other way was possible.

Language may be considered to have three levels: first syllables, then syntax-generating-words, and then meaning. Syllable sounds appear to be handled by the brain’s computer in Broca’s area in the left hemisphere, and syntax and the names of words by the brain’s computer in Wernicke’s area, also in the left hemisphere. Meaning appears to be handled in the front, conscious-bearing portion of the brain. However, although language is normally handled only by the left side of the brain, the initial perception
of print (and that includes the initial perception of printed language) can involve either the left or the right sides, either the left angular gyrus area or the right angular gyrus area in the back of the brain.

The left side of the brain is considered to be the language side, and the right side of the brain is considered to be the spatial (“picture”) side. Sound-bearing syllable writing would therefore initially be processed through the angular gyrus on the left side, but meaning-bearing picture writing through the angular gyrus on the right side. However, even though that initial perception step may have been done by either the right or left side, the next steps, turning that initial perception of print into actual language, would normally be handled only by the left, language side of the brain.

When meaning-bearing pictures are initially read by the right side (presumably by the right angular gyrus area) and their meaning is perceived, they are devoid of names until Wernicke’s area on the left side is activated to label them with names. This is how Japanese Kanji writing is apparently handled. First the meaning is “read” and perceived by the right side of the brain. Only afterwards is a word name attached to the meaning by Wernicke’s on the left side, and only afterwards are the syllables pronounced by Broca’s on the left side. Yet with Japanese Kana syllables, the sequence is apparently reversed: first the syllable sounds are pronounced by Broca’s, then the word-name is attached by Wernicke’s, and lastly the meaning is perceived by the conscious part of the brain. This reconstruction of what must happen in the reading act is my own, drawn from several sources describing various portions of the sequence, since I have never seen any completed sequential explanation in print of what actually happens when we read. Surely this is enormously curious.

In the ancient Near East, about five thousand years ago, Egyptians were forming their hieroglyphic-character, meaning-bearing “word” system with some sound signs for consonants. Nearby Sumeria was inventing a sound-bearing “syllable” system which also contained some meaning-bearing characters. Egyptian writing became dominantly meaning-bearing (“words”), while Sumerian became dominantly syllabic or sound-bearing.13

Yet, as I. J. Gelb explained in his writings, (as in his article “Logogram and Syllabary,” page 334A of Volume 14, in the 1963 Encyclopedia Britannica), the Egyptian “consonant” signs should not be considered as consonants, because they were really an abbreviated syllable system. “B,” for instance, stood for any syllable formed with b: ba, be, bi, bo, bu, etc. After a thousand years or so, the Protosinaitic syllabary developed out of these Egyptian influences (Davies, p. 42f). It was this abbreviated syllable system which was used in the ancient Canaanite/Phoenician syllabary, and it is presumed it may have developed from the Protosinaitic syllabary.

The left side of the brain scans from left to right, but the right side of the brain scans from right to left (“Lateral Eye Movements (LEMs)” as discussed by Sid J. Segalowitz in his book, Two Sides of the Brain, Prentice-Hall, Inc., Englewood Cliffs, New Jersey, 1983, pages 80-8l). The right side of the brain should be used for reading meaning-bearing symbols, as it is the right side of the brain which deals with pictures. The question arises, then: why did the Phoenicians write from right to left in their script, since their script was sound-bearing like the Protosinaitic from which it was derived? The obvious answer is that, lacking the vowels, Phoenician could not be read back as sound-bearing syllables but only as meaning-bearing whole words (sight-words). Therefore, with their letters, they could consciously spell - and read back - only meaning-bearing whole words, never syllables.

When the Greeks, between probably 800 and 700 B.C., invented the vowels, they reduced the newly completed alphabet to a purely syllabic system. As William A. Mason said in A History of the Art of Writing (The Macmillan Company, 1920, 1928, page 343):

“...The early Greeks also may be credited with other substantial contributions to the alphabet. At the time when the earliest known Thera inscriptions were written there already had been evolved out of the Phoenician characters five true vowels: alpha, epsilon, iota, omicron, and upsilon....”

Now that writing was purely sound-bearing, it could be read by the left or language side of the brain, understanding (meaning) arising only as a result of the recreation of the sound forms of words, as the Russian D. B. Elkonin described alphabetic reading (quoted in Brian and Joan Simon’s Educational Psychology in the USSR, 1963, page 165.) It is rather amusing to see what this switch from the right side to the left side of the brain caused in these early writing systems. When vowels first arrived in Greece, writing ceased to move from right to left, but the direction of their writing showed the great puzzlement caused to these ancients by the totally unsuspected “pull” from their brains. They now had to be using the left side of the brain to read their sound-bearing syllabic print, and eye movements dominated by the left side move from left to right. Therefore, they stopped writing consistently from right to left but showed great initial confusion. As William A. Mason said in his 1920 book, page 340:

“Strange as it may seem to us today many queer experiments were tried by the early Greek scribes before they finally adopted the consecutive left-to-right writing of each succeeding line. A strong predilection was manifest for continuous and uninterrupted writing. This was carried out in a variety of ways before the writing became standardized. Sometimes the writing was boustrophedon (Ed.: meaning as the ox plows) with the letters reversed in the alternate lines, sometimes the boustrophedon lines were written in inverted characters, and sometimes the writing proceeded spirally from the middle, at times rightward, again leftward.”

This confusion did not last long, and the ancient Greeks responded to the pull of their brains by switching the direction of alphabetic writing, now that it was sound-bearing and not meaning-bearing, from the left to the right.

Happily, mankind now had a totally syllabic and efficient system of writing which was sound-based. The ancients learned to read this syllabic writing with great ease, as shown by the quotation from Dionysius of Halicarnassus. No separation existed between the written syllables which were generating syntax as they were read aloud. (Oral reading was the norm as late as the time of St. Augustine of Hippo in the fourth century. W. J. Frank Davies reported about St. Augustine’s surprised comments on seeing St. Ambrose reading silently, in Teaching Reading in Early England, Pitman Publishing, London, 1973, page 78.) It was Alcuin, the English monk in the court of Charlemagne about the year 800, who “improved” this ancient system of continuous text by making it standard to show separations between parts of speech, or “words,” which had previously only been done on such things as monuments. What Alcuin actually did was to take the first step to change a sound-bearing system into a meaning-bearing system.

However, in the very literary culture in Ireland from about 500 to 800 A.D., before the Viking invasions and wars which lasted till almost 1100 A.D., no word separation normally existed on texts.

Of course, Latin, Greek, Arabic, Hebrew, Cyrillic and other scripts, which are variations of the alphabetic system, are not the only kinds of writing on earth. The other most common writing system on earth is the Chinese, and its adaptations as in Japanese. Chinese script is assumed originally to have been a syllabic sound-bearing system but very rapidly became meaning-bearing because of the nature of Chinese syllables and the many dialects in Chinese. It was only in the 1950’s after the Communists had...
taken over in China that Pinyin alphabetic characters were added to Chinese script, obviously to improve it by adding “sound.” However, the Japanese, because of the nature of their language, added syllable “Kana” characters to the Chinese “Kanji” characters many centuries ago to make the script adaptable to the Japanese language.

As has been discussed, all writing in the world is either meaning-bearing, like Chinese and the Japanese Kanji characters, or syllabic and sound-bearing like the Japanese Kana characters and alphabetic print. Many writing systems, like the Japanese, have used both meaning-bearing characters and sound-bearing characters. As has also been discussed, alphabetic writing is only an extended, economical form of syllabic sound-bearing writing and had its origin in some of the Egyptian characters which were sound-bearing. Although the Sumerian types of writing systems were predominantly sound-bearing syllabaries, they nevertheless died out and it was a small portion of Egyptian material which survived to evolve into alphabets. Early alphabetic writing has had numerous other descendants besides the Greek and Roman alphabets, such as the Arabic and Hebrew alphabets.

Despite the widespread use of Chinese “meaning-bearing” characters, it is alphabetic “sound-bearing” writing which has become overwhelmingly the dominant form of writing on earth. Specific information on the history of the world’s major writing systems is given in the remarkable works of I. J. Gelb, for those who wish to check further.

The incredible utility of the mere twenty-six letters of the present-day sound-bearing alphabet, when used sequentially to reproduce syllables, is matched by the incredible utility of the mere 10 Arabic meaning-bearing digits: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, when written sequentially to show place value. It is really astonishing that with only these thirty-six symbols, used in very specific sequential fashions, mankind has developed the ability to record and to transmit to future generations almost any thought of which mankind is capable! However, if the proper sequential use of either alphabetic letters or Arabic numerals is lost, so will the utility of either be lost. If the Arabic digit numerical system were to lose most of its meaning-bearing nature by abandoning its place value notation, the system would become largely worthless. Correspondingly, when the alphabet is permitted to lose most of its sound-bearing nature by ignoring the sounds of the syllables formed by it, it also becomes largely worthless!

The Persistence of Culture

The persistence of cultural customs is quite astonishing. That Irish child in the sixth century who was probably the user of the Springmount wax tablets went from the alphabet and its mysteries to the Psalms in Latin as the second step. Locke 1,100 years later said the ordinary route in reading in the late 17th century was the horn book (alphabet, syllabarium and the Lord’s Prayer), primer and then the Psalms in English as the third step. Noah Webster testified that in the mid-eighteenth century when he was a boy the second step in reading was the Psalms in English. While government schools certainly did not include the Psalms in teaching reading, many still at least included the reading of a portion of a Psalm in each day’s opening exercises until the U. S. Supreme Court decision outlawing prayer in schools about 1963. When I started teaching in Wayne, New Jersey in 1963, I found a Bible in the bottom desk drawer of the teacher’s desk that was in my classroom. Yet no part of that Bible including its Psalms could even be read to children in September, 1963, in any government school. Culture is far more likely to be tailored rapidly by change-agents to their liking than to persist in government schools.

A comparable cultural persistence to that of reading the Psalms in schools is shown by the use of the “Donat,” the Ars Minor or small Latin grammar widely used from the time St. Jerome was a schoolboy in the fourth century until the Reformation in the sixteenth century, and to some extent after that. It was still being used in some Italian schools as late as the twentieth century! In The Ars Minor of Donatus, by
Wayland Johnson Chase, University of Wisconsin, Madison, Wisconsin, 1926, Chase stated (page 10) that in Italy:

“...it is reported to be still employed in some of the schools.”

It should be noted here that, like the reading of the Psalms, effective teaching of English grammar has been swept from American schools by “experts.”

The one-thousand-five-hundred-years-long use of the Latin “Donat” grammar, of course, argues for a similar persistence in the unchanged systematic teaching of the syllabarium, which, it should be noted, the first century Latin teacher, Quintilian, felt was essential. Quintilian’s comments to that effect are quoted, in translation, elsewhere in this text. (The original Latin can be seen in The Institutio Oratoria of Marcus Fabius Quintilianus, With an English Summary and Concordance, by Charles Edgar Little, George Peabody College for Teachers, Nashville, Tennessee, in Two Volumes, printed for George Peabody College for Teachers, Nashville, Tennessee, 1951. Volume I, which work was only completed after Little’s death. On pages 26 and 27 appears that work’s translation of Quintilian’s comments on the syllabarium, which is very inferior and incomplete in comparison to the translation quoted elsewhere in this text. Nevertheless, on the opposite pages appears the full original Latin: “Syllabus nullum compendium est, perdiscendae omnes nec, ut fie plerumque, difficillima quaeque earum differenda, ut in nominibus scribendis deprehendantur.” Etc.)

The Utility of Written Latin

In Europe, after the fall of the Roman Empire in the early fifth century, and until the Reformation in the sixteenth century, Latin remained the language of most written communication and most books.

“Today we might underestimate the place and extent of Latin in the life and business of (England) in the Middle Ages. Though the English peasant conducted the affairs of his everyday life in his own vernacular, he could not escape being exposed to Latin. Every man had to attend church, and every man from childhood had to participate in prayers.... According to Giraldus Cambrensis, when Archbishop Baldwin was journeying through Wales, c. 1200, he found he was best understood when he was using Latin as his preaching medium....

“Latin remained the language of international communication throughout the whole of this period.... it was also the recording medium for most merchants, accountants and lawyers, with tallies, charters, wills, agreements and other documents being drawn up in it. Right into the sixteenth century traders and shopkeepers kept their accounts in it, and most of the entries in the Day Book of John Dorne (1520), a sort of catalogue of books of the period, were written in Latin.”

It is difficult for people today to realize how unstable and changeable most European languages were when they were largely oral, before the arrival of the printing press. In addition, these volatile languages had many shifting dialects. By contrast, modern European languages are relatively stable, their stability assured by a vast amount of written literature and by standard dictionaries with “correct” pronunciations and meanings.

“The symbolic character of writing has been partly lost sight of in the most advanced systems, which strives to make characters correspond to spoken sounds, while it stands out most starkly in the more primitive systems, where the spoken-tongue intermediary is omitted, and the character is symbolical not of a sound, but of a thought-concept.

“When a written form is achieved, the result is generally greater stability in the spoken tongue. Many languages of primitive groups are unwritten and consequently highly fluctuating, with many dialects, a rapid rate of change, and an undetermined standard form. Similar high variability in the spoken language is to be observed in tongues like Chinese, in which the written symbol for the thought rather than for the sound still persists. An ideographic system of writing places little restraint upon the spoken language. A phonetic system constricts the spoken tongue into a mold, forces the speakers, to a certain extent, to follow the traditional pronunciation, as indicated in the equally traditional orthography, rather than their own whimsical bent, and gives rise to ‘correct’ and ‘incorrect’ forms of speech which, were the spoken language unrestrained by a written form, would be equally ‘correct’ variants or, at the most, conservative or innovating forms.”

In this excerpt, Dr. Pei explained most lucidly why most European vernaculars were so highly changeable before they were recorded in writing, and why Latin during the same period, because it was written, remained relatively so very stable.

Of course, Latin had once been a second vernacular language for the common people, as well as a literary language for the literate, within the boundaries of the old Roman Empire. John Morris, who wrote The Age of Arthur, A History of the British Isles from 350 to 650, (Charles Scribner’s Sons, New York: 1973), claimed that spoken Latin died out in Britain among the common people after the fall of the Roman Empire, at which time “British turned into Welsh.” Yet perhaps spoken Latin never really died out among the common British people in what is now Wales, since spoken Latin is known to have been widely understood in Wales about 1200. (In contrast, in Charlemagne’s France, it was acknowledged that the common people could not understand spoken Latin about 800 A. D. Nor could they in King Alfred’s England not long after.) The Church and its official use of spoken Latin took over in Britain after the Roman Empire and its official use of spoken Latin disappeared about 400 A. D. Yet spoken Latin could well have remained a living second language for most of the Welsh instead of dying out, since almost all of them regularly attended the Latin services in church throughout all those long years from about 400 to after 1200. In contrast, there was no such spoken Latin tradition among the Anglo-Saxon ancestors of King Alfred’s subjects. The turmoil over the years in the land that became Charlemagne’s realm was certainly sufficient to wipe out a good part of the vestiges of Roman culture there, such as spoken Latin.

Yet, for those who were literate in all European countries, written and spoken Latin during those long centuries provided the means to bridge language differences, and the means for accumulated learning to bridge those centuries, as well. Such Europeans who could not have understood each other’s spoken dialects understood each other very well when they spoke Latin. Latin was a living, not a dead language, for the literate in those schools and countries. In addition, the students understood the Latin authors they were given to study, just as they understood the Latin Bible. To read and write during those long centuries from about 400 to well after 1200 meant, for the most part, to read and write in Latin.
Chapter 5
A Comparison of the Early with the Late Middle Ages, with a Discussion of the Generally Unacknowledged Drop in the Cultural Level and Its Effect on Literacy

In the later Middle Ages, after about 1150 A.D., it is evident from an unbiased reading of source material, without any preconceptions, that a sharp cultural and religious decline set in, in the British Isles and elsewhere. This was despite increased material prosperity that had accompanied an increase in population. (However, the population was abruptly decreased and the economy greatly but relatively briefly disrupted in the mid-fourteenth century when the Black Death or bubonic plague had wiped out one-third of the European population.) In the degenerate period of the later Middle Ages, the quality and extent of spoken and written Latin declined.

The cultural loss (in addition to the population loss) from the Viking raids on Britain, Ireland and the continent had been enormous. The raids lasted close to three hundred years, from shortly before 800 A.D. until well after 1000 A.D.

“...in 885-86 [the Danish army] was concentrating its efforts on the siege of Paris, where the forces of Christendom made a last desperate stand.

“It is of these dark years that the chronicler of St. Vedast [Annal. Vedast ann. 884] writes, ‘The Northmen cease not to slay and carry into captivity the Christian people, to destroy the churches and to burn the towns. Everywhere there is nothing but dead bodies - clergy and laymen, nobles and common people, women and children. There is no road or place where the ground is not covered with corpses. We live in distress and anguish before this spectacle of the destruction of the Christian people’....

“The Vikings once more diverted their efforts against King Alfred in the great invasion of 892-96, which is so fully described in the Anglo-Saxon chronicle, from which Wessex finally emerged battered but undefeated....”

The Vikings had not ceased their attacks with their defeat by King Alfred. A century later, the attacks were even worse. Dawson wrote on pages 93-94:

“Again for the last time the Viking fleets were launched against the West, and a new age of barbarian conquest began.... It was, however, England rather than the Continent that was the chief victim of the new Viking attack. The restored Christian kingdom of the house of Alfred, which had attained its zenith under King Edgar (959-75), had now fallen on evil times, and under the pressure of invasion it collapsed in blood and ruin. For twenty-five years England was plundered from end to end and drained of immense sums of money, relics of which are still found in graves and hoards and in runic inscriptions from one end of Scandinavia to the other. Finally, in 1016, Canute, the son of the leader of the pagan reaction, was recognized as king of England, thus becoming the founder of an Anglo-Scandinavian empire.”
A prayer which it is reported as common at the time of the Viking raids and invasions was, “From the fury of the Norsemen, oh Lord, deliver us!” Besides running a massive slave trade, selling captured Christians into slavery to the Spanish Arabs and eastern Islam (described in Michael Wood’s In Search of the Dark Ages, Facts on File Publications, New York, New York, and Oxford, England, 1987, pages 167-170), the early Vikings, before their own conversion to Christianity, exhibited a curious hatred toward the Christians’ books, often throwing them into rivers or lakes when raiding monasteries. The following, reported in Proceedings of the Royal Irish Academy, Vol. II, Dublin, 1844, (page 311?) is witness to the massive destruction of manuscripts in Ireland during that period:

“Mr. Petrie exhibited a drawing... of an ancient inscribed grave stone at Clonmacnoise... as a characteristic example of the usual sepulchral memorials of the Irish, from the sixth to the twelfth century... but also as a monumental record of a person very eminently distinguished for his learning in Ireland in the ninth century,...'Suibhne, the son of Mailaehumai.'

“Of the celebrity, in his day, of the person who is thus recorded, the Irish Annals, as well as those of England and Wales, bear abundant evidence. In the Chronicon Scotorum his death is thus recorded in the year 890.... in the Annals of Ulster... more correctly 891...

“Sir James Ware, in his Irish Writers, tells us, that ‘his works, and the titles of them, are lost.’

So, all that is left now of a ninth century scholar and author who was famous in his day is his grave stone. Presumably his works were “drowned,” as Fergal McGrath, S. J., explains in Education in Ancient and Medieval Ireland, (Studies “Special Publications,” Dublin, Ireland, 1979, page 123):

“‘DROWNING OF BOOKS

“A special menace to culture was the destruction of manuscripts by the Norse invader. There is frequent mention of the pitching of books, with other unwanted articles, into the nearest lake or river. Thus, in 922, ‘there came after that a fleet on Lough Dergderch, and they plundered Inis Celtra, and they drowned its shrines, its relics and its books.’ This destruction of books may have been in some cases motivated by hatred for the religious character of most of them, but probably more often it was due to simple contempt for what appeared to be useless lumber. These Norse pirates were not indeed uncultured savages.... But the Norse were illiterate.”

Yet many Norse were not illiterate, in the true meaning of the word, which would be that they were without “letters,” because the Vikings did have a true alphabet, the runes, as discussed earlier. Runes had spread to Scandinavia and been in use there for at least several hundred years when the Vikings started their raids about 800 A. D., having originated among Germanic peoples to the north of the Alps about 250 B. C. Runic letters were, however, very different in appearance from the Latin letters written in Irish script, and it is almost certain the pagan Norse were “illiterate” in those texts. The “shrines” referred to were often elaborate and costly containers made to hold special bells which had a religious history and which were highly prized (The Catholic Encyclopedia, Volume II, 1913, page 419) or made to hold texts such as the Cathach of St. Columba.

The latter is the copy of the Psalms from the St. Jerome Latin translation which St. Columba personally copied about 560 A. D. when St. Jerome’s translation first reached Ireland. The Cathach is still in existence, preserved in the library of the Royal Irish Academy, to which organization it had been donated in the nineteenth century by a descendant of St. Columba’s family. It had been held in his family for those thirteen centuries. Its far newer eleventh century Silver Shrine is in the National Museum of Ireland (R. I. A. Collection), Dublin.
Yet, as a result of losses from Viking raids and other influences such as the Normans, much of the “Insular” (Irish, English, Welsh and Scots) past has, indeed, been drowned. As recently as the beginning of the nineteenth century, in 1810, the excellent English church historian, John Lingard, who wrote Antiquities of the Anglo-Saxon Church, seemed unaware of the strong link between England and Ireland in the early days of Christianity. Only recently have excellent scholars such as John Morris, who wrote The Age of Arthur, A History of the British Isles from 350 to 650, (Charles Scribner’s Sons, New York: 1973) been piecing together the history from what writings remain. Yet the English language itself confirms the existence of the religious and cultural links between the English and the Irish in that period.

“Other Latin words came into Anglo-Saxon, or Old English, with the missionary work of St. Augustine, who landed in Britain in 597. The language lacked most of the words necessary to express the technical ideas of Christianity, and the gaps had to be filled by borrowings.... A few words of this period seem to have been taken first into Irish, and then brought by Irish missionaries to England: such are the words Christ, alms, monk, which start as Greek. These words are recognized as having passed through Irish, by some peculiar development in the sounds, as for example the long vowel in the name Christ....”

Kent listed many words which he attributed to St. Augustine, presumably because they lacked specifically Irish phonemes:

“...church, devil, minster, school, clerk, deacon, synod, stole, anthem, organ, pope, priest, all taken from Greek into Latin before they passed into Anglo-Saxon; abbot, from a Semitic dialect (Syriac) and angel, from Persian, passing through Greek and Latin into Anglo-Saxon; alb, cope, nun, shrine, mass, font, shrove (in Shrove Tuesday) and shrive, which are from pure Latin, or at any rate not traceable beyond Latin.”

There is no guarantee, of course, that such words came from Canterbury (Italian) and not York (Irish) influences simply because they lack specific Irish accents. It is noteworthy that the most important word of all, “Christ,” can be tied to the influence of the Irish monks through its accent. Kent listed as words with Irish accents Christ, alms, monk, tunic, ass, verse, fiddle, fan (for winnowing), and kiln. A sentence can be made of three of the words with such definite Irish accents: “Monks preached the giving of alms in the name of Christ.” But, the monks were not taking such alms themselves, as John Morris wrote in The Age of Arthur, pages 391 and following, quoting the eighth century English historian Bede.

With Bede’s history as his source, Morris told of Aedan, an early Bishop in Northumbria, England, who came there from Iona, which was the island monastery just off the western coast of Scotland, close to Loch Ness, founded in the sixth century by St. Columba of Ireland. Morris then quoted Bede who was writing about Aedan:

“What chiefly won men to his teaching was that he lived with his monks the life that he preached. He made no efforts to acquire worldly advantage.... all that kings or rich men gave him he cheerfully gave away to the first poor man he met. He travelled everywhere... on foot, never on horseback unless he had to.... Timidity or obsequiousness never restrained him from criticising the sins of the rich, and he never gave money to great men.”

Morris continued:
“Aedan’s church was spread by the conquering armies of Northumbria, who made themselves masters of England. When the West Saxon king was persuaded to accept Christianity, his Northumbrian suzerain stood sponsor at his baptism; the kings of the East Saxons and the Mercians went north for baptism by the banks of the Tyne. In the south and the midlands, as well as in the north, monasteries modelled on Iona proliferated, often double houses, for women and for men... and Irish teachers established themselves in ruined Roman forts or towns....”

In 731 A. D., Bede (673-735 A. D.) wrote A History of the English Church and People (translated by Leo Sherley-Price, Dorset Press, N. Y.: 1985). Bede told (pages 195-196) of these teachers in Ireland in 664 A. D.

“At this period there were many English nobles and lesser folk in England who had left their own land... either to pursue religious studies or to lead a life of stricter discipline. Some of these soon devoted themselves to the monastic life, while others preferred to travel, studying under various teachers in turn. The Scots (Ed.: at that time, a synonym for Irish) welcomed them all kindly, and, without asking for any payment, provided them with daily food, books, and instruction.”

Morris continued:

“...the ecclesiastical centre of Northumbria was established on the island of Lindisfarne, where the concepts of Iona more easily endured. Bede observed that even in the second generation the monks of Lindisfarne:

“owned no money and no cattle.... They refused to accept land or estates for the building of monasteries, unless constrained thereto by the secular government. This custom continued in the churches of Northumbria for a long time after.’

“The Irish founded the Northumbrian church, but the English organized it, under the guidance of archbishop Theodore (of Canterbury, an elderly Greek who arrived from Rome in 669); and the Northumbrian church was the principal influence in the conversion of the rest of England, outside of Kent.... “

Bede’s history, despite the reference to the “conquering armies of Northumbria,” tells of a gentler and far more cultured (and overwhelmingly more religious) time than the late Middle Ages. It goes far to explain why the English and the Irish were the most literate and cultivated people in Europe in the time of Charlemagne, about 800 A. D. and why the semi-barbaric Charlemagne sent over to those “insular isles” for the scholars he needed. As Morris said somewhere in his book, in words to this effect, the “Dark Ages” are called “dark” only because of darkness at our end of the time tunnel, not theirs. There certainly was no “Dark Age” in the British Isles before the Viking raids started about 800.

King Alfred in the late ninth century had managed to repel the Viking raids. He tried to rebuild the earlier Anglo-Saxon literary culture from the days of the Venerable Bede and Alcuin that had been swamped under the Viking attacks. In his book, Religion and the Rise of Western Culture, Gifford Lectures Delivered in the University of Edinburgh 1948-1949, Christopher Dawson referred to King Alfred’s ninth century further wish for the establishment of universal literacy in the free classes in what is now England. On pages 89 and 90, Dawson reproduced King Alfred’s words in the preface to King Alfred’s translation into Anglo-Saxon of St. Gregory’s treatise on Pastoral Care or Cura Pastoralis. King Alfred’s Anglo-Saxon was translated into modern English by M. Williams:
“For it seems well to me that we also change into the tongue that we all know the books that are most needful to be known by all men; and we will bring it about as we very well may, if we have peace, that all the youth of free men of England, those that have the opportunity to give themselves to it, should be bound to learning, while they can be bound to no other usefulness, until the time when they all know how to read English writing. Let them further learn the Latin tongue who desire to learn it and to rise to a higher state.”

The position of women was high in King Alfred’s day, so his use of the word, “men,” as translated from the Anglo-Saxon, most probably meant “mankind,” or both sexes. What King Alfred was proposing, therefore, was universal literacy in the vernacular for the free classes. To the degree that he found possible, King Alfred tried to restore and even to improve on the pre-Viking Anglo-Saxon cultural level.

Much of the last traces of that cultured and gentle pre-Norman time in the British Isles which might have lingered on the bookshelves of monastery libraries of England were wiped out by Henry VIII. Henry raided the monasteries for their wealth and most of their books silently disappeared.

In Insight, April 2, 1990, in “Restoring Volumes Bound for Ruin,” by Cathryn Donohoe, the story is told of book conservator Frank Mowery’s experience in 1984 at the Folger Shakespeare Library in Washington, D. C. Mowery started to repair two tattered 16th century medical texts bound in a single vellum cover. (The quotation is reprinted with permission of Insight. Copyright 1990, News World Communications, Inc. All rights reserved.)

“Sixteenth century binders used to recycle fragments of old texts that they thought were useless and make covers of them,” Mowery explains, his voice alive with the remembered thrill of discovery...

“On that day in October 1984, as the layers of paper came away from the vellum cover in his hands, Mowery caught glimpses of Latin words in dark brown ink and a script - Irish half uncial - known to be the earliest form of Irish writing....

“In fact, the cover was an entire double page from what turned out to be a manuscript copy of a church history translation from about 625. That means it predates the eighth century Book of Kells and even Bede’s “Ecclesiastical History of the English People.”

“It had lain for centuries in one of England’s monasteries, scholars think and had become cover scrap when Henry VIII ransacked the cloisters and doomed their collections to binders’ shops or worse.

“...today this double page - famed among book lovers as a fragment from Rufinus’s Latin translation of Eusebius of Caesarea’s fourth century ‘Ecclesiastical History’ - sits in Dublin with the Book of Kells.”

That seventh century Irish work which had managed to survive the Viking looters did not survive the violence of their descendant, the Tudor King Henry VIII. In The Library, Fourth Series, Vol. XXIII, No. 1, June 1942, Neil R. Ker wrote an article, “The Migration of Manuscripts from the English Medieval Libraries.” He said (page 1)

“Most of the medieval manuscripts in recently formed British and American collections, and especially the more ancient and interesting of them, are continental in origin.... Of the thousands of manuscripts described in the Census of medieval and renaissance manuscripts in the United
States and Canada. not many more than a hundred are likely ever to have been on the shelves of an English religious house.

“... (pages 5, 6, 7) The crisis in the history of the libraries of English religious houses came at the moment of the Dissolution. We have little definite knowledge of what happened to books at that time.... We see that the lists of extant books are no guide whatever to the actual contents of the medieval libraries. We see also that the kinds of books which had on the whole the best chance of surviving were historical, patristic, and biblical, and mainly of the twelfth and thirteenth centuries, and that the kinds of books which had the least chance of surviving were those containing the scholastic theology and philosophy of the later Middle Ages, and the law-books. Manuscripts of this sort were destroyed wholesale. Thousands of leaves of them exist still in the covers of books bound in the sixteenth and seventeenth centuries.

“What happened at St. Augustine’s, Canterbury, can be illustrated in some detail from the medieval catalogue and from the list of extant books. The catalogue, compiled at the end of the fifteenth century and arranged in a subject order, describes more than 1,800 volumes, of which the comparatively large number of 165, or, on an average, 1 in every 11 survive. Evidently the survivors are not a chance residue, but, in the main, a deliberate selection....

“The destruction of books was much more complete in the libraries of the smaller houses...the contents of which are known to us from late medieval catalogues....”

It was about the year 1000 that the lights of civilization in Europe had finally flickered and almost gone out under the latest wave of barbarian invasions, that of the Vikings. Europe had been subject to barbarian invasions since before the fall of the Roman Empire in the early fifth century. The year 410 A. D. marked the end of Pax Romana, that centuries-long Peace of Rome which was guaranteed throughout the vast Roman Empire by the Roman armies. But Celtic Ireland, as an island on the fringe of Europe, had been outside not only the Roman Empire but outside the range of those waves of wandering barbarians to the north of Rome. To describe the centuries-long and exceedingly complicated barbarian turmoil on the European continent, from about 200 A. D. until after 1,000 A. D., which turmoil gave rise to the term, the Dark Ages, would require volumes. However, Ireland remained largely untouched by the fall of Rome, and by that centuries-long and complicated barbarian activity, until the terrible arrival of the Vikings about 800 A. D. In their “insular” relative calm, and despite sporadic internal wars, Christianity and learning prospered in Ireland in the long centuries from about 450 to after 800 A. D.

In the Age of Arthur, John Morris told of the spread of the monasteries with their Latin learning from Illtud’s fifth century Celtic Britain to Ireland. (St. Patrick is also generally considered to have come from Celtic Britain, near the Severn River, slightly earlier.) About a century after Celtic Britain had ceased to be part of the Roman Empire, Illtud’s Celtic British school had retained the general form of Roman schools. This, of course, by itself and independently of the contact with Coptic centers which is discussed elsewhere, is an argument supporting the continued use of the syllabarium to teach beginning reading in the early Irish schools, which later had such an influence on the Continental schools. After all, the famous Roman educator, Quintilian, had said:

“For learning syllables there is no short way; they must all be learned throughout. Nor are the most difficult of them, as is the general practice, to be postponed, that children may be at a loss, forsooth, in writing words. Moreover, we must not even trust to the first learning by heart; it will be better to have syllables repeated, and to impress them long upon the memory; and in reading too, not to hurry on, in order to make it continuous or quick, until the clear and certain connection of the letters become familiar, without at least any necessity to stop for recollection. Let the pupil then begin to form words from syllables, and to join phrases together from words. It is incredible
how much retardation is caused to reading by haste; for hence arise hesitation, interruption, and repetition, as children attempt more than they can manage; and then, after making mistakes, they become distrustful even of what they know. Let reading, therefore, be at first sure, then continuous, and for a long time slow, until, by exercise, a correct quickness is gained.”

Quintilian would have been horrified by the “whole language” approach of today for beginners which results in all those things which Quintilian said should be avoided.

The above translation of the most pertinent Quintilian section on reading, which Barnard printed in his American Journal of Education article, “Quintilian on Education.” (1863-1864?, page 113) is the best that I have seen. From Mitford Mathews’ quotation of a portion of the same excerpt and with almost the same wording, for which translation Mathews cited the 1875-76 work of John Selby Watson, London, it seems probable that Barnard about 1863 was quoting from an earlier Watson translation.

Morris told of the subsequent flowering of Latin studies in the monasteries in Ireland in the sixth century. By the seventh century or earlier according to some sources, Gaelic was being written in Ireland as well as Latin. In the seventh century, the English (or Anglo-Saxons, who had themselves arrived in Great Britain from the continent only about two centuries before) enthusiastically adopted both Christianity and the monastic system, and began to write down Anglo-Saxon. Caedmon, who died at Whitby about 687, was the literary giant of the seventh century who wrote in Anglo-Saxon. His work is considered to have been adapted by Milton in Paradise Lost in the seventeenth century, just as the Irish work by “St. Fursa of the Visions” who died in 648 in Peronne, France, is considered to have been adapted by Dante in his Divine Comedy of the thirteenth century.

We tend to forget today that such use of ancient tales was not considered plagiarism in those days. For instance, Shakespeare also used old tales in writing some of his works.

First the Irish monks in the sixth century, and then both the English and Irish monks in the seventh century, commonly working together, flowed over both barbarian Europe in the north and lapsed-Christian Europe in the south. They were rivers of light, spreading both their devout faith and their learning. Illustrative maps showing the great numbers of Irish and English monasteries founded on the European continent in the period from about 600 to 750 A. D. are reproduced in Appendix A, which shows various reproductions pertinent to this history.

Alcuin’s reference about 800 A. D. to the Latin texts in the library of his monastery in England is an indication of the quality of the scholarship of those “insular” monks. So are the classical allusions in the writings of St. Columbanus of Ireland, who founded Bobbio monastery in Italy about 600, though an argument exists among scholars concerning whether such classical learning was general or not.

These old Irish and English monks founded a great number of monasteries as they spread across Europe. They brought literacy with them, and monasteries before Charlesmagne’s time, or before the ninth century, are known to have had two schools for children: one for those intending to be monks, and one for those who were outsiders. (These schools are discussed in many unbiased works dealing with the Middle Ages. Specifically, refer to the article on “Monasticism,” in the paragraph, “Education,” page 463, Volume X, The Catholic Encyclopedia, 1913.)

The libraries of the monasteries were storehouses of pagan literature, as well as Christian writings. The libraries of St. Gall in Switzerland and Bobbio in Italy, for instance, were mined by Renaissance scholars in the sixteenth century. Of those monasteries which survived the Reformation in the seventeenth century into the Age of Unenlightenment in the eighteenth century, “enlightened” governments closed many and scattered what was left of their ancient libraries. Monasteries were still being “outlawed” in
Mexico in the nineteenth and twentieth centuries, and in France at the beginning of the twentieth century. These facts hardly support the claim that the last few centuries have been notable for cultural “progress” and a devotion to “freedom.”

However, unlike eighteenth century Austria, nineteenth and twentieth century Mexico, or late eighteenth, early nineteenth and early twentieth century France, Ireland had been a safe refuge for monk-scholars from the arrival of St. Patrick in the mid-fifth century until the Viking raids started about 800 A.D. That darkest period for western Europe, the period of the Viking assaults, lasted from about 800 to after 1000 A.D. It was only in 1014 that Brian’s Irish army decisively defeated the Vikings outside Dublin. But when the lights of civilization were finally relit by the 1100’s, it was the Viking rulers and their aristocratic allies who were holding the torches, now all calling themselves Christian. Before 1000 A.D., such barbarians had largely been outside the Christian world, but after that date they were inside it, and they were inside it as rulers, in Normandy and elsewhere, even though they were only a few generations removed from their marauding Viking ancestors.

“In the tenth century we find these adventurous sea-rovers making permanent settlements on the continent of Europe. Bands of them sailed down the coast and forced the king of France to yield to them the fair province ever afterwards known by their name, the Duchy of Normandy. More of them went up the Rhine, the Loire, and the Gironde, and fought the Moors on the banks of the Gaudalquivir. Others of them pushed on past the Pillars of Hercules into the Mediterranean and built a powerful kingdom in Italy. Still others even found their way to Greece and the Black Sea. They planted colonies on the coast of Prussia, rounded the North Cape and discovered a route by water to the White Sea. By way of the Dnieper, the Dniester, the Volga and the northern stretches of the Dvina, their enterprising hucksters and freebooters penetrated into the interior of Russia, and in the year 861 laid the foundations of Novgorod, of the kingdom out of which has grown the modern Russia. Still more of them sailed down the Volga, to the Caspian, and, by the Dnieper, entered the Bosphorus and nearly succeeded in capturing the capital of the Sultan.

“At the other extreme end of Europe more than half of Britain was already in their power. The kingdom of Alfred the Great was threatened and shaken to its foundation, and the outlying islands were entirely occupied by them. They placed a Danish sovereign on the throne of England. Indeed at one time, that is about the middle of the ninth century, it looked as if the Vikings were on the point of becoming masters of the greater part of northern and western Europe.”

The Danish sovereign to whom Macmanus referred was Canute, but Canute who became king of England in 1016 was unlike earlier Vikings. Christopher Dawson wrote the following in Religion and the Rise of Western Culture, Image Books, Doubleday & Company, Inc., New York: 1957, (Sheed & Ward, Inc.: 1950), page 94:

“But the victory of Canute was not a victory for paganism. As soon as he was in power he dismissed the Viking army and ruled England ‘under the laws of King Edgar’ according to the traditions of Christian kingship. He became a great benefactor of the Church.... He introduced English bishops and monks into Denmark and Norway....”

The Vikings had been defeated in Ireland in 1014 which had ended the invasions there. Shortly after, the Viking nations were converted to Christianity and with their conversion the raids ceased. As Dawson documented, they became instead devout Christian nations.
But those Viking leaders who had established themselves as rulers outside Scandinavia in other
countries were a very different matter. McManus believed that the Viking defeat in Ireland in 1014
decisively removed the Vikings from control of Europe. He missed the point. Long before then, the
Vikings had established kingdoms like Normandy, and it was their royal descendants who shortly after
succeeded in controlling much of Europe as warring sovereign kings. The Norman kings of England were
just such sovereigns. William the Conqueror from Normandy won out in England in 1066 and his
Norman successor, Henry the Second, invaded Ireland in 1171. It was after the installation of these
descendants of the Vikings on the European scene as members of the aristocracy, from England to the
Volga in Russia, that feudalism increased and the position of farmers and peasants degenerated into
serfdom. The level of general culture and decency inexorably dropped. Exceedingly ugly anecdotes have
come down concerning the brutality of these Norman “aristocrats” to members of their own families, as
cited I believe in Thomas Wright’s A History of Domestic Manners and Sentiments in England in the
Middle Ages (1862).

Bad as the semi-barbaric Merovingian kings had been a few hundred years earlier in France, the
Norman kings were far worse. Posing as defenders of religion after conquering England (and extending
their activities as far as Sicily and Russia!), the Normans committed such anti-religious and political acts
as driving Anglo-Saxon monks from their monasteries and replacing them with Normans. The English
understandably boast that they will never be slaves, but they were almost slaves under the Normans,
during which period of subjection to those foreign kings even King Alfred’s Anglo-Saxon language was
partially obliterated. It emerged from its 300-year-long near suppression in greatly changed form. A
Norman version of French had been spoken in English schools and government until the mid-1300’s!

The Normans coveted the goods of the church, and their rapine extended even to the little parish
churches. The practice developed that a lord could bestow the “living” or church income on any rector he
appointed, but the rector did not have actually to serve the church. He could, instead, hire a deputy vicar,
and give him only some of the revenues. Frances and Joseph Gies record, in their Life in a Medieval

“A notorious example was Bogo de Clare, younger son of an earl, who in 1291 held
twenty-four parishes or parts of parishes plus other church sinecures, netting him a princely
income of $2,200 a year. Bogo spent more in a year on ginger than he paid a substitute to serve
one of his parishes, in which he took little interest....

“The Church did not condone such excesses as that of Bogo, whom Archbishop John Pecham
called ‘a robber rather than a rector.’ Efforts were made to limit the number of benefices a man
could hold, and bishops visited their parishes to check on conditions. In 1172 Pope Alexander III
decreed that vicars must have adequate job security and must receive a third of their church’s
revenues. The Fourth Lateran Council (1215) further denounced the custom whereby ‘patrons of
parish churches, and certain other persons who claim the profits for themselves, leave to the
priests deputed to the service of them so small a portion that they cannot be rightly sustained,’
and pronounced that the rector when not himself residing must see that a vicar was installed, with
a guaranteed portion of the revenues....

“The ‘poor parson’ of the Canterbury Tales was the brother of a plowman who had carted
‘many a load of dung... through the morning dew.’ This parson ‘did not set his benefice to hire/
and leave his sheep encumbered in the mire.../ He was a shepherd and no mercenary.’ Despite his
peasant background, Chaucer’s parson was ‘a learned man, a clerk who truly knew Christ’s
gospel.’ His colleagues in the country parishes were not all so well versed. Archbishop Pecham
charged priests in general with an ‘ignorance which casts the people into a ditch of error.‘“
The fault for the ignorance of these 14th century English priests, the contemporaries of Chaucer and descendants of the Anglo-Saxons, was obviously not theirs; the fault was the greed of the Norman foreigners. It should be remembered that it was the Insular missionaries (the Irish and the Anglo-Saxons) who had flooded the Continent from the late sixth century to the ninth century, and who were justifiably renowned for their learning. The enormous numbers of monasteries they founded all over continental Europe which at that time was either barbarian or sinking back into barbarism became centers of learning. St. Gall in Switzerland and Bobbio in Italy are two famous examples of such monasteries. Both were found to be treasure-houses of classical literature when their libraries were raided in the “Renaissance.” Alcuin and other insular English and Irish scholars had been imported by the semi-barbarian Charlemagne about 800 A.D. because they were the most learned men in Europe and because Charlemagne could find no men like them in his semi-barbaric kingdom. The fourteenth century English “descendants” of the Anglo-Saxon Alcuin were ignorant only because King Harold had lost out at Hastings in 1066 to William the Conqueror.

In the degenerate late Middle Ages, even the quality of spoken and written Latin itself began to decline, though it took about one hundred years after the Norman conquest for the effects to begin to be felt in education and for the fundamental scholastic practices of previous centuries to begin to be diluted. Clear proof of Latin degeneracy - and proof of an astonishing move from “sound” to “meaning” in deciphering Latin printed texts! - is given in The Invention of Printing by Theo. L. De Vinne, New York: Francis Hart & Co., 1876. De Vinne said in a footnote on page 164:

“Abbreviations, which deformed written Latin to such an extent that it is almost indecipherable to modern readers, were... esteemed a positive merit. The habit of making them was continued after printing was invented.... [In] the Logic of Ockham, 1488.... [appears] ‘sic hic e fal sm qd ad simple’ meaning ‘sicut hic est fallacia secundum quid ad simpliciter.’ (The section even omitted punctuation.) In 1498, John Petit, of Paris, published a dictionary which professed to be ‘A guide to the Reading of Abbreviations.’ It was not published too soon, for the practice of making contractions had increased to such an extent that books of abbreviations were legible only to experts.”

Eventually, even the teaching of beginning reading deteriorated, when the wax tablets used since 600 B.C. were replaced with the ABC books, and beginners were separated from exposure to “grammar” by the invention of that new institution, the petty school which used those ABC books instead of the wax tablets. Furthermore, as shown by the pre-1534 Latin ABC, the first page of which is reproduced in Appendix A, even beginning reading material used some of the degenerate Latin abbreviations.

A superb and largely ignored source for the history of education in this period is Education in England in the Middle Ages, by Albert William Parry (1874-1950). Parry was Principal of the Training College at Carmarthen when his book was published by University Tutorial Press, Ltd., W. B. Clive, London, 1920. Although his book is listed in the card catalog of the New York Public Library, it is missing from their shelves. However, a 1975 reprinted edition by AMS Press, Inc., New York, N. Y. 10003, is available at the Library of Congress (call number: LA 631.3.P37 - 1975). Parry drew on original documents for the periods he discussed, as well as on excellent previous histories, many of which do not occur in other bibliographies, such as Brother Azarius’ (P. J. Mullany’s) Essays Educational, (Chicago, D. H. McBride & Co: 1896); and L’Abbe Allain’s L’Instruction Primaire en France Avant la Revolution (Paris: 1881). Parry wrote:

“Preface - The purpose of this book is to give an account of the provision which was made in this country for Education during the period from the Introduction of Christianity to the Eve of the Reformation.... Whilst this work was in progress, the late A. F. Leach published his Schools
of Medieval England. His book, however, differs essentially from mine, his aim is different, the conclusions he arrives at are different; further, as he does not quote the authorities for the statements he makes, I did not find his work of direct assistance.

(Page 244) “Until comparatively recently it was generally believed that the educational provision available in this country could not be traced back further than to the efforts of the Reformers of the Church in the sixteenth century, and to the influence of the Renaissance. We are now able to realize that the two centuries preceding the Reformation, at least, were a period in which facilities for education in England were widespread and practically open freely to all. The educational effect of the Reformation - even though undesigned - was to remove from the great mass of the people the opportunities for attending school which had previously been available for them. It is also extremely probable that the significance of the Renaissance upon the educational development of this country has been considerably exaggerated....”

Parry recorded data on the quality of education shortly after the arrival of the Normans, and of the changes that took place in education as control gradually passed from the church into other hands. He spoke of class distinctions existing in England before the fifteenth century (page 51):

“In practice the manorial system implied that freedom of movement and choice of occupation scarcely existed. Even before serfs could send their children to school, it was necessary that the consent of the lord should be obtained, and in many cases fines were exacted before this permission was granted....

“The point which we wish to emphasize here, is that the only real social distinction on a manor was that between a lord and his tenants. Between these two grades there was a great gulf fixed. Socially, they were as far asunder as the poles. Between the tenants themselves the social separation was slight.... Even the priest in charge of the majority of the village churches belonged to the same social grade as his parishioners, and, in many cases, he was as poor as any of them, and glad enough to get a few acres and to add to his income by joining in the common agriculture....”

Nevertheless, in the initial Norman period in the 1100’s, when education was not in any sense under the Norman king’s direct control, education maintained its earlier high standards. In pre-Norman times, class had been no barrier to education, as Parry remarks (page 54):

“Indisputable evidence of the social grade of those who attended the schools of the Church in the tenth century is available. Not only were the various classes of persons who were employed on agricultural labour, such as shepherds, cowherds, swineherds, represented, but even members of the “unfree” class are described as being present in the school of which Abbot Aelfric gives us a picture.”

The practice of freely educating the poor to a very high educational level continued for a time after the arrival of the Normans.

The devastation over the many centuries of the Viking raids had been enormous. Under such conditions, educational facilities must have almost totally collapsed in England by about the year 1000. Yet, a hundred years later, English education was reviving again. Both the collapse and the revival are suggested by remarks of Guibert of Nogent about the year 1100. Dawson, who wrote Religion and the Rise of Western Culture, Gifford Lectures Delivered in the University of Edinburgh 1948-1949, said on page 182,
Guibert of Nogent, who wrote in the beginning of the twelfth century, described in his autobiography how before his day and even in his youth there was such a lack of schoolmasters that they could hardly be found save in the most important cities, and even their knowledge was scanty and ‘hardly equal to that of the wandering clerks’ - clerculis vagantius - of ‘modern times’, when, as he writes elsewhere, letters were so flourishing and the number of schools so great that they were accessible even to the poorest.

“For about this time, in the last decade of the eleventh century and the first two decades of the twelfth, there was already a remarkable revival of culture and literary activity which was not identified with any particular cathedral school but was common to the Western provinces of France... and found its patrons in the Anglo-Norman court of Henry I and that of his sister, Adela of Blois....”

Parry discussed John of Salisbury who lived in the twelfth century (page 217):

“...the friend and adviser of Thomas a Beckett, at whose death he was present.... John tells us that whilst he was a boy he was placed under the charge of a priest, along with some other boys, ‘ut psalmos addiscerem.’“

John of Salisbury’s first step as a little boy in his English/Norman twelfth century education was the learning of the Latin Psalms, just as it had been in Ireland in the seventh century. It resulted in fluency in Latin. Yet there is little question that John was a poor boy when he was receiving this excellent early education, as he is clearly recorded as a very poor young adult later (page 220):

“Apparently John was obliged to maintain himself during this period, as he had no parents or relatives who could support him. Consequently, we find that he taught the ‘children of noble persons.’...”

“In order to apply himself to the study of theology, John returned to Paris. His course was interrupted by his poverty; during the necessary interval he again acted as tutor.”

Parry discussed on page 221 William Fitzstephen (d. 1190) who was employed by Thomas a Beckett and who witnessed the murder of his master. Fitzstephen wrote Beckett’s biography. Quoting Fitzstephen, Parry said Beckett:

“...passed the years of ‘infantiae, pueritiae et pubertatis’ in the home of his father and ‘in scholis urbis.’ When he became a young man, Thomas proceeded to Paris to study.”

Manifestly, urban schools or town schools existed in twelfth century England for boys living at home.

Parry continued (page 222):

“These accounts we have given of the education of John of Salisbury, Alexander Neckham, and Thomas a Becket are noteworthy. They show that education in the twelfth century was much more general, and much more advanced, than we usually think. The audiences, assembled at the school festivities, were able to understand, and thoroughly to appreciate the dialectical disputations carried on in Latin. So too, we learn elsewhere, that when Giraldus Cambrensis was giving addresses, he was everywhere understood when he spoke in Latin....”

Parry discussed the availability of education (pages 53-54):
“The main demand for education at this time came from those who desired some position or other in connection with the Church. As will be shown in a subsequent chapter, the Church provided facilities for education for three reasons: as a partner of the State she was responsible for providing it; as holding the view that intellectual training was necessary for moral perfection it was, of necessity, her mission to supply it; and, in order that a sufficient number of adequately equipped clerks should be forthcoming, it would be imperative that she should take the necessary action.

“An important question now arises. To whom did the Church offer facilities for education? To the gentry and nobility? To the middle classes? Or to the labouring classes?....

“The nature of the education received by the children of the ‘nobility and gentry’ will be considered in Chapter VI; here it will be sufficient to state that the intellectual part of their education was given by a priest, but it was provided at the expense of the relatives... hence, in the ordinary acceptation of the term, the Church did not ‘provide’ facilities for the education of the children who were of ‘gentle’ lineage.

“Two social classes remain: the middle classes and the ‘gutter poor,’ as Mr. Leach elegantly terms them. Which of these two classes did the Church endeavor to educate?

“The answer is obvious when we consider the social structure of the period. For practical purposes, the middle class in England did not exist until about the close of the fourteenth century. The social distinctions between the various classes of tenants on a manor were so slight as to be negligible... Consequently when the question is asked as to the social grade for whom the Church provided educational facilities, the answer is that such facilities were offered regardless of social standing, and were available for the poorest, even the ‘gutter poor’ if the term is desired.”

But, as has been shown, the content of the curriculum changed for the beginning levels toward the end of the Middle Ages, although what Parry stated remained essentially true for the schools considered as a whole (pages 216-217):

“Any student who enters upon an investigation of the schools of the Middle Ages, without any preconception of what was taught in the schools, and who diligently reads through the documents of the period now available, would unhesitatingly state that the curriculum consisted of grammar and song....”

The problem is with the definition of grammar, which once had meant beginning with letters, or the ABC. Children had learned the alphabet/syllabarium and gone on to the Latin psalter and then the grammar for centuries, but by the fourteenth century a clear split had appeared between those learning the Latin grammar with the Donat and those who were only using ABC books or learning “song.”

This distinction is clearly shown by Parry’s quotation of the curriculum of an English grammar school, as shown by an entry in the Ipswich Court Book of 1476-7 (page 228):

“The grammar master shall henceforth have the jurisdiction and governaunce of all scholars within the liberty and precinct of this town, except only petties called ‘apeseyes’ and song, taking for his salary from each grammar scholar, psalter scholar, and primer scholar, according to the tariff fixed by the Bishop of Norwich, viz. for each grammarian 10d., psalterian 8d., and primerian 6d. a quarter.”
The curriculum sequence by 1476 is clear: first the ABC book and/or song, and then, but ONLY for those to whom the higher Latin training was to be offered, the primer, the psalter, and the grammar, which were all in Latin.

In those days, however, there was a clear distinction between the ABC book in Latin, which children were to learn to read, and the catechism in English, which children were to learn from oral instruction. That distinction is shown by a quotation Parry gives on a petty school curriculum for 1526 (page 229):

“The first full curriculum of a school which we have been able to trace, is that which was drawn up for the use of the school which was founded in 1526 at Childrey, in Berkshire, by Sir William Fettiplace. The priest to be appointed to the school was required to be well instructed in grammar. The children in the school were to be taught, first, the alphabet, and then in Latin, the Lord’s Prayer, the ‘Hail Mary,’ the Apostles’ Creed, all things necessary for serving at Mass, the De Profundis, collects for the departed, and graces for dinner and supper; and in English, the Fourteen Articles of Faith, the Ten Commandments, the seven deadly sins, the seven sacraments, the seven gifts of the Holy Spirit, the seven works of mercy, the manner of confession, good manners and good conduct. In addition, if any of those who attended the school were capable of profiting by further instruction, the master was required to instruct them in grammar.”

The Latin portion of the curriculum was a recital of the content of the known ABC books which showed up in print within the next decade of this sixteenth century; the English portion of the curriculum was essentially the content of Peckham’s 13th century, Thoresby’s 14th century, and Gerson’s 15th century catechisms, referred to again later. But it is obvious that children in these English petty schools were not learning Latin through their almost immediate memorization of the Psalter in Latin which in earlier centuries had resulted in the Latin fluency referred to by Parry.

In the later Middle Ages, which were materially prosperous but socially degenerate, St. Thomas Aquinas with his great work, and the few who could be considered like him, were swimming upstream in an intellectual milieu that was floating the other way. A comparison of Barbara W. Tuchman’s A Distant Mirror, The Calamitous 14th Century, (Alfred A. Knopf, New York: 1984), to the pre-Norman A History of the English Church and People written by Bede in the eighth century (translated by Leo Sherley-Price, revised by R. E. Latham, and reprinted by Dorset Press, New York: 1985), is very illuminating concerning the vastly different cultural viewpoints in these two periods.

Although Bede wrote from a monastery, the content of his history shows he was very well informed. As mentioned, the Historia Ecclesiastica translated by Michael Herren, concerns adult lay scholars in Ireland in the seventh century who traveled around the countryside, depending on voluntary donations from local farmers, which they received because scholars were held in such high esteem. Bede also confirmed the open-handedness in Ireland of the seventh century to foreign scholars.

By contrast, in the period of the University of Paris in the fourteenth century, foreign clerical, not lay, students were often cheated and robbed by the local people with whom they dealt. Yet some of these clerical students might be said to have deserved it, because of their own sometimes appalling behavior. These later Middle Ages were the time of the rise of the universities. Many of their “intellectuals” of the thirteenth to fifteenth century were a very good match for the “intellectuals” of today who are busy creating a cultural wasteland with such “disciplines” as “deconstructionism” in place of the real study of literature.

The “seven liberal arts” had been known since the latter days of the Roman empire. The seven consisted of the trivium (grammar, logic and rhetoric), and the quadrivium (arithmetic, geometry,
astronomy, and music). But, in the later Middle Ages, even the study of the liberal arts often degenerated into futile discussions.

Grammar, logic and rhetoric, the “artes triviale” or elementary arts, concerned language. It is interesting that amidst all the worthless material being published today concerning the teaching of “critical thinking skills,” a certain amount of very sensible material is to be found. Yet “thinking” cannot be taught or conditioned. As discussed elsewhere, the term, “thinking skills” in the sense in which it is used today is an oxymoron. Today’s small amount of worthwhile material should more properly be labeled, “skills to use when thinking.” Actually, this worthwhile material is concerned with the ancient “skills” of grammar, logic and rhetoric. It is possible to learn or to “condition” these skills, which skills having once been acquired can be used on command as yardsticks to judge and shape the logic or orderliness of one’s thinking or speaking.

That “critical thinking” and specific, teachable, subject matter on logic were once considered to be synonymous was shown as late as 1957, by the title of a textbook on logic, An Introduction to Critical Thinking, A Beginner’s Text in Logic, by W. H. Werkmeister, Director, School of Philosophy, University of Southern California, published by Johnsen Publishing Company, Lincoln, Nebraska, in the 1957 revised edition of the original edition of 1948. The book taught the specific, dead, “subject matter” of “logic,” which was meant to be used to judge and shape the orderliness of “live” thinking, so that it could be sufficiently “critical.” Yet that dead subject matter, in essence only a series of rules, was obviously not itself the live activity of “thinking.”

In the universities in the later Middle Ages, “refinements” were introduced in teaching the ancient material of grammar, logic and rhetoric, which “refinements” were actually as degenerate as “deconstructionism” is in today’s study of literature. The teaching of grammar, logic and rhetoric in the late Middle Ages therefore deteriorated.

Roger Bacon (born about 1214, died 1294) testified at great length on the academic degeneracy at all levels in the mid-thirteenth century, particularly at the famed University of Paris, which usually gets such great praise. Bacon made it crystal clear that advanced schooling had degenerated there, not improved. In particular, contrast Bacon’s comments below, on the attitude towards study of the Holy Scriptures in the University of Paris in the 1200’s, with the attitude in the ancient Irish saints “lives” from about 600 A. D. Portions of those ancient “lives” were quoted earlier. Note also Bacon’s astonishing complaint in the thirteenth century that greater concern was shown for precisely rendering the “classical poets” than for producing correct Biblical texts!

According to the Catholic Encyclopedia (1913), Vol. XIII, page 114, in its article on Roger Bacon:

“...the burden... of all his writings was: ecclesiastical study must be reformed. All his ideas and principles must be considered in the light of this thesis. He openly exposes the ‘sins’ of his time in the study of theology, which are seven.... The first sin is the preponderance of (speculative) philosophy. Theology is a Divine science, hence it must be based on Divine principles and treat questions touching Divinity, and not exhaust itself in philosophical cavils and distinctions. The second sin is ignorance of the sciences most suitable and necessary to theologians; they study only Latin grammar, logic, natural philosophy (very superficially!) and a part of metaphysics: four sciences very unimportant, scientiae viles. Other sciences more necessary, foreign (Oriental) languages, mathematics, alchemy, chemistry, physics, experimental sciences, and moral philosophy, they neglect. A third sin is the defective knowledge of even the four sciences which they cultivate: their ideas are full of errors and misconceptions, because they

have no means to get at the real understanding of the authors from whom they draw all their knowledge, since their writings abound in Greek, Hebrew, and Arabic expressions. Even the greatest and most highly-esteemed theologians show in their works to what an extent the evil has spread.

“Another sin is the preference for the ‘Liber Sententiarum’ and the disregard of other theological matters, especially Holy Scriptures; he complains: ‘The one who explains the “Book of the Sentences” is honoured by all, whereas the lector of Holy Scripture is neglected; for to the expounder of the Sentences there is granted a commodious hour for lecturing at his own will, and if he belongs to an order, a companion and a special room; whilst the lector of Holy Scripture is denied all this and must beg the hour for his lecture to be given at the pleasure of the expounder of the Sentences. Elsewhere the lector of the Sentences holds disputations and is called master, whereas the lector of the [Biblical] text is not allowed to dispute.’ (Opus Minus”, ed. Brewer, 328 sq.) Such a method, he continues, is inexplicable and very injurious to the Sacred Text which contains the word of God, and the exposition of which would offer many occasions to speak about matters now treated in the several ‘Summae Sententiarum’. Still more disastrous is the fifth sin: the text of Holy Writ is horribly corrupted, especially in the ‘exemplar Parisiense’, that is to say in the Biblical text used at the University of Paris and spread by its students over the whole world. Confusion has been increased by many scholars or religious orders, who in their endeavours to correct the Sacred Text, in default of a sound method, have in reality only augmented the divergences; as every one presumes to change anything ‘he does not understand, a thing he would not dare to do with the books of the classical poets’, the world is full of ‘correctors or rather corruptors’.... The reasons of ... false exposition are the corruption of the sacred text and ignorance of the Biblical languages. For how can they get the real meaning of Holy Writ without this knowledge, as the Latin versions are full of Greek and Hebrew idioms?

“The seventh sin is the radically false method of preaching: instead of breaking to the faithful the Bread of Life by expounding the commandments of God and inculcating their duties, the preachers content themselves with divisions of the arbor Porphyriana, with the jingle of words and quibbles. They are even ignorant of the rules of eloquence, and often prelates who during their course of study were not instructed in preaching, when obliged to speak in church, beg the copy-books of the younger men, which are full of bombast and ridiculous divisions, serving only to ‘stimulate the hearers to all curiosity of mind, but do not elevate the affection towards good’ (“Opus Tertium”, Brewer, 309 sq.).... First of all, if one wishes to get wisdom, he must take care not to fall into the four errors which usually prevent even learned men from attaining the summit of wisdom, viz. ‘the example of weak and unreliable authority, continuance of custom, regard to the opinion of the unlearned, and concealing one’s own ignorance, together with the exhibition of apparent wisdom’... Opus Majus, I, Bridges, 1, 2)....

“Besides the languages there are other means, e. g. mathematics, optics, the experimental sciences, and moral philosophy, the study of which is absolutely necessary for every priest, as Bacon shows at length. He takes special pains in applying these sciences to Holy Scripture and the dogmas of faith. These are pages so wonderful and evincing by their train of thought and the drawings inserted here and there such a knowledge of the subject matter, that we can easily understand modern scholars saying that Bacon was born out of due time. .... It is in these treatises (and other works of the same kind) that Bacon speaks of the reflection of light, mirages, and burning-mirrors, of the diameters of the celestial bodies and their distances from one another, of their conjunction and eclipses; that he explains the laws of ebb and flow, proves the Julian Calendar to be wrong; he explains the composition and effects of gunpowder, discusses and affirms the possibility of steam-vessels and aerostats, of microscopes and telescopes, and some other inventions made many centuries later. Subsequent ages have done him more justice in
recognizing his merits in the field of natural science.... He is an enemy only of the extravagances of Scholasticism, the subtleties and fruitless quarrels, to the neglect of matters much more useful or necessary and the exaltation of philosophy over theology. Far from being hostile to true philosophy, he bestows a lavish praise on it.... Bacon is sometimes not very correct in his expressions; there may even be some ideas that are dangerous or open to suspicion (e. g. his conviction that a real influence upon the human mind and liberty and on human fate is exerted by the celestial bodies etc.). But there is no real error in matters of faith, and Bacon repeatedly asks the reader not to confound his physics with divination, his chemistry with alchemy, his astronomy with astrology.... whilst his criticism often becomes violent when he blames the most eminent of his contemporaries, he never speaks or writes any word of disregard of the Fathers or ancient Doctors of the Church, even when not approving their opinion.... Bacon was a faithful scholar of open character who frankly uttered what he thought, who was not afraid to blame whatsoever and whomsoever he believed to deserve censure, a scholar who was in advance of his age by centuries.... he must be reckoned among the most eminent scholars of all times.”

Though Bacon was commissioned to write his main work by Pope Clement IV in a letter of June 22, 1266, he was asked to do so secretly. Bacon had met Pope Clement IV while he was still Cardinal Guy le Gros de Foulques, either on the cardinal’s trip to England or when Bacon was in Paris. At that time, Bacon had interested the cardinal in Bacon’s ideas on current abuses, particularly in ecclesiastical studies. Pope Clement IV’s secrecy requirement, of course, was an implicit admission that Bacon was surrounded by men who were not only incapable of appreciating his call for reform but who opposed it. The Catholic Encyclopedia (1913) stated, “About the rest of Roger’s life we are not well informed. The ‘Chronica XXIV Generalium Ordinia Minorum’ says that ‘the Minister General Jerome of Ascoli [afterwards Pope Nicholas IV] on the advice of many brethren condemned and rejected the doctrine of the English brother Roger Bacon, Doctor of Divinity, which contains many suspect innovations, by reason of which Roger was imprisoned’ (see the ‘Chronica’ printed in ‘Analecta Franciscana’, III, 360). The assertion of modern writers, that Bacon was imprisoned fourteen or fifteen years, although he had proved his orthodoxy by the work ‘De nullitate magiae’, has no foundation in ancient sources.”

Presumably those self-satisfied “learned” men of the time who were doing such a bad job steering culture’s ship could not tolerate the competence of Roger Bacon. The proverb, “the more things change, the more they remain the same,” certainly seems to apply concerning universities today, as demonstrated by Profscam: Professors and the Demise of Higher Education (1988), by Charles J. Sykes, and other sources.

Europe’s universities first began to arise about the twelfth century, and soon replaced the monasteries as the centers of learning. Yet, earlier standards were apparently slower to change in the monasteries than in those new institutions, the universities. An example of the survival of earlier academic standards appears in an article on Gertrude of Hackeborn, Cistercian Abbess of Helfta, near Eisleben, Germany, who was born near Halberstadt in 1232 and died towards the end of 1292. That article in the Catholic Encyclopedia (1913), page 533, stated:

“She required her nuns to be educated in the liberal arts, but insisted especially on the study of Holy Scripture....”

In insisting on education in the liberal arts, Gertrude of Hackeborn was only requiring of her nuns what had been the standard in Christian schools for over a thousand years before her time, from before the days when St. Jerome had been a schoolboy studying his Donat. Yet Gertrude’s high academic standards from those far earlier times were dying out in Roger Bacon’s and her era, even though the hollow form of the basic studies remained the same: the liberal arts and Holy Scripture.
Education usually acts as a mirror of the culture in which it takes place unless government schools, under the control of change-agents, have altered the natural state of things. The drop in educational excellence in the late Middle Ages was the result of the drop in culture between the earlier Middle Ages and the late Middle Ages/Renaissance.

That decline is illustrated very disturbingly by a short biography which appeared in 30 Days in the Church and the World, July-August, 1990 (United States Edition: 2515 McAllister Street, San Francisco, California 94118..) The article concerned St. Camillus, (1550-1614).

There was nothing about Camillus when he was young, when he was addicted to gambling and was both illiterate and immoral, that even remotely suggested what was to be his amazing and saintly future. Yet Camillus became converted from his ugly old ways and then almost immediately, and undoubtedly to the astonishment of many, behaved like a very great saint.

It was at the age of 25, in 1575, that Camillus changed completely, and he devoted himself to the sick in the pest-holes that were the Roman hospitals of the Renaissance. Other men gathered around him and formed an order in 1586, Congregation of the Ministers of the Sick. Wearing a large red cross on their chests, they went into battlefields to help the wounded and dying. It was the sight of these religious which inspired the Swiss philanthropist of the 19th century, Henri Dunant, to found the Red Cross. What is of interest for this history is that the short biography of St. Camillus recorded the downward spiral in European culture from the tenth century to the sixteenth century. That downward spiral culminated in those sixteenth-century Roman pest-holes called hospitals in which St. Camillus first did his great work.

The article said that, during the early Middle Ages, when the first hospitals had appeared, they had been attached to the monasteries and had been meant for both monks and laity. Then, during the 1200’s, a great increase in charitable work resulted in the founding throughout Europe of hospitals, convalescent homes and leper colonies, which were numbered in the thousands. These establishments also helped, in addition, pilgrims and the poor. Surviving records from the Cluny monastery show that the monastery each year fed an average of 10,000 poor people. Yet the principal purpose of the hospitals was to extend help to the sick, the elderly, and the disabled. To support that work, they received substantial funds from bequests dedicated to God.

The article reported the following concerning the drop in standards from the 900’s and the 1200’s to the 1400’s and the 1500’s (although the order of the quotations has been changed):

“At the hospital of Siena, founded in the 900s... chronicles speak of diets based on chicken, bread and wine, and of the use of silk sheets. The rules speak of sick people who have the right to ‘a servant who will make their bed for them and feed and serve them’; of the sick called ‘lords’ and of the duty of the rector himself out of ‘reverence for God and the Blessed Virgin Mary’ to serve ‘the poor and the sick.’”

The article stated that Pope Innocent III, in the 1200’s, became personally involved in supporting Guido di Monpellier’s work, and built in Rome and through Europe the “Hospitals of the Holy Spirit, which were to be operated by religious orders and confraternities. The article continued:

“ ‘Innocent III’s order to call the sick who were cared for there ‘patrons’ and the Christians who attended them ‘servants’ reflects the primacy that mercy had in medieval civilization. All were bound to this cult of ‘love owed to Christ, God and Man, who is himself sick in the poor’ (as one reads on the entrance of the hospital in Turin)....
“...At the beginning of the 1400s, another culture began to spread....religious orders, in crisis, were replaced in the hospitals where they had worked by convicts, the dregs of society, forced to work in increasingly dirty, infected, and horrible places.

“Descriptions in chronicles of the time are chilling.... sometimes the sick were piled together with corpses, sometimes patients died of maltreatment or from the violence of the staff. For days invalids were left to lie in filth.... In the authors of the time - Berni, Pier Salvietti, Mauro, Strascino - disrespect and mockery toward old, sick and deformed women were common.... There was a horror of death.... esoteric doctrines spread at this time. Spiritualism and hedonism are the content of Renaissance culture and pagan customs. The sick person, who in the Middle Ages was venerated as Christ crucified, was now hated and rejected. Everyone fled from the hospitals, except for the convicts forced to work there.”

The conditions of the hospitals in the sixteenth century were hideous, and yet, six hundred years earlier, conditions had been wonderful. That downward spiral in hospital care serves to corroborate the downwardly spiraling degeneracy of the so-called Renaissance.

After Camillus’s conversion, his work at the Rome hospital for the incurable had certainly presented a stark contrast to the terrible conditions that had preceded his arrival. Instead of leaving the sick to lie abandoned and unattended, the biography reported that Camillus, himself, had washed their filthy, infected, sick bodies when they entered, cleaned their infected wounds, carried them and consoled them.

Camillus was in a time-warp, his behavior reverting back to that of the earlier Middle Ages, and the superiority of that earlier behavior is obvious. Yet Camillus was out of step with the Renaissance (of pagan culture) which continued on its intellectual development. By the period of the Unenlightenment in the 18th century, that intellectual development was producing men like Voltaire, Diderot, and Rousseau, none of whom anyone would expect to find washing the sores of derelicts in a hospital for the abandoned poor.

The late Middle Ages and the Renaissance (of pagan culture) were an appalling period from the standpoint of basic decency. Yet it was in these dreadful times that basic literacy was becoming more widespread, but it was apparently literacy largely in the vernaculars, not in Latin, for most of Europe (England being a possible exception). That meant that the learning of previous ages, most of which was still in Latin, was largely beyond the reach of the great majority of people.

While the common view of the late Middle Ages from about 1300 to about 1500 is that the vast majority of lay people were illiterate, Barbara A. Tuchman in her book, A Distant Mirror, thought otherwise, speaking of the period after 1340 (page 59-56). She said that although the ordinary person absorbed information mainly through sermons, plays, and public recitals of poems and stories, the reading of the upper classes and of the nobility had increased because written manuscripts had become more available. She stated the following:

“Books of universal knowledge, mostly dating from the 13th century and written in (or translated from the Latin into) French and other vernaculars for the use of the layman, were literary staples familiar in every country over several centuries. A 14th century man drew also on the Bible, romances, bestiaries, satires, books on astronomy, geography, universal history, church history, rhetoric, law, medicine, alchemy, falconry, hunting, fighting, music, and any number of special subjects....

“Contemporary writers rapidly found an audience. In Dante’s life time his verse was chanted by blacksmiths and mule-drivers....”
Dante Alighiere lived from 1265 to 1321. The blacksmiths and mule-drivers of his day were most probably illiterate, but enough literate people must have been available to read Dante in public or blacksmiths and mule-drivers could not have memorized his verse.

Barbara Tuchman said also (page 53):

“Women of noble estate were frequently more accomplished in Latin and other school learning than the men, for though girls did not leave home at seven like boys, their education was encouraged by the Church so that they might be better instructed in the faith and more fitted for the religious life in a nunnery, should their parents wish to dedicate them, with suitable endowment, to the Church. Besides reading and writing in French and Latin, they were taught music, astronomy, and some medicine and first aid.”

Although she gave no sources for this statement, she undoubtedly had data to support it in the 14th century France of which she was writing. In Italy and England, however, original sources which would be too lengthy to cite here show that the education of women deteriorated in the late Middle Ages, English nuns sometimes becoming unable to handle Latin, in sharp contrast to the brilliance of English nuns about 700 A. D. In Italy, some of the humanists even discounted the desirability of educating women at all except for the extremely high-born, and then only as a matter of expediency.

The contempt in which women were held in Italy in these later days appears to have arisen in large part from an identifiable source of cultural degeneracy: the writing of the Roman de la Rose, which was in part obscene allegory. Tuchman described it as (page 212):

“...the monumental bible of love written in two sections fifty years apart during the 13th century. Begun in the courtly tradition of one author, it was expanded in a cynical and worldly version and at an inordinate length by another....”

She then briefly quoted the obscene allegories with which it ends. Completed in the 13th century, it was in circulation before the beginning of the 14th century or the year 1300, and, by the time Christine de Pisan wrote in 1399, literature in the vernacular languages of Europe which were modeled on the Roman de la Rose had become widespread. The very fact that it became more comfortable for literate people to read the Roman in the vernacular than in Latin is, of course, testimony to the degeneracy in Latin teaching.

Tuchman discussed Christine de Pisan, the prolific feminist author born in 1364, and her war against the Roman. In 1399, Christine wrote the Epistle to the God of Love, and in it asked why the attitude to women in France had so greatly changed. They had once been honored but were at that time being insulted, not just by the ignorant but by clergy and nobles. Tuchman considered that Christine’s Epistle had been written in direct opposition to Jean de Meung’s vicious satire on woman in his addition to the Roman de la Rose, which Tuchman called the most popular book of the time. At that time, de Meung, who had a master’s degree in Arts from the University of Paris, was a professional writer. Tuchman said de Meung was:

“...the Jonathan Swift of his time, a satirist of the artificial conventions in religion, philosophy and especially chivalry and its central theme of courtly love....

“[Christine de Pisan’s] protest was to provoke a vociferous debate between antagonists and defenders of Jean de Meung in one of the great intellectual controversies at the turn of the century (pages 218-219).”
One of Christine de Pizan’s most vocal supporters was Jean Gerson. A history of the debate on the Roman de la Rose and Gerson’s part in it is given in The Epistles on the Romance of the Rose and Other Documents in the Debate, by Charles Fredrick Ward. This was Ward’s Ph. D. Dissertation at the University of Chicago, and it was reprinted in Transactions of the Royal Society of Canada, Section II, 1910, VIII. Ward wrote (page 3):

“From its first appearance the Roman de la Rose enjoyed great vogue. We observe in this connection the glowing tributes of contemporary and succeeding writers, the numerous manuscripts, which compensate for the art of printing not then invented, the translations into English, Dutch, Italian, and other languages. Even the numerous paintings and tapestries of scenes from the romance point to its great popularity....

“...As we shall see, Gerson, Chancellor of the University of Paris, saw the danger to morals in the average man’s reception of a poem which tended to free him from all restraint. Christine de Pisan, too, with a much narrower range of thought, assails with singular energy and with the courage of her convictions a book which contains so many attacks on her sex.

“...its fundamental purpose or idea (whether altogether so intended by Jean de Meung or not does not matter) was to disseminate in a popular form the philosophy of the Latin writers... Plato, Aristotle, Cicero, Horace, Juvenal, etc., and especially... the De Consolatione Philosophiae of Boethius, the De Nuptiis of Theophrastus, the De Planctu Naturae of Alain de Lille, and... the Ars Amatoria and Metamorphoses of Ovid. As a popular exposition of the favorite doctrines of Latin philosophy, as an encyclopaedia of knowledge on almost every subject, good and evil, the nature of government, the Church, society, morals, manners, women, etc., etc., the Roman de la Rose was admired by the bourgeois, the average man....

“...the constant appeal to a clear and uncompromising reason, lead(s) us to agree (as far as such comparisons will hold) with Gaston Paris that Jean de Meung is the Voltaire of the Middle Ages....

“We remark that up to this point the great popularity of the Roman de la Rose had carried everything before it. Its influence upon literature was supreme. It was the masterly work which terminated the middle ages. But there was to be a reaction against its doctrines and we come now to the first public challenge of the work of Jean de Meung, at the beginning of the fifteenth century.

“Christine de Pizan was not the first woman to resent the insinuations against the feminine sex contained in many parts of the Roman de la Rose, if we are to believe the rather doubtful legend concerning the ladies of the court who were going to whip the author....

“...Christine found powerful allies in Jean Gerson, Chancellor of the University of Paris, Guillaume de Tignonville, Prevot de Paris, and Marshal Boucicault....

“The controversy seems to have commenced... with oral discussions between Christine de Pizan, Jean de Montreuil, and a third person, probably Gerson.”

Ward commented in a footnote, concerning Montreuil, that he was a diplomat and secretary to the king, and one of the leading humanists of his time. Ward said that Montreuil:
“...was charged with paganism because he inscribed the ten laws of Lycurgus on the portico of his house, and confessed that he preferred them to evangelical principles.... His attitude in this matter is inseparably connected with the quarrel concerning the Roman de la Rose which, while it is a most ancient literary quarrel, is really moral and religious in nature.”

Continuing in the body of his text, Ward said:

“Doubtless Christine had already been confirmed in her attitude by the support of Jean Gerson. The latter had written in 1399 a Sermon contre la luxure, in one place in which, with all the authority he possessed, he condemned the Roman de la Rose to the fire: “Au feu, bonnes gens, au feu!.... C’est la remede meilleur.” (Ed.: To the fire, good people, to the fire!.... It is the best remedy.”) Gerson’s condemnation of the work was based on grounds somewhat different from those of Christine. He saw in it a work subversive of private and public morality. Although a humanist and a friend of humanists, he failed to see the real literary and philosophical merits of Jean de Meung’s work....”

All of this confirms the moral and religious degeneracy of the period, and the gradual weakness in Latin of the literate classes so that they were more comfortable when reading written material in the vernacular. The bilingual monks of the early Middle Ages were no longer even a memory. Yet, curiously, the dispute on Roman de la Rose also confirms widespread literacy in the vernacular in the thirteenth and fourteenth century. Would Gerson have thundered from his pulpit in 1399: “To the fire, good people, to the fire!” if numbers of his parishioners had not possessed copies of the Roman in French to throw into the fire? If they had bought the book from the commercial scribes, it is only reasonable to presume they could read it!

Despite the fact that Christine de Pisan was writing some of her books largely for women about 1400 so she obviously expected many women to be literate, in the same era Joan of Arc is known to have been illiterate. That is proof that, despite what may have been relatively widespread literacy, literacy was not universal. Concerning the clear distinction that should be drawn between the pre-Reformation ABC books and the pre-Reformation catechism, Joan of Arc must have had no contact with the ABC book, but it cannot be seriously questioned that she was familiar with the catechism, which was commonly taught orally to the parents in church, so that they could teach their children later at home. Yet the illiterate Maid of Orléans inspired Gerson and Christine de Pisan to write about her. It is interesting that Gerson, who had according to Tuchman (page 479) a general aversion to mystics, nevertheless was:

“in the last year of his life, one of only two theologians willing to guarantee the authenticity of the voices of Joan of Arc.”

Also, shortly before her death about 1430, Christine de Pisan wrote Hymn to Joan of Arc:

“...the only contemporary tribute to Joan of Arc and the only evidence of her achievements outside the trial records written during her lifetime.” (Christine de Pisan, The Treasure of the City of Ladies, Translated by Sarah Lawson, Penguin Classics: 1985, Harmondsworth, Middlesex, England, page 26).

Joan of Arc continued to inspire gifted authors in later centuries, with Mark Twain judging his own painstakingly researched biography of Joan of Arc to be the very best of all his works.

An unusually silly, fairly recent, thesis has predictably been given great credence by “intellectuals.” The thesis is that the concept of childhood did not exist in the Middle Ages. The author of this silliness is Philip Aries of France. Aries proposed the thesis despite the fact that Aries, himself, quoted a 13th
century document outlining seven ages of man, the first of which was infancy and the name for the second of which was derived from the Latin root “puer” meaning “boy,” or child. The excerpt from Beckett’s twelfth-century biography, referred to earlier, clearly mentions three of these stages: “infantiae, pueritiae, et pubertatis.”

However, the final effect of Aries’ idea that in the past no meaningful distinction was made between adults and children may be seen as vicious, rather than silly. Such an idea implicitly denies that the family is a natural, rather than cultural, unit, and that the family therefore exists by the right of natural law. Such an idea implicitly denies that the duties and obligations existing between adult parents and immature children are also natural. Therefore, as an obvious result, such an idea denies that only parents have the right, by natural law, to shape the education of their children.

The following is from the “Pontifical Letter of Approbation To Our Beloved Son, Mateo Crawley-Boevey, Priest of the Congregation of the Sacred Hearts of Jesus and Mary” from Pope Benedict XV, dated April 27, 1915, and is quoted in the booklet, Enthronement of the Sacred Heart in the Home, published by the Benedictine Convent of Perpetual Adoration, Clyde, Missouri, 1962, which booklet carries an Imprimatur and Nihil Obstat:

“...The malicious efforts of the wicked are specially directed against the home, the family circle. Since the family contains the root, the elements of civil society, the enemies realize well that the hoped-for transformation or rather the hoped-for destruction of all human society cannot take place before the ruin of the family is accomplished. Every effort is being made to weaken the firmness and indissolubility of the marriage bond and to prevent our youth from coming under religious influence....”

Almost eighty years after the above remarks, the following appeared in Special Report No. 115, July, 1994, of Human Life International, Gaithersburg, Maryland:

“The final meeting of the Preparatory Committee for the Cairo International Conference on Population in April produced a much-disputed 87-page document. Only seven pages dealt with development; the rest trumpeted IPPF’s [International Planned Parenthood Federation’s] vision of sexual ’morality’ and the total autonomy of individuals behaving with impunity and without rules of any kind.

“Many nations’ delegations opposed calling the family ‘the fundamental unit of society,’ as does the Universal Declaration of Human Rights and other official documents....”

It is obvious that the war against the family which Pope Benedict XV decried in 1915 was continuing, but far more successfully, in 1994, almost eighty years later.

However, the fourteenth-century Gerson knew nothing of the twentieth-century Aries’ “discovery” that such men as Gerson and his contemporaries were to be presumed to be incapable of making any meaningful distinction between children and adults. Therefore, the inconvenient fact for Aries’ thesis is that Gerson did concern himself greatly with the education of children. Obviously, he recognized a stage called childhood, because he spent so much of his free time teaching children. In The Catholic Encyclopedia (1913) article on Gerson (Volume VI, page 531), are these comments:

“(At Lyons) he spent his last years in exercises of devotion and in performing his priestly functions.... (and) wrote various works.... Combining example with precept, he loved to surround himself with little children in the church of Saint-Paul and delighted to teach them the elements of
Christian doctrine. These ten years were the sweetest of his militant life. Statues have been raised to his memory at Paris and Lyons."

The Catholic Encyclopedia, (1913) Volume V, page 79, in its article on doctrine, said:

"...John Gerson (1363-1429). He realized that the much-needed reform of the Church should begin by the instruction of the young and though he was chancellor of the University of Paris he devoted himself to this work. He composed a sort of little catechism entitled ‘The A B C of Simple Folk.’"

It is obvious Gerson used the term, “ABC,” only in the sense of “fundamentals” because his material was only a catechism and had nothing whatsoever to do with teaching reading. It began with these words:

"Thus commences the ABC of simple people.

“Listen all, little and big, boys and girls and other simple people, (Ed.: petiz et grans, filz et filles et aultres gens simples) I will write for you in French your a.b.c. which contains the pater noster that God made with his own mouth, and the ave Maria that the angel Gabriel announced to the blessed Virgin Mary, and the Credo that was made by the 12 apostles, and the ten commandments of the law, and the virtues and the gifts of the Holy Spirit, and other points of our Christian faith, which points have been revealed from God...."

The content of Father Gerson’s catechism was largely the standard material of the catechisms of the time. This can be seen from the catechism of John Peckham, Archbishop of Canterbury, England, in 1281, and from the catechism of John De Thoresby, Archbishop of York, England, in 1357, as outlined in The Lay Folk’ Catechism, published for the Early English Text Society, London, 1901. Besides the material listed above, Gerson also included the seven spiritual works of mercy, the seven corporal works of mercy, the seven sacraments, and more.

However, it is obvious that this catechetical material on the Pater Noster was only meant to be an explanation of the Pater Noster which would have already been memorized in Latin. That the Pater Noster was not meant for recital in the vernacular is shown in Gerson’s, Le Doctrinal aux Simple Gens. In this he said, “ou en disant ta pater nostre tu diz: dimitte nobis, etc.,” (“or in saying your Pater Noster you say: dimitte nobis, etc.”). It is clear Gerson expected the “simple gens” not merely to call the prayer by its Latin name, “Pater Noster,” but actually to recite it in Latin: “dimitte nobis, etc.” Except for one isolated instance, the prayer was uniformly known by its Latin name in England, also, until after the Reformation, as C. C. Butterworth pointed out in his article, “The ‘Term Lord’s Prayer’ Instead of ‘Pater Noster,’” (The Library Chronicle, University of Pennsylvania, Philadelphia, Pennsylvania: 1952, vol. XVIII, p. 24)

About 1414, Gerson also wrote for religious instruction Opusculum Tripartitum de Praeceptis Decalogi, de Confessione et de Arte Moriendi. According to M. Reu on page 574 of his article, “Religious Instruction of the Young in the Sixteenth Century,” from the Lutheran Church Review, Volume 34, No. 5, of October, 1915:

“Gerson wished to have his book written wholly or at least partially on boards affixed to the walls in churches, schools and hospitals in order to keep its contents always before the eyes of people who were able to read.”

Therefore, some French churches of Gerson’s period, about 1400, displayed tablets containing catechetical material to be learned. This is further confirmation of widespread literacy about 1400, because there would be no point to display such materials unless many people could read them. But it is
also confirmation that the churches about 1400 often contained adults who had become literate, almost certainly in childhood, but who still had not learned the simple material of the oral catechism which they would have learned in earlier times orally as children, directly from their parents. The tablets were just another sharp indication of cultural decline in the late Middle Ages, despite spreading literacy.

As mentioned earlier, Gerson’s book of catechetical material, the Tripartito, was one of the very first books printed in America, about 1544, on the press imported to Mexico by Archbishop Juan Zumarraga. In John Clyde Oswald’s Printing in the Americas, he said that a copy of the Tripartito is presently in the New York Public Library, and it contains a picture, “Adoration of the Virgin,” which makes it the first American illustrated book.

Since it is obvious that literacy was widespread in Western Europe before the sixteenth century, it is meaningful that absolutely NO material has surfaced from before the Reformation dealing with the actual teaching of beginning reading, beyond the frequent but bare mention of ABC classes and reference to the prayers in the ABC books. For instance, Gerson was enormously concerned with the teaching of religion to little children and also with education. Yet Gerson apparently never mentioned anything about the very beginning step: how to teach beginning reading. Furthermore, the teaching of reading was almost never mentioned in writings from classical times, except for a few rare comments. It is obvious that teaching beginning reading in Latin or Greek by the syllable method was such a simple thing that it was not even worth mentioning.

However, as soon as the switch was made from Latin to the vernaculars for teaching little beginners in the Germanic languages after the Reformation, authors began writing about a beginning reading problem, starting with Ickelsamer in Germany, and, shortly afterwards, Hart and others in England. (A powerful contributing factor also was that little three- and four-year old children instead of seven-year-old children were being pestered with the alphabet.)

Children who learned to read in Latin first had little difficulty learning to read English (but not vice versa, because of English spelling irregularities). That learning to read in another language than English need not cause any difficulty in later reading English is shown by a comment by Dr. Chall on page 38 of her book, Learning to Read, The Great Debate:

“...children and adults who are literate in one language that uses the Roman alphabet can, if they learn to speak another language, usually learn to read the second language quite readily.”

That comment carried the following footnote which confirms that English-speaking children can learn to read fluently when they are taught initially in another language than English:

“Indeed, the Ecole Francaise, a bilingual private school in New York City, teaches American children to read French first, then English. That is, the fundamentals of the reading process (decoding) are taught to kindergarten and first-grade children in the French language, which is spelled more regularly than English. In the second grade, the children learn to read English. According to the headmistress, most children need little instruction in English reading. Some ‘errors’ I observed during oral reading of English in a second-grade class involved pronunciation of an English word with a French accent. This was usually corrected by the child from the general sense of what he read.”

However, in the culturally degenerate late Middle Ages before the Reformation, from at least the end of the fourteenth century, the quality of spoken Latin was declining, and so was the teaching of Latin. The record shows that children at that time no longer learned to practice their newly learned syllables by immediately reading and writing the Psalms in Latin on their wax tablets. Therefore, little children no
longer acquired as a by-product the ability to understand Latin. In these later Middle Ages, children first learned to read only a few prayers: the Pater Noster, the Ave Maria and the Credo. It is intriguing to find how many cities in Europe still have streets named “Pater Noster,” reaching back to those pre-Reformation days, which apparently dated from the early days of printing, when printers may have been located on these streets.

As is obvious, not all children who learned to read the Pater Noster, the Ave Maria and the Credo by syllables in their ABC books in the petty schools went on to learn the Psalms and the Latin grammar in the grammar schools and so to learn to understand Latin beyond these simple prayers. Even though they could read in their vernaculars, they were culturally inferior, or “functionally illiterate” in all those literary works which were in Latin. It was to meet their needs, apparently, that literature in the vernaculars grew in the thirteenth to fifteenth centuries, but Latin remained the standard language of scholarship and the Church.
Chapter 6  
On the Switch from Latin to the Vernacular in the Teaching of Beginning Reading

With the Reformation, beginning reading shifted from learning Latin to learning the vernacular. In most countries, however, the spelling patterns of words matched the sound patterns of syllables very closely, and the shift to the vernacular caused relatively little trouble. This is despite the fact that Germanic languages have many closed syllables which are also meaning-bearing words, while Latin languages tend to have more open syllables, which are only parts of words and are therefore solely sound-bearing.

Therefore, in the learning of whole syllables, the structure of the Germanic languages causes by their very nature a shift toward “meaning” in beginning reading and away from “sound,” which is not the case in the Latin languages.

Something that did cause great trouble in the teaching of reading in the vernacular was the practice, apparently dating only from about the time of the Reformation, of attempting to teach little three-year-olds to read. Many three-year-olds cannot yet distinguish the geometric shapes of letters, as shown by Dr. Elizabeth Koppitz’s published norms in 1963 for the Bender-Gestalt test of visual-motor integration.

The European Germans and the European Swedes, the Pennsylvania Germans, and others continued to use the ABC books for beginners, with the alphabet and syllabarium, but the Our Father and simple prayers were now in the vernacular. The Protestant ABC books usually also included the catechism. Before the Reformation, the catechism had, of course, been in the vernacular, but it was taught orally, so was not included in the ABC Latin books.

As has been shown, in England, the switch to the vernacular to teach beginners to read caused problems because of the irrational spellings of many syllables and words which had accumulated in that language. English has many roots: Anglo-Saxon, Danish, and French being most evident, and it did not actually emerge as one language until just about the time printing arrived in the mid-fifteenth century. (The Norman version of French was still being used in English schools and government until about the mid-fourteenth century!) Printing managed to produce some uniformity among the several English dialects. Spelling, however, was anything but uniform, as can be seen by reading materials written in the reign of Henry VIII - by St. Thomas More in 1532, for instance.

The reason the syllable method to teach beginning reading has survived into the twentieth century in Latin-language nations is because the old syllable method matches Latin languages so well. For instance, a very good primer in French is Syllabaire Illustre, by Francis Martin, Brussels: 1974, a beginning reading book which teaches phonics by syllables, which is a very easy thing to do in French.

It is not so easy to use the syllable method in Germanic languages, and particularly so in English. English spelling produces many open syllables which terminate in short vowels: pa-nel, for instance (which the dictionary shows as pan-el but which is not pronounced that way.) Yet, according to the syllabary, open syllables should terminate in long vowels: ba, be, bi, bo, bu, and closed syllables (ending with a consonant) contain short vowels: ab, eb, ib, ob, ub. The rule for short vowels in closed syllables usually works beautifully in English; the rule that open syllables end in long vowels often does not work, particularly in multi-syllable words when the rules for breaking words into syllables are followed. To
confound the problem, English writing has many double vowels which are pronounced as only a single vowel sound (ee, ea, ai), which is not true in Latin.

The ancient schools taught children to divide running texts into syllables, not words. It was a very easy thing to do. They simply had to look for the vowel-consonant patterns. They knew that every vowel produced a syllable, so they divided the vowel-syllables in this fashion: if the vowel were followed by only one consonant, the syllable division came before the consonant, as in “PA - ter.” If the vowel were followed by more than one consonant, the syllable divided after the first consonant, as in NOS - ter. All they had to do then was to remember from their syllabary practice how to pronounce “pa” from pa-pe-pi-po-pu, and “os” from “as-es-is-os-us.” If they had been taught a complete syllabary, they had already practiced putting “n” in front of “as-es-is-os-us” and so had no trouble with “nos.” They also would have practiced putting “t” in front of “ar, er, ir, or, ur,” so had no trouble with the “ter” in both pa - ter and nos - ter. They worked their way through their texts, dividing and pronouncing, using the memorized syllable sounds to pronounce. Meaning, of course, eventually came - but it was a very late arrival after sound.

The curious thing is that the early English spelling books often divided words in the same classical way, even though this rule for division often does not work in English because so many open syllables in English end in short vowels. A perfect example for this kind of Latin division being incorrectly applied to English words is the New England Primer, where the word divisions match the old Latin system. Of course, the pronunciations they produced were wrong, but a little six-year-old child who had learned the syllabary could nevertheless pronounce EVERY SINGLE ONE of these syllabicated “wrong” pronunciations with ease. If the child already knew the correct sound of the “word,” he could then correct his mispronunciation.

Ge-ne-ral-ly, de-di-ca-ti-on, ce-re-mo-ny, de-cla-ra-ti-on.
A-bo-mi-na-ble, be-ne-fi-ci-al, for-mi-da-ble.

It should never be forgotten that moving from reading by the syllabary to reading by “words” made reading in English enormously more difficult for beginners, because they no longer had that bunch of keys - the memorized syllable sounds - with which they could unlock at least the approximate sound of anything in print.

Sometimes, of course, the Latin-style divisions did produce the right vowel sounds in English, and even most of the wrong ones will “work” if the open syllables are pronounced with a short vowel sound instead of the “proper” long vowel sound. But, it is curious that Noah Webster, who “corrected” this way of syllabrating English in his spelling book, never seemed to realize WHY it had been done that way in the first place: It was to give beginning readers the capability of pronouncing ANYTHING in print, once they knew their syllabary and how to syllabicate texts. It is really curious that a scholar of Webster’s stature did not seem to realize such syllabration in English was only a hang-over from teaching the reading of open and closed syllables in Latin. But, by Webster’s time, the ancient conception of print as representing a river of syllable sounds had died out. Print now represented “meaning.” Print in the English language was now uniformly considered to be composed of meaning-bearing words. Even the general awareness in English-speaking people of the importance of the syllable was on its way out.

This was not true in Latin-language countries, nor is it true even today. Shortly before Webster wrote his speller in 1793, the following appeared in the famous Encyclopedie ou Dictionnaire Raissonne des Sciences, des Arts, et des Metiers, by Denis Diderot et al, published in 28 volumes from 1751 to 1772 in Paris, France, in the article “Syllabaire,” on pages 713-715 of the volume covering “S.” It was very likely that the article was written by that arch mover-and-shaker, Denis Diderot, himself, but in it he endorsed
Pascal phonics, which had appeared in the Grammaire of Port Royal in 1664. However, he meant, obviously, that Pascal’s synthetic phonics was to be applied to syllables:

“But I shall remark, as an important thing concerning the syllables of which I have indicated the detail and the divisions, it is necessary not to omit a single one in the tables that will be made from them: Syllabis nullem compendium est, perdiscendae omnes. This is the opinion of Quintilian. (Inst. I. j. 3); & he wished that one stop the children there until one had all the certitude possible that they were not puzzled in the distinction of a single syllable.”

The distinction between syllables and words was still clear in Germany in the 16th century, in the time of Luther, who would himself have learned to read in Latin. As shown by the following quotation from The True Believer by Eric Hoffer, Perennial Library, 1966, Harper & Row, New York, Luther obviously considered the syllable to be the atom of speaking and reading. Luther would have agreed with the 18th century author just quoted, who was very probably Diderot. However, Hoffer’s publisher obviously made a misprint in quoting Luther: showing “world” instead of “word.” I have therefore used “word” below instead of “world.” Luther’s remarks obviously concern the Bible:

“So tenaciously should we cling to the word that were I to see all the Angels of Heaven coming down to me to tell me something different, not only would I not be tempted to doubt a single syllable, but I would shut my eyes and stop my ears....”

Luther, most probably Diderot, and Quintilian were all in agreement: first come syllables, and only afterwards come words. Syllables generate words. Yet the illusion gradually arose after the sixteenth century in English-speaking countries that “words” were the atom in speaking and reading, instead of syllables.

The combination of syllabating problems and inconsistent spellings in English caused great trouble when children first began to be taught to read in English, instead of Latin. Therefore, although the ABC books in the vernacular, containing the catechism, continued to be published in England after the Reformation, with “official” ones approved by the state, there appeared along with them, less than fifty years after the switch to the vernacular, “spelling” books for beginners in which children learned to spell, not just syllables, as before, but syllables in specific words. As is obvious, this was a giant step from “sound” to “meaning.

In Volume Four, Spelling Books, of the twelve-volume series, A Bibliography of the English Language from the Invention of Printing to the Year 1800, Bradford, England, by R. C. Alston, the first spelling book listed was a circa 1561 London edition by Ihon (sic) King, An A.B.C. for Children. Here is an A.B.C. deuised (sic) with Syllabes (sic).... That was apparently a kind of hybrid ABC/spelling book, and Alston said it has surviving copies. One of the first spelling books that was a true spelling book was Clement’s in 1576. However, Alston also listed An alphabet and plaine pathewaye to the facultie of readinge by Andrewe Mansell in 1576. That may also have been a true spelling book like Clement’s, as a 1601 copy survives of a work by Mansell with a slightly different title which was clearly a speller: A nevy booke of spelling with syllables: or an alphabet and plaine pathwayne to the facultie of reading the English, Romane, Italica, and secretarie hands....

Alston listed a record of a publication by Thomas Johnson in 1590, The pathwaye to readinge; or, the neweste spelling A.B.C: conteyninge a most shorte, easie, and profitable way of teaching to spell and reade. Alston said, however, that Johnson’s 1590 book might only have been a reprint of Mansell’s 1576 work. Mansell’s had a few editions, but Clement’s apparently had only two: the 1576 one referred to in the body of Clement’s 1587 edition, and the 1587 one recorded by Alston which is still in existence.
Alston listed as the next speller published that of Edmund Coote in 1596, which is also still in existence. It was Coote’s which became massively popular, being published in a huge number of editions from 1596 until 1737. (Coote’s speller is not mentioned in Nila Banton Smith’s reading instruction “history.”)

By 1737, a large number of other spellers were on the market. As can be seen, Alston’s data which is highly reliable differs somewhat from Foster Watson’s data from early in the twentieth century, but the confusion may lie in the definition of a spelling book.

The switch from Latin to the vernacular to teach beginners to read marked the end of Latin as a common tongue for Western civilization. The sixteenth century humanists made a sincere attempt to repair the damage to spoken Latin which had occurred in the degenerate late Middle Ages, but they did so with “improved” Latin grammars like Lily’s, which sometimes used the vernacular to teach largely WRITTEN Latin, instead of the ancient Latin Donat which had been used to teach largely SPOKEN Latin, even though boys were then encouraged to speak in Latin in the grammar schools of the sixteenth century. It is true that Latin grammar schools persisted widely into the middle nineteenth century, and some probably persist in many areas today, but it was not spoken Latin which was ultimately learned in these schools, but a written, dead language. For all ordinary purposes except in the Church liturgy, Latin died out as a living, spoken tongue about the beginning of the seventeenth century. Not surprisingly, it therefore largely died out as a written tongue also not long afterwards.

The National Institute of Education, Washington, D. C., published Fifteenth to Eighteenth Century Rare Books on Education, A Catalog of the titles held by the Educational Research Library, 1976, which library is a division of the U. S. Department of Education. The Catalog shows what happened to Latin after the sixteenth century. This collection of books are those which managed to survive over hundreds of years in an English-language country: the United States of America. They should reflect the language usage, therefore, for the educated classes in America over those early years. This is the breakdown I found:

The Catalog showed for Part I - l5th and l6th centuries - 21 titles. Since this period ran from the arrival of printing, c. 1450, to 1599, some of these books were possibly acquired by the forebears of those who ultimately settled in the English colonies in America early in the next century. I counted 17 Latin titles, two Italian, and two German. Latin therefore represented a huge 81 per cent of the surviving titles of books published up to 65 years after the switch to English in the ABC books. There were NO surviving English-language titles.

The Catalog showed for Part II - 17th century - 53 titles. However, counting only one edition for each title, I counted only 50, which produced 24 Latin titles, 4 Italian titles, 3 German titles, 5 French titles, and 16 English titles (but counting the English version of Comenius’s work as well as the Latin version.) Since my list, not counting separate editions except for Comenius, totals only 50 instead of 53, it produces 24/50 Latin titles compared to 16/50 English titles. The Latin for the period 1600-1699 represents only 48 per cent but the English has increased from zero per cent for the two centuries from 1400 to 1599 to 32% for the century 1600-1699.

The Catalog shows a relatively huge number of books surviving for the 18th century: 309 titles. In this group, Latin has declined to only a little over 10%, and English titles are the majority. But also included are a large number of French, German, Italian, and Dutch works (but only one Spanish work! An iron curtain had descended between the English-speaking world and Spain by that date!)

The ease with which educated Europeans could communicate with each other in the fifteenth century, with the living Latin language, was gone forever by the eighteenth century. Now, in order to
communicate, one either had to be a linguist (fluent in English, French, German, Italian, Dutch, Polish, Spanish, Portuguese, Gaelic, Welsh, Icelandic, Finnish, Hungarian, Czech, Danish, Norwegian, Swedish, Bulgarian, Finnish, Latvian, Romanian, etc., etc.) or to have access to easy translations. That is difficult now but was almost impossible then. Yet we are to asked believe that the eighteenth century was the Age of Enlightenment!

Comenius wrote a famous, successful and enormously widely used textbook for teaching Latin to beginners in the seventeenth century, the Orbis Pictus. While it undoubtedly did a great deal of good, the book did not succeed in returning Latin to its former pre-eminence, most likely because it was given to children after they had already learned to read in the vernacular.

However, the fable which originated at Columbia Teachers College about 1900 that Johann Amos Comenius (1592-1670), the famous Moravian educator, endorsed sight-words in the seventeenth century in his Orbis Pictus has been very widely promoted. Mathews provided the refutation of that fable in his book.

In his bibliography on page 210, Mathews showed:

“Comenius, Johann Amos. Joh. Amos Comenii Orbis Sensualium Pictus... Written by the author in Latin and High Dutch... Tr. into English by Charles Hoole M. A. for the use of Young Latin Scholars. New York, 1810. This work by Comenius appeared in 1657 and was at once translated by Hoole who signed his ‘Translator’s Preface, From my School in Lothbury, London, Jan. 25, 1658.’ The New York printing was a reproduction of the 12th London Edition.”

Mathew’s book and Johnson’s Old Time Schools and Schoolbooks reproduce a total of three separate pages from Comenius’ material. Those pages clearly demonstrate that Comenius was only teaching Latin, not beginning reading, in the book concerned, Orbis Pictus. Yet Charles Hoole, Comenius’ seventeenth century English translator, included a preface which may or may not have been adapted from Comenius’ original work. The preface said that the Latin/vernacular book could also be used for teaching beginning reading by starting with the pictured alphabet table and then ADDING a “Table of the chief Syllables” from an outside source since such a table was not in the Latin/vernacular book. Therefore, Hoole (and possibly Comenius) was only recommending the standard alphabet-plus-syllabary approach of the seventeenth century for the teaching of beginning reading. Furthermore, in Comenius’ alphabet table, he had used whole syllables to demonstrate analytically each letter sound and not Pascal synthetic phonics (the consonant plus a muted vowel, the schwa sound).

The “preface” to Orbis Pictus may or may not have been Hoole’s translation of what Comenius had written himself. Mathew’s bibliography entry quoted above, however, citing an 1810 edition of Hoole’s translation, seems to imply that Hoole wrote the whole preface himself. Yet, on page 142, Mathews had clearly implied that at least the ideas in the preface on beginning reading were Comenius’ ideas. Very possibly, Mathews himself was not too sure about who was actually responsible for the ideas in the preface.

However, whether the preface was Hoole-translating-Comenius, or only pure Hoole, the fact remains that there is no evidence whatsoever that Comenius ever intended the book to be used as a sight-word BEGINNING reading book. The only certain facts are that Comenius wrote his book in order to teach Latin, and that the book itself did not suggest otherwise, as the three reproduced pages from Comenius’ book in Johnson’s and Mathews’ books indicate.

There was a recommendation in the preface, however, to make a move from sound to meaning AFTER the beginning syllable “sound” stage. Whether the recommendation originated with Hoole or
Comenius, of course, is unknown. The recommendation was to drop “spelling” after the syllable sounds have been memorized and to rely instead on the pictures to identify the new words. With today’s concept of “spelling,” which is only giving the letters in a whole word in sequential order, the real sixteenth-century meaning of the word, “spelling” when used in reading (not writing) is not even suspected.

“Spelling” in those days when used in reading meant to “sound out” or figure out the pronunciation of an unknown word, syllable by syllable. First, the child divided the unknown word into its syllables the easy “Latin” way. The child resurrected those previously memorized syllable sounds by reciting their letters, and then used those resurrected sounds as so many keys in order to pronounce each syllable in the new word aloud. Even though they undoubtedly divided many syllables incorrectly with the Latin method instead of by today’s usage, little five-year-olds could “spell,” or sound out, syllable by syllable, multisyllable words like those in the word lists in the New England Primer, using as keys the previously memorized syllable sounds. They resurrected these memorized syllable sounds by association, through the act of naming their letters (i.e., the so-called “spelling”). “Meaning” had nothing to do with it.

However, after the beginning “syllable” stage, Hoole (or Comenius) did make the startling recommendation to drop such sounding out of unknown words by syllabating them and then naming the letters in each syllable to resurrect the syllable sounds. Children past the beginning syllable stage were to rely instead on the pictures to identify the words. That is not, however, the same thing as learning INITIALLY to read by whole sight words and INITIALLY dropping “sound” for “meaning.”

Mathews attributed the error on Comenius to R. R. Reeder of Columbia, who wrote Historical Development of School Readers, New York, 1900. Mathews said:

“This erroneous attribution came about in a peculiar way. In 1887, C. W. Bardeen, an editor and publisher in Syracuse, New York, brought out The Orbis Pictus of Jon Amos Comenius. This little volume was a reproduction of a translation of the Orbis Sensualium Pictus (‘The World of Sense Objects Pictured’) of 1657 by Comenius. He wrote his Orbis primarily to assist students of Latin, but he hoped it might also help a child learn to read his own language more readily. It contained about one hundred and fifty composite pictures, showing all kinds of objects of everyday life. Each object pictured was named in both German and Latin.

“As soon as the Orbis appeared, Charles Hoole, then in charge of a Latin school in London, translated it for the use of students of Latin. In rendering Comenius’ preface to the reader, Hoole wrote:

“First it will afford a Device for learning to read more easily than hitherto; especially having a Symbolic Alphabet set before it, to wit, the Characters of the several Letters, with the Image of that creature, whose voice the letter goeth about to imitate, pictured by it. For the young Abc-Scholar, will easily remember the force of every Character by the very looking upon the Creature, till the imagination being strengthened by use, can readily afford all things. And then, having looked over a Table of the chief Syllables also (which yet was not thought necessary to be added to this Book) he may proceed to the viewing of the Pictures, and the Inscriptions set over them. Where again the very looking upon the thing Pictured, suggesting the name of the thing, will tell him how the Title of the Picture is to be read. And thus the whole Book being gone over by the bare Titles of the Pictures, Reading cannot but be learned; and indeed too, which thing is to be noted, without using any ordinary tedious spelling, that most troublesome torture of wits.’

“Dr. Reeder, coming upon this passage in Bardeen’s volume of 1887, selected most of the last part of it, beginning ‘The very looking upon the thing’; and ignoring what Comenius had said
about the alphabet and syllables ‘for the young Abc-Scholar,’ he concluded that Comenius in 1657 had advocated a word method of teaching a child to read his own language. The most notable of those who have recently cited Reeder as authority for crediting Comenius with ‘recommending a “word recognition” or “look-and-say” method’ is Dr. Arthur I. Gates of Columbia.”

Comenius had sincerely praised the work of William Bathe and credited it as the source for the method he used to teach Latin in his book, Orbis. Dr. Sean P. O’Mathuna wrote William Bathe, S. J., 1564-1614, A Pioneer in Linguistics, 1986: Philadelphia and Amsterdam, John Benjamin’s, from which I learned of the work of Bathe. William Bathe, an Irish Jesuit, wrote Ianua Linguarum in Spain in 1611. As Dr. O’Mathuna established, Father Bathe’s method for teaching a language with its heavy dependence on teaching in syntactical wholes instead of disjointed words had been used in Bathe’s Irish family in the sixteenth century. An article from about 1922, which was part of a collated volume I saw in the New York Public Library but unfortunately did not record, referred to a folk method the author had seen in use in rural western Ireland for learning languages by memorizing sentences in Gaelic along with the same sentences in English. There is a striking resemblance to Bathe’s method and to Comenius who copied Bathe.

The probability is that the original source for Comenius’ method for learning a language which he adopted from Bathe, the comparing of such whole sample “meaning-bearing” sentences, is very ancient in Ireland. It is conceivable that it could have originated in the learning of Latin texts by little Gaelic-speaking students as long ago as the sixth century and was the method by which the Irish monks had become so competently bilingual. Gaelic-speaking children could not at that time, learning Latin from written texts, have concentrated very much on isolated “words” because words were not separated in texts, and I have seen no reference to the early existence of a true Gaelic/Latin dictionary. As Michael Herrin discussed in his edition of Hisperica Famina, glossaries of the rarer and more difficult words were probably available, but they would have been for the use of advanced students.

It is known that in the ancient world learners were taught to separate written texts into syllables, not words. It appears probable that, in language, syllables generate syntax, which only then generates words. Dr. Mathuna pointed out that Bathe’s method did not rely over much on either the vocabulary/grammar approach, or on the “immersion” approach, but was a blend of both. Very probably, what might be called Bathe’s “syllable-to-syntax” method matches more correctly the natural flow of language.

However, despite Comenius’ praiseworthy Orbis Pictus which he had based on Bathe’s 1611 work, the use of Latin in written works continued to decline in the seventeenth century and to be replaced by the many European vernacular languages.

Dr. O’Mathuna commented (page 127) on the use of Quintilian’s texts:

“Quintilian had for long enjoyed a richly deserved reputation. His Institutio Oratoria, particularly its opening books, contained more practical common sense capable of ready translation to the classroom than almost any other treatise from antiquity. By the late Middle Ages, however, only fragmentary copies of his famous work were known to have survived: the ideas developed in his opening books were known only through secondary sources, such as John of Salisbury (c. 1115-1180) in Metalogicon, or through tradition. In 1415, however, Poggio Bracciolini, who was attending as secretary at the Council of Constance, rediscovered a complete copy of all twelve books of ‘The Training of an Orator’ in the library of the Benedictine Monastery of St. Gall. This happy find had considerable influence on educational theory for many years to come and nowhere more than in the Jesuit order.”
This establishes quite clearly that the early Middle Ages were very superior, culturally, speaking, to the late Middle Ages. Before 1180, John of Salisbury in England had sufficient access to Quintilian’s work that he could write a secondary work based on it. Probably long before John of Salisbury in England in the 1100’s (possibly from at least 900, to judge from reports dating surviving complete books) the St. Gall Monastery in Switzerland had all twelve of Quintilian’s books. Yet the use of Quintilian’s works had declined so much in all of Europe after 1200 that copies of most of Quintilian’s works had disappeared by 1415. How, then, can the 1200’s and 1300’s be considered culturally advanced over the 800’s, 900’s, 1000,’s and 1100’s, as is almost uniformly considered to be true?

Dr. Mathuna uncovered another fascinating point. In the early 1600’s, Father Bathe had been concerned with studying word frequency. That is an astonishing thing to learn, since it has been uniformly assumed that word-frequency studies are of far more recent date.

As a postscript to Comenius’ work based on Bathe’s work (and as a postscript to Comenius’ exceedingly sad personal life, disrupted by war and persecution), Comenius apparently eventually developed some kind of interest in “spiritualism” or what might more clearly be called the occult. After the mid-nineteenth century, when William James and Agassiz, and the Superintendent of Schools in New York, Kiddle, and many others, had a great interest in “spiritualism,” a large section of books appeared in the 1876 American Catalogue under that title. Most promoted “spiritualism,” but some denounced it, like texts from the Southern Baptists and the Methodists. The numerous entries demonstrated that “spiritualism” was, indeed, all the rage among the American “intellectuals.” (It was also the rage among “intellectuals” in England.) One of the books in that strange category apparently referred to Comenius: “Eleven Days at Moravia - 2nd Edition, 1874” by T. R. Hazard, published by Colby. The Colby publishers were shown in the 1876 American Catalogue listings to be also grinding out a considerable number of other books on “spiritualism.” If that book did concern Comenius and if Comenius had left sufficient “spiritualist” material to fill one of Colby’s trashy books, then perhaps the poor old fellow went a little mad at the end of his sad life.

The loss of Latin as a common language for Western society has been a cultural disaster of massive proportions. Yet, strangely, it is seldom alluded to. It had provided a way for the reader to reach back in time - to before Julius Caesar - and across distances - to every literate member of Western Europe. The loss of Latin slammed a curtain down between the present and the pre-Reformation past for the vast majority of people. My inability to speak Latin has hampered me greatly in this historical research. At least now, however, a strong movement is on in many countries to use English as a second language, and it promises to replace Latin as a world language. Yet, English as a language is itself degenerating, because of incompetent meddling by “intellectuals” in education. The teaching of basic reading skills, which are absolutely fundamental, is in a catastrophic state. The teaching of grammar is degraded and sometimes ignored, and the teaching of literature - REAL LITERATURE - is virtually non-existent. However, it is entirely conceivable that our “intellectuals” may do it again and almost destroy another language, damaging English so badly it would no longer be recognizable to Shakespeare, Milton, Dickens, Agatha Christie, Mark Twain or Lincoln, or be of much use as a world language.

The reason Latin survived so long as a SPOKEN language was because it had its roots in an unchangeable, written literature, which was read aloud by “sound,” not “meaning,” and which was studied through an understanding of its grammar. It is interesting that the seventh century Irish scholars wrote a series of Latin grammars, indicating the great importance they attached to the learning of Latin grammar (discussed in Donat et La Tradition de l’Enseignement Grammatical... [from the fourth to the ninth centuries] by Louis Holtz, Centre National de la Recherche Scientifique, Paris, 1981). The level of the Latin scholarship of the ancient Irish from the sixth century onwards might very well be viewed as a function of their deep understanding of Latin grammar, and the same would be true of the Anglo-Saxon scholars from the seventh century onwards.
Modern English stabilized as a language at the precise time it developed its great literature. It has remained stable because it has been firmly rooted in that literature as its standard. Our functional illiterates have no knowledge of these roots. Even our literate students have little exposure to literature and virtually no real exposure to grammar. Their sloppy speech is a good index not only to their ignorance of phonics but to their poor grasp of both grammar and literature and to their resultant, probably sloppy, thinking.

In the New England colonies, however, at the beginning of the eighteenth century, Latin was still important as a school subject, though the book lists just cited show it was rapidly deteriorating into a largely useless acquirement. Almost all meaningful reading, as in the Bible, was done in English.
PART 3
The French Sources

The Teaching of Reading in France, and Its Influence on the Teaching of Reading in English, Both Considered in the Historical Context of the Times
Chapter 7
Eighteenth Century Attitudes on Education and the Background on Eighteenth Century Literacy Levels

The American “Revolution” is wrongly named. Unlike the French Revolution, which was a true revolution, it is more properly called the War for Independence. Furthermore, its religious philosophy was very different, at least for most of its dominant actors, from that of the anti-religious French Revolution.

These two differences between the events in America and in France are demonstrated by the words of George Washington in June, 1776:

“If it be the will of God that America should be independent of Great Britain, and that this be the season for it, even I and these unhopeful men around may not be thought unworthy instruments in His hands ... In this persuasion I resolve to go on, contented to save my country, or die in the last ditch.”

A parallel is also lacking between the writing of the American Constitution and the writing of the French constitution, both begun in the year 1789. When the framers of the American Constitution were having no success, they were counseled by Benjamin Franklin to pray for guidance as a group, as his long life had convinced him no success could come without such prayer. When they did pray for guidance as a group, they quickly succeeded in writing our Constitution, and it has lasted for over 200 years. In contrast, the majority of the writers of the French constitution were irreligious and they certainly did no praying as a group for guidance. Their constitution took two years to write. Yet, even after a major revision, it lasted only a few years.

Despite such differences between American and French history, the Western World of which France and America are a part, and the major forces acting on the Western World, can only be understood as unitary things, because Western Civilization is a unitary thing. When that unitary viewpoint replaces splintered viewpoints, it reveals that the nineteenth century, far more than the last half of the eighteenth century, was an age of revolution. That was not just at the overt level of the states of the Western World, but below that at what might be called the covert level by the enacting of revolutionary laws, some of which were very good but some of which were very bad.

Far from the least of those revolutionary laws were those which mandated compulsory government education. Compulsory education by the government was only proposed for the first time since the days of ancient Greece in eighteenth-century France. Yet compulsory education by governments was astonishingly in place almost everywhere in the Western World, not just in France, only a century later.

That was an absolutely stunning development, as compulsory government education had apparently never existed anywhere in history before the eighteenth century except in Sparta in ancient Greece. The very idea of compulsory government education had apparently not even been considered until the eighteenth century except in Sparta centuries before Christ.

Carlo M. Cipolla stated on page 80 of Literacy and Development in the West (Penguin Books, Baltimore, Maryland: 1969) that Austria-Hungary under Maria Theresa in 1774 passed what was perhaps
the first true legislation on compulsory school attendance\textsuperscript{15}, although it had been preceded by similar earlier legislation in Prussia. In Prussia in 1717:

“Frederick I ordered all children to attend school where schools existed....”

That fact was cited in the Encyclopedia Britannica (1963) in its article, “Education, History of,” Volume 7, page 1006. Such a vague ruling in a time when schools were normally run by the churches does not qualify as legislation mandating compulsory attendance at government schools. However, the encyclopedia added the following:

“In 1763 the Landschulreglement of Frederick the Great laid down the broad lines upon which the Prussian state thereafter proceeded, asserting the principle of compulsory school attendance.”

In 1763 and later, the ideas of the French “philosophers,” commonly called the “philosophes,” were influencing all Europe and America as well. Therefore, that legislation in Austria and Prussia in 1763 and 1774 cannot be considered apart from the ideas of the “philosophes” which produced the French Revolution in 1789 with its later mandatory government-school attendance proposals. Yet it should be noted here that the American Constitution of 1789 completely and undoubtedly intentionally omitted the topic of education. Despite the influence of the “philosophes,” the framers of the American Constitution accepted the fact that American education was totally in the private sphere, since they were certainly aware that no American states were involved in education at that time.

Thomas Jefferson was in France at the time the Constitution (but not the Bill of Rights) was written and so had nothing to do with its composition. Jefferson apparently was more receptive to the ideas of the French “philosophes” than most others of the founding fathers since he was later in contact with du Pont de Nemours concerning possible government schools. However, it should also be noted that Jefferson was very different from the “philosophes” in his attitude to religious congregations and to schools maintained by them. The Ursuline nuns in New Orleans wrote to Jefferson after the Louisiana Purchase while Jefferson was president because they were worried about the future of their establishment under the new American government. In New Orleans, the Ursulines maintained an “academy, day school, orphan asylum, hospital and instructions for coloured people in catechism” (Catholic Encyclopedia, 1913, Volume XI, p. 10). Jefferson, who was a “theist” and not a Christian, took the time personally to reassure the Ursuline nuns concerning their safety and their rights, and he did so in a very warm and comforting manner, as reported below:

“On 21 March, 1804, the Ursulines addressed a letter to Thomas Jefferson, President of the United States, in which they solicited the passage of an Act of Congress guaranteeing their property and rights. The president replied reassuring the Ursulines. ‘The principles of the constitution of the United States,’ he wrote, ‘are a sure guaranty to you that it will be preserved to you sacred and inviolate, and that your Institution will be permitted to govern itself according to its own voluntary rules without interference from the civil authority. Whatever diversity of shades may appear in the religious opinions of our fellow citizens, the charitable objects of your Institution cannot be of indifference to any; and its furtherance of the wholesome purpose by training up its young members in the way they should go, cannot fail to insure the patronage of

\textsuperscript{15} The Dictionnaire de Pedagogy et d'Instruction Primaire does show on page 889, under “Ephemerides,” that January 23, 1759, was the date of the Ordinance of Christian VI making primary instruction obligatory in Denmark. There is, however, nothing to indicate this meant compulsory attendance in government schools or to indicate that church or home education was unacceptable. Similar legislation for church schools apparently existed briefly in Germany after the Reformation in the sixteenth century, but was ineffective because of wars.
the government it is under. Be assured that it will meet with all the protection my office can give it.” (The Catholic Encyclopedia, (1913), Volume XI, page 10.)

A contrast in “Christian” behavior towards such groups as the Ursulines is remarkable between Jefferson, who was actually not a Christian, and Reverend Lyman Beecher. Beecher certainly SHOULD have been a Christian, since Beecher was at least officially a Presbyterian clergyman. That very possibly was in name only, as the period in which Beecher lived was full of “free-thinkers” who abandoned their roots. The pantheist, Reverend Ralph Waldo Emerson, was one of them. (See page 141, S. L. Blumenfeld’s Is Public Education Necessary?.) Paul A. Fisher wrote the following concerning Beecher’s offensive behavior (page 64, Behind the Lodge Door, Tan Books and Publishers, Inc., Rockford, Illinois, 1991, copyrighted by Paul A. Fisher in 1988). Beecher’s remarks not only confirmed the fact of his bigotry but accidentally confirmed two other facts. One is that American children and adults in 1836 had a very high literacy level, and the other is that Beecher promoted “government” schools because he thought they could shape and control children’s minds:

“In 1836, Bishop John Purcell of Cincinnati deplored the calumnious writings against Catholics which were distributed everywhere. Above all, he was concerned because religious and political tracts were made available to children and imbued them with hatred and prejudice against the Catholic Church.

“Among the most notable opponents of the rise of Catholicism in the West [Ed.: Cincinnati area] was the famous Boston Presbyterian clergyman, Rev. Lyman Beecher.

“On August 11, 1834, following a series of anti-Catholic sermons by Beecher, the Ursuline Convent at Charleston, a Boston suburb, was set afire and sacked by a mob. Even the cemetery was violated: graves were dug up, coffins were opened, and their contents exposed.

“In his best-selling book, A Plea For The West, the Boston clerical firebrand wrote: ‘...the conflict which is to decide the destiny of the West will be a conflict of institutions for the education of her sons, for the purposes of superstition, or evangelical light, of despotism or liberty.’

“...He further warned:

“‘If we do not provide the schools which are requisite for the cheap and effectual education of the children of the nation, it is perfectly certain that the Catholic powers of Europe intend to make up the deficiency....’

“Later, the Boston minister wrote in his autobiography: ‘Before I left (Boston), the tide had turned and Catholicism forever in New England must row upstream, carefully watched and increasingly understood and obstructed by public sentiment.’“

It is to be presumed that the wild bigot, Beecher, was speaking of the same kind of “public sentiment” which had resulted after his “sermons” in the burning down of the Ursuline convent and the digging up of the graves there. It is curious that Bronson Alcott and Lyman Beecher, 1830’s contemporaries afflicting the unfortunate city of Boston, both produced daughters who had remarkably more attractive minds than their distasteful fathers. Alcott’s daughter, Louisa May, wrote the classic, Little Women, and Beecher’s daughter, Harriet Beecher Stowe, wrote Uncle Tom’s Cabin.

The 1774 Austrian general law for schools required that “all children of both sexes must without exception attend the public school from the age of 6 years until they are sufficiently instructed to choose a
trade or profession.” This law implicitly outlawed home education, which was completely under the control of the children’s parents and was at the time called “private” education, as opposed to “public” education in schools outside the home. By this deadly law of 1774, the legal authority for shaping a child’s character passed officially from the children’s parents to outsiders (who at least in Austria were probably the personnel of the church schools, and not the personnel of true government schools). Cipolla had said on page 81 that:

“The Austrian law of 1774 was much in advance of contemporary legislation in any other country, except the two Regulations of 1763 and 1765 of Frederick II of Prussia.”

Note Cipolla’s use of the judgmental, positive term, “in advance,” which reflects the present-day largely unchallenged “establishment” opinion on mandatory government schools.

The prevalent deep-seated belief is that mandatory government schools are an “advance” in culture. Yet, contrast our vast armies of appallingy ignorant functional illiterates being turned out every year by our enormously expensive compulsory American government schools to the historically demonstrated intellectual level of Americans in 1774. That year of the Austrian compulsory legislation, 1774, was more than fifty years before the campaign in America to have the government take over education, which only started in earnest in 1826.

It was also only two years before our War for Independence, in which written pamphlets distributed throughout the general population played such a large part. The “readability” and information levels of those pamphlets were astonishingly high. However, it is probable that only a small percentage of our high school graduates today, the products of our compulsory so-called education, could either read correctly or understand such pamphlets.

The young soldiers in George Washington’s army were serving without pay when, before dawn on Christmas day, they rowed Washington across the Delaware River through the broken ice to attack Trenton. It was not money that motivated those young soldiers in our War for Independence. It was the material contained in those widely circulated pamphlets which the young men undoubtedly had read with high “reading comprehension.” Yet these young men in the 1770’s were probably only about the age of the present-day armies of functional illiterates in our “compulsory” high school senior classes, or only a few years older.

Compulsory government school attendance laws dating from the late eighteenth century, which had such a high priority with the French Revolutionists, have been justified by the ridiculous fable that in the eighteenth and early nineteenth centuries the vast majority of people were illiterate. Yet that was manifestly not true in most places, and certainly not in the United States.

The founder of the du Pont family in the United States and supporter of the French Revolutionary government is a surprising source for testimony on almost universal literacy in America in 1800. He also grudgingly gave testimony to a certain level of literacy in pre-Revolutionary France, though he almost certainly grossly underestimated it.

A brief biography on Pierre Samuel du Pont de Nemours is given in the Dictionnaire de Pedagogy et d’Instruction Primaire (1880-1888, Vol. 1 - 1, page 748 and following). It states du Pont was born in Paris in 1739 and died in the United States in 1817. It is not completely accurate, however, as it said du Pont’s first book was composed while he was in America and was published in France in 1812 in Annales de l’Education, M. F. Guizot, Editor. Actually, what may have been du Pont’s first written work was listed in a separate article in the Dictionnaire, the “Bibliographie,” under 1794 as Views on National Education, prepared when du Pont was a member of the French Revolution’s assembly. That 1794 work included a
description of du Pont’s reading method, according to a third article, “Lecture,” in the Dictionnaire. The “Bibliographie” also records that in 1812 du Pont de Nemours published a book in France, National Education in the United States, Paris, of 160 pages. This is presumably the same material as that listed in his brief biography in the Dictionnaire as Annales de l’Education, 1812.

The Dictionnaire biography on du Pont said he commented at the beginning of the 1812 work:

“This was made in 1800 at the request of Mr. Jefferson, President of the United States of America; it has the approval of this great judge and of his respectable successor.”

The article then described the 1812 material, quoting du Pont directly at times.

“Addressing next his subject, du Pont recorded that in the United States education is very general. ‘Almost all the young Americans learn to read, to write, and to compute. (Les jeunes Americaines apprennent presque tous a lire, a ecrire et a compter.) There are not more than four in a thousand who cannot write legibly and also properly; as for [those] in Germany, in Spain, in Portugal, in Italy, there are scarcely a sixth of the nation who know how to read; in France, even, not more than a quarter. (Il n’y en a pas plus de quatre sur mille qui n’ecrivent pas lisiblement et meme proprement; tantes qu’en Allemagne, en Espagne, en Portugal, en Italie, il n’y a guere qu’un sixieme de la nation qui sache lire; en France meme, pas plus d’un quart.)’

Yet du Pont had run no literacy survey in any of those countries. Nor did he apparently have any authoritative sources on literacy in Germany, Spain, Portugal, or Italy. His comments on those countries are only opinions. In any case, as Cipolla made clear in his book, very few meaningful statistics exist for Europe at that period. But, concerning France and the United States, du Pont was speaking from personal contact, so his comments for those two countries do have objective value. He had sat in the French assembly in 1794 that was so busy “improving” France, particularly its education system, and that assembly was doing so with a deep contempt for France’s past. Therefore, it is hardly likely that du Pont would have over-estimated French literacy, even though his estimate was based on his own personal knowledge, but would have under-estimated it.

It is probable the same negative tendency had affected Saint Thomas More when he made his early sixteenth-century estimate of English literacy of about sixty percent. More probably underestimated rather than overestimated literacy as he was finding fault with what he considered very poor conditions. (In More’s time, however, beginning reading was taught in Latin. It was far, far easier both to teach reading and to learn to read in regularly-spelled Latin than in the wildly complicated spellings of English and French. Therefore, there probably would have been a higher degree of literacy among the poorer classes, who would have found it very easy to teach their children or their apprentices.)

Since du Pont estimated that a quarter of France was literate, the probability is that a considerably greater proportion than a quarter were literate. In America, du Pont prepared material on education especially for Jefferson in 1800 while du Pont was presumably staying in the vicinity of Wilmington, Delaware, and Washington, D. C., and not even in New England which had a tradition of common schools to account for high literacy. (It should be noted here that originally such “common schools” were locally-controlled schools, not state-controlled schools, and so were not originally “government” schools.) With this first-hand and high-level contact with the America of 1800, du Pont had concluded that not more than four out of a thousand young Americans were illiterate. Du Pont’s testimony in 1800, therefore, was that America was a place where young adults were virtually all literate! (Unfortunately, however, du Pont was obviously not considering those Blacks in the South who were still in slavery and who were denied education, so his figures only concerned free young adults.)
However, since du Pont was in a highly authoritative position to comment on the level of U. S. literacy in 1800, it is extraordinary that his testimony has been almost totally overlooked.

The Encyclopedia Britannica (1963) reported that du Pont prepared a plan for national education and gave it to Thomas Jefferson. It also said that du Pont tried to promote trade between France and the United States by forming companies to engage in it, but that none succeeded in doing so. Du Pont’s two sons, Eleuthere and Victor, had come to the America with him, and Eleuthere began to produce gunpowder in America in what eventually became the famous du Pont factories. However, the elder du Pont went back to France in 1802, reportedly to foster the Louisiana Purchase.

Du Pont de Nemours had apparently been a rich man all his life, with influence for a time in the court of Louis XVI before the Revolution, for a time in the French legislature in the Revolutionary period, and for a time at a high level after the take-over by Napoleon. Du Pont had returned to France in 1802, and much later was part of the post-Napoleon provisional government in 1814, but when Napoleon briefly returned for the “Hundred Days,” du Pont left France for Delaware in the United States where his son was living, and where he died in 1817. Apparently, du Pont had refused to work again under Napoleon’s government. Du Pont had therefore demonstrated all through his life a surprising knack for always endorsing what became the next winning team.

Du Pont, however, had added meaningful testimony in 1800 on the extent of eighteenth-century literacy, at least for America and France. Yet even where there was considerable illiteracy, as well as where there were relatively smaller amounts, financial aid to existing church schools in all countries of the West could easily have extended education to those still lacking it, and at far less cost than was involved in establishing the government schools that were demanded by the French Revolutionists.

Carlo M. Cipolla’s Literacy and Development in the West gave some firm figures for literacy before 1800, but most of his figures are after that date. At all times, he relied heavily on the percentage of signatures on marriage records, as opposed to making a mark, as an indication of literacy. Yet using signatures as a test for literacy is not an adequate test for the years before 1800 since for many centuries before that time writing had not usually been taught at the same time as reading. The teaching of writing at the same time as reading had disappeared with the dropping of wax tablets for beginners and the arrival of the ABC books about 1350. Such ABC books were ubiquitous on the European Continent until the mid-eighteenth century, and in England till after the beginning of the seventeenth century. Even when ABC books in England largely disappeared in the seventeenth century and only spelling books and horn books were used as a first step, “spelling” was still only done orally. Writing itself was still taught apart from reading, if it were taught at all. Even in New England through the eighteenth century, “writing” schools were separate from reading schools.

Far more than Andrew Bell with his monitorial school sand tablets (which he eventually dropped, anyway) it was the educational theorists of the French Revolution who were largely responsible for the significant educational improvement of reuniting the teaching of writing to that of reading. (That is, of course, a mute testimony to their widespread influence).

Shakespeare’s daughter in the seventeenth century had been unable to sign her own name, but it is unlikely that she was illiterate. The Paston women in England in the fifteenth century, referred to elsewhere, were also unable to write but are known to have been literate. Yet Cipolla’s method of citing signatures as an index of literacy would have listed the Paston women and Shakespeare’s daughter among the illiterate.

I have read that some aphasics who had lost the ability to read have nevertheless retained the ability to write, but were then unable to read their own writing. This certainly seems to suggest that the learned
conditioned reflexes for writing are at least in part totally separate from the learned conditioned reflexes for reading, and that therefore the conditioned reflexes for writing must be specifically acquired. Many pre-nineteenth century literates who were never specifically taught to write may very well have been able to read while remaining unable to write. Signatures on such documents as marriage records are therefore an unreliable source for literacy statistics before about 1800.

Furthermore, Cipolla had a curious bias for the years before 1800, implying that literacy was more closely associated with urban, and not rural populations, and, of course, populations were far more rural before the industrial revolution of the nineteenth century. He said:

“...one must realize that the educational progress outlined in the previous pages had essentially an urban character,” (page 55).

Cipolla apparently did not know that Ireland had no towns or cities whatsoever before the Viking invasions which had started about 800, and so was totally rural. Yet, for centuries before those invasions, Ireland had highly developed schools, both secular and religious, and had exported scholar monks to found schools all over Europe.

It cannot be emphasized too often that to teach reading in Latin by the syllable method was a very easy thing to do, and, to paraphrase a slogan, each literate could, indeed, teach another illiterate without even trying very hard. “Schools” were therefore not even necessary to teach simple literacy in Latin.

Furthermore, Cipolla’s reference to provisions for lay students as well as clerical students in church and monastic schools before 1000 A.D. is inadequate, since such provisions were the norm and must have produced a considerable degree of lay literacy.

Instead of acknowledging such facts supporting the existence of literacy in those so-called “Dark Ages,” Cipolla emphasized the fact that the later Norman kings were illiterate, which is only what one would expect since their Viking ancestors were illiterate in the Latin alphabet (but almost certainly not in the runic alphabet). Cipolla also emphasized the fact that, before the semi-barbaric Charlemagne about 800 A.D., some semi-barbaric French kings who preceded him (whose general behavior was appalling) were also illiterate. This is hardly surprising, considering their degeneracy, but Cipolla seemed unaware of the fact that educational facilities for common people had existed at that time, and for hundreds of years before and after, in much of western Europe and in the British Isles.

Some information on pre-French-Revolutionary education is given in the article, “France,” in the Catholic Encyclopedia (1913), pages 182, Volume VI:

“From the eleventh century onwards, history shows unmistakable traces, in most provinces of France, of small schools founded by the church, such as were recommended in Charlemagne’s capitulary in the year 789. The ever-increasing number of schools, writes Guibert de Nogent in the twelfth century, makes access to them easy for the humblest.”

That last is an astonishing statement from an apparent contemporary, suggesting that access to education (real education, and not just simple literacy) was easier in the twelfth century in France than in the eighteenth century all over Europe!

Before the sixteenth century when literacy in Latin was replaced by literacy in the vernaculars which made the achieving of simple literacy far more difficult, education had been conceived of as something to be acquired only AFTER the simple learning of reading in Latin was already finished. That fact is demonstrated by the famous fifteenth century print, so often reproduced, of a boy’s arriving at the door of
education’s tower already carrying his ABCs (from Margarita Philosophica, by Gregory Reisch, Heidelberg, 1486, reproduced in Appendix A of this history.)

Most historical reference works, like Cipolla’s, make a time-jump from the fall of the Roman Empire to the Renaissance (of pagan culture). They imply that not much of cultural importance happened in the more than a thousand years that lies in between those two markers. The making of that time-jump is particularly true of many reference works on the history of education. Although Cubberley’s historical work on education is better, it is biased and incomplete, and, in any event, largely forgotten today. Yet, in order to understand what happened to education in the Western World because of the influence of the eighteenth-century philosophers of the so-called “Enlightenment” and the influence of the French Revolution, it is necessary to have concrete information on education during those largely ignored thousand years before the Renaissance. The following specific historical information which includes that period is taken from pages 555 to 557 of the article, “Schools,” in the Catholic Encyclopedia (1913), Volume XIII:

“...II. Catechetical Schools. These flourished about the middle of the second century of the Christian era. They were brought into existence by the conflict of Christianity with pagan philosophy. They were, consequently, academies of higher learning.... We have reason to believe that in some instances, as in the catechetical school of Protogenes at Edessa (about 180), not only the higher branches but also the elementary branches were taught in the catechetical schools. Schools of this type became more numerous as time went on. In the Council of Vaison (529), the priests of Gaul are commanded to take boys into their household and teach them to read ‘the Psalms, and the Holy Scriptures and to instruct them in the Law of God’. From these sprang the parochial schools of medieval and modern times.

“...In the first centuries great stress was laid on the importance of home education, and this task was committed in a special manner to Christian mothers. It is sufficient to mention the Christian matrons Macrina, Emmelia, Nonna, Anthusa, Monica, and Paula, mothers of saints and scholars, to show how successfully the home under the direction of the Christian mother was made to counteract the influence of pagan schools. There were also private schools for Christian youth, taught by Christians, for instance the school at Imola, taught by Cassian.

“III. Monastic Schools. - Monasticism as an institution was a protest against the corrupt pagan standards of living which had begun to influence not only the public life of Christians but also their private and domestic life. Even in the fourth century, St. John Chrysostom testifies to the decline of fervour in the Christian family, and contends that it is no longer possible for children to obtain proper religious and moral training in their own homes. It was part of the purpose of monasticism to meet this need and to supply not only to the members of the religious orders but also to children committed to the care of the cloister the moral, religious, and intellectual culture which could not be obtained elsewhere without lowering the Christian standard of life. At the same time episcopal schools, though instituted primarily for the education of clerical candidates, did not decline to admit secular scholars, especially after the State schools of the empire had fallen into decay. There were parochial schools also, which, while they aimed at fostering vocations to the priesthood, were expressly commanded not to deny their pupils the right to enter the married state as soon as they reached the age of maturity (cum ad aetatum perfectam pervenerint). The explicit enactment of the Council of Vaison (529) in this matter is important because it refers to a similar custom already prevailing in Italy.

It remains true, however, that although the episcopal and presbyteral (parochial) schools thus contributed to the education of the laity, the chief portion of the burden of lay education in the Middle Ages was borne by the monasteries. The earliest monastic legislation does not clearly
define the organization of the ‘internal’ and ‘external’ schools. Nevertheless, it recognizes the existence in the monastery of children who were to be educated, not for the cloister, but for the world. In Ireland, as Archbishop Healy says, the monks ‘taught the children of the rich and poor alike’ (‘Ireland’s Ancient Schools and Scholars’, 102) and to Ireland went not only clerics but laymen from England and the Continent, to receive an education. On the Continent also the education of the laity, ‘gentle and simple’, fell to the lot of the monks. It is difficult to say when the distinction between the ‘internal’ school (schola clausi) and the ‘external’ (schola canonic, s. externa) was first introduced. We find it in St. Gall, Fulda, and Reichenau in the ninth and tenth centuries. In the internal school the pupils were novices, future members of the order, some of which were offered up (oblati) by their parents at a tender age. In the external school were the children of the neighbouring villagers and the sons of the nobility; many of the references to this class of pupils in the monastic code lay stress on the obligation to treat all with equal justice, not taking account of their rank in life. There was a similar custom in regard to the reception of young girls in the convents, as appears from several enactments of Bishop St. Caesarius of Arles and his successors. At Arles, moreover, according to Muteau (see bibliography) open schools (ecoles ouvertes) were held by the nuns for the benefit of the entire neighbourhood. The curriculum of studies in the monastic schools comprised the trivium and quadrivium, that is to say, grammar, rhetoric, dialectic, arithmetic, geometry, astronomy, and the theory of music. Besides, the monks cultivated the science and art of healing; they devoted attention to agriculture, building, and the decorative arts. They took pains to transcribe the Classics as well as the distinctly ecclesiastical works that had come down to them; and in doing this they developed the art of penmanship and that of illumination to a high degree of perfection. They were annalists also, noting down year by year the important events not only in the life of their own community but also in the Church at large and in the political world. Finally, by example and precept they dignified manual labour, which in pagan Rome was despised as fit only for slaves.

“The head of the monastic school was called magister scholae, capiscola, proscholus, etc. By the end of the ninth century, however, the usual name for the head of the school was scholasticus. His assistants were called seniores. The method of teaching was influenced largely by the scarcity of books and the need of handing down without diminution the heritage of the past. The master dictated (legere was the word used to signify the act of teaching), and the pupils wrote not only the text but also the master’s explanation or commentary. Of the many textbooks in use the most popular was the work by Marcianus Capella (about 420) entitled ‘Satyricon, seu de Nuptiis Mercurii et Philologiae’.

“That the instruction given to the laity in the monastic schools was entirely gratuitous is evident from the decree of Bishop Theodulf of Orleans in the eighth century, and from other documents. When, at Tours, the external school was frequented by a number of wealthy pupils, whose voluntary gifts to the monastery put the poorer students in a position of apparent inferiority, the bishop of that see, Amalric, gave a generous donation to the monks to be used in the maintenance of poor students. The Carlovingian revival of education affected not only the internal schools of the monasteries but also the external schools, and, during the reign of Charles’s successors, bishops and popes by a number of decrees showed their interest in the maintenance not only of schools of sacred science, but also in schools ‘for the study of letters’. The external school had by this time become a recognized institution, which the sons of the farmers in the neighbourhood of the monasteries frequented not by privilege but by a right freely acknowledged. We know that before the end of the ninth century both boys and girls attended the schools attached to the parish churches in the Diocese of Soissons. As time went on the establishment and maintenance of schools by the Church was made a matter of express canonical enactment. No document could be more explicit than the Decree of the Third Council of Lateran
(1179): ‘That every cathedral church have a teacher (magistrum) who is to teach poor scholars and others, and that no one receive a fee for permission to teach’ (Mansi,XXII,234).

‘IV. Cathedral Schools. - [Ed.: refers to ‘Cathedral’ and ‘canonicate’ schools, the latter under local churches.] ...In both institutions there came to be distinguished (1) the elementary school (schola minor) where reading, writing, psalmody, etc. were taught; and (2) the higher school (schola major) in which the curriculum consisted either of the trivium alone (grammar, rhetoric, and dialectic), or of the full programme, namely the seven liberal arts, Scripture, and what we now call pastoral theology. The method employed in the cathedral schools was identical with that of the monastic schools.

‘V. Chantry Schools... The chantry was a foundation with endowment, the proceeds of which went to one or more priests carrying the obligation of...saying Mass...for the soul of the endower, or for the souls of persons named by him. It was part of the duty of the incumbents of a chantry foundation to ‘teach gratis the poor who asked it humbly for the love of God’. (See ‘Catholic University Bulletin’, IX, 3 sq.).

‘VI. Guild Schools, Hospital Schools, and City Schools, the last beginning with the thirteenth century, shared the work of education with the cloister, cathedral and chantry schools. The guilds and hospitals were ecclesiastical foundations, were guided by clerics, and engaged in the work of education under the direction of the Church. The city schools at first met with opposition from the teachers in the monastic and cathedral foundations, although they also were under the control of ecclesiastics. Kehrein in his ‘History of Education’ (see bibliography) mentions a Decree of Alexander III which prohibits any abbot from preventing any magister or scholasticus from taking charge of a school in the city or suburb ‘since knowledge is a gift of God and talent is free’. Towards the end of the Middle Ages the task of the ecclesiastical teacher became so important that communities of clerics were founded for the express purpose of devoting their lives to the duties of elementary education. The best known of these communities is that of ‘The Brothers of the Common Life’ founded by Gerard Groot (1340-84) at Deventer. It soon extended to Windedheim, Agnetenberg, and other towns in Holland and North Germany. To this community belonged Thomas a Kempis, the author of ‘The Imitation of Christ.... Allain (see bibliography) has told the story of primary education in France; Ravelet (see bibliography) has gone over the whole question of primary education in medieval times; Leach has told part of the story (see bibliography) as far as pre-Reformation England is concerned....’

Leach produced an enormous amount of useful historical data from surviving documents on the widespread existence of schools in England before the sixteenth century. In a later section, “In England,” of this article, “Schools,” on page 571, the following appears:

“A. F. Leach begins his masterly work, ‘English Schools at the Reformation’ (London, 1896) with the sentence: ‘Never was a great reputation more easily gained and less deserved than that of King Edward VI as a Founder of Schools.’ The truth is that the few educational foundations made by the Government either of Henry VIII or Edward VI were but re-foundations forming a small salvage from the wreck of educational endowments confiscated with the monasteries and chantries. In fact England was singularly well provided with schools previous to Henry VIII. Among them were the cathedral schools, collegiate grammar schools, monastery schools, guild schools, and perhaps most numerous of all, chantry schools... They usually taught reading, writing and Latin. Many reached a good standard and included rhetoric and dialectic in their curriculum. There were also song schools of more elementary character. As most of the grammar schools taught gratuitously, a very liberal provision of education was open even to the poorer
classes.... ‘The proportion of the population which had access to Grammar Schools, and used them was much larger than now’ (Leach, p. 97).”

It should be mentioned that Leach did not consider the monasteries to have been important for lay education in England in the late Middle Ages, but did consider the local grammar and ABC schools to have been of great importance.

The following continues the excerpts from pages 555 to 557 of the article, “Schools:”

“Both the particular and the general councils of the Church, imperial capitularies, and episcopal and papal decrees show that bishops and popes, while concerned primarily for the education of future members of the clerical body in sacred sciences, were also at pains to encourage and promote the education of the laity. For instance, the Council of Cloveshoe, held by Cuthbert, Archbishop of Canterbury in 749, prescribes that abbesses as well as abbots provide for the education of all their households (familiae). A Carlovingian capitulary of 802 enjoins ‘that everyone should send his son to study letters, and that the child should remain at school with all diligence until he became well instructed in learning’. Theodulf of Orleans in 797 decrees that gratuitous instruction be given by the priests in every town and village of his diocese, and there cannot be the least doubt that education of the laity is meant. The Council of Chalon-sur-Saone in 813 legislates in a similar spirit that not only ‘schools of Sacred Scripture’ but also ‘schools of letters’ be established. The Council of Rome, held in 853, directs the bishops of the Universal Church to establish ‘in every episcopal residence (in universis episcopiiis) among the populations subject to them, and in all places where there is such need’ masters and teachers to teach ‘literary studies and the seven liberal arts’. These and similar documents lay stress on the obligation which rests on the parents and godparents to see to the education of children committed to their care.

“By the middle of the ninth century the distinction between external and internal monastic schools being clearly recognized, and parish schools having become a regular diocesan institution, the testimonies in favour of popular education under the auspices of the Church becomes clearer. In the tenth century, in spite of the disturbed conditions in the political world, learning flourished in the great monasteries such as that of St. Gall (Switzerland), St. Maximin (Trier), and in the cathedral schools, such as those of Reims and Lyons. The greatest teachers of that time, Bruno of Cologne and Gerbert of Aurillac (Pope Sylvester II), taught not only the sacred but also the profane sciences. In the eleventh century the school of Chartres, that of Ste-Genevieve at Paris, and the numerous schools of rhetoric and dialectic show that even in the higher branches of learning, in spite of the fact that the teachers were invariably clerics, the laymen were welcomed and were not denied education of the secondary kind....

“... Specht (see bibliography) has produced documentary evidence to show the extent to which laywomen were educated in the convent schools of the ninth and the following centuries; he has also shown that daughters of noble families were, as a rule, educated by private teachers who, for the most part, were clergymen. The assertion so frequently made that, during the Middle Ages, learning was considered out of place in a layman, that even elementary knowledge of letters was a prerogative of the clergy, is not sustained by a careful examination of historical records.... ‘Knowledge’, says a twelfth century writer, ‘is not an exclusive privilege of the clergy, for many laymen are instructed in literature. A prince, whenever he can succeed in escaping from the tumult of public affairs and from [the confusion of] constant warfare, ought to devote himself to the study of books.’ (P. L. CCIII, col. 149). The number of distinguished laymen and laywomen, emperors, kings, nobles, queens and princesses who, during the medieval era, attained prominence as scholars shows that the advice was not disregarded....
“The destruction of this vast and varied system of ecclesiastical legislation is a fact of general history. The schools, as a rule, disappeared with the institutions to which they were attached. The confiscation of the monasteries, the suppressions of the benefices on which the chantries were founded, the removal of the guilds from the control of ecclesiastical authority, the suppression of cathedral and canonical chapters and the sequestration of their possessions by the State, were the immediate cause of the cessation of this kind of educational activity on the part of the church at the time of the Reformation and afterwards. In Protestant countries these events took place in the course of the fifteenth and sixteenth centuries. In Germany, a compromise was reached in some States by the recognition of both Protestant and Catholic ‘confessional’ schools and the division of school funds, an arrangement which lasted until the beginning of the nineteenth century; in France the work of confiscation began with the French Revolution; in Italy, Spain, and Portugal the suppression and spoliation have taken place within the last half-century and are still going on....”

As has been mentioned previously, additional references concerning education before the French Revolution were cited by Brother Azarius (P. J. Mullaney) in his book, Essays Educational, Chicago: D. H. McBride & Co., 1896, which is also listed in the above bibliography. His references included L’Abbaye Allain who wrote L’Instruction Primaire en France Avant la Revolution, Paris: 1881, also shown above; Armand Ravelet, who wrote L’Instruction Primaire dans les Campagnes Avant 1789, Troyes: 1875; and Babeau who wrote L’Instruction Primaire, 1875. Others Azarius cited were listed on page 172 in his chapter, “Primary School.” Another excellent reference on primary education in the Middle Ages, which has also been mentioned previously, is the 1920 work of Albert William Parry, Principal of the Training College at Carmarthen, entitled Education in England in the Middle Ages, published by University Tutorial Press, Ltd., W. B. Clive, London.

The article, “France,” in the Catholic Encyclopedia (1913), pages 182, Volume VI, testified to increased church efforts in France from the seventeenth century to the time of the French Revolution to spread primary education:

“The seventeenth century saw the foundation of a certain number of teaching institutes: the Ursulines who between the year 1602 and the Revolution, founded 289 houses, and who numbered 9000 members in 1792; the Daughters of Charity of St. Vincent de Paul, founded in
1630, recognized [by the Church] in 1657; the Congregation of Notre-Dame, founded by St. Peter Fourier, recognized in 1622; the Brothers of the Christian Schools, called, in the eighteenth century, Brothers of Saint Yon, founded by St. John Baptist de la Salle, and who had 123 classes in 1719, when their founder died, and 550 classes in 1789. In the last twenty years a large number of monographs which have been given restricted publication in the provinces, have presented historical evidence of the care which the Church was devoting to primary education during the period immediately preceding the Revolution.”

Casual entries in biographies of the pre-Revolutionary period can be illuminating concerning facts on primary education in France at that time. For instance, in the Biographie Universelle (Michaud’s) published in Paris in 1854 and republished in Austria in 1969 by Akademische Druck-u. Verlagsanstalt, the following appears in an entry for Jacques Deschamps (1677-1759), a priest in Normandy (not the Abbe Deschamps discussed later). Old Pastor Deschamps’ will gave as a legacy to his own church his entire estate, amounting to 10,000 francs, for the cost of maintaining a school-mistress for his own church. Such a school-mistress obviously would have been teaching both boys and girls, almost certainly at the primary level. It is reasonable to assume that there was nothing unusual about Pastor Deschamps’ will, either. There must have been many wills like his, just as there had been many legacies very like his in pre-Reformation England. When Pastor Deschamps wrote his will some time before 1759, in which year he died at the age of 82, he was certainly not the only one in France who considered primary education of such high importance, as the existence of the large religious teaching orders proves.

However, concerning Cipolla’s low figures for literacy even after 1800 when handwriting again began to be taught more routinely, in many places pre-existing educational facilities had been badly disrupted by the extensive wars of the late eighteenth and early nineteenth centuries, so early nineteenth century figures are no real indication of what might have been the norm one hundred or two hundred years earlier.

To show the high regard for literacy before 1800 and to suggest literacy was far more widespread than Cipolla presumed, when the Protestant and Catholic Spanish, French, English, German and Swedish settlers arrived in America in the sixteenth, seventeenth and eighteenth centuries, one of their first concerns was with the teaching of beginning reading to children. The Spanish in Mexico in the 1500’s, and the English Pilgrims in Massachusetts and the French in Canada in the 1600’s also tried to teach the Indians to read. According to The Catholic Encyclopedia, Vol. XV, page 229, “Ursulines of Quebec”:

“The Ursuline monastery of Quebec is the oldest institution of learning for women in North America. Its history begins on 1 August 1639.... Their first pupils were Indians.... Marie de l’Incarnation mastered the difficult Indian languages thoroughly, and composed dictionaries in Algonquin and Iroquois, also a sacred history in the former, and a catechism in the latter idiom....”

Actual records exist, cited elsewhere, concerning German ABC books (Klinefelter) Spanish-Indian ABC books (Berry and Poole,) and Swedish ABC books (Wickersham) in America during the sixteenth, seventeenth and eighteenth centuries. Concerning further evidence on French attitudes, Marguerite Bourgeoys of the Congregation of Notre Dame, an order whose work was the teaching of poor girls gratuituously, founded a branch in Montreal, Canada, in 1657, confirming a concern in France and Canada not just for literacy but for the literacy of poor women, a powerless class, in 1657 (The Catholic Encyclopedia (1913), Vol. III, page 296, “Canons”). When the Ursuline nuns founded a convent school for girls in New Orleans in 1727 and were welcomed with pleasure by the influential townspeople, they were only extending into the relative wilderness the facilities available for well-born girls in the French homeland (The Catholic Encyclopedia, Vol. IX, page 379, “Louisiana”).
Klinefelter documented the enormous concern of the Protestant Pennsylvania Germans in the late seventeenth and all the eighteenth century for the teaching of reading in their pioneer settlements. Du Pont’s unfounded estimate that only a sixth of Germany was literate by 1800 certainly is in total disagreement with the historical fact that there was an enormous concern for literacy in the eighteenth century among the Pennsylvania Dutch (Germans) of all religious denominations.

Such citations on the widespread concern for literacy shown by settlers from all these countries, both Protestant and Catholic, could be multiplied almost endlessly. Yet the sixteenth, seventeenth and eighteenth century American settlers were obviously only carrying on Old-World practices, though, indisputably, greater or lesser degrees of illiteracy also nevertheless existed in their countries. However, the best indication of widespread literacy in Western Europe in the eighteenth century, at least for those who were not poor, is the vast market for books, newspapers and journals. The indications are that there was a brisk market for all these materials in the eighteenth century. After all, how else could the Encyclopedists and Voltaire have spread their ideas all over Europe at that time except through such printed materials? Furthermore, Gedike’s comment, quoted elsewhere, on the vast numbers of children’s books at the Leipzig book fairs in the 1770’s certainly suggests there must have been even more books available for their parents!
Chapter 8
The Suppression of Religious Schools and Promotion of Government Schools Originated with the Change-Agents of the Eighteenth Century.
The Relationships to the Teaching of the Deaf

Subsidizing the increase of already-existing church schools could have avoided any government control of curriculum (though it did not in Great Britain), but such string-free subsidies would, of course, also have aided traditional religion. The historical record for the nineteenth century tells of the suppression of religious orders in various places, most of which orders were involved in running schools, and in the suppression of all sorts of religious rights. Of course, it was religion itself that was the primary target of such nineteenth-century laws, despite the lies of change-agents about the necessity for laws of suppression to increase both “liberty” and “enlightenment.” Therefore, change-agents were certainly not going to promote the granting of string-free subsidies to church-sponsored schools since church schools would promote the “unenlightenment” of traditional religion. Instead, the change-agents worked for the establishment of government schools which would teach the safe “religion” of secularism.

The following comment on the power of change-agents in nineteenth-century secret societies, which appear to have been major influences in the suppression of religious freedom and religious-sponsored education, appears in a biographical entry on Pope Gregory XVI (page 9, Volume VII) The Catholic Encyclopedia (1913):

“On 20 May, 1846, [Gregory XVI] felt himself failing, and ordered Cretineau-Joly to write the history of the secret societies against which he had struggled vainly....”

Cretineau-Joly apparently did write such a history, because the bibliography at the end of the entry included his L’Eglise Romaine en face de la Revolution (Paris, 1859). It is perhaps in that work that he made the remark about Voltaire which was quoted by Robert Henry Goldsborough on page 2 of Lines of Credit, Ropes of Bondage. J. Cretineau-Joly is reported to have referred to Voltaire as:

“The most perfect incarnation of Satan that the world has ever seen.”

Yet Voltaire most commonly receives the most respectful treatment from the general media. In contrast, the weekly bulletin for May 16, 1993, of Our Lady of Mount Carmel Church in Lyndhurst, New Jersey, had this to say, although it did not cite the source for Voltaire’s comments:

“Voltaire predicted that within a hundred years of his day (i.e., the 18th century) Christianity would be nothing but a relic of the past. He had to admit that in order for that to happen, the world would first have to get rid of Sunday. He said: ‘There is no hope of destroying Christianity so long as the Christian Sabbath is acknowledged and kept.’“

Not surprisingly, the “decadi” persecution broke out in the French Revolution. Sunday was abolished, and every tenth day (“decadi”) was to be the day of rest. Those who opposed the new legislation were persecuted.

It is not difficult to find the primary eighteenth-century source for the anti-religious attitudes of the nineteenth-century change-agents and the secret societies “against which [Gregory XVI] had struggled vainly....” It was not the French Revolution which was the primary source, because the French Revolution was itself only one of the products. The primary source was a group of “philosophers” of the eighteenth
century, and one of the most virulent was Voltaire. An account of the rabid hatred of these “philosophers” for Christianity, and of their successful suppression of the Jesuit order which ran so many schools as a “first step” toward suppressing Christianity itself, appears in the biography, “Clement XIII, Pope,” Volume IV, page 32, The Catholic Encyclopedia (1913). Clement XIII was born in 1693, was elected to the papacy in 1758, and died in 1769.

However, the pertinent excerpted portion cited later begins by using the terms “regalism” and “Jansenism.” Knowing the meaning of these terms is necessary in order to understand the excerpt. While the meaning of “regalism” becomes self-evident from the excerpt itself, the reference to Jansenism does not. Jansenists were an anti-papal faction among Roman Catholics which followed the heretical teachings of Roman Catholic Bishop Jansen, first published in 1640, which denied the effectiveness of free will. Jansenists were a grim and joyless sect who in practice regarded pleasures as evil. Their most famous adherents in the seventeenth century were Antoine Arnauld and the Port Royal school at which Jacqueline Pascal taught. That was the first school to use the brilliant synthetic phonics reading method of Jacqueline’s brother, the genius, Blaise Pascal. Blaise Pascal, the renowned mathematician/scientist and inventor of the synthetic phonics “sound” beginning reading method, was possibly a Jansenist sympathizer without actually being a Jansenist.

The famous teacher of the deaf who used the “meaning” beginning reading method, the Abbe de l’Epee, was a Jansenist. When he was first to be ordained to the priesthood, he refused to take an oath in opposition to Jansenism and so did not then receive holy orders. He was later ordained in 1736 by the bishop of Troyes, who employed him in his diocese. According to the brief biography on de l’Epee in the Dictionnaire de Pedagogie et d’Instruction Primaire (page 884):

“At the end of some years, the death of this prelate made the abbe decide to settle in Paris. One knows his attachment to the doctrine of Port-Royal and his well-followed relations with the venerable Soanen. This is why he was censured and struck with an interdiction by Monseigneur de Beaumont, Archbishop of Paris.”

It would appear from the fact that de l’Epee’s work with the deaf was sponsored by Louis XV that de l’Epee was not only an active Jansenist but was probably also a “regalist,” in the sense that he would tend to reject any opposition to positions taken by the king. This is particularly so since de l’Epee’s father had been the king’s architect, and his brother who later supported his work had also become the king’s architect. Kings tend to employ sycophants, not opponents. De l’Epee’s well-placed “connections” very probably accounted for the wide publicity and many visitors he received, while pre-existing and other teachers of the deaf in France such as the Abbe Deschamps and the Portuguese, Peirere, faded into obscurity.

After having considered the meaning of the terms, regalism and Jansenism, in the life of the famous de l’Epee, those terms may have more meaning in the following excerpt, “Clement XIII, Pope,” Volume IV, page 32, The Catholic Encyclopedia (1913).

“Regalism and Jansenism were the traditional enemies of the Holy See in its government of the Church, but a still more formidable foe was rising into power and using the other two as its instruments. This was the party of Voltaire and the Encyclopedists, the “philosophers” as they liked to call themselves. They were men of talent and highly educated, and by means of these gifts had drawn over to themselves many admirers and adherents from among the ruling classes, with the result that by the time of Clement XIII, they had their representatives in power in the Portuguese and in all the five Bourbon Courts. Their enmity was radically against the Christian religion itself, as putting a restraint on their license of thought and action. In their private correspondence they called it the Infame (the infamous one), and looked forward to its speedy
extinction through the success of their policy; but they felt that in their relations with the public, and especially with the sovereigns, it was necessary to feign some kind of Catholic belief. In planning this war against the Church, they were agreed that the first step must be the destruction of the Jesuits. “When we have destroyed the Jesuits”, wrote Voltaire to Helvetius, in 1761, “we shall have easy work with the Infame.” And their method was to persuade the sovereigns that the Jesuits were the chief obstacle to their Regalist pretensions, and thereby a danger to the peace of their realms; and to support this view by the diffusion of defamatory literature, likewise by inviting the co-operation of those who, whilst blind to the character of their ulterior ends, stood with them for doctrinal or other reasons in their antipathy to the Society of Jesus. [Ed.: One such group was the Jansenists, since the Jesuits had opposed them.] Such was the political situation with which Clement XIII saw himself confronted when he began his pontificate [Ed.: in 1758].

“PORTUGAL. - His attention was called in the first instance to Portugal, where the attack on the Society had already commenced. Joseph I, a weak and voluptuous prince, was a mere puppet in the hands of his minister, Sebastiao Carvalho, afterwards Marquis de Pombal, a secret adherent of the Voltairean opinions, and bent on the destruction of the society.... [By 1760] Pombal... shipped off all the Jesuits from Portugal and its colonies, save the superiors who were still detained in their prisons, and sent them to Civitavecchia, “as a present to the pope”, without a penny from their confiscated funds left to them for their maintenance....

“FRANCE. - It was to be expected that the Society’s many enemies in France would be stimulated to follow in the footsteps of Pombal. The attack was opened by the Parlement, which was predominantly Jansenist in its composition, in the spring of 1761.... Louis XV, like Joseph I, had a will enervated by lust, but unlike him, was by no means a fool, and had besides an underlying respect for religion. Thus he sought, in the first instance, to save a body of men whom he judged to be innocent.... but the king was being drawn the other way by his Voltairean statesmen and Madame de Pompadour... the arret of 2 August, 1762, by... the Parlement suppressed the Society in France.... Finally ... the king, weakly yielding to the pressure of his entourage, suppressed the French [Jesuits] by his edict of November, 1764....

“SPAIN. - The statesmen who had the ear of Charles III were in regular correspondence with the French Encyclopedists, and had for some years previously been projecting a proscription of the Society on the same lines as in Portugal and France. But this was not known to the public, or to the Jesuits, who believed themselves to have a warm friend in their sovereign. It came then as a surprise to all when, on the night of 2 - 3 April, 1767, all the Jesuit houses were suddenly surrounded, the inmates arrested and transferred to vehicles ordered to take them to the coast, thence to be shipped off for some unknown destination - forbidden to take anything with them beyond the clothes which they wore....

“Finally, on 18, 20, 22 January, 1769, the ambassadors of France, Spain, and Naples presented to [Pope Clement III] identical notes demanding the total and entire suppression of the Society of Jesus throughout the world. It was this that killed him. He expired under the shock on the night of 2 - 3 February....”

It is impossible to read this account of “identical notes” in 1769 from three governments without acknowledging organized group action involving several countries with the suppression of the Jesuits as the aim. It was probably also largely clandestine group action. Yet, as Voltaire’s remark made clear, the real target was not the Jesuits, but the “Infame,” or Christianity itself.

The “philosophers” after the mid-eighteenth century were very influential on general culture. A review of the chronological “Bibliographie” from the Dictionnaire de Pedagogy et d’Instruction Primaire
shows a remarkable change in emphasis on the entries on education after about 1760 when the “philosophers” became so famous. Prior to that time, the entries had largely been concerned with education by the church and by the home, and many had a pronounced emphasis on training in piety. After the mid-eighteenth century appeared many entries calling for a “national” education but the emphasis on “piety” almost disappeared.

A subdivision of the “Bibliographie” entries on education are those on the teaching of the deaf, which, of course, concern methods for teaching reading. De l’Epee with his emphasis on sign language and sight-words learned for “meaning” was NOT the only teacher of the deaf in Paris. He was preceded by a Portuguese, Peirere, who successfully taught the deaf to speak. Soon after, the Abbe Deschamps, who had been amazed by Peirere’s results, began his life work of teaching the deaf, and consciously modeled his work on Peirere’s. Therefore, the Abbe Deschamps successfully taught spoken language to the deaf as the initial step and refused to work with de l’Epee because of de l’Epee’s dependence on sign language and his failure to teach speech as a beginning step. Abbe Deschamps wrote of his own great success by teaching such “sound” methods instead of “meaning” methods, and several entries for his books appear in the “Bibliographie.” The following concerning Deschamps appears in the article, “Education,” Catholic Encyclopedia (1913), Vol. 5:

“The Abbe Claude Francois Deschamps (1745-91), in his treatise on the education of the deaf and dumb, is said to have also sketched the outlines of the art of teaching the blind to read and write.” (page 308)

“When the Abbe de l’Epee originated the method of signs, many of his contemporaries, such as the Abbe Deschamps, refused to be associated with this new school, and between him and Samuel Heinecke of Leipzig, the great upholder of the speech method, there was carried on a spirited controversy, which has continued ever since, among the educators of the deaf.” (page 318)

The entry on Abbe Deschamps in Michaud’s Biographie Universelle (1854, 1969) adds further information.

“An unforeseen circumstance resulted in his meeting a pupil, mute from birth, in whom Peirere had created the faculty of speech. This miracle of art struck him so perfectly that at that instant his vocation was decided. Fortune, talent, existence, he consecrated all to the education of deaf-mutes. This was particularly so to the class of people to whom he offered the lessons free: to pupils of this kind he gave bread and lessons at the same time. The attempt was made to associate him with the Abbe de l’Epee; but he refused to sacrifice to his advancement his preference for the system of the Israelite over that of his illustrious emulator. Thus the Abbe Deschamps lived unknown, and died almost ignored, but very regretted by his friends and above all by his pupils, in January, 1791. (On tenta de l’attacher a l’abbe de ’Epee; mais il refusa de sacrifier a son avancement le sentiment de preference qu’il accordait au systeme de l’Israelite sur celui de son illustre emule. Ainsi l’abbe Deschamps vecut obscur, et mourut presque ignore, mais tres-regrette de ses amis et surtout de ses eleves, en janvier 1791.)”

Deschamps received no Royal and apparently almost no other support, while the Jansenist de l’Epee, whose father had worked for the royal court, received great support and even had crowds of visitors come to see his “success.” A half century later, similar crowds came to see Robert Owen’s “success” in his “infant school” at New Lanark, Scotland, and crowds of sight-seers have appeared in turn at every change-agent promotion throughout the nineteenth century, as with Colonel Parker’s in Quincy, Massachusetts. That certainly indicates that organized group support must have existed for these historical “wonders.” Yet Deschamps, despite his entries in the “Bibliographie” and his objective success, had no
such crowds and no such support and has fallen into total oblivion. Heinecke in Germany, de l’Epee’s far more famous “sound” opponent, had more good fortune.

De l’Epee is presented as an innovator with his use of sign language, of which he is wrongly called the inventor, since sign language has existed in many forms since the dawn of time. However, printed sight words are a form of signs, and de l’Epee is the apparent inventor of the pure sight-word reading method for alphabetic print. On a scale from Code 1 to Code 10, in which Code 1 represents a pure “meaning” approach to decoding, and Code 10 represents a pure “sound” approach, and Codes 2 to 9 represent relative mixtures of the approaches, de l’Epee’s initial method rates a pure Code 1. In later stages, de l’Epee undoubtedly taught his pupils to compare sight-words, in order to identify like parts so as to tell them apart (phony phonics), so at later stages his method would probably rate a Code 3.

Yet de l’Epee’s invention some time after 1760 of a pure Code 1 “meaning” method for reading alphabetic print may very well have been inspired by the developing Code 3 “echo” reading method in France, very popular after 1744. (It was based on the whole-word comparison of memorized sample words to new words.) As discussed later, what became the Code 3 “echo” method had originated in France in an incomplete form with de Vallange’s New Systems or New Plans of Methods.... in 1719. In 1744, Abbot Bertaud elaborated on the basic concept and published the Quadrille des Enfants, which became very popular. In essence, it taught two-step, whole word phony phonics. After several more versions written by others, the Code 3 approach appeared in a further revised form as Daubanton’s Lecture Par Echo in 1810. Of course, the use of the word, “echo,” confirms that the material was indeed two-step phonics. Since what was being “echoed” was the sample whole word which had been used to teach a particular phoneme, Lecture Par Echo represented two-step, whole-word, phony phonics, in principal very like like W. S. Gray’s 1930 “phonics.”

De l’Epee used his Code 1 reading method as the initial “meaning” method for teaching his deaf and mute students to read. It is true that de l’Epee did first teach his deaf-mute students the manual alphabet, but apparently he never taught them to write the individual letters as isolated letters. Instead, to judge from de l’Epee’s own description of his work, referred to elsewhere, he introduced his deaf-mute students to written letters only as part of meaningful, written whole words. Furthermore, de l’Epee introduced such great numbers of written words at this initial step that normal minds could not have memorized their spellings. Instead, his students would have had to remember the sight-words (if they could remember them at all) only as whole words.

Earlier teachers of the deaf had first taught the deaf to use a manual alphabet and a written alphabet, and only after that taught them to use the written alphabet to build written words. Also, most taught them while they were still at the initial alphabet step to make the sounds of the letters they were learning with their mouths, and then to speak, before they introduced any degree of “meaningful” language. For such deaf students who had learned the written alphabet first, and often learned to speak first, the printed word and the spoken word became the second, derivative step. In a sense, that parallels the hearing child who learns the sounds of the letters first, and then to speak, and then learns the sounds of the printed letters as a first step in learning to read. For such a hearing child, both spoken and printed words are derivative, second steps.

Manual sign language, which may have partly inspired de l’Epee to use whole printed words also as “signs,” is as old as man. American Indian sign language achieved astonishing perfection, as observed by Columbus and other explorers. (See Indian Sign Language, by William Tomkins, 1931 Fifth Edition, Reissued and Corrected in 1969 by Dover Publications, Inc., New York and London.) Surely the great number of French explorers in America, from Quebec to New Orleans and on the Great Plains, so many of whom were priests and missionaries to the Indians, would have known of Indian sign language used by Plains Indians. They surely must have reported on it in some published fashion in France. Therefore, de
l’Epee and others in Paris must have had some knowledge of the existence of workable Indian manual sign language before de l’Epee began his work about 1760. De l’Epee must have worked out his own manual sign system, which apparently preceded his use of whole sight-words as signs, after having such knowledge. Yet no reference is made to prior sign languages in any reports on de l’Epee that I have seen. De l’Epee apparently was willing to accept international acclaim for having “invented” manual sign language.

Spoken languages can also be “signed” by a manual alphabet, though undoubtedly it must be far slower in transferring “meaning” than Indian or de l’Epee’s signs. Manual alphabets to teach spoken languages had actually been used successfully with the deaf for centuries, and since the sixteenth century had been the foundation on which oral speech and lip-reading were later taught to the deaf so that they could communicate with hearing people. What de l’Epee actually originated was the practice of teaching a pure sign language to the deaf which was unrelated to any spoken language, as manual alphabets are. De l’Epee’s sign language was meant to be used instead of a standard spoken language. Therefore, de l’Epee cut the deaf off from the rest of society, which was an extraordinarily cruel thing to have done.

It is worth while here to contrast manual signing to speech, using quotations from William Tomkins’ Indian Sign Language (1931 and earlier; Dover Publications, Inc. 1969, page 100). Indian sign language is the equivalent of de l’Epee’s sign language approach. In the following selections, let the reader decide for himself whether signing or sound-based language is the more precise and efficient method for transferring thought.

“Spoken: The man is poor and blind.
Signed: Man have money not, see not, eye wiped out.

“Spoken: The old woman went to the farmer to get some corn.
Signed: Woman old go farm-man, bring corn.

“Spoken: In the middle of the night it began to rain. Before daylight we were soaking wet. One of my friends got sick, and there was no doctor anywhere near. Much to our disgust, we had to break camp and come back home.
Signed: Middle night begin rain. Morning come. We all much water. One friend arrive at sick. White-Chief-Medicine near no. Heart much tired, we must stop sit camp, come home.”

The superiority of spoken language over signed language appears obvious. Furthermore, how could such constricted signed language possibly deal with the nuances of meaning in great poetry, or with its beauty?

William Tomkins’ book also gave two interesting but undated quotations on page 91 concerning the differences between “sound”-based alphabetic writing and “meaning”-based ideographic writing:

“Ideographic writing directs the mind of the reader by means of a picture or a symbol directly to the idea existing in the mind of the one who uses it, while alphabetic or literal writing is simply the written expression of the sound, and only indirectly expresses the idea.” Prof. C. J. Ryan, Theosophical University, San Diego.

Ryan’s remarks are a verbal explanation of the “triangle” appearing in the article on reading by Henry Suzzallo of Columbia in the 1913 Cyclopaedia of Education, which article is discussed further in Part 7.
Ryan was with the Theosophical University, and “theosophy” was well known by about 1880. It is intriguing that the “meaning” approach in beginning reading, justified by the reasoning in Ryan’s quotation, began to be vastly promoted in America again starting about 1875 in Quincy, Massachusetts, as discussed in Part 5 of this history.

The second quotation was from Professor William Gates of the Peabody Institute:

“There is one great broad line that divides the nations and civilizations of the earth, past and present, in all their arts of expression. We may call it that of the ideographic or general, as against the literal or definite. It controls the inner form of language and of languages; it manifests in the passage of thought from man to man; it determines whether the writing of the people shall be hieroglyphic or alphabetic.”

In his undated statement, Gates had the cart before the horse: hieroglyphic writing produces imprecise language, not the other way around.

Therefore, de l’Epee’s sign language, and the sight-word method for hearing people, represent the “general” as against the “definite.” No reasonable person can conclude that such language methods, which are incapable of precision, are equal or superior to language methods which have precision. The history demonstrates that de l’Epee’s work, from its inception, was a degenerate approach. That it should have received the support of the “great” such as the Austrian Emperor and the Russian Empress and have been praised all over the Western World were developments which defied all reason. However, the promotion of de l’Epee’s work paralleled the widespread promotion of sight-words and “whole language” in reading instruction today all over the English-speaking world, which also defies all reason.

De l’Epee had been aware of the “sound” and “meaning” aspects of spoken and written language for many years, since the following appears in his biography in Biographie Universelle (1854, 1969):

“...he had not lost sight of the irrefragable principle that his tutor of philosophy had tried to inculcate in him when he was on the dusty benches of the school: ‘Ideas and pronounced sounds do not have a rapport any more natural or more immediate than ideas and written characters.’”

De l’Epee’s teacher’s ideas were probably based on centuries-old work with the deaf. The article, “Education of the Deaf and Dumb” in the Catholic Encyclopedia (1913), Volume V, page 316, referred to “the principle announced by Girolamo Cardano (1501-1576), a friend of St. Charles Borromeo that ‘writing is associated with speech, and speech with thought, but written characters may be connected together without the intervention of sounds. The deaf can hear by reading and speak by writing.’”

Both de L’Epee and Sicard later did try to add “sound” speech to their curriculum, but only after the deaf-mute students had been taught to communicate by “meaning-bearing” signs and to read whole sight-words by “meaning” and not by “sound.” Yet, as stated in the excerpt in Appendix A from the July 28, 1900, issue of The School Journal by Dr. A. L. E. Crouter, based on his school’s twenty years of experience in teaching deaf children in Pennsylvania with different methods, teaching deaf children initially by the “meaning” signing approach achieves sharply inferior results later in the teaching of spoken language in comparison to teaching deaf children from the beginning with the “sound” approach. This is obviously because of diametrically opposed conditioned reflexes established at the beginning stage, one type established by teaching “sound” and the other by teaching “meaning.” Such reflexes are apparently highly resistant to change. The “triangle” in Suzzallo’s article, “Reading,” in the Cyclopaedia of Education (1913) shows the “sound” vs. “meaning” paths pictorially and very effectively, though no reference is made to the fact that the two different paths are actually two different and opposite conditioned reflexes in reading.
De l’Epee’s short biography in Biographie Universelle told of his great but puzzling “success.”

“Soon fame announced the unprecedented results of his method, and his humble school, the cradle of moral emancipation of these pariahs of nature, saw itself besieged each day by the curious belonging to the highest classes of society. Among these last, one cites the ambassador of Catherine I, Empress of Russia, and the Emperor Joseph II. This monarch, amazed at the prodigies to which he was witness, and more by the disinterestedness of the humble priest, after having observed the contrary at the place of his antagonist, Pereira (sic)...[wished] to create in his States a school of deaf-mutes in imitation of that of Paris....”

Yet Deschamps had been so impressed by Peirere that he spent the rest of his life imitating Peirere’s “sound” speech work in teaching the deaf, while Deschamps had been appalled by de l’Epee’s “meaning” sign language in teaching the deaf. Why, then, was it de l’Epee’s “meaning”-approach school that received such enormous fame, and why did the Russian ambassador and Emperor Joseph II of Austria evaluate the situation in that school so very differently from Deschamps who was himself a teacher of the deaf? It seems only reasonable to assume that such visitors should have been more impressed by seeing born-deaf people speaking in Peirere’s school, than by seeing born-deaf people only able to use hand signs in de l’Epee’s school! All these facts certainly seem to suggest that for some reason de l’Epee and his strange but inferior “new” Code 1 “meaning” method was being promoted over the pre-existing and highly successful “sound” method by people who were expert at using “influence.”

De l’Epee is credited as having founded the first “school” for the deaf, but this also is to be questioned, since the real meaning apparently is that he founded the first boarding school, with pupils actually living in his establishment. His high reputation remained at the moment of his death in Paris on December 23, 1789 (apparently not sometime in September, 1789, as reported by the Biographie Universelle. The Catholic Encyclopedia (1913), Vol. V, page 484, gave that precise date of death and the fact de l’Epee been born at Versailles on November 25, 1712.) His funeral oration, delivered the following February 23, 1790, by the Abbe Fauchet, was attended by a deputation from the National Assembly and other dignitaries, seven months after the storming of the Bastille.

Abbe Deschamps died about a year later in January, 1791, and he had also taught impoverished deaf children but by the “sound” method instead of the “meaning” method that de l’Epee used. Deschamps had even fed the poor children, using his own money to do so. Yet Deschamps died “almost ignored” (Biographie Universelle). Therefore, Deschamps had no such funeral oration attended by a Revolutionary delegation and other dignitaries. His life’s work teaching the deaf to read by “sound” instead of “meaning” fell into almost total obscurity, while de l’Epee and his school became more and more famous, receiving heavy governmental support.

Note that de l’Epee’s enormously famous school apparently had no religious connections, despite the fact that de l’Epee himself was a priest (although apparently an “heretical” one, since he was a Jansenist). Note also that his school began and prospered in the very period in which religious schools, such as those of the Jesuits, were being closed. His school later received the enormous support of the French Revolutionists at the very time they were outlawing all religious schools and promoting government schools.

About 1800, De l’Epee even had a famous play written concerning his work with a foundling deaf-mute. De l’Epee had unsuccessfully claimed the deaf-mute foundling was the heir of a rich family. The play, called The Abbe de l’Epee by Bouilly was apparently performed on stages all over Europe from about 1801 until the 1820’s and later, since it had editions not only in French but in English, German and Italian, and perhaps other languages. This certainly suggests continued promotion of de l’Epee’s work by
his enthusiasts. An English adaptation was Deaf and Dumb, or the Orphan Protected, by Thomas Holcroft (1745-1809), and another English adaptation was by Benjamin Thompson from a German edition, both of which have 1801 dates listed in the New York Public Library catalog.

The Thompson version of the play, The Abbe de l’Epee by Jean Nicolas Bouilly (1763-1842) also reportedly had an 1818 edition published by S. G. Goodrich of Hartford, with a preface by Laurent Clerc. This suggests that the play had a continued connection with the movers-and-shakers, since Samuel G. Goodrich was later a famous and rich Boston publisher and was also for a time publisher of the change-agent Journal of Education in America. Although it is possible that the date (1818) and the place (Hartford) are in error, it seems unlikely that the initials (S. G.) refer to some other Goodrich as the publisher of the play. Woodbridge, the second editor of the Journal of Education, was working in Gallaudet’s school for the deaf by 1818 when “Goodrich” published the play. Gallaudet had founded the school in 1817 after returning from France with the deaf-mute Clerc who had been trained by Sicard, de l’Epee’s successor. These are some of the many ties among these people. However, since the play’s preface was written by the deaf-mute and teacher of the deaf, Clerc, whom Gallaudet had brought from France only two years before, that fact suggests a possible and surprising connection between Gallaudet and Goodrich as early as 1818 (if the 1818 date is not in error. Both Gallaudet and Goodrich were then near the beginning of their highly successful careers. Publication of the play also identified Goodrich, like Gallaudet, as one of the widespread promoters of de l’Epee’s “meaning” work.

The play contains the following lines, certainly showing the author’s philosophical point of view:

“Science would (vote) for D’Alembert, and Nature say Buffon, Wit and Taste present Voltaire, and Sentiment plead for Rousseau, but Genius and Humanity cry out for de l’Epee, and him I call the best and greatest of all.”

It is interesting to see that the author of the play about de l’Epee saw fit to put him on the same rating scale as Rousseau and Voltaire, two historical villains. This also tells something about the play’s promoters.

The information about the play is from “The Preface of the Translator” (who did not name himself) on a translation of de l’Epee’s work. It was entitled, The Method of Educating the Deaf and Dumb, Confirmed By Long Experience.... Translated from the French....., London, 1801. It had appeared in 1776 in France under the title, Institution of the Deaf and Dumb by the Way of Methodical Signs. The 1801 edition in English also included the exchange of letters between de l’Epee, the promoter of the “meaning” method for the deaf, and Heinecke, the German promoter of the “sound” method for the deaf. Much was made of the fact that both Heinecke and Peirere received pay, while de l’Epee did not. Yet the high-born de l’Epee had his own private funds, and the support of the rich and powerful and the state. Were Heinecke and Peirere, neither of whom were “high-born” and who therefore lacked such resources, supposed to starve? (Heinecke stated that he did take some poor students, and so, very probably, did Peirere.) That kind of unfair and emotionally-loaded argument which was used to attack both men is characteristic of attacks by change-agents.

In the 1801 English translation of the second edition of de l’Epee’s book, the translator wrote,

“When the world was deprived of the great and good man, the instruction of the deaf and dumb was continued by the Abbe Sicard, and prosecuted likewise by the language of methodical signs. The editor being in Paris in 1790 and 1791, frequently visited this school....

“He found, however, that the Abbe Sicard had wholly set aside teaching them Utterance, alledging that the benefit of it to the Deaf was by no means adequate to the trouble of acquiring it,
assigning reasons to which the Editor, who had himself had occasion to observe its utility, could not subscribe.

“Conferring with the scholars by means of writing, he (the Editor) happened to signify to one of them... that Deaf persons in England were taught to speak. The youth was instantly struck, as if electrified; then upon recovering himself, ran with eagerness round the school to impart the information to his companions, and afterwards expressed an anxious wish to be carried to England to learn the art of speaking.”

It is extraordinary that the Abbe de l’Epee’s method, which ultimately resulted in so many deaf pupils remaining permanently mute, should have been promoted and glorified over previously successful methods which taught the deaf to speak and enabled them to take their places in ordinary society. The Abbe in his second edition admitted that originally he had made no effort to teach speech, though he was now attempting to do so. In this book, de l’Epee also implicitly admitted the success of Peirere’s oral method in Paris before he began his own work, saying on page xxviii:

“They... deemed the idea which I had conceived... as more calculated to obstruct than to facilitate the progress of my pupils. This censure acquiring a certain degree of credit from the reputation of Mr. Perreire (sic), I was under the necessity of combatting the prejudice of the public mind against my method of tuition, when I was induced to print it for the benefit of the Deaf and Dumb, both of the present and future generation, regarding myself to be in a manner charged by Providence to render this unfortunate class all the service in my power.

“I therefore attacked the false principles of these gentlemen’s argument, and even took upon myself to show that although the system made use of by Mr. Perreire for the tuition of his pupils, denominated Dactylology, ... the science of the movement and position of the fingers, could by degrees conduct the deaf to learn to speak, it was nevertheless absolutely incapable of teaching them to make a legitimate use of their faculty of thinking.”

Therefore, de l’Epee, himself, opposed “sound” as the entrance to reading and language, and endorsed “meaning” as the first step, just like our “reading experts” today!

“But I had to combat other and more formidable adversaries, I mean a number of theologians, of (rational) philosophers, and academicians of different (countries?) who maintained the impossibility of subjecting metaphysical ideas to representative signs, and, consequently, the necessity of their ever remaining above the intelligence of the deaf and dumb.”

In conducting public lessons “attended by the learned from all parts of Europe,” de l’Epee defended his approach, and, of course, he was right that “metaphysical ideas” can be transferred by signs, the reason being that both the sender and the receiver have minds that deal naturally with such “metaphysical ideas.” William James in his 1890 psychology text referred to a deaf man who remembered that, before he had learned any language, he had as a child speculated silently on the origin of the world. That youngster who had no language at all nevertheless had no difficulty conceiving and dealing with such “metaphysical ideas” as the origin of the world. The problem concerns the precision of such ideas, and whether they can be clearly focused by the thinker or remain more vague. It is not just a waste of ink that English dictionaries contain up to a half million or so words, while sign languages and pictographic writing contain only a few thousand. Clearly, therefore, ideas conceived and transferred in such sound-bearing English words can be far more precise than ideas conceived and transferred in “meaning-bearing” sign language or pictographs.
In summary, royal financial support and enormous international publicity were given to the Jansenist de l’Epee, who promoted the “meaning” method in primary teaching of the deaf, a method which left most born-deaf students forever mute. Yet virtually no support was given to Deschamps, who promoted the “sound” method in primary teaching of the deaf, a method which taught the born-deaf to speak and which enabled them to take their places in general society. Deschamps was ignored, and his work fell into oblivion, along with Peirere’s. In contrast, de l’Epee’s method lived on, not only in the teaching of the deaf. It became the source for the Code I “meaning” sight-word approach in the teaching of reading to children with normal hearing. The Code I approach, along with the Code 3 two-step, phony-phonics whole word approach discussed later, which also originated in eighteenth-century France, produced massive functional illiteracy throughout the English-speaking world starting about 1826.

It is disturbing to read in the Biographie Universelle article on Roch-Ambroise Cucurron Sicard, (1742-1822) that de l’Epee’s school had been supported in large part under decrees of 1778 and 1785 by money obtained when the Royalist French government suppressed a Celestin convent. That means, of course, de l’Epee benefited directly from the religious persecution of others! When the Revolutionary assembly nationalized all the monasteries in 1790, government payments to the deaf-mute school which had been based on Celestin monastery properties temporarily ceased until funds were voted again by the Revolutionary assembly in July, 1791. Sicard’s biographer in the Biographie Universelle censured Sicard for the distasteful tone of his remarks before the assembly in which Sicard fawned on them for having reinstated his payments.

When de l’Epee died shortly after the beginning of the Revolution, Sicard was chosen in his place. Therefore, the Revolution supported Sicard and the “meaning” method by eventually supporting his schools, while it totally ignored the “sound” work of Deschamps, who had died in 1791 but who had left an extensive body of writings, and, presumably, a functioning school which he had always supported with his own money.

As has been shown, by 1764 in France, the Jesuits with their renowned schools had been outlawed. As reported in a later quotation, Louis XV had also “nationalized” Jesuit property. Yet, when the French Revolution began in 1789, except for home education, most schooling in France still remained in the hands of the surviving “religious orders and congregations” or in the hands of the parish priests with their “petite ecoles” and their hired primary school-mistresses or school-masters/bell ringers.

Then, on February 13, 1790, all the other “religious orders and congregations” joined the Jesuits in banishment from France when their very existence was outlawed by the Revolution’s Assembly. That was the same Assembly that only ten days later, February 23, 1790, produced a respectful delegation to attend de l’Epee’s eulogy, which suggests their respect for the Jansenist de l’Epee had nothing whatsoever to do with religion. The outlawing of the “religious orders and congregations” was also only a little more than half a year after the Bastille was stormed! Once the “philosophers” and their allies had gained control in France, their burning hatred for Christianity did not take long to burst into roaring flames.

Soon after the outlawing of “religious orders and congregations,” the “non-juring” parish priests who had refused to take the oath to support the anti-religious legislation were exiled or killed, and these “non-juring” priests had composed about 55 per cent of the total number of priests. The removal of the “non-juring” priests must have had a catastrophic effect on their “petite ecoles” or parish primary schools. Not long after, all Christianity was suppressed, and presumably, with it, all the rest of the “petite ecoles” or primary schools run by parish churches under the direction of the parish priests.

The outlawing of “religious orders and congregations” and eventually of Christianity itself meant that the old French school system was effectively destroyed not long after February 13, 1790. It is therefore hardly surprising that in that same year of 1790, and in the few years following, vast plans appeared in
France for government schools, as evidenced by the chronological bibliography on education in Dictionnaire de Pedagogie et d’Instruction Primaire. The plans of the French Revolution for government schools were built on the dead body of church schools.
Chapter 9

Necessary Background Information on the French Revolution

The intent of the legislation of the French Revolution was to place all education under centralized state control. However, to understand properly the chronological account of the Revolution’s publications and decrees on education which mandated centralized state control, it is necessary to have a chronology of the French Revolution itself, to provide the framework in which to place such publications and decrees to be discussed later. Yet most otherwise well-informed people have only a generalized picture of the events of the French Revolution, and such a generalized picture is insufficient to follow the progression of the Revolution’s legislation on education. Therefore, to provide that necessary chronological framework, following are excerpts from the article, “Revolution, French,” by George Goyau, pages 9 - 16, Volume VIII, Catholic Encyclopedia [1913].

The surprisingly approving words for Napoleon with which Goyau ended his pre-1913 article suggest that Goyau was probably French himself. He was certainly familiar with French documentary sources, even though his apparent opinion of Napoleon is jarring. The fact that Goyau said he emphasized “more especially the relations between the Revolution and the Church” means that his article also comes very close to emphasizing the relations between the Revolution and pre-existing education, since almost all pre-Revolution education was given by the Church.

The excerpts from his article, “Revolution, French,” follow:

“The last thirty years have given us a new version of the history of the French Revolution, the most diverse and hostile schools having contributed to it. The philosopher, Taine,... admirably demonstrated the mechanism of the local revolutionary committees and showed how a daring Jacobin minority was able to enforce its will as that of “the people”. Following up this line of research, M. August Cochin has quite recently studied the mechanism of the societes de pensee in which the revolutionary doctrine was developed and in which were formed men quite prepared to put this doctrine into execution. The influence of freemasonry in the French Revolution proclaimed by Louis Blanc and by freemasonry itself is proved by the researches of M. Cochin. Sorel has brought out the connexion between the diplomacy of the Revolution and that of the old regime. His works prove that the Revolution did not mark a break in the continuity of the foreign policy of France.... This article, however, will emphasize more especially the relations between the Revolution and the Church.

“MEETING OF THE ESTATES. - The starting point of the French Revolution was the convocation of the States General by Louix XVI [Ed.: for the first time since 1614]. They comprised three orders, nobility, clergy, and the third estate, the last named being permitted to have as many members as the two other orders together.... The clergy advocated almost as forcibly as did the Third Estate the establishment of a constitutional government based on the separation of the powers, the periodical convocation of the States General, their supremacy in financial matters, the responsibility of ministers, and the regular guarantee of individual liberty. Thus the true and great reforms tending to the establishment of liberty were advocated by the clergy on the eve of the Revolution. When the Estates assembled 5 May, 1789, the Third Estate demanded that the verification of powers should be made in common by the three orders, the object being that the Estates should form but one assembly in which the distinction between the “orders” should disappear.... when on 17 June the members of the third estate proclaimed themselves the “National Assembly,” the majority of the clergy decided (19 June) to join them. As the higher clergy and the nobility still held out the king caused the hall where the meetings of
the Third Estate were held to be closed (20 June), whereupon the deputies, with their president, Bailly, repaired to the Jeu de Paume and an oath was taken not to disband till they had provided France with a constitution. After Mirabeau’s thundering speech (23 June) addressed to the Marquis de Dreux-Breze, master-of-ceremonies to Louis XVI, the king himself (27 June) invited the nobility to join the Third Estate. Louis XVI’s dismissal of the reforming minister, Necker, and the concentration of the royal army around Paris, brought about the insurrection of 14 July, and the capture of the Bastille.... There was no rising en masse of the people of Paris, and the number of the besiegers was but a thousand at most; only seven prisoners were found at the Bastille, four of whom were forgers, one a young man guilty of monstrous crimes...and two insane prisoners. But in the public opinion the Bastille symbolized royal absolutism.... Louis XVI yielded before the agitation, Necker was recalled, Bailly became Mayor of Paris, Lafayette, commander of the national militia; the tri-colour was adopted, and Louis XVI consented to recognize the title of “National Constituent Assembly”. Te Deums and Processions celebrated the taking of the Bastille; in the pulpits the Abbe Fauchet preached the harmony of religion and liberty....”

Note that almost from the beginning the French had called, in effect, a constitutional congress. Although initially moderate and reasonable, it ultimately produced unspeakable horrors. We should remember that fact when considering the recurrent drive in America for just such a constitutional congress which would suspend our current Constitution with its safeguards. At present, only resolutions from two more states are needed to bring that about. Yet our “free press” remains strangely silent!

“DECLARATION OF THE RIGHTS OF MAN. CATHOLICISM CEASES TO BE THE RELIGION OF THE STATE. - Before giving France a constitution the Assembly judged it necessary to draw up a “Declaration of the Rights of Man and of the Citizen” which should form a preamble to the Constitution.... the only article relating to religion was worded as follows: “No one shall be disturbed for his opinions, even religious, provided their manifestation does not disturb the public order established by law.” In fact it was the wish of the Assembly that Catholicism should cease to be the religion of the State and that liberty of worship should be established.... But it soon became evident in the discussions relating to the Civil Constitution of the Clergy that the Assembly desired that the Catholic Church, to which the majority of the French people belonged, should be subject to the State and really organized by the State.

“The rumours that Louix XVI sought... a counter revolutionary movement... brought about an uprising in Paris. The mob set out to Versailles, and amid insults brought back the king and queen to Paris (6 Oct., 1789). Thenceforth the Assembly sat at Paris.... At this moment the idea of taking possession of the goods of the clergy in order to meet financial exigencies began to appear in a number of journals and pamphlets. The plan of confiscating this property, which had been suggested as early as 8 August by the Marquis de Lacoste, was resumed (24 Sept.) by the economist, Dupont de Nemours, [Ed.: the same Dupont previously discussed, the author of a beginning reading method who later came to America and presented a plan for government education to Jefferson, and whose son shortly after settled in America and founded the famous Dupont company] and on 10 October was supported in the name of the Committee of Finances in a report which caused scandal by Talleyrand, Bishop of Autun, who under the old regime had been one of the two “general agents” charged with defending the financial interests of the French clergy. On 12 October Mirabeau requested the Assembly to decree (1) that the ownership of the church property belonged to the nation that it might provide for the support of the priests.... The advocates of confiscation maintained that the clergy no longer existed as an order... and that the State had the right to claim (the property),... that in 1749 Louis XV had forbidden the clergy to receive anything without the authority of the State, and that he had confiscated the property of the Society of Jesus [the Jesuits]..... Finally, on 2 November, 1789, the Assembly decided that the possessions of the clergy be “placed at the disposal” of the nation. The results of this vote were
not long in following. The first was Treilhard’s motion (17 December), demanding in the name of the ecclesiastical committee of the Assembly, the closing of useless convents, and decreeing that the State should permit the religious to release themselves from their monastic vows.

“The discussion of this project began in February, 1790, after the Assembly by the creation of assemblies of departments, districts, and commons, had proceeded to the administrative reorganization of France. The discussion was again very violent. On 13 February, 1790, the Assembly... decreed as a “constitutional article” that not only should the law no longer recognize monastic vows, but that religious orders and congregations were and should remain suppressed in France, and that no others should be established in the future. After having planned a partial suppression of monastic orders the Assembly voted for their total suppression....

“CIVIL CONSTITUTION OF THE CLERGY. - On 6 February, 1790, the Assembly charged its ecclesiastical committee, appointed 20 Aug, 1789, and composed of fifteen members to prepare the reorganization of the clergy. Fifteen new members were added to the committee on 7 February. The “constituents” were disciples of the eighteenth-century philosophes who subordinated religion to the State.... ...Taine has proved that in many respects their religious policy merely followed in the footsteps of the old regime, but while the old regime protected the Catholic church and made it the church exclusively recognized, the constituents planned to enslave it after having stripped it of its privileges.... the Assembly... discussed the Civil Constitution of the Clergy from 1 June to 12 July, 1790, on which date it was passed....

“At the festival of the Federation (14 July, 1790) Talleyrand and three hundred priests officiating at the altar of the nation erected on the Champs-de-Mars wore the tri-coloured girdle above their priestly vestments and besought the blessing of God on the Revolution... On 10 July, 1790, in a confidential Brief to Louis XVI, Pius VI expressed the alarm with which the project under discussion filled him. He commissioned two ecclesiastics who were ministers of Louis XVI... to urge the king not to sign the Civil Constitution of the Clergy. On 28 July, in a letter to the pope, Louis XVI replied that he would be compelled, “with death in his soul”, to promulgate the [Civil] Constitution [of the Clergy], that he would reserve the right to broach as soon as possible the matter of some concession, but that if he refused, his life and the lives of his family would be endangered.... At the end of October, 1790, [the bishops] published an “Exposition...”... in which they rejected the [Civil] Constitution [of the Clergy] and called upon the faithful to do the same. This publication marks the beginning of a violent conflict between the episcopate and the [Civil] Constitution [of the Clergy]. On 27 November, 1790, after a speech by Mirabeau, a decree stipulated that all bishops and priests should within a week, under penalty of losing their offices, take the oath to the [Civil] Constitution [of the Clergy], that all who refused and who nevertheless continued to discharge their priestly functions should be prosecuted as disturbers of the public peace....

“It may be said that from the end of 1790 the higher clergy and the truly orthodox elements of the lower clergy were united against the revolutionary measures. Thenceforth there were two classes, the non-juring or refractory priests, who were faithful to Rome and refused the oath, and the jurors, sworn, or [Civil] Constitutional priests, who had consented to take the oath.... Out of 125 bishops there were only four, Talleyrand of Autin, Brienne of Sens, Jarente of Orleans, and Lafond de Savine, of Viviers; three coadjutors or bishops in partibus, Gobel, Coadjutor Bishop of Bale; Martial de Brienne, Coadjutor of Sens; and Dubourg-Miraudet, Bishop of Babylon. In the important towns most of the priests refused to take the oath. Statistics for the small boroughs and the country are more difficult to obtain. M. de la Gorce...asserts...that in 1791 the number of priests faithful to Rome was 52 to 55 out of 100....

203
“On 5 February, 1791, the Constituent Assembly forbade every non-juring priest to preach in public. In March the elections to provide for the vacant episcopal sees and parishes took place. Disorder grew in the Church of France; young and ambitious priests, better known for their political than for their religious zeal, were candidates. On 13 April, 1791, [Pope Pius VI] issued a solemn condemnation of the Civil Constitution in a solemn Brief to the clergy and the people. On 2 May, 1791, the annexation of the Comtat Venaissin and the city of Avignon by the French troops marked the rupture of diplomatic relations between France and the Holy See. The Masses celebrated by non-juring priests attracted crowds of the faithful. Then mobs gathered and beat and outraged nuns and other pious women. On 7 May, 1791, the Assembly decided that the non-juring priests as pretres habitues might continue to say Mass in parochial churches or conduct their services in other churches on condition that they would respect the laws and not stir up revolt against the Civil Constitution. The [Civil] Constitutional priests became more and more unpopular with good Catholics...

“The king’s tormenting conscience was the chief reason for his attempted flight (20-21 June, 1791). Before fleeing he had addressed to the Assembly a declaration of his dissatisfaction with the Civil Constitution of the Clergy, and once more protested against the moral violence which had compelled him to accept such a document. Halted at Varennes, Louis XVI was brought back on 25 June and was suspended from his functions till the completion of the [major] Constitution, to which he took the oath 13 Sept., 1791. On 30 Sept., 1791, the Constituent Assembly dissolved, to make way for the Legislative Assembly, in which none of the members of the Constituent Assembly could sit....

“THE LEGISLATIVE ASSEMBLY. - When the Constituent Assembly disbanded (30 Sept., 1791), France was aflame concerning the religious question. More than half the French people did not want the new Church, the factitious creation of the law; the old Church was ruined, demolished, hunted down, and the general amnesty decreed by the Constituent Assembly before disbanding could do nothing towards restoring peace in the country, where that Assembly’s bungling work had unsettled the consciences of individuals. But the majority of the members of the Legislative Assembly had sat in the departmental or district assemblies; they had fought against the non-juring priests and brought violent passions and a hostile spirit to the Legislative Assembly. A report from Gensonne and Gallois to the Legislative Assembly (9 October, 1791) on the condition of the provinces of the West denounced the non-juring priests as exciting the populace to rebellion and called for measures against them. It accused them of complicity with the emigres bishops. At Avignon the Revolutionary Lecuyer, having been slain in a church, some citizens reputed to be partizans of the pope were thrown into the ancient papal castle and strangled (16-17 Oct., 1791). Calvados was also the scene of serious disturbances.

“The Legislative Assembly, instead of repairing the tremendous errors of the Constituent Assembly, took up the question of the non-juring priests. On 29 November, on the proposal of Francois de Neufchateau, [Ed.: See later his extensive work on beginning reading instruction] it decided that if within eight days they did not take the civil oath they should be deprived of all salary, that they should be placed under the surveillance of the authorities, that if troubles arose where they resided they should be sent away, that they should be imprisoned for a year if they persisted in remaining and for two years if they were convicted of having provoked disobedience to the king. [Ed.: Note the hypocrisy, since the king himself was effectively a prisoner at this point!] Finally it forbade non-juring priests the legal exercise of worship. But this decree was the object of a sharp conflict between Louis XVI and the Assembly. On 9 Dec., 1791, the king made his veto known officially. Parties began to form. On one side were the king and the Catholics faithful to Rome, on the other the Assembly and the priests who had taken the oath. The legislative power was on one side, the executive on the other. In March, 1792, the Assembly
accused the ministers of Louis XVI; the king replaced them by a Girondin ministry.... They had a double policy: abroad, war with Austria, and at home, measures against the non-juring priests....

“A papal Brief of 29 March 1792, renewed the condemnation of the Civil Constitution [of the Clergy] and visited with major excommunication all juring priests who after sixty days should not have retracted, and all Catholics who remained faithful to these priests. The Assembly replied by the Decree of 25 May, 1792, declaring that all non-juring priests might be deported by the directory of their department at the request of twenty citizens, and if they should return after expulsion they would be liable to ten years’ imprisonment. Louis vetoed this decree.... At the ministerial council Roland read an insulting letter to Louis, in which he called upon him to sanction the decrees of November and May against the non-juring priests. He was dismissed, whereupon the populace of Paris arose and invaded the Tuileries (20 June, 1792), and for several hours the king and his family were the objects of all manner of outrages.... there came petitions for the deposition of the king, who was accused of being in communication with foreign rulers. On 10 August, Santerre, Westermann and Fournier l’Americain at the head of the national guard attacked the Tuileries defended by 800 Swiss. Louis refused to defend himself, and with his family sought refuge in the Legislative Assembly. The Assembly passed a decree which suspended the king’s powers, drew up a plan for education for the dauphin [Ed.: Note the Assembly’s curious and constant preoccupation with education], and convoked a national convention. Louis XVI was imprisoned in the Temple by order of the insurrectionary Commune of Paris.

“Madness spread through France caused by the threatened danger from without; arrests of non-juring priests multiplied. In an effort to make them give way, the Assembly decided (15 August) that the oath should consist only in the promise “to uphold with all one’s might liberty, equality, and the execution of the law, or to die at one’s post.” But the non-juring priests remained firm and refused even this second oath. On 26 August the Assembly decreed that within fifteen days they should be expelled from the kingdom, that those who remained or returned to France should be deported to Guiana, or should be liable to ten years’ imprisonment. It then extended this threat to the priests, who, having no publicly recognized priestly duties, had hitherto been dispensed from the oath, declaring that they also might be expelled if they were convicted of having provoked disturbances. [Ed.: Sicard, de l’Epee’s successor in the Paris school for the deaf, who had apparently been exempt from taking the first oath, took this second oath in August, 1792, and even made a financial donation to the government at the same time, though most non-juring priests apparently did not take the second oath, either. Sicard’s article in Memoires Sur Les Journees de Septembre 1792, published in 1823 by Baudouin Freres, Paris, referred to elsewhere, and Sicard’s biography in Biographie Universelle of J. Fr. Michaud (1854, 1969), show Sicard to have been a very vain, foolish and even silly man. Yet, despite his enormous vanity and his taking of the second oath, Sicard was apparently very well-intentioned and was really devoted to his deaf students.] This was the signal for a real civil war. The peasants armed in La Vendee, Deux Sevres, Loire Inferieure, Maine and Loire, Ile and Vilaine. This news and that of the invasion of Champagne by the Prussian army caused hidden influences to arouse the Parisian populace; hence the September massacres. In the prisons of La Force, the Conciergerie, and the Abbaye Saint Germain, at least 1500 women, priests and soldiers fell under the axe or the club. The celebrated tribune, Danton, cannot be entirely acquitted of complicity in these massacres. The Legislative Assembly terminated its career by two new measures against the Church: it deprived priests of the right to register births, etc., and authorized divorce....

“THE CONVENTION; THE REPUBLIC; THE REIGN OF TERROR. - The opening of the National Convention (21 Sept., 1792) took place the day following Dumouriez’s victory at Valmy over the Prussian troops. The [Civil] constitutional bishop, Gregoire, proclaimed the republic at
the first session; he was surrounded in the assembly by fifteen [Civil] constitutional bishops and twenty-eight [Civil] constitutional priests. But the time was at hand when the [Civil] constitutional clergy in turn was to be under suspicion, the majority of the convention being hostile to Christianity itself. As early as 16 November, 1792, Cambon demanded that the salaries of the priests be suppressed and that henceforth no religion should be subsidized by the State, but the motion was rejected for the time being. Henceforth the convention enacted all manner of arbitrary political measures: it undertook the trial of Louis XVI, and on 2 January, 1793, “hurled a king’s head at Europe.” But from a religious standpoint it was more timid; it feared to disturb the people of Savoy and Belgium, which its armies were annexing to France. From 10 to 15 March, 1793, formidable insurrections broke out in La Vendee, Anjou, and a part of Brittany. At the same time, Dumouriez, having been defeated at Neerwinden, sought to turn his army against the Convention, and he himself went over to the Austrians. The Convention took fright; it instituted a Revolutionary Tribunal on 9 March, and on 6 April the Committee of Public Safety, with formidable powers, was established.

“Increasingly severe measures were taken chiefly against the non-juring clergy.... On 18 March it was decreed that any emigre or deported priest arrested on French soil should be executed within twenty-four hours.... The proconsuls of the Convention, Freron and Barras at Marseilles and Toulon, Tallien at Bordeaux, Carrier at Nantes, perpetrated abominable massacres. In Paris the Revolutionary Tribunal, carrying out the proposals of the public accuser, Fouquier-Tinville, inaugurated the Reign of Terror. The proscription of the Girondins by the Montagnards (2 June, 1793) marked a progress in demagogy.”

Mass execution of clergy had predated March 18, 1793, in the September, 1792, massacres referred to previously. Abbe Sicard’s arrest, despite his having taken the 1792 oath, took place over a half year before this March 18, 1793, ruling, and Sicard narrowly and accidentally escaped execution by the Paris Commune on September 3, 1792, even though he had the support of the Assembly. He was a witness at that time to terrible atrocities and murders. All the others with him in a wagon, which wagon was transferring the group to a second prison, were either wounded or murdered en route by the crowds. Since Abbe Sicard’s fellow prisoners, as a mark of their respect, presumably since he was a clergyman, had told him to get on the wagon first, Sicard had been in a recessed position in the wagon where he had been out of the reach of the crowds. Sicard later watched untold brutal executions and hideous crowd behavior from his cell window while he awaited his own execution. A member of the Paris Commune finally brought about Sicard’s release just before Sicard’s scheduled execution, which had been delayed only because of a cloudburst. (“Relation Adressee par M.l’Abbe Sicard... sur les Dangers..2 et 3 Septembre, 1792,” Memoires sur les Journees de Septembre, 1792, Paris: Baudouin Freres, 1823.)

The article continued:

“The assassination of the bloodthirsty demagogue, Marat, by Charlotte Corday (13 July, 1793) gave rise to extravagant manifestations in honour of Marat. But the provinces did not follow this policy. News came of insurrections in Caen, Marseilles, Lyons and Toulon; at the same time the Spaniards were in Roussillon, the Piedmontese in Savoy, the Austrians in Valenciennes, and the Vendeans defeated Kleber at Torfou (Sept., 1793). The crazed Convention decreed a rising en masse; the heroic resistance of Valenciennes and Mainz gave Carnot time to organize new armies. At the same time the Convention passed the Law of Suspects (17 Sept., 1793), which authorized the imprisonment of almost anyone and as a consequence of which 30,000 were imprisoned. Informing became a trade in France. Queen Marie Antoinette was beheaded 16 October, 1793....
“From a religious point of view a new feature arose at this period - the [Civil] constitutional clergy, accused of sympathy with the Girondins, came to be suspected almost as much as the non-juring priests...In October the Convention declared that the [Civil] constitutional priests themselves should be deported if they were found wanting in citizenship. The measures taken by the Convention to substitute the Revolutionary calendar for the old Christian calendar, and the decrees ordering the municipalities to seize and melt down the bells and treasures of the churches, proved that certain currents prevailed tending to the de-christianization of France. On the one hand the rest of decadi, every tenth day, replaced the Sunday rest; on the other the Convention commissioned Leonard Bourdon (19 Sept., 1793) to compile a collection of the heroic actions of Republicans to replace the lives of the saints in the schools.”

Note again the intense interest in elementary education, at the very same time that the Reign of Terror was in full force! Note also the deliberate suppression of religious influence on the public’s children by suppressing study of the saints’ lives, and that the “decadi” legislation outraged not just all Christians but Jews as well!

“The ‘missionary representatives’, sent to the provinces, closed churches, hunted down citizens suspected of religious practices, endeavoured to constrain priests to marry, and threatened with deportation for lack of citizenship priests who refused to abandon their posts. Persecution of all religious ideas began. At the request of the Paris Commune, Gobel, Bishop of Paris, and thirteen of his vicars resigned at the bar of the Convention (7 November) and their example was followed by several [Civil] constitutional bishops.

“The Montagnards who considered worship necessary replaced the Catholic Sunday Mass by the civil mass of decadi. Having failed to reform and nationalize Catholicism they endeavoured to form a sort of civil cult, a development of the worship of the fatherland which had been inaugurated at the feast of the Federation. The Church of Notre-Dame-de-Paris became a temple of Reason, and the feast of Reason was celebrated on 10 November. The Goddesses of Reason and Liberty were not always the daughters of low people; they frequently came of the middle classes.... On 23 November, 1793, Chaumette passed a law alienating all churches in the capital. This example was followed in the provinces, where all city churches and a number of those in the country were closed to Catholic worship. The Convention offered a prize for the abjuration of priests by passing a decree which assured a pension to priests who abjured, and the most painful day of that sad period was 20 November, 1793, when men, women and children dressed in priestly garments taken from the Church of St. Germain des Pres marched through the hall of the Convention. Laloi, who presided, congratulated them, saying they had “wiped out eighteen centuries of error”....

“Indeed a reactionary movement was soon evident. As early as 21 November, 1793, Robespierre complained of the “madmen who could only revive fanaticism”. On 5 December, he caused the Convention to adopt the text of a manifesto to the nations of Europe in which the members declared that they sought to protect the liberty of all creeds; on 7 December, he supported the motion of the Committee of Public Safety which reported the bad effect in the provinces of the intolerant violence of the missionary representatives, and which forbade in future all threats or violence contrary to liberty of worship. These decrees were the cause of warfare between Robespierre and enthusiasts such as Hebert and Clootz. At first Robespierre sent his enemies to the scaffold; Hebert and Clootz were beheaded in March, 1794, Chaumette and Bishop Gobel in April. But in this same month of April Robespierre sent to the scaffold the Moderates, Desmoulins and Danton, who wanted to stop the Terror, and became the master of France with his lieutenants Couthon and Saint-Just.... Robespierre’s true intentions are still an historical problem. On 6 April, 1794, he commissioned Couthon to propose in the name of the
Committee of Public Safety that a feast be instituted in honour of the Supreme Being, and on 7 May Robespierre himself outlined in a long speech the plan of the new religion. He explained that from the religious and Republican standpoint the idea of a Supreme Being was advantageous to the State, that religion should dispense with a priesthood, and that priests were to religion what charlatans were to medicine, and that the true priest of the Supreme Being was Nature. The Convention desired to have this speech translated into all languages and adopted a decree of which the first article was: ‘The French people recognize the existence of a Supreme Being and the immortality of the soul.’ The same decree states that freedom of worship is maintained but adds that in the case of disturbances caused by the exercise of a religion those who ‘excite them by fanatical preaching or by counter-Revolutionary innovations’ shall be punished according to the rigour of the law. Thus the condition of the Catholic Church remained equally precarious and the first festival of the Supreme Being was celebrated throughout France on 8 June, 1794, with aggressive splendour. Whereas the Exageres wished simply to destroy Catholicism, and in the temples of Reason political rather than moral doctrines were taught, Robespierre desired that the civic religion should have a moral code which he based on the two dogmas of God and the immortality of the soul. He was of the opinion that the idea of God had a social value, that public morality depended on it, and that Catholics would more readily support the republic under the auspices of a Supreme Being....

“While danger from abroad was decreasing, Robespierre made the mistake of putting to vote in June the terrible law of 22 Prairial, which still further shortened the summary procedure of the Revolutionary tribunal and allowed sentence to be passed almost without trial even on the members of the Convention. The Convention took fright and the next day struck out this last clause. Montagnards... threatened by Robespierre joined with .. Moderates... to bring about the coup d’etat of 9 Thermidor (27 July, 1794). Robespierre and his partisans were executed, and the Thermdorian reaction began. The Commune of Paris was suppressed, the Jacobin Club closed, the Revolutionary tribunal disappeared after having sent to the scaffold the public accuser Fouquier-Tinville and the Terrorist, Carrier, the author of the noyades (drownings) of Nantes. The death of Robespierre was the signal for a change of policy which proved of advantage to the Church: many imprisoned priests were released and many emigre priests returned. Not a single law hostile to Catholicism was repealed, but the application of them was greatly relaxed. The religious policy of the Convention became indecisive and changeable. On 21 December, 1794, a speech of the constitutional bishop, Gregoire, claiming effective liberty of worship, aroused violent murmerings in the Convention, but was applauded by the people; and when in Feb., 1795, the generals and commissaries of the Convention in their negotiations with the Vendeans promised them the restoration of their religious liberties, the Convention returned to the idea supported by Gregoire, and at the suggestion of the Protestant, Boissy d’Anglas, it passed the Law of 3 Ventose (21 Feb., 1795) which marked the enfranchisement of the Catholic Church. This law enacted that the republic should pay salaries to the ministers of no religion, and that no churches should be reopened, but it declared that the exercise of religion should not be disturbed, and prescribed penalties for disturbers. Immediately the constitutional bishops issued an Encyclical for the re-establishment of Catholic worship, but their credit was shaken. The confidence of the faithful was given instead to the non-juring priests who were returning by degrees. These priests were soon so numerous that in April, 1795, the Convention ordered them to depart within a month under pain of death. This was a fresh outbreak of anti-Catholicism. .....on 30 May, at the suggestion of the Catholic, Lanjuinais, the Convention decreed that (Law of II Prairial) the churches not confiscated should be placed at the disposal of citizens for the exercise of their religion, but that every priest who wished to officiate in these churches should previously take an oath of submission to the laws; those who refused might legally hold services in private houses. This oath of submission to the laws was much less serious than the oaths formerly prescribed by the Revolutionary authorities, and the Abbe Sicard has shown how Emery, Superior
General of St. Sulpice, Bausset, Bishop of Alais and other ecclesiastics were inclined to a policy of pacification and to think that such an oath might be taken.

“But the policy of religious pacification was not lasting. ... On 6 Sept., 1795 (Law of 20 Fructidor), the Convention exacted the oath of submission to the laws even of priests who officiated in private houses. The Royalist insurrection of 13 Vendemiaire, put down by Bonaparte, provoked a very severe decree against deported priests who should be found on French territory; they were to be sentenced to perpetual banishment. Thus at the time when the Convention was disbanding, churches were separated from the State. In theory worship was free; the Law of 29 Sept., 1795 (7 Vendemiaire), on the religious policy, though still far from satisfactory to the clergy, was nevertheless an improvement on the laws of the Terror, but anarchy and the spirit of persecution still disturbed the whole country. Nevertheless France owes to the Convention a number of lasting creations: the Ledger of the Public Debt, the Ecole Polytechnique, the Conservatory of Arts and Crafts, the Bureau of Longitudes, the Institute of France, and the adoption of the decimal system of weights and measures. The vast projects drawn up with regard to primary, secondary, and higher education had almost no results. [Ed.: Note the admission of “vast projects” on education, including primary education, simultaneous with the years of the Reign of Terror. Their actual results will be considered later, but the proposed educational “projects” continued under the Directory, which was the next governmental form.]

“The DIRECTORY - In virtue of the so-called ‘Constitution of the Year III’, promulgated by the Convention 23 Sept., 1795, a directory of five members (27 Oct., 1795) became the executive, and the Councils of Five Hundred and of the Ancients, the legislative power. At this time the public treasuries were empty. ... The Directors... were averse to Christianity, and in the separation of Church and State saw only a means of annihilating the Church. They wished that even the [Civil] constitutional episcopate, though they could not deny its attachment to the new regime, should become extinct by degrees, and when the [Civil] constitutional bishops died they sought to prevent the election of successors, and multiplied measures against the non-juring priests. The decree of 16 April, 1796, which made death the penalty for provoking any attempt to overthrow the Republican government was a threat held perpetually over the heads of the non-juring priests. That the directors really wished to throw difficulties in the way of all kinds of religion, despite theoretical declarations affirming liberty of worship is proved by the law of 11 April, 1796, which forbade the use of bells and all sorts of public convocation for the exercise of religion, under a penalty of a year in prison, and, in case of a second offence, of deportation. The Directory having ascertained that despite police interference some non-juring bishops were officiating publicly in Paris, and that before the end of 1796 more than thirty churches or oratories had been opened to non-juring priests in Paris, laid before the Five Hundred a plan which, after twenty days, allowed the expulsion from French soil, without admission to the oath prescribed by the Law of Vendemiaire, all priests who had not taken the [Civil] Constitutional Oath prescribed in 1790, or the Oath of Liberty and Equality prescribed in 1792; those who after such time should be found in France would be put to death. But amid the discussions to which this project gave rise, the revolutionary Socialist conspiracy of Babeuf was discovered, which showed that danger lay on the Left; and on 25 Aug., 1796, the dreadful project which had only been passed with much difficulty by the Five Hundred was rejected by the Ancients.

“The Directory began to feel that its policy of religious persecution was no longer followed by the Councils. It learned also that Bonaparte, who in Italy led the armies of the Directory from victory to victory, displayed consideration for the pope.... The elections of 20 May, 1797, caused the majority of Councils to pass from the Left to the Right.... The Directors, alarmed by what they considered a reactionary movement, commissioned General Augereau to effect the coup d’état of 18 Fructidor (4 Sept., 1797),... and laws against the emigres and non-juring priests [were] restored
to their vigour. Organized hunting for these priests took place throughout France; the Directory cast hundreds of them on the unhealthy shore of Sinnamary, Guiana, where they died. At the same time the Directory commissioned Berthier to make the attack on the Papal States and the pope, from which Bonaparte had refrained. The Roman Republic was proclaimed in 1798 and Pius VI was taken prisoner to Valence. An especially odious persecution was renewed in France against the ancient Christian customs; it was known as the decadaire persecution. Officials and municipalities were called upon to overwhelm with vexations the partisans of Sunday and to restore the observance of decadi. The rest of that day became compulsory not only for administrations and schools, but also for business and industry. Marriages could only be celebrated on decadi at the chief town of each canton....

“Through its clumsy and odious religious policy the Directory exposed itself to serious difficulties. Disturbed by the anti-religious innovations, the Belgian provinces revolted; 6,000 Belgian priests were proscribed. Brittany, Anjou and Maine again revolted, winning over Normandy.... Bonaparte’s return and the coup d’état of 18 Brumaire (10 November, 1799) were necessary to strengthen the glory of the French armies and to restore peace to the country and to consciences.”

On this apparently pro-Bonaparte note, the author ended his remarkably detailed summary, which certainly does clarify for a casual reader many of the turbulent events of the Revolutionary period. He had also provided a background against which the French Revolution’s legislation on primary education - and on textbooks and reading methods - can better be understood. It also provided the background for a better understanding of subsequent history in much of the Western World, since the French Revolution was such a pivotal event.
Chapter 10
The Publishing Record Demonstrates the Influence of the Activists

By the end of the eighteenth century, little sympathy for the French Revolution and its attack on religion existed in America. Although the Club of Jacobins in Paris had been closed with the execution of Robespierre in mid-1794, and the Illuminati in Bavaria, Germany, had been presumably disbanded not long before when their existence was accidentally discovered, the use of these two notorious names still persisted as labels for other hidden activist groups after the mid-1790’s.

That such hidden groups had at least some influence in America is strongly suggested by material quoted by Robert Henry Goldsborough in his book, Lines of Credit: Ropes of Bondage. Goldsborough reported on page 4 that the Rev. Timothy Dwight, President of Yale University, spoke to New Haven churchgoers, in July, 1798, about the French Revolution’s outrages against religion and about the influence of both Voltaire and the Illuminati (which name was probably only a generalized label for such secret groups):

“Is it that we may see the Bible cast into a bonfire, the vessels of the sacramental supper borne by an ass in public procession, and our children either wheedled or terrified, uniting in the mob, chanting mockeries against God....? Shall our sons become the disciples of Voltaire and... our daughters the concubines of the Illuminati?”

On page 3, Goldsborough wrote:

“At Charleston, S. C., on May 9, 1798, the Rev. Jedediah Morse preached this remarkable sermon on the Illuminati: ‘Practically all of the civil and ecclesiastical establishments of Europe have already been shaken to their foundations by this terrible organization.... The order has its branches established and its emissaries at work in America....’ “

If these two respected ministers were right, the long arm of the “philosophers” and the change-agent secret societies which certainly appear to have had some kind of connection with them had reached across the Atlantic.

But the probable effect of the activities of the “philosophers” such as Voltaire and Diderot, and their fellow-travelers such as the change-agent secret societies, is first evident in the mid-eighteenth century change in the nature of the entries in the “Bibliographie” (pages 194 and following) of the Dictionnaire de Pedagogie et d’Instruction Primaire, 1887, Librairie Hachette et Cie., Paris, edited by Ferdinand Edouard Buisson, (1841 - 1932). The sharpest distinction in the bibliography between the pre-1760 material and the post-1760 material is in the educational topics themselves. Before 1760, the emphasis had been on training children - boys AND girls - to a Christian way of life. After 1760, the emphasis was on “plans” for founding “national” schools under state control.

Those two words, “plan,” and “national” constantly appeared in essays on education after Chalotais’s 1763 work proposing state control of education, mentioned below, which used those two words.

It is interesting that many pre-1760 entries specially concerned only the education of girls, which suggests that a far higher value was given in France at that time to female education than is generally acknowledged. For instance, St. Peter Fourier (1565-1640) founded in 1598 the Congregation of Notre-Dame, a group of nuns whose work was the teaching of poor girls gratuitously. He wrote at length on teaching methods (Sommaire des constitutiones des Religieuses de la congregation de Notre Dame,
1649) and the Ven. Marguerite Bourgeoys founded a branch of the order in Montreal, Canada, in 1657. The Ursuline order, which also taught women, had already arrived in Montreal by 1639. (Saint John Baptist de la Salle, founder of the Christian Brothers, had begun his work for educating poor boys in 1679.)

Some pre-1760 “Bibliographie” entries concerned home schooling and training by parents. Some entries concerned matter-of-fact references to the ages-old parish schools known as the petite schools, but these references did continue after 1760 until the Revolution in 1789. (The Elizabethan English term, “petty schools,” may be a direct parallel, since “petty” is conceivably a derivative of petite.)

The Christian Brothers’ schools for poor boys begun in the late 1600’s and the Jesuits’ schools begun in the mid-1500’s had been highly successful in France before 1762. Yet, as quoted earlier, in 1762 (by the Parlement) and in 1764 (by the king, presumably ratifying the Parlement act), the Jesuits were outlawed and their schools presumably closed. After the revolution, other religious schools run by other religious orders were outlawed in 1791 with the suppression of religious orders. Such religious orders, plus the parish, cathedral, and monastic personnel, had been the dominant educators in France for over a thousand years. A very large literature appeared in the nineteenth century documenting the church’s involvement in education in France back to before the time of Charlemagne in the ninth century. Brother Azarius’s works and others from the late nineteenth century give ample bibliographies on that topic.

Therefore, to judge from the Bibliographie, a sharp preference for religion in education, by religious groups or privately at home, was apparent before about 1760, but an implicit opposition to religion in education, given by religious groups or by parents, became apparent after about 1760.

What is also highly meaningful is that not long after 1760, simultaneously with the de-emphasis on religion, came the first call for “national” schools. Why should that sudden change of direction after 1760 have occurred unless some hand or hands, somewhere, were trying to hold culture’s rudder? Certainly one of the hands on the rudder was not Rousseau’s. That distasteful faker had made no plea for “national” schools, because he did not believe in ANY schools! It is more reasonable to assume that the people who promoted Rousseau’s book in the 1760’s were the same people who promoted “national” schools. That group presumably included personalities like Diderot and Voltaire, as well as some of the highly influential eighteenth-century women intellectuals. The existence of such highly influential women intellectuals, of course, belies the fable that French women of the period were uneducated.

The first entry in the Bibliographie that may have dealt with the topic of the government’s taking over of education, instead of education’s being handled by churches or by parents, was written by “Anonymous.” It was published in Amsterdam in 1762, under the title, “Of Public Education.” (“Public education” in the eighteenth century only meant education outside the “private” education of the home, so the text may not have proposed government involvement.) The Bibliographie commented, “Wrongly attributed to Diderot. This work is probably by Crevier.” However, the fact that it had been attributed to Diderot certainly seems to confirm that the material was in agreement with the general ideas of the “philosophers” and so that it may have recommended education by the government instead of by religious groups or by the home.

The next entry in the Bibliographie clearly dealt with the topic of the government’s take-over of education. The material was published in 1763 and was enormously important. It was by Louis Rene de Caradeuc de la Chalotais and was entitled, “Essay on National Education, or Plan of Studies for Youth.” The Encyclopedia Britannica (1963), in its article, “Education, History of, page 989, Volume 7, stated that Chalotais’s “Essay” was very influential, and that Chalotais had revived the Greek idea of state control of education. Chalotais criticized education by the Jesuits, saying:
“I venture to claim for the nation an education which depends only on the state, because it is essentially a matter for the state.”

In Chalotais’s view, only the state should dispense “education,” but it is horrifying to learn how little “education” he thought most people should receive. Yet, unlike so many others in the eighteenth century, Chalotais did not endorse mandatory school attendance. Instead, Chalotais promoted something far, far worse: the government monopoly and control of ALL education. However, Chalotais in 1763 was not the first in France to think that education should be limited or non-existent for most people. That view had been simmering since at least 1746. It had existed side by side with the massive Christian Brothers schools for the poor, and other charity-run schools, spread all over France, and the “petite ecoles” (little schools) attached to so many parish churches, which had taught simple reading to children for far more than a thousand years, since long before the days of Charlemagne.

The fact that giving an education to the majority of the population in eighteenth-century France met some powerful opposition is demonstrated by a quotation from Chapter 3 of Literacy and Development in the West, Penguin Books, Baltimore, Maryland, 1969, by Professor Carlo M. Cipolla. In reading the quotation, it should be remembered that in the eighteenth century the great majority of people were peasants. Cipolla quoted the startling title of a topic debated by the Academy of Rouen (France) in that year of 1746:

“Is it advantageous or is it harmful for the state to have peasants who know how to read and write?”

Cipolla cited as his source for that information Histoire de l’enseignement primaire avant 1789, by De Fontaine de Rasbecq, Lille-Paris, 1878, p. 98.

In Chapters 3 and 4 Cipolla also quoted some absolutely astonishing remarks (astonishing to our modern-day eyes). They are particularly so since they were made by Chalotais, the person who was, apparently, the very first since the days of Ancient Greece to propose that education should be controlled by the state. Cipolla quoted from pages 54 and 55 of (L. R. de Caradeuc de la) Chalotais’s 1763 work, Essay on National Education, as translated and edited by H. R. Clark in London, England, in 1934. Chalotais was the Attorney-General of the King of France:

“Never before have there been so many students... even the working people want to study... the Brothers of Christian Doctrine, called the Ignorantins, are pursuing a fatal policy; they are teaching people to read and write who should have learnt only to draw and to handle planes and files but who no longer wish to do so. The good of society demands that the knowledge of the people should not exceed what is necessary in their occupation. Every man who sees further than his dull daily round will never follow it out bravely and patiently. Among the common people it is really only necessary for those to learn reading and writing who live by means of these accomplishments, or who need them in their daily tasks.”

“...after a poor education that teaches them only to despise their fathers’ profession, they turn to the cloisters and join the clerics; they take posts as officers of the law, they often become persons harmful to society....”

“It is recognized that under a good administration the classes of men that live on the labour of others must not be too numerous, they must be limited to the essential minimum.”

Cipolla showed that the same general opinion, about a society of rigid “classes,” in which only the upper classes were supposed to be literate, was held by some very influential people in England as late as
1807, at the time that a Bill had been proposed by a man named Whitbread to set up elementary schools all over England. The bill was defeated in the House of Lords. Cipolla quoted the remarks at that time by the President of the Royal Society who had been strongly opposed to the bill.

“However specious in theory the project might be of giving education to the labouring classes of the poor, it would in effect be found to be prejudicial to their morals and happiness; it would teach them to despise their lot in life, instead of making them good servants in agriculture, and other laborious employments to which their rank in society had destined them; instead of teaching them subordination, it would render them factious and refractory, as was evident in the manufacturing counties; it would enable them to read seditious pamphlets, vicious books, and publications against Christianity; it would render them insolent to their superiors; and in a few years the result would be that the legislature would find it necessary to direct the strong arm of power toward them.”

Cipolla’s source for the previous extraordinarily ugly comments by the President of the famous Royal Society was page 57 of Town Labourer by J. L. and B. Hammond, published in London in 1918.

Education reformers in England had to struggle against that kind of powerful opposition to education for the poorer people because education supposedly gave the poor too much power.

In Chalotais’s 1763 rejection of education by the Jesuits, he was clearly siding with the “philosophers” because they had succeeded in having the Jesuit order legally suppressed in France in 1762 by the Parlement and in 1764 by the king. (The legal distinction between those two actions most probably was that the 1762 parliament act could not take effect until it was signed by the king, in 1764.) As was quoted previously in the article on the French Revolution, it should be noted again here that Voltaire, the most famous of the “philosophers” (or “philosophes” in French) had written to Helvetius in 1761, saying, “When we have destroyed the Jesuits, we shall have easy work with the Infame,” the “Infame” being the Christian religion. Therefore, the real target of the “philosophers” was Christianity, and not just the Jesuit order.

Of course, in stating that education “is essentially a matter for the state,” Chalotais also dismissed the rights of parents to educate their children in any manner that they see fit, and by doing so he was therefore attacking the family unit. Yet the Christianity which the “philosophers” aimed to destroy exalts the family as the fundamental unit in society and considers that only parents are the legitimate teachers of their children. In the Christian view, schools can receive the authority to teach children only through the consent of their parents, and schools only act “in loco parentis,” or in place of the parents. Therefore, any attack on Christianity may also be an attack on the family unit since Christianity considers the family unit to be of paramount importance.

The “National” schools that Chalotais recommended in 1763 (and that “Anonymous” may possibly have recommended in 1762) had apparently been unheard of since the time of ancient Greece. Of course, Voltaire, Diderot and their intellectual “mafia” must have been well acquainted with the Greek classic, Plato’s Republic, which endorsed such state-controlled schools as well as massive state control in general. In case some people should think all of ancient Greece’s ideas were sparkling wonders, it is suggested that such people carefully read Plato’s proposal for rule by an oligarchy. Plato proposed a dictatorship of a few presumably superior beings over the masses of their inferiors - which means the rest of us.

A very perceptive article by John Taylor Gatto, New York State Teacher of the Year for 1991, was entitled “The Curriculum of Reform.” It included these comments on the pervasive influence of the bloodless Plato:
“The Pagan Bible

“The indispensable utopia is Plato’s Republic.” * All Plato is a footnote to the Republic - it is
the perfected utopia showing perfect justice to be harmony among all parts of society. Those who
are subordinate accept their subordination willingly. The leadership can be said to create the
moral world of simpler folk, lying to them when necessary as a kind of beneficent oil to assist
operations of the State.

“The family is openly regarded as an enemy. Everything is where it ought to be. The best and
brightest are at the top. It is a world going nowhere; it has already arrived.

“Ask the question who reads Plato’s Republic then and now and you get the surprising
answer that everybody who counts did and does.” ** The majority of elite young college men in
the past three centuries all read it. Other classics come and go, the Republic stays. It is on sale in
every American bookstore. On the shelves of every single library; even the collections in tiny
towns. The continuity of this pagan bible in Western tradition has no peer.

“Delving into this phenomenon discloses further strangeness. The Christian Bible is filled
with fantastic tales, oriental color, vivid language and images. Even in its decline the narratives
are kept alive by tens of thousands of ritual assemblies each week. Great cinematic and televised
adventures from the Testaments have been popular entertainment for over half a century. The
great national celebration is Christ’s birthday.

“The pagan bible seemingly has no advantages. Plato gives us a group of men dressed in
sheets who sit around talking about ideas. No action, the drama is eventless, and the republic
being discussed is imaginary: How can we account for the fact that this dull book’s ideas have
been continuously taught over a vast area for two thousand years and more?

“Something had kept the Republic and its antifamily message vigorously alive.... there is no
consensus..... except about one thing and that is the universal fascination with the book’s nature as
a comprehensive secular agenda to organize all human society.... The history of utopian writing
after Plato shows plainly how impossible it has been to even think of a social design not
involving more state control.... The philosophical climate is always one of sanitary distance
between rulers and ruled, augmented by an atmosphere of illusion in these exercises.... Platonic
goals are indifferent to human aspirations or indigenous cultures, platonic reforms are imposed in
the absence of popular acceptance as public education was imposed.... The estrangement of the
political system from human values is expected in a Platonic republic. Sophisticated men hardly
bother to deplore it....”

*Bertrand Russell raised a few eyebrows in 1920 when he announced that a close inspection
of the new Russian Bolshevik state would reveal its theoretical substructure to be identical with
that of Plato’s Republic - and almost certainly stolen from there!

**According to biographers of the Ayatollah Ruhollah Khomeini, his vision of an Islamic state
led by a philosopher-king stemmed from his time in Qum as a young man when he became enchanted
by Plato’s Republic; a recent display as in The New York Times for Adelphi University announced
that ‘everyone’ should read Plato’s Republic before entering college.

While only someone like Hitler could admire the mandatory government schools which existed in
Sparta in ancient Greece, we are all supposed to be entranced with the government schools which existed
in Athens in ancient Greece. Yet, such schools in Athens were only for the “free” part of the population,
and then only for the “male” part of the “free” population, which was actually only about five per cent of the total population.

That male, “free” part of the population was the only part which could vote. Therefore, all of the famed love of democracy in Athens concerned only about five percent of its population. It should also be noted that the ancient Greeks apparently lacked any kind of constitution (either written or oral and traditional), which could have served to protect the rights of minorities from the “democratic” majority.

I have become very irritated with hearing about the Greek love for and presumed invention of democracy (as well as the Greeks being credited with so much of Western culture - when they were, themselves, so often drawing on others like the Egyptians). However, concerning their “democratic” (majority rule) form of government, the Greeks were part of the Indo-European peoples, and Indo-European peoples almost uniformly had such a legislative (“democratic”) type of government. (That government was admittedly composed only of the higher classes.) Therefore, the Greeks did not invent the concept of self-rule, but only inherited it, as did other Indo-European peoples.

For instance, the famed Icelandic Parliament of a thousand years ago, the earliest Parliament in Europe, was only an extension of Indo-European traditions perhaps at least three thousand years old. So, too, was the civil arrangement in Celtic ancient Ireland an Indo-European type, where a king was “elected” at a similar “parliamentary” gathering. (The Irish, however, did have a “constitution” to protect rights, the ages-old pagan Brehon Laws.)

One of the ancient Irish “saints’ lives” from about the fifth century even tells as background material of a saint’s mother traveling alone in a chariot to such a legislative gathering - though presumably she was not supposed to vote. (Such accidental background information in legends is highly reliable. The tale about the saint himself might have been largely fictional, but its casual mention of the fact that at that time a well-born woman could ride alone in a chariot to attend a public legislative meeting is almost certainly true.) Yet no ancient Greek woman would have been welcome in any ancient Greek “democratic” gathering! The other ninety-five per cent of the population in Greece, including all of the women, had nothing whatsoever to say about anything! Women in Athens were relegated to women’s quarters and did no traipsing about alone in chariots.

Indo-European “democracy” was far more real and widespread in Celtic pagan Ireland before the fifth century A. D. and in pagan Iceland in the tenth century A. D. than it was in pagan Indo-European Athens in the sixth and fifth centuries before Christ, where only about five per cent of the population had the right to vote!

Yet, if Plato had his way with his tiny oligarchy ruling everyone else, there would be considerably LESS democracy in Plato’s ideal civil society than there was even in Athens!

Admirers of ancient Greek schools should research what actually was the reason for the schools in ancient Athens. Students were trained to be good citizens because they were effectively perceived to be wards of the state, not of their parents. This was NOT true of ancient Rome, where education was strictly a private affair and was arranged for by children’s parents, the family being the important unit. Yet no one can doubt the patriotism of those ancient Romans, nor the remarkably stable government they had for so very many years, nor Rome’s cultural level!

The first “national” schools since the days of ancient Greece were established in Prussia under Frederick some years before the French Revolution, and, as discussed, possibly the first requirement for compulsory public school attendance came under Empress Maria Theresa in Austria in 1774. However, Frederick and Maria Theresa were only putting into practice the “Platonic” idea of state control that was
being promoted by French “philosophers” before the French Revolution. As might have been surmised, Frederick was a member in good standing of that so-called “Enlightenment” along with Diderot and Voltaire.

“National” schools on the Greek model (NOT the Roman!) finally appeared as one of the most enduring fruits of the French Revolution, itself the fruit of the so-called “Enlightenment.” In true “national” schools, students are treated as wards of the state. Since then, “national” schools have spread all over the globe, and mandatory school attendance laws are generally in place all over the Western world. Why is it that such mandatory attendance laws are NEVER identified for what they really are: involuntary servitude to the state?

The fact of such state control of children which is firmly in place all over the Western world in the twentieth century should be contrasted to the situation in the Western World before the sixteenth century. Before the sixteenth century, Western children were considered to be so totally the wards of their own parents that even religious catechism lessons were expected to be given by their parents. The parents were instructed in the catechism in church and were then expected to go home to teach their children!

In the Lutheran Church Review, Volume 34, No. 5, October, 1915, in the article, “Religious Instruction of the Young in the Sixteenth Century,” by M. Reu of Dubuque, Iowa, the following appears on pages 567 and 569. The author was making the point that it was widespread parental laxness in the sixteenth century which caused Luther to make his church directly responsible for education of the young, instead of indirectly responsible. However, in doing so, the author established that before the sixteenth century it had been only the parents, and not even the church, who were in actual control of the education of their children. Reu wrote:

“It is firmly established, firstly, that the opinion according to which the sponsors and parents are responsible for the religious instruction of the youth (an opinion which can be found as far back as the time of Charlemagne) was alive also in the 15th Century; that, secondly, the ordinance requiring the parts of the catechism to be read from the pulpit every Sunday was often renewed in this time and carried into effect by not a few priests; that, thirdly, the church, by means of the so-called sacrament of confession, exercised control over the sponsors and parents as to whether they were fulfilling this duty in the way of instructing the young, and also made provision for a rich literature which was intended to enable both the priest and Christian home to discharge their duties along educational lines (some of the books here in question, as can be proved, were published in 25, 60, and 75 editions....

“...Where conditions were most favorable, the medieval church endeavored to influence the adults religiously by no insignificant literature as well as by not too infrequent preaching. Where, however, it gave religious instruction to the young at all, it was done directly in exceptional cases only. Indirect teaching through parents and sponsors was the rule, and in some instances the school also served as a medium....”

The medieval tradition that the parents were responsible for the religious instruction of the young was an affirmation of the importance and dignity of the family. What has happened with the arrival of “national” or state education is a weakening of the family. It is certainly no accident that it was in ancient Greece, where the family was of minimal importance, and where anti-family homosexual behavior was acceptable and widespread, that “national” or state schools were promoted. Yet in ancient Rome, where the traditional family was of paramount importance, “national” or state education was unknown!

Some annotated excerpts from the educational “Bibliographie” from the Dictionnaire de Pedagogie et d’Instruction Primaire (Paris, 1887) and from some other sources in the Dictionnaire are given below, to
show the religious and family emphasis in French education before about 1760, and the propagation of the “national” schools idea and the de-emphasis of religion after about 1760. However, in addition, some of the entries indicate the status and development of methods for teaching beginning reading in France. Of course, the bibliography itself in the Dictionnaire is far, far longer, and those excerpts which were selected are only a few of the total entries.

1649

[Ed. As mentioned elsewhere, he founded an order for the teaching of poor girls, and this was a “teacher’s guide” which included instructions for using the syllable method to teach beginning reading.]

1654

Anonymous [Ed.: Pere I. D. B.] - The Parish School, or the Manner of Properly Instructing Children in the Little Schools, by a Priest of a Parish in Paris. (L’école Paroissiale ou la maniere de bien instruire les enfants dans les petites ecoles, par un pretre d’une paroisse de Paris.) Paris. (Prescribed or recommended by a great number of bishops) [Ed.: Contained precise instructions for the teaching of beginning reading by the syllable method and it was reprinted for many years.]

1664

Grammaire Generale of Port Royal. [Briefly described Pascal’s 1655 synthetic phonics method without naming Pascal. That Pascal was the true author of the synthetic phonics method is shown by an extant letter of 1655 from Pascal’s sister, Jacqueline, to Pascal asking for his further explanation. That Arnauld knew of the source of the synthetic phonics method is shown by his surviving letter of January, 1656. The Grammaire Generale of Port Royal is not listed in the “Bibliographie,” but is discussed in other Dictionnaire articles, “Lecture,” “Pascal, Blaise” and “Pascal, Jacqueline.”]

1668

Demia - Expostulations for the Establishment of Christian Schools for the Instruction of Poor People (Remontrances pour l’establissement des ecoles chretiennes pour l’instruction du pauvre peuple.) Lyon. [Described on pages 1534 of article, “Lecture.” Pere Demia founded a school to train teachers. He also wrote on the teaching of beginning reading, and outlined the use of the syllable method. For teaching a class how to tie letters together in cursive writing, he recommended the use of a “table noire,” a blackboard, possibly the first such reference to blackboards in educational literature.]

1673

Pommereuse (La mere Marie de) The Chronicles of the Order of Ursulines (Les Chroniques de l’Ordre des Ursulines). Paris. 2 vol. (The Second is from 1676.)

1695

Lefebvre, (P.-C.) Senior Professor of the College of Grassins. - Instruction for the petites ecoles of the diocese of Mirepoix. Toulouse. 176 p. [Ed.: It is evident that “a great number of bishops” would not have prescribed and recommended the anonymous Pere I. D. B.’s work after 1654 if they did not already have parish schools, or petite ecoles, in their dioceses, nor would they have had such parish schools, obviously largely for poorer people, if literacy were not highly valued. Nor would Professor Lefebvre bothered to have written his 176-page book of instructions in 1695 for the petites ecoles (note the plural) in the
diocese of Mirepoix, unless such primary schools were actually in existence in that diocese. The reason J. B. de La Salle founded the Christian Brothers was because not enough teachers could be found for already existing poor schools, good teachers too often choosing to leave to go to work for richer people. Pere Demia was also concerned with training teachers. Therefore, facilities for teaching beginning reading to the poor did exist in France in the seventeenth century, though teachers were too scarce, and education for the well-to-do was obviously more available.]

1695

1698

Liancourt, the Duchess of, died in 1674: Rule given by a woman of high quality to Madame, her daughter, for her conduct and that of her house, with another rule that this woman has made for herself. Paris. “Reprinted many times, among others in 1811 under the title: Of the Christian Education of Young Men and Young Women.”

1719

De Vallange [Not on the “Bibliographie” but from page 1540 of article, “Lecture,” which indicated by an asterisk that another entry on de Vallange appeared in the Dictionnaire] - “New Systems or New Plans of Methods to Succeed Quickly and Easily to the Knowledge of Languages, Sciences, Arts, and Exercises of the Body, exposing a procedure of his own invention, which consisted of teaching reading by means of symbolic figures corresponding to the different sounds of the language. This idea was revised by the Abbot Bertaud, who executed it in 1744 under the name, Quadrille des Enfants...” “See 1744 entry for Bertaud, and 1801 entry under Madame de Genlis concerning a discussion of the method, and other revisions, which included Anonymous in 1751, Alexandre in 1777, Michel in 1779, possibly Madame de Genlis in 1801, and Daubanton in 1810, who wrote Lecture Par Echo.”

1719

Py-Poulain Delaunay, [Ed.:from the article, Lecture, but not listed in the Bibliographie] Methode de Sieur Py-Poulain de Launay, ou l’art d’apprendre a lire le francais et le latin, Nicolas Le Clerc and Jean-Francois Herissant, Paris. [Ed.: His son published a revision of his father’s original 1719 book, with notes in 1741. In it, his father had referred to Abbe de Saint Cyran using phonics, presumably the Abbe de Saint Cyr who was Bishop Jansen’s associate and follower, and who was himself followed by Antoine Arnauld as the leader of the Jansenists. However, it seems very unlikely that St. Cyr did this, since Arnauld wrote a letter on January 31, 1656 (quoted in the Blaise Pascal article on page 2215 of the Dictionnaire) asking Arnauld’s niece at Port Royal about how to use Pascal phonics as Arnauld wished to teach an illiterate. If Saint Cyr had originated the phonic method before Pascal, Arnauld would not have written that letter. The elder Delaunay also referred to seeing a book by a Benedictine religious referring to a phonic method, which, of course, could have been Pascal phonics. Then the elder Delaunay said by 1719 that he had finally found the 1664 Port Royal grammar which described the Pascal phonic method. Curiously, the account said, presumably from Delaunay’s own observation in 1719, that some people wanted to renounce spelling. This anticipated Cherrier’s dropping spelling in 1755 by almost forty years. (Cherrier is discussed later.) The elder Py-Poulain used italic print or red to mark silent letters in initial lessons and when beginning with connected reading, and was assumed to have been the first to have done so].
1720

La Salle (J.-B. de) - Conduct of Christian Schools, Divided in Two Parts (Conduite des ecoles chretiennes, divise en deux parties). Avignon. [This was de La Salle’s “teacher’s guide” in schools for the poor. He recommended teaching beginning reading in French, and not Latin, because many poor children spent little time in school, but it must have caused problems because of irregular French spelling. He also used wall charts to teach letters and syllables to a whole class, apparently one of the first to use such charts, although Demia had used a blackboard to show cursive writing to a whole class.]

1720

Anonyme - Mechanical Alphabet (Alphabet mecanique). Typographical Bureau of Dumas for Reading (Bureau typographique de Dumas pour la lecture). Paris. [Louis Dumas used Pascal’s 1655 synthetic phonics, knowledge of which was spreading from Port Royal, on collections of separate letter cards, which the children selected to build words based on their sounds. See the 1733 entry.]

1724

1726

Rollin, Charles (1661-1741) - On the Manner of Teaching. (De la maniere d’enseigner et d’étudier les belles-lettres) or Treatise on Studies (Traite des etudes.) Paris.

[Ed.: Rollin elaborated on Dumas’ 1720 method, and in doing so also implied Pascal’s approach which Dumas had used, although Rollin did not name Pascal or Port Royal where the approach was first used in 1655. Surprisingly, the 1664 Grammaire of Port Royal by Arnauld which first published information on the Pascal phonic method is not listed in this bibliography. A translation of Part I of Rollin’s work was published with John Locke’s Some Thoughts Concerning Education in a Dublin edition of 1738. That Dublin edition very possibly inspired the Irish Spelling Book of 1740, referred to elsewhere in this history. Thomas Sheridan’s use of Pascal phonics most probably resulted from his having seen the Irish Spelling Book. The 1738 Dublin edition of Rollin’s material is listed in Fifteenth to Eighteenth Century Rare Books in Education, published in 1976 based on the library collection in what is now the Department of Education.]

1728

Lambert, the Marquise of - Advice of a Mother to Her Son and Her Daughter. Paris.

1728

Saint-Pierre, the Abbot of - Project for Perfecting Education. Paris, Briasson.

1733

Dumas, Louis, 1676-1744, natural son of Louis de Montcalm, disciple of Malebranche. La Bibliothèque des Enfans. Three volumes, the first explaining the Bureau Typographique, the second l’Abecedaire Latin, and the third l’Abecedaire Francais. [Ed.: From article “Lecture” and Dictionnaire
biographical entry. Dumas had traveled to the principal cities in France before 1726 to exhibit his methods. His Pascal phonics used the notation, “c = ce, ka, qu.” That bore a strong resemblance to the printed tables in the Irish Spelling Book, and, with Rollins’ book, was the probable source of the Irish Spelling Book. However, Dumas’ total method was intolerably over-complicated, to judge from its description in the article, “Lecture.” See also the 1720 entry, above.

1740

Saint-Pierre, the Abbot of - Advantages of Education in Colleges over Domestic Education. Amsterdam, Paris.

[The use of the word “college” did not have any necessary connection to universities. In this particular title, it meant collections of students, or student groups outside the home.]

1744

[This information is from the article, “Lecture,” page 1540, Volume I, Part II of the Dictionnaire de Pedagogie et d’Instruction Primaire, and the article on the Abbe Bertaud (Berthauld possible alternate spelling) in the Dictionnaire, Volume I, Part I. Bertaud is not listed in the article, “Bibliographie,” of the Dictionnaire.

[Abbe Bertaud wrote the program, Quadrille Des Enfants, teaching basic sounds by hieroglyphs. It was an elaboration of the idea first developed by Vallange in 1719, New System or New Plans, etc. (Nouveau Systeme ou Nouveau Plans etc.) Both Vallange and Bertaud inspired the later methods of Anonymous in 1751, Alexandre in 1777, Michel in 1779, possibly Madame de Genlis in 1801, and Daubanton in 1810. All those materials are the apparent source of Code 3, two-step, whole-word phony phonics as it has been used in English since the early nineteenth century. In his book, Emile, Rousseau had testified that a vast interest existed in the teaching of reading in France by 1762, and these programs are only some of the confirmations of that interest.

The article, “Bertaud, Abbe” in Volume I-I of the Dictionnaire... explains his reading program:

“Reading without spelling. 88 square cards from which comes the name of quadrille. [Ed.: quadrillage is a French noun for squaring, and quadrille is a French noun meaning a troop.] These cards each carry a picture representing an object known to the child and are meant to make him remember mnemonically one of the 86 syllables in which the Abbe Bertaud summarizes all the teaching of French reading; for example, to remember the sound, “u,” the picture shows a bossu [Ed.: a hunchback. Note that the example, for a little child, is of something that is sad. Unhappy examples have strangely been characteristic ever since in materials meant to teach beginning reading to little children by “meaning.”] One shows the engraving to the pupil and at the same time the word bossu, then only the letter u. The pupil remembers that letter, at first by the aid of the picture, and insensibly by the same form of the letter that is written thus in his memory. (One recognizes there in principal the system of “normal” words of Vogel.) When the pupil knows a series of 12 cards, he applies his acquired knowledge, in a series of syllables, of words and of sentences that one finds in the teacher’s book. By this means, the child quickly learns the 88 cards; he knows how to read at the end of some weeks of exercises.

“This method had a great vogue in the last century. The king of Prussia, who had been struck by the results, had the prince royal, Frederick William, taught to read by this procedure. Like all
reading methods without spelling, it succeeds only with those pupils who have, as has been said, the memory of the eyes.”

This Dictionnaire article was signed, A. Demkes. The French “Quadrille” system of 1744 as described by Demkes is clearly the origin of Code 3 two-step, whole-word “phonics.” It is apparently the first program which taught children to read whole words like “bossu” long before they knew the whole alphabet, and therefore before they knew the rest of the letters in those whole words which they were learning by their “meaning.” Demkes specifically described the Quadrille method as a reading method “without spelling” That seems to confirm further that the child was expected to work with whole words and whole word parts, instead of sequentially naming all letters in new syllables and words. Demkes specifically said “reading” began when only 20 of the 86 whole-word cards had been learned! Possibly the remaining two, to bring the total to the recorded 88, were the alphabet, one in upper and on in lower case letters.

The once-famous Quadrille method is also obviously partly like the approach of Gedike of Germany, which whole word approach Gedike is wrongly presumed to have invented. Its obvious use of sight-words suggests that it very probably provided the inspiration for Abbe de l’Epee’s sight-word method for the deaf, after 1760, and for the sight-word proposals of de Randonvillers in 1768 and of Adam in 1787, discussed later.

Just as is true today, two-step, whole-word phonics brought failure in its wake, as Demkes clearly noted: “Like all reading methods without spelling, it succeeds only with those pupils who have, as has been said, the memory of the eyes.”

The “memory of the eyes” was of the whole, meaning-bearing sight words, each containing only one phoneme to be studied for its sound, which phoneme was remembered as part of that whole, meaning-bearing sight word. The method was a very famous one in the mid-eighteenth century, endorsed even by the king of Prussia. It was the probable source for the “meaning” method introduced in America in 1826, and in Great Britain about the same time. See the 1801 entry under Madame de Genlis for a further discussion of the method.

1751

Anonymous - Methode Facile Pour Apprendre a Lire, Dediee a M. le Prince de Bouillons [from article, “Lecture,” page 1540. Variation on Bertaud’s Quadrille of 1744, which was based on De Vallange’s 1719 work, later similar programs being Anonymous in 1751, Alexandre in 1777, Michelle in 1779, and Daubanton in 1810, who wrote Lecture Par Echo. See Madame de Genlis, under 1801, who reportedly used the approach, for a further discussion of the method.]

1755

Canon Cherrier [Ed.: not in “Bibliographie” but discussed on page 1541 of the Dictionnaire de Pedagogy…] - New Methods to Teach Reading (Methodes Nouvelles Pour Apprendre a Lire), Paris. [Cherrier’s text gave a history of reading instruction to 1755. Cherrier wanted learners to drop the spelling of syllables and to learn them as wholes - a very significant deterioration. The approach was later adopted in part by the monitorial school founder, Andrew Bell of Great Britain. Yet Bell made no mention of Cherrier or his French successors, Viard and Boisjermain. Cherrier recommended naming the letters in a modified Port Royal fashion, with an e mute before and after each consonant, but this “improvement” only made Port Royal phonics useless for blending, which was the only purpose for which it had been
invented. However, since Cherrier wanted the syllables learned as wholes anyway, without spelling (which also meant without Port Royal Pascal blending), he said traditional letter names could be used if desired. Cherrier’s degenerate method of 1755, which had dropped the spelling of syllables, was a very significant milestone. Viard’s 1759 method, revised in 1778 by Luneau de Boisjermain and reprinted in the year VI of the French Revolution, continued with the dropping of the spelling of syllables. Quotations from the article, “Lecture,” concerning Cherrier are given later.]

1759

Viard, Master of a boarding school - True Principles of Reading, of Spelling (Orthographie) and of French Pronunciation (Vrais Principes de la Lecture...). [Ed.: Listed in article, “Lecture,” but not in “Bibliographie.” Viard’s work rejected the spelling of syllables, as Cherrier had done in 1755, and had numerous editions. See the entry under 1778 for Luneau de Boisjermain’s revision, reprinted in the year VI of the French Revolution. Quotations from the article, “Lecture,” concerning these works are given later.]

____________________

On the following selection of entries after 1760, note the appearance for the first time of books on “national” education, the omission of entries on home education, and the relative lack of concern for training in “piety,” although books on parish schools continue.

Abbe de l’Epee’s work appears later, but it is of interest that it was about 1760, in that kind of watershed period, that de l’Epee is reported to have started his education of the deaf, initially with two impoverished twin girls. De l’Epee reportedly took over the twins’ education from a priest who had died about 1760.

Annotated comments have been given at some length on the following entries if they are needed as necessary background.

1762

Rousseau, J. J. - Emile, or Of Education

1762

1762

Rivard, F. D. - Memorandum on the Necessity of Establishing in Paris a House of Instruction to Form Teachers and Some Colleges for the Lower Classes.

[With the exit of the very highly educated Jesuits as schoolmasters, a call had come for normal schools to train teachers. Yet, previously, the Christian Brothers and Jesuits had trained their own teachers. Works cited earlier by Pere I. D. B. and Pere Demia from the 1600’s also concerned the training of teachers. Note also the edition of the matter-of-fact manual for pastors concerning schoolmasters, listed
below under 1768. It implicitly confirms the widespread existence of church schools before 1768 and the resultant need for instructions by pastors to such schoolmasters. Note the entry under Anonymous for 1770 which also confirms the widespread existence of such petite schools before that date.]

1762

Anonymous - “Of Public Education. Amsterdam. (Wrongly attributed to Diderot. This work is probably by Crevier.)”

1763

According to the Encyclopedia Britannica (1963), in its article, “Education, History of, page 989, Volume 7, Chalotais revived the Greek idea of state control of education, criticizing education by the Jesuits:

“I venture to claim for the nation an education which depends only on the state, because it is essentially a matter for the state....”

The Encyclopedia article claimed that Chalotais’ essay was very influential. Napoleon began state-centralized education by founding in 1808 the so-called Universite de France which was more a state department of education than a university. In doing so, however, Napoleon concerned himself very little with primary schools.

See the history given later on the progression in the nineteenth century and early twentieth century of state control of French education. The intense movement for state control of education in modern times originated with Chalotais in 1763. The Prussian state regulation, mentioned earlier, endorsing the principle of mandatory school attendance, which came out in that same year of 1763, was not the same thing, because the Prussian regulation apparently did not rule out the legitimacy of private schools. Chalotais’ proposal was refined by Condorcet in 1792, although Napoleon was apparently the first to make any meaningful, long-lasting change. The shocking success of Chalotais’ proposal in France in the early twentieth century, at which time church schools were legally suppressed once again and government schools were exalted, is discussed later.

1763

1763

Navarre (the R. P.) Of Christian Doctrine, Etc. Discourse which Carried Off the Prize, by the Judgment of the Academy of the Jeux Floraux, in the year 1763, on these words: “What Would Be, in France, the Most Advantageous Plan of Studies?”

1768

Abbe de Radonvilliers, Academie Francaise - On the Manner of Teaching Languages [De la maniere d'apprendre les langues], Paris.

[Ed.: Not listed in “Bibliographie,” but in “Lecture,” page 1541. That article’s author said he believed that de Radonvilliers was the first who had suggested beginning the teaching of reading with whole words, followed by Nicolas Adam. Radonvilliers had outlined his ideas in a few paragraphs, portions of which - or possibly all - were quoted in the article. It seems highly likely that de Radonvilliers conceived the idea of teaching sight words to hearing children from knowing of de l'Epee’s use of whole sight-words in teaching the deaf some time after 1760, and also of the 1744 Quadrille Code 3 method previously described.]

1768

[Ed.: This is further confirmation of the widespread existence of parish schools in France before 1768.]

1768

LeRoux, Master of Arts in the University of Paris - Journal of Education, Presented to the King. Amiens. (This journal, which was published in 1768, from July to December, suspended its publication and reappeared from 1776 to 1778.)

[Ed.: Note the journal has the same title as Boisjermain’s material described in the following 1787 entry for Nicolas Adam, as the 1816 French journal also listed later, and as the 1826 American journal first edited by William Russell.]

1769

Diderot - Plan of a University for the Government of Russia, Addressed to Catherine II.

1770

1770

Anonymous - Instructive and Curious Letters on Education.

1770

[Ed. The publication of the third edition of this work by 1770 also confirms the widespread and long-standing existence of parish schools in France.]

1770

Anonymous - “Treatise on Education, to Serve as a Supplement to Emile by J. J. Rousseau. Neuchatel, Societe Typographique. (This is a collection of many pieces on education taken from the Encyclopedie [of Diderot].)”

1774.

Filassier - Historical Dictionary of Education. Paris. (Many editions, the last in 1837.)

A 1784 copy of Filassier’s book is in the Department of Education library in Washington and is reviewed on page 25 of Fifteenth to Eighteenth Century Rare Books on Education, A Catalog of the Titles Held by the Educational Research Library, National Institute of Education, Washington, D. C.: 1976. It is described as “Stories and anecdotes from history, illustrating qualities for a good life.” It is not, therefore, a history of education. However, as shown, the book by Cherrier on his new reading method in 1755 was preceded with a history of reading methods, and such a history of reading methods is almost unheard of today. Because of Cherrier’s history, and very possibly other such histories in French, when Neufchateau modeled his reading method in 1798, he was able to do it by contrasting it with reading methods that had been considered before 1798.

1774

L’Epee, l’Abbe de - Institution for Deaf Mutes. Training.
1774

1774

Anonymous - Plan of Studies and of Education, with a Discourse on Education. Paris. [The phrase, “Plan of Studies” or “Plan d’etudes,” appeared fairly frequently in the post-1760 period in this French bibliography. Note later the use of the word, “plan,” which is used in both English and French, in the post-1826 period in America by both sight-word promoters, Angell and Russell, concerning their sight-word reading methods.]

1774

1777

Alexandre, Professor Emeritus from the Ecole Militaire [Ed.: not in Bibliographie, but listed on page 1540 in article, “Lecture”] - Revision of Bertaud’s 1744 Quadrille des Enfants. [See also de Vallange in 1719, Anonymous in 1751, Michelle in 1779, and Daubanton in 1810, who wrote Lecture Par Echo. See Madame de Genlis, under 1801, who reportedly used the approach, for a further discussion of the method.]

1778

Luneau de Boisjermain

[Ed.: Not listed in “Bibliographie” but in article, “Lecture” which said that in 1778 and 1795 Boisjermain had revised the 1759 work of Viard, listed above. Viard’s work had also dropped the spelling of syllables, as was done by Cherrier in 1755. The article said that Viard’s work:]

“...which had numerous editions, was revised in 1778 by Luneau de Boisjermain, and reprinted again in l’An VI. Francois de Neufchateau said ‘that it had served usefully for more than 20,000 private instructions.’ It did not offer anything original: it is an abecedaire with a number of tables of syllables and of words. The name given to the letters is that of the grammar of Port Royal; the syllables must be joined without the child spelling: it is not necessary for him to say be-a ba, but all at once ba.’ (‘Il ne faut pas lui faire dire be-a ba, mais tout d’un coup ba.’)”

[Ed.: Boisjermain was at least the third in dropping the spelling of syllables: Cherrier in 1755, Viard in 1759, and Boisjermain in 1778, although Delaunay had said as early as 1719 that some recommended the dropping of spelling. The monitorial school founder, Andrew Bell of Great Britain, later dropped the spelling of syllables, although only for words of two syllables or more, but his doing so was clearly not an innovation. Quotations from the article, “Lecture,” concerning Cherrier, Viard, and Boisjermain are given later. For Boisjermain’s Journal of Education concerning the teaching of other languages, refer to the 1787 entry which follows for Nicolas Adam.]
1779

1779

Desloges, P., Bookbinder - Observations of a Deaf-Mute on "Elementary Course of Education for Deaf-Mutes" by the Abbe Deschamps. Amsterdam and Paris. [Ed.: This suggests organized opposition to Deschamps' "sound" approach for teaching the deaf, since the material was published in both Amsterdam and Paris. The Abbe de l'Epee with his "meaning" method was located in Paris, and it is highly likely that the deaf-mute credited with writing this apparent 1779 rebuttal of Deschamps 1779 work was one of de l'Epee's pupils. That fact is further suggested because the apparently literate author is referred to as a deaf-mute, while Deschamps' graduated pupils were no longer mute, but only deaf. While de l'Epee later attempted to teach speech after having first taught sign language and sight-word reading, he did not initially do so. Nor did his successor, Sicard, attempt to teach oral speech until long after he took over from de l'Epee in 1790.]

1779

Miremont, Madame the Countess of - Treatise on the Education of Women, and Complete Course of Instruction, Paris.

1779

Thelis, the Count of - Plan of National Education in Favor of Poor Country Children. [Ed.: Note the activist buzz-words by 1779: "plan" and "national," which recurred with increasing frequency after this date. Both words had been used in 1763 by Louis Rene de Caradeuc de la Chalotais in his enormously influential Essay on National Education, or Plan of Studies for Youth. Yet "poor country children" in France at that time were very frequently being taught to read by the local parish priests' bell-ringers/schoolmasters, as is indicated by the previous entries on teachers' guides for such parish priests dating from 1649, 1654 and later.]

1779

Michel, Paris - Methodical Plan of the First Principles of French Reading [From article, "Lecture," page 1540-1541 - An elaborate version of Bertaud's Quadrille, 1744, using wall charts and individual cards for the child's use. The method had originated with Vallange in 1719, was further revised by Anonymous in 1751, by Alexandre in 1777, and Daubanton in 1810, who wrote Lecture Par Echo. See Madame de Genlis, under 1801, who reportedly used the approach, for a further discussion of the method.]

1780

Deschamps, l'Abbe - Letter to M. de Bellisle, to Serve as a Response to the Observations of a Deaf-mute on the Elementary Course of Education for Deaf-Mutes Published in 1779. Followed by Many Letters to the Author. [Ed.: It is obvious that the 1779 work in opposition to Deschamps which was listed above must have been very influential, or Deschamps would hardly have written another work specifically to contradict his critic.]
1781

1781

Goyon D’Arsac, de - Memorandum on the Best Plan of Education for the People (Crowned by the Academy of Chalons-sur-Marne) (Reprinted in 1783 at Chalons under the title of Essay of Laopedie.)

[Ed.: Note not only the buzz-words, “Plan of Education,” but the all-inclusive word, “the People,” suggesting not only “national” education but the leveling of all class distinctions. Desirable as it is to remove odious class distinctions, the record of the French Revolution on that topic was unspeakably hideous. Only ten years after this work was published, that kind of “leveling” had become the hallmark of the French Revolution. Note also the wide support by 1781 for the ideas in the phrase, “Plan of Education for the People,” since the work was “Crowned by the Academy of Chalons-sur-Marne,” and then reprinted in 1783.]

1781

Vaureal, the Count of, Senior Officer of the Royal Corps of Engineers - Plan or Essay of General or National Education, or the Best Education to Give to Men of All Nations. Bouillon. (Asked for a reform in teaching, especially in that which concerned grammar, Latin, “la scholastique;” wished that one followed natural theology [“veut qu’on suive la theologie naturelle”]). [Ed.: By dropping the study of Latin for most literate people, culture was being largely cut loose from primary sources on the history of Europe before about 1500.]

1784

Lesbroussard, Jean-Baptiste - Memorandum on This Question: What Are the Means of Perfecting Education in France?

Gosselin, P.-Ch.-Rob. - Plan of Education, in Response to the Academies of Marseille and of Chalons of Which One Proposed for the Subject of the Prize, “What Is the Plan of Public Education the Most Conformed to the Situation of the Mercantile and Maritime City?”, the Other: “What Are the Actual Vices of Education and the Means of Correcting Them?” Amsterdam....

Adam, Nicolas [1716-1792] - The True Manner of Teaching Any Language Whatever, Living or Dead, by the Means of the French Language.

According to the article, “Lecture,” page 1541 of the Dictionnaire, Adam’s book contained some pages entitled, “New Manner of Teaching Reading to Children Without Speaking to Them of Letters and of Syllables,” from which pages the article quoted extensively. The quotations demonstrated that Adam had outlined at length the pure sight-word, Code I, method for teaching beginning reading, and did so far more completely than was suggested by the Abbe de Radonvillier in 1768. It is astonishing that Adam’s basic 1787 work is no where to be found in our reading experts’ literature, nor is any reference ever made to the Abbe de Radonvillier’s brief 1768 comments.

The author of the article, “Lecture,” had an acid comment to make concerning the famous Jacotot and his “new” method in the early 1820’s for teaching beginning reading, by using the text of Fenelon’s Telemaque and reading it sentence by sentence. Although Jacotot began the teaching of reading with whole words, he immediately analyzed them phonically, which Radonvillier and Adam had not. Nevertheless, like them, Jacotot did begin with the whole word. The “Lecture” author therefore said, “The process that Jacotot announced with so much pomp as a marvelous invention was simply that which had been proposed in the preceding century by the Abbe de Radonvillier and Nicolas Adam: it was the analytic step substituted for the synthetic step.”

What appears to have been Jacotot’s direct source for his idea of using the “whole” in teaching both beginning reading and other languages was the Journal of Education, published by Pierre Joseph Francois Luneau de Boisjermairn. On page 483 of the biography on Boisjermain in J. F. Michaud’s Biographie Universelle, republished in 1969 by Akademische Druck- u. Verlagsanstalt, Graz, Austria, the journal is described as a series of “cahiers” or notebooks. They ultimately formed three textbooks for learning Italian, English or Latin and they were composed of interlinear translations of well known works. The textbook containing the English material was composed of interlinear translations of Milton’s Paradise Lost and Fenelon’s Telemaque. The article credited as the sources for the interlinear translation method “Dumarsais” and the “judicious principles posed by Radonvilliers in his Maniere d’apprendre les langues (Manner of Learning Languages).” Boisjermain’s biography then stated that Boisjermain’s language materials “had much success in their novelty.” Jacotot’s recommending the use of a French copy of Fenelon’s Telemaque to his Dutch students, and asking them to make what amounted to their own interlinear translations, appears to have been an approach taken directly from Boisjermain, who had also used Telemaque. (It also saved Jacotot from the drudgery of making a Dutch translation himself for his
students! As Boisjermain’s biography noted, Boisjermain’s materials had “much success” so Jacotot, who was a young college teacher in France in the 1790’s, almost certainly would have known of them.

However, crediting “Dumarsais” and Radonvilliers as the source for the idea of interlinear translations in learning languages is clearly in error. Comenius used the idea in his famous Orbis Pictus in the seventeenth century, and is on record crediting William Bathe, S. J., (1564-1614) in the sixteenth century as his source. Yet Bathe used as his source a method used in Ireland in the sixteenth century. Bathe’s work is discussed fully in Sean P. O’Mathuna’s William Bathe, S. J., 1564-1614, A Pioneer in Linguistics, 1986, John Benjamin’s, Philadelphia and Amsterdam. The probability is that the method of learning languages by studying syntax (whole sentences) instead of isolated words had been used in Ireland for many centuries. It is a more successful method than the learning of word lists and possibly matches brain structure better. In speech, syntax appears to generate words, instead of the other way around. The reason for the use of syntax to learn written Latin in Ireland before about 800 may have been the fact that texts at that time were not divided into words but were run together. The student was taught to divide such texts initially into syllables. As a result, his flow in reading (or in learning a written language) would mimic the natural flow in speech: syllables would generate syntax, which would finally generate words.

Like Radonvilliers and Boisjermain, Nicolas Adam was also concerned with other languages, and most probably his “True Manner of Teaching Any Language Whatever, Living or Dead, by the Means of the French Language” was the interlinear approach that had been used by Radonvilliers in 1768. Nicolas Adam also used the Code 1 approach for teaching beginning reading recommended by Radonvilliers in 1768. Adams’ 1787 work, therefore, appears to have been only an elaboration of Radonvillier’s 1768 work. It is of interest that all three authors of methods for learning other languages, Radonvilliers, Adam and Boisjermain, also concerned themselves with methods for teaching beginning reading, though Boisjermain did not use a Code 1 method. Concerning Boisjermain’s reading method in his 1778 and 1795 revisions of Viard’s 1759 material, see the 1778 entry.

1788

Bourdon de la Crosniere, Leonard - Plan of an establishment of national education. Orleans.

1789

Sicard, l’Abbe - Memorandum on the Art of Instructing Deaf-mutes from Birth (Memoire sur l’art d’instruire les sourds et muets de naissance). Bordeaux. [Ed.: Sicard had headed the school in Bordeaux in 1789, just before he was chosen to head the Paris school, over the head of de l’Epee’s former Paris assistant. The hostility of the Paris Commune to Sicard in 1792, despite his approval by the Assembly, which hostility nearly resulted in Sicard’s execution in 1792, conceivably may have had its source in that fact.]

1789

Verlac, Lawyer and Professor of the English Language at the Royal Marine School at Vannes - New Plan of Education for All Classes of Citizens, with a Treatise on Liberty in General, on Civil Liberty, and on the Principles of Government; The Work Extracted from an English Author and Which, in France, Can Serve as a National Catechism. Vannes. (Caustic criticism on Education Before 1789. Asked for instruction of all, teaching of living languages, the study of French, of history, of geography, of religion; a normal school, a school of commerce. [Ed.: It would be of interest to find who the English author was.]
There were ten entries in the Dictionnaire’s “Bibliographie” of education for 1789, the year the French Revolution began, slightly more than previous years, including the above and two by Sicard on teaching deaf-mutes. Of the remaining seven, three used the phrase, “plan d’éducation nationale,” and one used “plan of education and of public instruction, dedicated to the National Assembly.” Of the remaining three, one read “project of education for all the realm, preceded by some reflections on the National Assembly,” which joined, in meaning, the words “plan d’éducation nationale.” Of the remaining two, The Art of Forming a Man was written by the Abbe de Vaniere and another, by Anonymous, was Letters on Education, Paris, of 24 pages, which sounded like an argumentative pamphlet. Therefore, the push for “national education” was overwhelming in France by 1789. In 1790 the entries increased to 12, sharply more than pre-Revolution years, and the nature of some of these entries is revealing:

1790

1790

Extract of Deliberations of the General Assembly of the Section of Luxembourg, of December 15, 1790. Paris. Asks that the municipal body of Paris design in each section a building where all citizens would be admitted to receive free instruction, and where would be explained to them the principles of morality and of the constitution.

1790

Paris, de l’Oratoire, Member of many academies and literary societies. Project of National Education. Paris. (32 p.) (Compulsory Education, Free for All Paupers at All Degrees of Instruction. 40 pupils to a school; three degrees of instruction; Salary of 1600 livres for the teachers; tax on the celibate.)

[Ed. Note the implicit persecution of members of the “celibate” teaching orders like the Christian Brothers, which persecution would be operative even after the teaching orders had been outlawed.]

1791

Extract from the Minutes of the General Assembly of the Section of Palais-Royal, of May 30, 1791, Concerning the Instruction of the People. Paris. (Against Congregationist Teaching) [Ed.: That meant against teaching by religious orders such as the Christian Brothers.]

1791

Gossin, Deputy from Bar-le-Duc - Motion made to the Constituent Assembly on the Necessity of Establishing National Schools. Paris, Imprimerie Nationale. 8 pages. (The principal object of education will be the principles of the new Constitution, the rights and the duties of men, exercises of the body, living languages preferred to dead languages.) [Ed. Note the reference to “exercises of the body,” an early endorsement of physical education or gym classes. It represented, of course, the Greek tradition and would have met with Plato’s approval.]
M. D., chevalier de Saint-Louis - Call to Public Opinion on National Education. Paris. 16 pages. Free education, election of the teacher by the people, prayer replaced by a hymn to the fatherland. In the morning, teaching of children; in the afternoon, teaching of adults.

[Ed.: in French “National Education,” the author wanted prayer to be “replaced by a hymn to the fatherland.” Hitler (and probably Hegel) would have loved that.]

The “Bibliographie” on education is obviously only a partial selection. Even in the Dictionnaire itself, it is possible to see that many surviving books on reading were omitted from this “Bibliographie” since many appear elsewhere in the article, “Lecture” which are not to be found in the “Bibliographie.” However, taking the “Bibliographie” entries as a chance selection, which they obviously are, and even allowing for the fact that great numbers of books published in those years on education are almost certainly totally omitted, the relative size of each year’s entries in the “Bibliographie” does tell something about relative activity on education in France in that year. Therefore, no doubt can exist after seeing the relative size of these “Bibliographie” entries that the very worst years of the French Revolution were also overwhelmingly the most active years concerning educational theorizing and research.

We should remember that fact, when considering the great “push” going on today by the federal government promoting “America 2000” and national achievement tests. Never in the history of the Western World, except during the French Revolution, has there been as much propaganda as there is today for educational control from the top by the national government. As in the French Revolution, the flood of material is published by government-owned printing presses, at taxpayer expense. Those in opposition (such as this writer) must use their own limited funds and their own limited resources to refute the tax-supported flood of material promoting a centralized “control” of culture.

Ideas fostered in the French Revolution assemblies later spread throughout the Western World, possibly in large part because the assembly also had its own printing press. So many of these Revolutionary entries were followed by a little dagger, indicating that they were officially printed papers. Therefore, the enormous emphasis given to educational theorizing during the French Revolution can be judged solely from the size of the yearly entries, although not all of them, of course were printed by the official press.

In the 20 years before 1789, yearly entries in the “Bibliographie” had varied from about two to about eight, and in 1789 had reached ten. The only previous year in the bibliography with more than ten entries was 1762, when Rousseau’s Emile caused such a stir that the entries swelled to fifteen. The stir continued in the following year, 1763, when the entries reached ten, which figure was not equaled again until 1789, the first year of the Revolution. In 1790, the second year of the French Revolution, the entries totaled 12. However, in 1791, the entries exploded to a total of 33. These 33 1791 entries, with notes, occupied a little more than a page in the “Bibliographie” of books on education. The numerous entries for the next year, 1792, covered about 3/4 of a page, and the 1793 entries, by which time France was in a massive civil ferment, covered an incredible two full pages! Entries for the following year, 1794, occupied more than a page, and 1795 entries occupied almost a page. The entries dropped off starting in 1796, when they covered only 3/8 of a page, and in the years after that until about 1816 the yearly entries varied from between less than 1/8 to more than 1/4 of a page. There was a slight increase in 1816 and 1818, but a note appeared on 1818 indicating that the relative size of the entries for books could no longer be an adequate barometer of educational activism:
“N. B. At this year and in the following [appear] numerous brochures for and against education.”

Change-agent activism had increased again starting about 1815 when the Lancaster monitoryal school approach was imported into France from Great Britain, with the support of influential men. The “Bibliographie” of books on education later also dutifully showed other British entries: one by the socialist/atheist Robert Owen who was promoting infant schools, and one by Lord Brougham who was promoting government schools. Therefore, the lines of communication on educational ideas were obviously wide open between France and the English-speaking world in those years. However, in the years of the French Revolution, the intellectual currents were apparently largely running the other way. Instead of ideas from the English-speaking world being imported, ideas from the French-speaking world were being exported. Those ideas concerned “national” education (the shaping of children’s minds by the state), compulsory education, government normal schools (the shaping of the minds of the children’s teachers by the state) - and, obviously, beginning reading instruction. The Revolutionists’ big ideas were largely mere talk in France during the disordered Revolutionary period, except for the government normal school. However, the educational ideas from Revolutionary France were published and so lived on as a perverse influence on education throughout the whole Western World right up to the present day.

The legislators of the French Revolution gathered together and studied all the reading methods promoted in the earlier part of the century, so that accumulated knowledge was ready and waiting for action in later years. It might be said that new and different reading methods which concentrated on “meaning” as well as on “sound” were conceived in eighteenth-century France, were gestated in the French Revolution, and were ready to be sent out into the world by the beginning of the nineteenth century, in the very same “Revolutionary” package that promoted government schools.

After all, the beginning of the nineteenth century is exactly when the shift from “sound” to “meaning” in the teaching of reading first becomes apparent in English-language sources, as with Richard Edgeworth’s 1798 recommendation in the book he wrote jointly with his daughter, Maria, Practical Education, that the ancient syllable method be dropped and be replaced by the study of letter sounds in whole words. This was not necessarily a bad thing, of course, but was a pronounced shift to “meaning.” However, this was also shortly before the time that Edgeworth is known to have been working hard to promote government or national schools in Ireland, as shown by 1806 correspondence quoted by Andrew Bell, referred to in Part 5. Therefore, Edgeworth’s activities demonstrate the twin packaging of government schools and “meaning” instruction for beginning reading (with some kind of analytic phonics, but how much is unknown). When Edgeworth promoted the teaching of beginning reading by “whole words” (with an addition of an unknown amount of analytic phonics), he was jettisoning the almost three-thousand-year-old “ABC syllable” method.

By 1792, the French Revolution had degenerated into a bloodbath. Against that hideous background, therefore, it is startling to read the educational proposals which follow in that year:

1792

Order of 22 Frimaire An I (12 Dec. 1792) on the organization of primary schools.

1792

Leclerc, Deputy from Maine-et-Loire, Discourse on Obligatory Public Instruction. [Ed.: “Obligatory Public Instruction” was being discussed in the bloody year of 1792!]
Maudru - Letter to the Committee of Public Instruction, or Reasoned Exposition of the New System of Reading Applicable to All Languages. Paris. 56 pages. [Ed. Nothing further has surfaced on this. It is very possibly an extension of Nicolas Adams’ 1787 work, The True Manner of Learning Any Language Whatever (La Vraie Maniere d’Apprendre Une Langue Quelconaque), in which Adams had a section concerning learning to read initially by pure sight words, or Code l.]

1792

Condorcet - Report and proposed law on the general organization of public instruction presented to the National Legislative Assembly, April 20 and 21, 1792.

1792

Codet (Silvain) Deputy of Ille-et-Villaine. - Considered Opinion on the general plan of organization and of public instruction presented by M. Condorcet, and proposed law for promptly organizing all the primary schools of the French Empire. Imprimerie nationale. 36 p. (Against the plan of Condorcet.)

Condorcet’s work described in the above last two entries is of the highest importance in considering the history of government schools. It is worthwhile at this point to discuss its long-term impact on education in France, though it apparently did not directly concern the teaching of beginning reading. However, Condorcet’s disciple, du Pont de Nemours, did affect the teaching of beginning reading.

The ideas of Marie Jean Antoine Nicolas de Caritat, Marquis de Condorcet (1743-1794), economist, mathematician, philosopher and revolutionary, were a source of inspiration for nineteenth and twentieth century French and Prussian government schools. F. Buisson, an admirer of Condorcet, wrote the following in L’Annee Pedagogique, 1913, on the occasion of the Prussian anniversary of school reform in 1813. Buisson commented, “But Fichte himself was inspired by Condorcet. And in another language... he appropriated the (ideals) of the French Revolution....” Yet Condorcet’s influence was not limited to early nineteenth century Prussia and France. Condorcet’s ideas on government schools have influenced education from the time of the French Revolution to the present day.

Pierre Samuel du Pont de Nemours (1739-1817) was an economist who was a follower of Condorcet’s economic theories, according to the Encyclopedia Britannica. Volume 7, pages 769-770. Like Condorcet, (and Buisson), du Pont also rejected Christianity. An article in the Catholic Encyclopedia (1913) Volume XIII, page 16, stated:

“Another religious venture of this period was that of the Theophilanthropists, who wished to create a spiritualist church without dogmas, miracles, priesthood or sacraments, a sort of vague religiosity, similar to the ‘ethical societies of the United States.’ ...It was the private initiative of a former Girondin, the librarian Chemin Dupontes, which gave rise to this cult; Valentine Hauy, instructor of the blind and former Terrorist, and the physiocrat, du Pont de Nemours, collaborated with him.”

Both du Pont and Condorcet were very active in the French Revolution’s Assembly. Du Pont was also probably a disciple of Condorcet’s theories on public education which Condorcet presented to the
Revolutionary Assembly. Du Pont most probably incorporated many of Condorcet’s ideas into the government education plan he later presented to Jefferson after Napoleon had come into power.

The Encyclopedia Britannica (1963) article on Condorcet said that he was one of the workers on the famous Encyclopedie and that his wife conducted one of the most famous “salons” of the time (intellectual social gatherings). However, although Condorcet wrote the declaration on suspending Louis XIV, he voted against actually executing the king. As a result of that unpopular vote, he was eventually imprisoned in 1794 and was found dead two days later, but whether he was poisoned or not is not known. His book, Esquisse, published in 1795, opposed all religions, in particular Christianity. The Encyclopedia Britannica said that it was:

“Pervaded by a spirit of excessive hopefulness ...Condorcet’s ethical position gives emphasis to the sympathetic impulses and social feelings and had considerable influence upon Auguste Comte.”

A note in the “Bibliographie,” mentioned earlier, under 1793, said that the assembly had analyzed in detail the plans of Talleyrand and Condorcet and then proposed its own hierarchical organization, with inspection of schools, and a director general of studies at the head of all public instruction. The theory of governmental control of all education from the top down was therefore being clearly worked out in 1793, actually during the Reign of Terror! It is the same top-down control we are threatened with in America today, over two hundred years later, but to be exercised here through government-ordered, and change-agent-written “tests” and “America 2000.”

After Napoleon’s take-over in 1799, concern for primary education sharply diminished. However, it was under Napoleon that educational control finally passed totally to the state, since a system was set up so that only the state “university” (a bureaucratic body, and not a real university) could grant credentials “certifying” that a student had satisfactorily completed whatever studies he had undertaken. Such certification was based on government-constructed “tests,” just as we are faced with today.

However, private primary education was finally authorized again in France by a law of 1833, but it was not until the Loi Falloux of 1850, which was passed over the opposition of Victor Hugo, that private education was again fully authorized at the secondary level. (“Establishment” darlings like Victor Hugo often pop up in history unexpectedly, doing unpleasant things like opposing educational freedom.)

The article, “Falloux,” page 772, Volume V, Catholic Encyclopedia of 1913, states:

“Minister of Education from December, 1848, until 31 October, 1849, de Falloux immediately determined to push vigorously against the educational monopoly of the university.... in June, 1849... he strongly advocated the passage of a law establishing liberty of education.... In two years’ time 257 free schools sprang up, and it is from this law, the last remnants of which the French Parliament is now (1908) preparing to abrogate, that dates the development of the Catholic teaching orders in France....”

The university monopoly on higher education was abolished by the law of July 12, 1875 (“France,” page 183, Volume VI, Catholic Encyclopedia - 1913). Yet by 1882, education at the primary level was adversely affected once again by the Ferry laws. Finally, after the beginning of the twentieth century, religious orders were once more outlawed by the government and church property was seized, just as had been done during the French Revolution. All private education by religious at all levels which the orders had been carrying out was effectively destroyed.
Condorcet’s ideas on government control of education were still being lauded in the twentieth century by Ferdinand Edouard Buisson (1841-1932). F. Buisson was Inspector General of Primary Instruction in France in 1887, according to the title page of the volume 1er Partie, Tome Premier, of the Dictionnaire de Pedagogie et d’Instruction Primaire published in that year, on which Buisson was editor. Presumably Buisson also was Inspector General of Primary Instruction when the other Dictionnaire volumes of which he was editor were published between 1880 and 1888.

Gabriel Compayre was in great good favor with American education “experts” at the turn of the century, as shown by the fact that he was one of the contributors to the Cyclopedia of Education (1913) which was edited by Paul Monroe of Columbia University. Yet Compayre was given to wild historical distortions in his general writings. He was attacked because of them by Brother Azarius (P. J. Mullany) in Essays Educational, D. H. McBride & Co., Chicago: 1896, in the chapter, “M. Gabriel Compayre as an Historian of Pedagogy.” Compayre therefore was a very fallible French authority on higher education, accepted by American “experts,” about the same time that Buisson was accepted by them as a French authority on primary education. Commenting on the influence of these two men, Brother Azarius said on page 280:

“Will the Buissons and the Compayres continue to write our histories, and formulate our theories of pedagogy? Children of the Revolution, they find all excellence, all modern progress, all educational reform growing out of that terrible upheaval. Inimical to the Church, they can see nothing good come out of Nazareth.”

Buisson had been influential on French education for years, having also attended the 1876 Philadelphia Exposition and the Vienna world’s fair in 1873 as a French representative. Buisson was also a Member of the Chamber of Deputies, apparently in the same early years of the twentieth century when teaching by religious groups was outlawed in France. He made a report to the 8th Legislative Session of the Chamber of Deputies in France, No. 1509, 16 pages, Annex to the Supplementary Report, “Report Made... Relative to the Suppression of Congregationist Teaching,” Paris, 1904. Although the nature of his comments are unknown, at least Buisson was certainly in the middle of things when religious teaching was again being suppressed for the first time since the French Revolution.

Besides writing approvingly of Condorcet’s education plans, Buisson also lauded Jules Ferry, who worked so hard in France to secularize education in the nineteenth century, resulting in the infamous 1882 Ferry laws. From Buisson’s comments in his later writings, it is apparent that Buisson had ideas on the nature of things which place him firmly in the camp of the anti-ecclesiastical members of the French Revolution like Cordorcet, as Brother Azarius clearly recognized in 1896. F. Buisson was active for many years in the Union of Free Thinkers and Free Believers for Moral Culture. At Buisson’s death, the periodical, Revue de Metaphysique et de Morale, Annee 39, 1932, commented on him:

“...he remained always the ‘militant, the propagandist par excellence. ... after the war [World War I]... the secular idea, the socialist idea, the pacifist idea... found in Ferdinand Buisson the most convinced of patrons....”

In 1919, World Book Company, Yonkers, New York, who also published some of Edward L. Thorndike’s work and Nila Banton Smith’s, published French Educational Ideals of Today, An Anthology of the Molders of French Educational Thought of the Present, “Edited by Ferdinand Buisson, Formerly Director of Primary Education in France and Member of the Chamber of Deputies” and Frederic Ernest Farrington of Columbia University and Chevy Chase School, Washington. At the beginning of this book which is composed of earlier articles, on page 4, this remarkably hysterical material appeared. (The comments may or may not have been Buisson’s.)
“Do you wish to free lay teaching? Dare affirm what three centuries have affirmed before you, that it is sufficient unto itself, that it exists of itself, that it itself is belief and science.

“How has modern science been constituted? By breaking away from the science of the Church. The civil law? By breaking away from canon law. The political constitution? By breaking away from the religion of the State. All the elements of modern society have developed by emancipating themselves from the Church. The most important of all - education - remains to be emancipated. By a conclusion deduced from all that precedes, is it not clear that we can regulate it only on condition that it be completely separated from ecclesiastical education?”

It is easy to see the French Revolution’s and Condorcet’s hatred of religion peeping out from behind that flood of immoderate speech in that World Book Company text of which Buisson had been one of the two editors. That book also contained material starting on page 5 written by Jules Ferry (1832-1893). The preface to the Ferry material described Ferry as Mayor of Paris during the siege of 1870-71, a member of the National Assembly, then of the Chamber of Deputies, and from 1879 to 1885 Minister of Public Instruction several times. The preface read:

“Deriving his inspiration from Condorcet’s ‘Plan of Education’ and from the ideas of Edgar Quinet, he brought about the enactment of the school laws which have been justly named the Ferry laws.’ These laws provide for compulsory, free, elementary education to be given by laymen, for the secondary instruction of girls, for professional schools and normal schools. They instituted the ‘Higher Council of Public Instruction’ and laid the foundation of the system of national education which has been gradually realized by the Third Republic.”

The date of the promulgation of the Ferry laws was March 28, 1882. As the foregoing indicates, Condorcet had been, indeed, enormously influential.

On page 42 of Buisson’s 1919 text was an article on Felix Pecaut (1828-1898), extracted from Buisson’s lecture delivered at the University of Geneva in April, 1900. The article’s preface said that Pecaut was “in his youth a Protestant minister,” and became one of the founders of the movement known as “liberal Protestantism.” Buisson was also called a “liberal Protestant.” If Buisson’s writings on religion are typical of that group’s views, then the group certainly would not be considered Christian by any Protestants that I know! Pecaut, probably more accurately described as a FORMER Protestant Christian, was chosen by Jules Ferry to organize the higher primary normal school for women at Fontenay-aux-Roses, which he directed until just before his death.

“For fifteen years he furnished the inspiration for a type of moral education whose originality consisted in uniting deep religious feeling with the complete independence of mind characteristic of the lay spirit. It is at Fontenay, the ‘Port-Royal of the Third Republic,’ that the teachers and principals of normal schools for women are trained. Without question Pecaut has had the most far-reaching influence over the primary education of women in contemporary France.”

Buisson began his 1900 lecture remarks on Pecaut:

“You all know what an effort we have been making in France for the past quarter of a century to organize a system of national education after the type outlined by the men of the French Revolution. The name of Jules Ferry suffices to personify for you this great political movement. [Ed.: Note the interesting 1900 identification of “education” with a “political movement!”] The public school that has become a lay school - lay in program, lay in personnel, lay in the spirit that animates it - such is the end that the laws of the Third Republic have permitted us to attain after long years of violent struggle.”
On page 321 of Buisson’s 1919 book was an address by Professor Paul Painleve (1863 - ) before the International Educational Conference at the Sorbonne, May 21, 1916:

“Forty-five years ago, just after our defeat, Jean Mace... gave his entire attention to the Educational League (Ligue de l’Enseignement). Our assembly here today is due to the initiative of this organization.... The program of the League, at that time daring, now commonplace, may be summed up in the phrases: compulsory education, free education, secular education; compulsory, because the child’s interests demand that he should not be kept in ignorance on account of the ignorance of his parents; free, for it is adding penury to poverty to deprive a child of all education because those who are bringing him up cannot pay for it; secular, because the State in carrying out its duties as teacher has no right to force any particular religious belief upon its children.”

“You are aware, gentlemen, what a storm of criticism this program has raised. You have not forgotten the anxiety and the distrust shown only too readily with regard to the educational work of the Republic, even during the months directly preceding the war....”

So Painleve even admitted there had been “a storm of criticism” to the government’s education program. He actually admitted that the change-agents in France had nevertheless ridden rough-shod over the rights of all those who opposed them and by 1916 had forcibly taken over the education of their opponents’ children.

Note that the last point Painleve made, “the State... carrying out its duties as teacher” is based on the enormously false assumption that it is the state that actually has the duty of “teacher,” instead of a child’s parents! So the pernicious theories in 1792 of the violently anti-Christian Condorcet had lived on to become the very foundation for French education before 1916!

The following appeared concerning the 1882 Ferry laws in the article, “France,” under the sub-heading, “The Laicization of Primary Instruction,” in the Catholic Encyclopedia (1913), Volume VI, page 181:

“...in the public schools dependent on the municipality of Paris, the antispiritualist tendency became so violent that, after 1882, the new editions of certain school books expunged, even where they occurred in selected specimens of literature, the words God, Providence, Creator.... In 1894, M. Devinat, afterwards director of the normal school of the department of the Seine, wrote: ‘It may be affirmed without any exaggeration that, since 1882, the lay public school has been very nearly the Godless school.’“

Such government invasions of parental liberty concerning textbooks extended over many years. The following appeared on page 182 of the same article about actions in 1909, the year the article was written:

“Bills introduced... impose heavy penalties on fathers whose children refuse to make use of the irreligious books given them by their teachers, and render it impossible for parents to prosecute teachers whose immoral and irreligious instruction may give them reason for complaint....”

It is apparent from the article, “France,” in the Catholic Encyclopedia (1913), pages 182-183, Volume VI, that some religious brothers and nuns had still taught in the government schools after the 1882 Ferry laws which forbid any mention of religion and which forbid priests to enter government schools.
However, the presence of such religious teachers in the public schools was finally outlawed, at least theoretically but not in fact, in 1886. The encyclopedia article stated:

“Laicization of the Teaching Staff - The Law of 30 October, 1886... called for the laicization of the teaching staff in the public schools. In the schools for boys this laicization has been an accomplished fact since 1891, since which date no Brother of the Christian Schools has acted either as principal or as teacher in public primary instruction. The difficulty of forming a body of female lay teachers impeded the process of laicizing the public schools for girls; but this, too, has been complete since 1906, except in some few communes, where it is to be effected before the year 1913.”

Removing the teaching brothers and sisters, who apparently could be employed at low cost, from the state-supported public primary schools and then eventually forcing the closing of the private Catholic primary schools had an apparently catastrophic effect on education in France. Figures quoted later suggest that a third of poor children may have been denied primary education as a result of that anti-clerical legislation.

Concerning a much earlier period, the encyclopedia article discussed the 1833 revival of “Denominational Primary Instruction,” which meant non-public school facilities.

“At the beginning of the Consulate [Napoleon’s], Fourcroy, anti-religious as he was, alarmed, to use his own words, at the ‘almost total ineffectiveness of the primary schools’ (nullite presque totale), recommended it as a useful expedient, to confide a portion of the primary teaching to the clergy and to revive ‘the Institute of the Brothers, which had formerly been of the greatest service’. In 1805 the Brothers, having re-established a mother-house at Lyon, were solicited to furnish teachers in thirty-six towns. The Government of the First Empire authorized in ten years 880 communities or establishments of teaching sisters; the Restoration, less generous, authorized only 599, the Monarchy of July, only 389. Until 1833 these congregations could exercise their functions only in schools controlled by the State, for the University would allow no infringement of its monopoly. The magnificent tribute to the educational activity of the clergy which Guizot uttered during the debates on the Law of 1833 was endorsed by the law itself, which, partially suppressing the monopoly of the University, established the principle of free primary teaching....”

So private religious primary schools spread after 1833, although, obviously, brothers and nuns were often still employed by the government schools. Yet the free condition of the private primary schools only lasted about fifty years:

“The [Ferry] law of 28 March, 1882...[provided] that every teacher must hold a diploma (brevet) from one of the government jurys, or examining boards. The congreganistes... submitted to this formality. With this exception, the Law upheld the liberty of private teaching.... The masters and mistresses of private schools might give religious instruction in their schools... but the state authority... might prohibit the introduction and use of books judged contrary to morality, the Constitution, or the law... the establishment and support of these schools has fallen on Catholic charity exclusively. The communes can only give assistance to poor pupils in private schools as individuals.

“A first, very serious, attack on the principle of freedom of teaching was made by the Law of 7 July, 1904, which formally declared that ‘teaching of every grade and every kind is forbidden in France to the congregations’.... Every Brother, every religious woman, who wished to continue the work of teaching was forthwith compelled to be secularized... M. Combes immediately closed
14,404 out of 16,904 such schools, and it is decreed that in 1910 the last of the congreganiste schools shall have disappeared.

“From time to time the Ministry publishes lists of congreganiste schools which must be closed definitely by the end of the school year... The bishops are seeking to maintain primary Catholic education or to reorganize it with secularized or lay teachers... Already in twenty-four dioceses there are diocesan organizations for free teaching.... These measures have been imperatively demanded in order to repair the losses suffered by free primary education, the number of pupils having fallen, according to statistics compiled in 1907 by M. Keller, from 1,600,000

The Encyclopedia Britannica (1963), Volume 9, page 634, reported those infamous events as follows:

“...in 1901...religious congregations could be formed only with proper authorization and could be dissolved by decree. This measure was aimed specially at the Assumptionists and the Jesuits. Then Emile Combes, dignitary of Freemasonry, who succeeded Waldick-Roussau in 1902, suppressed nearly all the congregations and took away their right to run schools (1904).”

It is utterly incredible that a militantly anti-Catholic Freemason like Combes, clearly acknowledged as such by the Encyclopedia Britannica (1963) in the above excerpt, was elected in France in the twentieth century and was permitted to annihilate almost the entire Catholic school system of France!

Therefore, the religious persecution and attempted indoctrination of children which were hallmarks of the French Revolution and which were undoubtedly implicit in Condorcet’s government education plans were both alive and well in France in the early twentieth century. Those facts made early twentieth-century talk of French “liberty” not only hollow but ridiculous.

Excerpts from the “Bibliographie” of the Dictionnaire de Pedagogie et d’Instruction Primaire continue:

1793

1793

Opoix, Deputy of Seine-et-Marne, Opoix to his Colleagues, Paris. Insists on the introduction of religious education which did not figure in the project presented to the Convention by the Committee of Public Instruction. [Ed.: This is clear confirmation that the official planners of government education during the French Revolution, such as Condorcet, deliberately meant to exclude education in religion as early as 1793. This was in vivid contrast to the practice before 1760 when religion had been the dominant theme of education in the “petites ecoles.”]

1793

Arbogust, L. F. A., Deputy of Bas-Rhin. Report and Proposed Decree on the Composition of Primary Elementary Books. Paris. [Ed.: Note the French Revolutionary Government attempt as early as 1793 to censor schoolbooks, which means to censor what children are taught, by legally mandating “official” content. Such control of textbooks is now in place in America in Texas, California, and some other states. Besides the appalling invasion of intellectual freedom which such “adoptions” represent, and the fact that they are probable violations of the Bill of Rights which guarantees freedom of speech and of the press, official “adoptions” also provide a hot-house climate for potential graft. The textbook scandal in Texas under Governor “Ma” Ferguson, reported in a front-page article in the New York Times on December 4, 1925, certainly proves that.]

Masuyer. C. (L.), Deputy of Saone and Loire, Discourse on the Organization of Public Instruction and of National Education in France.

Lanthenas, F. Fundamental Basis of Public Instruction and of All Free Formation, or the Way to Tie Public Opinion, Morality, Education, Teaching, Instruction, the Feasts, the Propagation of Enlightenment and the Progress of All Knowledge to the National Republican Government. (Reissued year III, second augmented edition.) [Ed.: Note the wildly ambitious ideas concerning control from the top in 1793: “Big Brother” in earnest. Note the acceptance of those ideas, since the book was reissued in year III, or 1795, in an augmented edition. Note also that the hideous years of the Reign of Terror were under way by 1793, while the “National Republican Government” carrying out that Reign of Terror was simultaneously talking about its “Propagation of Enlightenment.”]

Massieu, deputy de l’Oise. Report and Proposed Decree on the Establishment of a School for Deaf-Mutes in the City of Bordeaux, Presented in the Name of the Committees of Help and of Public Instruction. [Ed. Note that the Committee of Public Instruction had reason to be very familiar by 1793 with methods of teaching the deaf to read, while it was at the same time reviewing all prior methods of teaching reading.]

In case anyone should have admiration for the promotion of government education by that “Convention,” the above entry shows that the Convention listened in 1793 to plans for “National Education” which came straight from the Jacobins and were read by Robespierre, of all people! The
materials had even been printed by the Society of Jacobins. This was a year of intense educational activity by the convention as a whole, as well as one of the worst years of the French Revolution’s blood-bath. That unspeakable blood-bath was, of course, associated closely with Robespierre and the Jacobins who were finally overthrown with the coup d’etat of 9 Thermidor (27 July, 1794).

Robespierre and his partisans were executed, and the Thermdorian reaction began. The Commune of Paris was suppressed, the Jacobin Club closed, and the Revolutionary tribunal disappeared. Le Peletier’s plan read by Robespierre in 1793 was to force parents to have their children all educated in exactly the same way, at state expense and totally under state control. The purpose was to promote “equality” and presumably “fraternity” although, of course, the plan simultaneously destroyed parental “liberty.”

1793

Inauguration of the Normal School of Paris (from “Ephemeredes,” page 889)

1793

Thiebault (Dieudonne) et Borely, Journal de l’instruction publique, Paris, 28 issues, 8 vol., published from 1793-1795

This periodical magazine on education, originally published in 1793 during the height of the Terror, continued until 1795. The periodical press, of which this magazine is an early member, is customarily given credit for being the promoter of liberty. Yet it can easily lend itself to propaganda, for good or evil, because its necessarily short entries permit no elaboration. More importantly, the periodical press controls the selection of topics, and only what news it sees fit to print ever gets printed, while no such control normally exists in the world of books. The periodical press as we know it has only been in existence since the change-agent eighteenth century, so perhaps it is not surprising that it is the eighteenth century which “invented” this vehicle that lends itself so readily to the influence of change-agents.

1793

By the fall of 1792, Joseph Lakanal (1762-1845) had joined the Convention. Lakanal’s work on education, like that of Condorcet, du Pont de Nemours, and Neufchateau, is of critical importance.

Concerning his background, Michaud’s Biographie Universelle (1854, Akademische Druck- u. Verlagsanstalt, Gaz, Austria, 1969) contains an eight and a half-page biography on Lakanal, far longer than most other entries. It was written by a man who knew Lakanal very well in Paris in the years just before Lakanal’s death in 1845. (Only the initials of the author were given: I. G. S. H.)
The article also quoted approvingly and at length from “l’Eloge de Lakanal” by Mignet, May, 1857, which indicates the entry was prepared after the Biographie Universelle began publication in 1854. A footnote on page 592 from Mignet’s speech lamented the fact that Lakanal was among those who voted the death penalty for Louis XVI, “a vote cruel and incompetent, which, by the royal murder, was bound to lead to other murders, and deliver the blood-stained revolution to anarchy and to despotism.”

With that ugly but early vote as an apparently established fact, it is therefore startling to see the praiseworthy picture of Lakanal which emerged, particularly from the author of the long excerpt, who was Lakanal’s personal friend when Lakanal was an old man. Lakanal had arrived at the Convention in the last half of 1792 as a 30-year old college teacher, and almost immediately was given great responsibility. For years, he worked enormously hard and capably in government positions to promote education and general culture.

In 1815 after the fall of Napoleon, Lakanal came to the United States as a refugee and Congress presented him with a large tract of land in Alabama as a token of its high regard. Lakanal remained in America until after the 1830 shift in power in France. When Lakanal returned to France in 1837, he was momentarily lionized, but then fell into semi-obscenity and poverty. His holdings in America, on which he had been depending for income, were “mishandled” there so he died a poor man, with his funeral attended only by twenty people, including the author of the article, who obviously was very fond of Lakanal, and Lakanal’s wife.

Lakanal’s history, despite the ugly entry on his vote for Louis XVI’s death, simply does not fit the profile of most movers-and-shakers, who usually profit handsomely from the net of influence of which they are a part. First of all, in the French Convention, Lakanal received great authority but it apparently was because he was the one willing to do great amounts of work: movers-and-shakers are more likely to “delegate” responsibility than to do the hard work themselves. Secondly, Lakanal ended a poor, and almost certainly cheated, man, and died in semi-obscurity. Movers-and-shakers are more likely to have their deaths respectfully publicized, and to leave fat inheritances for their heirs.

Lakanal’s biography contains two entries, based apparently on the author’s personal conversations with Lakanal in his old age, that indicate Lakanal was an unusual Revolutionary. During the persecution of priests who had refused to take the government oaths, Lakanal aided the escape of such a priest, who was his friend from Lakanal’s short period in a seminary before the Revolution. The priest would otherwise have faced execution, but, by aiding his priest friend, so would Lakanal have been executed if discovered. On another occasion, Lakanal took from the desk of an official an incriminating, foolish, letter written by Abbe Sicard because Sicard would have been in great danger if the letter were not destroyed.

The picture of Lakanal that emerged from the biography is of a highly principled, compassionate man, despite the extraordinary vote (if correctly reported) for the death of Louis XVI. That Lakanal’s vote might have been misrepresented is suggested by Lakanal’s words shortly before his death:

“I go to appear before God, the heart pure, the hands clean.”

Lakanal was obviously a primary source for the history of the French Revolution, and he was also a scholar and teacher before and after his period in public life during the revolution. Not surprisingly, therefore, Lakanal had begun to write his memoires in America and resumed writing his memoires shortly after his return to France. The friend of his old age who wrote the short biography said:

“...two works occupied him day and night: the one is the Expose Sommaire de ses Travaux (Short Account of His Works) during the revolution, a collection of pieces and of letters often of
great interest; the other, a considerable work commenced long before in America, and which, finished about 1840, was, until the last days of Lakanal, his joy and his hope, hope very cruelly disappointed! This work, of which we have often seen the manuscript volume and the title already printed, has mysteriously disappeared at the moment of the death of Lakanal! Has it been annihilated for ever? Is it held in reserve to reappear one day?"

That was a very strange development. Lakanal’s impoverished wife, with the child of his old age, seems an unlikely candidate to have suppressed Lakanal’s enormously important historical work, since its publication could have provided her with much-needed funds. It had been completed for five years before Lakanal’s death, with only the title page in print, which fact is itself very strange. Others obviously knew of the existence of the manuscript, as well as the author of the short biography, who had “often seen the manuscript volume.”

One such person who knew of Lakanal’s book might have been, surprisingly, Lord Brougham, whose work on education as a member of Parliament is described in Part 4. The author of Lakanal’s short biography recorded:

“We assisted one day at a visit that Lord Brougham made to the ex-conventionnel. ‘Your Lord,’ said Lakanal to Lord Brougham, who answered him, ‘Dear Citizen.’”

As indicated elsewhere, Brougham curiously omitted from his own multi-volume memoires most of his enormous work on education, which suggests that Brougham may have preferred sanitized history. Was Brougham in any way associated with the mysterious and total disappearance of Lakanal’s great work, which very probably was discussed and perhaps even shown to him when Brougham visited Lakanal?

Was there some material in Lakanal’s history that was so embarrassing to some persons in France, England, or America that they had his book stolen on the very day of his death? After all, it is an attested fact from a close friend of Lakanal that Lakanal’s written history:

“...mysteriously disappeared at the moment of the death of Lakanal!”

From the year 1792, Lakanal’s name recurs again and again on entries in the bibliography concerning education, as a member of the Committee of Public Instruction. The information given in his biography makes such recurring appearances understandable. Unfortunately, Lakanal was apparently in total agreement with the “need” for government schools, for normal schools, and for government-issued textbooks, as subsequent entries will make clear.

____________________

1794

Committee of Public Instruction. Report... on the Organization of a Jury to Judge Elementary Books....

1794

1794
Lakanal - Report on the Establishment of Normal Schools, Meeting of 2 Brumaire, An III

1794

National Convention - Decree of 9 Brumaire, An III 30 October, 1794, Relative to the Establishment of Normal Schools. [Ed.: This was made on the report of Lakanal, according to “Ephemerides,” page 890 of the Dictionnaire.]

1794

Lakanal- Report and Proposed Law on [the organization] of Primary Schools Presented to the Convention in the Name of the Committee of Public Instruction, 7 Brumaire, An III.

[Ed. Many other entries about this time concerned primary schools]

1794

Dupont (de Nemours) - Views on National Education, by an Agriculturist, or Means to Simplify Instruction and to Make it at the Same Time Moral, Philosophical, Republican, Civil and Military, Without Disordering the Work of Agriculture and the Arts on which the Young Must Cooperate. Paris.

[Ed.: Included a description of his method which taught beginners only how to write, not how to read, from which knowledge of writing the children learned to read incidentally. It was presumably a “sound” and not a “meaning” method, and, if so, should have been quite successful.]

1794

[Ed.: This particular legislative entry was followed by one after another on the education of the deaf. The interest of the assembly in the education of the deaf was extraordinary. However, by supporting Sicard and ignoring Deschamps’ work, the assembly was promoting the “meaning” approach instead of the “sound” approach.]

1794

1794

[Ed.: Since the Committee of Public Instruction was also concerned with elementary textbooks, this again shows that those who were studying reading methods were also studying methods for teaching the deaf.]

1795

[Ed.: Printed by the government press. Note that it was not printed for two years, but what is printed is permanent. The convention’s ideas on primary schools stayed alive in print for many years after Napoleon had unseated the Revolutionaries in 1799. The ideas were finally largely realized in France in the nineteenth century. So did the Revolution’s written research on reading history and methods stay alive in the next century. This is despite the fact that the educational plans of the Revolutionists were very poorly and incompletely executed during the Revolutionary period, and were apparently largely ignored during Napoleon’s tenure.]

1795

National Convention- ?Jouenne, Calvados, Deputy - [Reporting on two establishments for deaf-mutes in Paris and Bordeaux]

1795

General Program of the Course of Normal Schools - to the Convention

1795

Merlino - Report on an Establishment for Blind Workers

1796 (and 1818)

Brun - [From the article, “Lecture,” page 1545, but not in Bibliographie] “Another grammarian, Brun (author of New Method of Teaching which had been distinguished in the year IV by the jury of elementary books), wished to start the pupils with numeration, verbal at first, then written; after having written some figures, the child commenced to trace some letters, the vowels at first, then the consonants, which he associated with the vowels in pronouncing the syllables without spelling; in putting together some syllables, he next formed some words, which he read at the same time that he wrote them (Journal d’éducation, January, 1818).”

1796

Barbe-Marbois - Report Made to the Council of Five Hundred [Conseil des Cinq Cents, the lower house of the Revolutionary legislature after the constitution of September 23, 1795] Relative to the Works Which Should Serve as Elementary Books in the Primary Schools.

1796

Fourcroy - Opinion on the Action of II Germinal, Year IV, on the Resolution Relative to Elementary Books.
1796

La Chabeauniere, French Catechism or Principles of Philosophy, Morals and Republican Policy for Use by Primary Schools. (“Work considered classic by the government and printed free by the state.”)

1796

1797

[Ed.: Only five entries, for 1797, including the following:]

Couret-Villeneuve - Letter to the Citizen Sicard, Teacher of Deaf-mutes, Member of the Institut Nationale “(etc.)”. Paris.

[Ed.: Sicard was in trouble again with the Revolutionary authorities at this time, as discussed in his biography in the Biographie Universelle (page 286).]

1797

DeBry (Jean) Statement on the Inviolability of the Right of Kinship With Reference to the Education of Children (22 Vendemiaire, Year VI)

[Ed.: Note the implicit acknowledgment that government education was invading the rights of parents.]

1798

Francois de Neufchateau, The Institute of Children, or Advice of a Father to his Son. (Imitates the verses that Muretale wrote... for... his nephew and which could serve all the little schools [petite ecoles]). Paris.

1799?

Francois de Neufchateau - Practical Reading Method [Methode Pratique de Lecture], Year VII

The above was listed in the article, “Lecture,” page 1543, and quoted in the article in the “Supplement,” pages 3030-3031, on Herbault. In de Neufchateau’s book on reading, he reviewed earlier reading methods and then invented his own, using reading and writing simultaneously and teaching whole syllables by sound, without spelling them.

The Dictionnaire article on Herbault included quotations from a lengthy report by Neufchateau of an eye-witness account of 1747 of Herbault’s charity school (Classe de l’Enfant Jesus, Hospice de la Pitie) run in Paris for 300 children, using Dumas’ phonic typographic bureau. Herbault’s 1747 school was run on what became known as the monitorial plan, with older children teaching younger children. The author of the article on Herbault, which was quoting de Neufchaeau at length, pointed out that Herbault did not invent the approach of older children teaching younger children as it had been used by Pere I. D. B. in
Paris in 1654 and by Demia at Lyons about 1675. Therefore, the 1816 claim of the Societe Pour l’Instruction Primaire that Herbault, rather than Bell and Lancaster, was the inventor of the monotorial schools was not correct, as even Herbault was only carrying on I. D. B. and Demia’s approaches.

1799

Jury of Instruction of the Arrondissement of Treves - Plan of Interior Organization of the Primary Schools, Year VII [Listed only in the article, “Lecture,” page 1542]

Entries after 1800 were very sparse, but were obviously published in a very different intellectual climate after Napoleon’s take-over. The following entry seems to suggest that opposition to the Revolutionists was surfacing under Napoleon:

1800

Anonymous - Sessions at the Normal Schools Collected by Shorthand, Etc. 600 p.

Appearing in 1800 after the Revolutionists were safely overthrown, this sounds as if “Anonymous” had produced 600 pages of debunking transcripts concerning what actually went on in the government normal schools for the training of teachers. The government normal schools were one of the few concrete educational “achievements” of the Revolution. Note that the term, “normal school,” apparently originated in the Revolution, although religious training schools for teachers date back at least to the seventeenth century, when Pere Demia is known to have established one in Lyons.

1801

Genlis, Madame de - New Method of Teaching for Early Childhood, Paris

If the book by Madame de Genlis included instruction on beginning reading, it was almost certainly two-step whole word phonics, the precursor of the basal reader Code 3 whole-word phonics of today. Information is given on page 1548 of the Dictionnaire on Madame Genlis’s use of that method as revised by Professor Emeritus Alexandre of the Ecole Militaire for the “enfants d’Orleans,” presumably the children of the royal family.

In 1719, M. de Vallange had originated what appears to have been that approach. It was revised by the Abbot Bertaud in 1744 under the title, Quadrille des Enfants, as discussed in the 1744 entry for Bertaud. “Anonymous” had also made a revision in 1751. The article, “Lecture,” stated, “The system due to Vallange and to Bertaud enjoyed a vogue that lasted rather a long time. It is related that Crebillon and Marivaux had it put to the test in their presence on two chimney-sweeps who, at the end of a month, by
means of two lessons a day, were in the state of fluent reading. The Abbe Desfontaines called the process the philosopher’s stone for the teaching of reading.”

Yet, as A. Demke stated, who is quoted in the 1744 entry on Bertaud, “Like all reading methods without spelling, it succeeds only with those pupils who have, as has been said, the memory of the eyes.” That the two-step whole-word phony phonics method, the precursor of the Code 3 phony phonics of today’s basal readers, was called the philosopher’s stone for the teaching of reading, showed that poor approaches in teaching reading have often received warm approval!

In 1777, the material was revised again by Alexandre, a professor emeritus from the Ecole Militaire and was used by Madame de Genlis. It was revised again in 1779 by Michel. Finally, it was revised by a professor of grammar, Daubanton, in his 1810 book, Reading by Echo. Daubanton also applied the method to the teaching of writing in his book, Application of Reading by Echo to Writing, 1811.

Yet all these authors had used the idea of teaching reading by the so-called “echo,” which meant comparing the sounds in new words to the memorized sounds from memorized whole sample words. This is, of course, two-step whole word phonics since it requires resurrecting the memories of whole, meaning-bearing words before it is possible to sound out the sequential parts of an unknown whole, meaning-bearing word.

Becoming a Nation of Readers, The National Institute of Education, U. S. Department of Education, Washington, D. C., 1985, page 12, lines 3 through 20, confirms that the time-consuming and distracting two-step “echo” approach is what is used by most American readers today. This is hardly surprising, since most adult Americans were taught to read with Dick and Jane or its clones. (The article, “Lecture” from Volume I-I of the Dictionnaire de Pedagogie et d’Instruction Primaire, Librairie Hachette et Cie., Paris: 1887, summarized the history of the “echo” method on page 1540.)

1805

Choron, Alexandre-Etienne (1772-1834) [Ed.: from the article, “Lecture” and biographical entry] - Method for Teaching Reading and Writing (Methode pour apprendre a lire et a ecrire) “He used the simultaneous method and the omniphonique procedure. His superior method to most of those which existed before was adopted in the mutual teaching schools.”

[Ed.: The entry mentions Francois Edme Jomard (1779-1862) who was, according to his own biography in the Dictionnaire, one of the founders of the Society for Elementary Instruction that promoted the French monitrial schools. “Minister Carnot... (in) April, 1815, charged a commission of five members to give him an opinion on the best method of primary teaching.....” and Jomard was one of the five. The “simultaneous method” usually meant whole-class teaching, which had been used by the Christian Brothers, but it certainly could not have been used in the monitrial schools, in which older children taught younger children (“mutual teaching”). In this context, it obviously referred to the second meaning used for “simultaneous” in teaching at that time, which was the “simultaneous” teaching of reading and writing, instead of holding off the teaching of writing until later. However, what the “omniphonique procedure” was is unknown.]

1810-1811

Daubanton, Reading by Echo (Lecture par Echo), Application of Reading by Echo to Writing (1811), Paris.
See the entries under Bertaud in 1744 and under Madame de Genlis in 1801 for a discussion of this two-step whole-word phony phonics approach, the probable precursor to the Code 3 whole-word phony phonics approach in use today. The method had originated with Vallange in 1719, was revised by Bertaud in 1744, by Anonymous in 1751, by Alexandre in 1777, by Michel in 1779, possibly by Madame de Genlis in 1801, and finally by Daubanton in 1810. All but the last two would have been reviewed and studied by the Revolutionists working on reading methods. The Code 3 whole-word phony phonics method was effectively in general use in England by the 1830’s, as in Reading Disentangled and the Irish Readers, and was equivalent to much of the Code 3 whole word phony phonics used in American texts since at least the 1870’s. However, from shortly after 1826 and until about the 1870’s, most American readers had used only Gallaudet Code 1 sight words, until the partial but aborted return of phonics in the 1860’s. This had resulted in the use in America of Code 3 “echo” phony phonics in the 1870’s and later. The “echo” Code 3 method was still in almost universal use in England in the 1870’s as shown by beginning readers of that period.

Although proposed years earlier, the Institute of France of which Daubanton was a member came into actual being during the period of the Directory, through Lakanal’s organizing it (page 596 of the article on Lakanal, previously cited). The Institute initially had forty-eight chosen members, and the article listed twenty-six of them. It is interesting that the list included two who wrote reading methods, Daubanton, whose method has just been described, and Lebrun, whose method was described previously. Another Institute member was Sicard, who taught reading to the deaf, and another was Hauy, who taught reading to the blind. Whether du Pont de Nemours and Neufchateau were members of the Institute is unknown, but these famous men also wrote beginning reading materials during the French Revolution. Truly, the French Revolution had been a hot-house for reading instruction methods written by the “great,” most of whom were apparently acquainted with each other and so most probably with each others’ teaching approaches.

1812

1812

Laborde... Plan of Education for the Child... After the Two Methods... Dr. Bell and M. Lancaster. English System of Instruction.

1814

1816 (or Earlier)

Journal of Education (Journal d’Education)

[Ed.: This is referred to several times in the article, “Lecture,” and the first such entry is for May, 1816, in the section on the monitorial schools on page 1544, which method is reviewed later. Note that the 1816 magazine carried the same title, Journal of Education, as the magazine founded in 1826 by an unknown person or persons in America on which William Russell was employed as the first editor, which was only the second American magazine on education and the first such successful American magazine.]

1817 [and for an unknown time before]

Biographie Universelle of Michaud’s, published in Paris in 1854 and republished by Akademische Druck-u. Verlagsanstalt, Graz, Austria, in 1969, had an entry on Pierre-Alexandre Lemare (1766-1835) who, despite the different initials, was obviously the same man, since it credited him with writing the above book and also referred to him as a physician and grammarian. Lemare was born in the canton of St. Laurent, the son of a poor laborer, and achieved his education “almost alone.” That fact confirms that some kind of educational opportunities were available for the poor in France in the 1770’s. When Lemare was nineteen years old, he was named the professor of rhetoric and principal of the “college de St.-Claude,” a school probably similar to our junior and senior high schools. The lengthy entry shows Lemare to have been not only brilliant but an adventurer, “ardent friend of the revolution, but a man of good will, he wished to stop the excesses, and he made the administration of which he was a member suspend the committees of surveillance. Proscribed then by a decree of the convention, he was re-established in his function after the fall of Robespierre....”

Lemare’s life continued for many years until after the fall of Napoleon to be material fit for an adventure movie. He eventually returned to academic life and, in the course of his lifetime, wrote an incredible number of books, one of which was a dictionary, Dictionnaire Francais, Par Ordre d’Analogie, Paris, 1820. Lemare also wrote Stories Adapted to Simultaneous and Mutual Teaching, As Well as to Private Teaching (Contes Appropries a l’Enseignement Simultane et Mutuel, Aussi Bien qu’a l’Enseignement Particulier), meant to follow his Course de Lecture, above. The biography cited a sixth edition of his “Stories...” in 1829. Therefore, like the dictionary author Noah Webster in the English language, the dictionary author LeMare in the French language can be truly said to have written a series of readers, his “Course of Reading” (which the article said had been a revision of his original work, Systeme Naturel de Lecture or Natural System of Reading with 50 Figures in Copper-plate Engravings) and his “Stories Adapted....”

1817

---

16 A separate article appeared in the Dictionnaire on Lemare. That separate article showed that Lemare had actually started children with the alphabet and its sounds, despite the title of his book. His title obviously only meant that the “spelling” or naming of letters and syllables was dropped in the teaching of reading. Since the children knew the sounds of the letters first, that made his method an analytic phonics method, as opposed to a synthetic phonics method in which children would have sounded the letters. Lemare’s original work must have come out some time before 1817, since it had a fourth edition in that year.
Butet* de la Sarthe [Ed.: From article, “Lecture,” page 1545, but not in “Bibliographie.” The asterisk indicated Butet had a separate article in the Dictionnaire. The 1815 monitorial school method, described elsewhere:]

“...was nevertheless susceptible to some perfecting, and, as the public attention was vividly drawn at this moment towards the problems of education, a great number of attempts more or less successful were produced. We will cite among others the syllabary of Butet* de la Sarthe, who reduced the elements of pronunciation to 30 sounds and to 19 articulations. While allowing the simultaneous teaching of reading and writing, Butet wanted [that teaching] preceded by exercises of oral syllabicating. His syllabary was the object of a favorable report by the Society for Elementary Instruction (Journal d’éducation), September, 1817.”

1818

“N. B. At this year and in the following [appear] numerous brochures for and against education.”

“Description Composed by Laurent Clerc and Read by Mr. Gallaudet to Examine Some Pupils in the Asylum Established in Connecticut, etc.”, Geneva.

[Ed.: Note from the Butet 1817 entry that a “great number of attempts” to compose beginning reading materials had been made in French since about 1815, with the foundation of the French monitorial schools, and they had as a resource the material on reading methods from the French Revolution. With the end of the Napoleonic wars, the great interest in secular education in France that had been exhibited by the “intellectuals” of the French Revolution had resurfaced. Napoleon had certainly been no “intellectual.” Note that in 1818, a year of great interest in education in general in France, as shown by the writing of “numerous brochures” on education, a report in French was published on the work of Gallaudet who was teaching deaf-mutes in the United States. Gallaudet had returned from Sicard’s Paris school with the deaf-mute Clerc of France and had opened his Connecticut school by 1817, only one year before the publication of the 1818 report in French. Possibly that report was printed in Geneva, Switzerland, rather than in France, through some connection with Pere Girard’s monitorial school there. Girard’s work was a great favorite with “experts” of the period. Concerning the very poor educational results in such monitorial schools as well as the vast publicity from change-agents to promote their spread, see later the comments of the anonymous Scottish Schoolmaster from 1828 and 1829.]

1818

Freville, A. F. J., Reading by Pictures [Lecture par images] or Fitting, Amusing Method to Pique the Curiosity of Children and to Teach Them to Read, etc....Paris.

[Ed.: It would have been more than a little astonishing to see what is possibly a Code I sight-word work openly promoted in France in 1818, except for the fact that Lemare’s curious work, although it had not actually dropped the alphabet as a first step, was published some time before 1817 and it already had a fourth edition by that year. Since Lemare’s work, despite its title, was preceded by teaching children the alphabet and letter sounds, conceivably so may Freville’s work have included teaching the alphabet and letter sounds before teaching whole words by pictures. Nevertheless, both Lemare and Freville are possible precursors of the total “meaning” Code I approach that appeared in America by 1826.]
1825

[Ed.: The “Bibliographie” showed a translated work on Robert Owens’ New Lanark infant school. Lines of communication continued to be open between England and France on secular education approaches.]

1826

Translation of Brougham’s Practical Observations on the Needs of the People. [Ed.: Lord Brougham’s work in England pushing for government schools was obviously being read in France in 1826.]

1827

De Laffore, M. [Ed.: from article Lecture only, pages 1545 1546. Statilegie which dropped syllabicating but used letter sounds on whole words:]

“...enjoyed a momentary vogue endorsed by men like Messrs. Mignet, Francoeur and Magendie.”

[Ed.: This 1827 reference is one of the few in French to the dropping of syllables in the teaching of beginning reading. Yet Worcester in America had already dropped teaching syllables in 1826, as discussed elsewhere, but Worcester also omitted any use of letter “sounds,” which this method did not.]

______________________

Rousseau’s Emile was published in 1763, but Rousseau’s general ideas do not really account for the changes in the teaching of reading after 1760, even though Rousseau specifically rejected any need to teach Emile to read. Rousseau did refer to what amounted to a flood of material in France at that time concerning the teaching of beginning reading. Rousseau’s comment certainly confirmed that ideas concerning the teaching of beginning reading were growing (festering?) in eighteenth-century France. No such development had ever happened before, despite the few works in English which had appeared in the previous hundred years or so concerning the teaching of beginning reading. The purpose of those English works was only to circumvent the difficulties in English spelling, and not to invent new methods to teach beginning reading.

The “Bibliographie” of the Dictionnaire de Pedagogie... is curiously lacking in texts on the teaching of reading, except before 1730. The article, “Lecture,” however, more than makes up for those omissions and many of its entries have been cited above. The many entries demonstrate that, as Rousseau had said, there was a great interest in France in the topic of teaching beginning reading in the mid-eighteenth century.

However, some of the entries only mentioned in passing in the previous chronological summary are worth describing in more detail. One is that of Cherrier’s.

The canon Cherrier (discussed on page 1541 of the Dictionnaire de Pedagogy...) had written in 1755 the book, New Methods to Teach Reading (Methodes Nouvelles Pour Apprendre a Lire), Paris. In it, he reviewed earlier methods, so his text very interestingly provided a history of reading to 1755. In it, he also recommended the Port-Royal naming of the consonants with an e muet, but in a fashion which would have made the Pascal approach useless for synthetic phonics. That is because Cherrier recommended preceding and following each consonant with the e muet, which would make blending impossible. However, Cherrier wanted learners to drop the spelling of syllables, anyway, and to learn them as wholes
a very significant deterioration. Since he recommended dropping the spelling of syllables, which would
make the use of Port Royal phonics unnecessary, he said he could find no fault with naming letters by
their traditional names as they would not be used in “spelling,” anyway. Therefore, Cherrier’s strange
adaptation of Port Royal phonics was virtually useless.

Cherrier had said, “It is proposed not to spell the letters to syllabicate, but to make the children
pronounce the syllables as soon as they know the letters.” He wanted children to learn to read in Latin.
His work ended with alphabets and “methodical Latin and French syllabaries... with useful and agreeable
readings in the one and the other language.” What was critical, of course, was the dropping of spelling.

The Dictionnaire wrote the following on Viard and on Luneau de Boisjermain (page 1541):

“In 1759, Viard, master of a boarding school, published True Principles of Reading, of
Spelling (Orthographie) and of French Pronunciation (Vrais Principes de la Lecture....). This
work, which had numerous editions, was revised in 1778 by Luneau de Boisjermain, and
reprinted again in l’An IV [1795]. Francois de Neufchaeau said ‘that it had served usefully for
more than 20,000 private instructions.’. It did not offer anything original: it is an abecedaire with
a number of tables of syllables and of words. The name given to the letters is that of the grammar
of Port Royal; the syllables must be joined without the child spelling: ‘il ne faut pas lui faire dire
be-a ba, mais tout d’un coup ba. (It is not necessary for him to say be-a ba, but all at once ba).’"

If reading at the fundamental level should only be the correct and sequential pronouncing of
individual syllables in words, and if these syllables are learned best by memorizing their sequential parts
(i. e., “spelling” their letters), then any change which suppresses either the breaking of words into these
syllables or the naming of the letters in the syllables adversely affects efficiency in reading. Reading is
defined as the correct pronounciation of a text, so that the message can be understood just as if it were
spoken and not written. After all, the whole purpose for which alphabetic writing was invented was to
encode speech so that it could be precisely reproduced later. Until well into the Christian era, reading
quite literally meant pronouncing a text out loud. By contrast, highly inefficient picture writing, which
can be read only by guessing from the meanings of groups of pictures, and which does not require speech
at all, is acknowledged to be a primitive and barbaric method.

It seems hardly surprising that the “Age of Unenlightenment” in France also produced the first
deliberate suppression of teachings on syllables. The reading disabilities that can result from such
suppression, of course, make it more difficult for a reader to obtain any information or truths transmitted
by print. Yet the suppression of syllable teaching was supposed to be an improvement. Almost all of the
French reading “improvements” suppressed one or more of the facets of correct “sound” beginning
instruction in reading. Only a few of the French methods for hearing children, however, went all the way
to recommend teaching beginning reading by Code 1 “meaning” (Radonvilliers, Adam, and possibly
Freville). Of course, de l’Epee’s method for deaf children was a pure Code 1 approach.

The article, “Lecture,” also had a section reviewing the work of the French Revolution period and the
years immediately following. It said that the years of the Revolution had not been objectively productive
concerning reading methods, despite much activity on them. However, just before Napoleon’s take-over,
the Revolutionary government finally endorsed an official phonic method written by de Neufchateau, a
high government official who was not, himself, a schoolmaster. De Neufchateau had a huge volume of
written material to draw on in preparing his own reading method, since for more than a century so much
had been written in France concerning new and different ways to teach beginning reading. Neufchateau
reviewed some of that history in his work. The section of the Dictionnaire... article, “Lecture,” concerning
the Revolutionary period stated:
“In the year IV, Lakanal, rendering an account to the Five Hundred of the results of the concourse opened by the Convention for the composition of elementary books, said: ‘The concourse has not produced, on the art of teaching reading and writing, any work that the jury has judged worthy to be adopted in the primary schools of the Republic. It is even persuaded that none exist in French, and that until now the patience of the teachers and of their pupils has been exhausted.’

“Meanwhile, the necessity of organizing in the primary schools a methodical and regular teaching of reading was evident. It was to answer this need that Francois de Neufchateau, Minister of the Interior, composed and published in the Year VII his Practical Method of Reading (Methode Pratique de Lecture). In a preface addressed to the citizen Janny, his compatriot, professor at the central school of the Vosges, he explained in these terms the end that he was proposing to himself: ‘The methods described in Cherrier’s books are scarcely applicable except to private education. Their authors had in view only the children of the great, and had not dreamed of the people.... The methods which were easy for teaching the nobles and the rich to read could not fill the end that I proposed to myself, to put a simple teacher within reach of showing the elements of reading to many children of two sexes, in a manner not costly and which could suit the countryside as well as the cities.... We constantly returned to this interesting problem. You have for your part attempted to resolve it by trying yourself to teach some children to read in a village of our mountains. Finally, from the combination of all our ideas, there has resulted a system justified already by successful experience. This is the basis of the work that I address to you today, divided in four parts. The first gives an account of the principal difficulties of the art of teaching reading. The second gives an idea of the different methods proposed until now for removing such difficulties. The third discloses the plan that a teacher should follow, charged with 100 pupils, to show them how to read and write, at the same time. Finally, the fourth contains the necessary tables for the execution of the plan, and which free the pupils from the cost and the torment of books. All are preceded by a general table of voices and articulations of the French language. You will learn with pleasure that this practical method will be demonstrated to the teachers of Paris by a skillful grammarian, one of my illustrious colleagues of the National Institute, and one of the dignified professors of the central schools of the Department of the Seine.

[Ed.: Sicard, teacher of the deaf, was also a member of the National Institute.] The zealous and brilliant Urban Domergue [Ed.: 1745-1810] readily seized this occasion to enoble the first degree of education, by descending from the heights of grammatical science to abecedaire ideas. It is to raise oneself without doubt to descend in this way. Could the professors of the central schools follow that example. Alas! until now childhood has been stupified by lessons of routinism. It is time that liberty and philosophy are introduced in the bosom of the primary schools. The constitution wishes it; the policy asks for it. The revolution of enlightenments can only consolidate that of the government.’

“Francois de Neufchateau counts thirty-four fundamental voices and articulations: fourteen vowels and twenty consonants. He begins by making known to the pupils the different manners of representing these thirty-four sounds. At the end of the class is a large blackboard (tableau noir) divided by some horizontal slats of which the interior angle is a little turned down in such a manner that one can introduce there and fasten there some cardboard tablets on which are painted some alphabetical characters; the pupils are each provided with a plain black tablet, and a piece of chalk. The master puts on the blackboard, by means of the grooved slats, the first voice of the alphabet, by presenting it under under its four formes, e, eu, eu [Ed.: with a dot over the u] and oeu. He pronounces it, has it pronounced by three or four pupils, then by all simultaneously. Each pupil must immediately reproduce on his tablet the characters that he said. The master traces himself these characters by chalk on the big board, in order to show how they must be made. One passes immediately to the second voice, then to the third, etc.; in five or six days, in ten or fifteen at the most, the pupils know all the vowels and all the ways to represent them. By the same
procedure, they learn next the consonants, that one pronounces for them by means of the e muet. Then one makes them spell in applying successively the different vowels to the different consonants; and they write on their slates all the syllables that they spell. They do not pass to compounded syllables until they are absolutely trained in the simple syllables, and one only speaks to them of words when they do not experience the least hesitation on compounded syllables. To arrive there one should exhaust all the combinations possible of vowels and of consonants. Remaining are the difficulties coming from the irregularities of pronunciation, the mute letters, the letters which have many different sounds; one comes to this end by the following exercise: one asks the children to guess the letters of a word that one pronounces aloud; one places these letters on the tableau and one makes them write in proportion as they are guessed; this is what Francois de Neufchateau calls spelling under dictation. These preliminaries achieved, the children become stronger in reading by the means of exercises where they find regular applications of what they have learned. These exercises are methodically distributed in sixteen tables, covering some words and some short sentences. After having gone over these sixteen tables, the pupils, who have still not had books in their hands, reach fluent reading at last and the teacher has them read a book of morals and a treatise on orthography.

“The method of Francois de Neufchaeau, of which the general adoption had constituted a considerable progress for primary teaching, had received the approbation of the Counsel of Public Instruction. But the political change that was the consequence of the coup d’etat of 18 Brumaire suddenly stopped the reforms that the republican government projected; the primary schools ceased to be the object of the authorities, and all progress, in the domaine of methods of education was put off for a long time.”

Ever since the wax writing tablets for beginners had been dropped during the fourteenth century, and until the French Revolution, the teaching of reading had generally been separated from the teaching of writing. There were, of course, always a few children who still learned writing at the same time as reading. The teaching of writing with beginning reading appeared again in force during the French Revolution. It is probable Revolutionary France was also the source for the numerous German methods which followed shortly after in the early nineteenth century, combining the teaching of reading and writing. A separate sub-section appeared in the Dictionnaire article, “Lecture,” entitled “Reading-Writing.” It read in part:

“The idea of teaching reading and writing simultaneously to children is very old. Montaigne said that he was taught to read at the same time as he learned to write, by [his teacher’s] putting the letters, the vowels and the words that served as examples under some sheets of horn or of transparent paper, so that he had only to trace the shape of the letters, stroke by stroke. Delaunay’s son, in 1741, advised parents who taught their children to read to put a pen in their hands as soon as they begin to read and to make them write, however, young they may be.’ The Canon Cherrier pointed out, as ‘an expedient simpler than all the others for teaching reading’ the following procedure: to write on a slate with chalk one or two letters at a time, and to make the children name them and to imitate them as well with the chalk. If they form the characters badly, they erase them to begin to make them again; one gives them next some syllables and some words which one teaches them at the same time to write and to pronounce. ‘One can by this means,’ he adds, ‘train children in a short while to read and to write syllables and words at the same time. Children of five years of age who have been instructed in this manner have been known to read fluently and to form their letters and all sorts of figures passably well.’

“Many attempts to compose practical systems of reading-writing are to be found in the Revolutionary period. A citizen, H. B., published in the year III a Method to Teach Writing and Reading, and to Write Under Dictation at the Same Time, which is cited by Francois de
Neuchateau. The author of this method showed that much time was gained by uniting the two studies which aided each other; he added that a single teacher could instruct at the same time a great number of pupils; it was sufficient to place in the class a blackboard [tableau] on which one could trace the letters, the syllables, etc. A little later, in the year VII, the jury of instruction of the arrondissement of Treves published Plan d’organisation interieure des ecoles primaires in which it is recommended to begin by writing, at which the child must be exercised ‘before learning to read.’

“Du Pont de Nemours went further. According to him, reading is nothing, writing is all. Historically and logically, writing precedes reading; he who knows how to write knows how to read. ‘It is necessary,’ he said, ‘to begin the literary instruction of children by teaching them to write, and one should not trouble them at all with reading, of which one will not have the need to make a separate study, if writing is well taught.... I have had the good fortune to have had several children to educate who are today men of merit, and who have never especially learned to read.’ (Vues sur l’éducation nationale, An II)”

After an inactive period during Napoleon’s tenure, interest in beginning reading instruction was revived about 1815 with the promotion of the French monitorial schools, modeled on the English schools of Lancaster and Bell.

The Journal d’Education was in existence in May, 1816, since it was mentioned on page 1544 in the section of the “Lecture” article concerning monitorial schools. On page 1545 appeared the information that the journal had also referred in an article in September, 1817, to the Society for Elementary Instruction (Societe Pour l'Instruction Elementaire), which was concerned with the founding of monitorial or “mutual” schools. On page 1544, information appeared on “The Method of the Schools of Mutual Education” (“La Methode des ecoles d’enseignement mutuel”). This was the reading method used in the French version of the Lancastrian monitorial schools and not surprisingly was modeled after the English method. The English method had been based on studying one-syllable words first, made up in tables first of two-letter words, then three-letter words, and so on to very long one-syllable words. This was a poor method for English, but it was considerably worse for French, because French has so many more multi-syllable words of high frequency. The article described the French monitorial schools and method:

“With the creation of the Society for Elementary Teaching in 1815, primary teaching received in France a new and fertile stimulus. A group of distinguished men gave themselves the mission to create some schools on the monitorial system, and put themselves to the search for the most reliable and the most rational methods for teaching elementary subjects. The reading method of the mutual schools, imitating that of Lancaster but adapted to the nature of the French language, was the work of Choron (who had published since 1805 a remarkable Methode pour apprendre a lire et a ecrire), of Jomard and of the Abbe Gaultier. It offered, like the method of Francois de Neuchateau, which it very much resembled, the advantage of teaching writing at the same time as reading. We shall outline the principal steps, from the Journal of Education [Journal d’éducation], the number for May, 1816.)

“The teaching of reading in the French mutual schools must be done by the means of a Syllabaire, forming 38 tables divided among the eight classes of the school, and of Lessons of reading.

“The first class (10 tables) is only kept busy with the alphabet; It is presented in three different ways: following the accustomed order, to teach the pupil the names of the letters; second, according to the form of the letters, straight, angular or curved, and to learn to trace them.
on sand; third, following the nature of the sounds, distinguishing voices and articulations and arranged in the order adopted by Choron (14 voices, single-lettered or double-lettered, and 21 articulations, equally expressed by one sign or by two. The alphabets are in roman type and in cursive type. The children, with the index figures of their right hands, trace on the sand all the letters, large and small, roman and cursive.

“The second class (3 tables) spell some syllables of two letters (a single articulation and a single letter, and the opposite). The pupils also spell by heart: the table reversed, the monitor asks: he says de; the first pupil replies d, and the second de. They write on the slate some syllables of two letters, given by the monitor.

“The third class (6 tables) spell some syllables made of a single articulation and a two-letter voice (bou, beu) and the opposite; of a double articulation and of a single-letter voice (bla), and the opposite; of a single-letter voice or two-letters voice between two simple articulations (bal).

“The fourth class (4 tables) spell some syllables formed of a double articulation and of a two-letter voice (brou), and the opposite; of a triple articulation and of a single-letter voice or two-letter voice (stri); of a single-letter voice or two-letter voice between two single, double or triple articulations (tris, trist, strid, strict). In the spelling by heart, the children begin by saying the syllable, then they break it apart by pronouncing all the letters.

“The fifth class (5 tables of the syllabary and 7 tables of reading) begin to consider the syllables as forming some words. The tables of the syllabary contain a vocabulary of monosyllables, arranged under the voice or the articulation relating to their principal sound; by this means, the pupil perceives by a glance what must be the pronunciation and how to know all the equivalent notations of the same sound. The tables of reading offer some monosyllabic and disyllabic sentences with divisions between syllables (sentences and proverbs). The children who in the third and the fourth class could only write syllables, begin to write entire words but of single syllables.

“The sixth class (5 tables of the syllabary and 18 tables of reading) study a vocabulary of disyllabic words, and read some polysyllabic sentences with divisions between syllables (sentences, proverbs, maxims from the Old Testament). The children write some words of two and of three syllables.

“The seventh and the eighth classes (5 tables of the syllabary, 25 tables of reading common to the two classes) study a vocabulary of polysyllabic words, and read some polysyllabic sentences without separations between the syllables (stories from the Bible). It is here that one begins to put books into the hands of the children (catechism, moral stories). The pupils write some words of three, four and five syllables, those of the eighth class using ink and paper.

“The method that we review, officially adopted by the Society for Elementary Instruction, offered a systematic ensemble, of which all the parts were logically combined, and which rested on a rational analysis of the elements of the language. That was the most remarkable attempt that had been done, with that of Francois de Neufchateau, for organizing the collective assignment of reading for the school.”

The French monitorial schools met with some intense opposition. An article in the Dictionnaire (page 1482) on the Abbe Jean-Marie-Robert de Lammenais (1775-1861) said he wrote in opposition to it the book, De l’Enseignement Mutuel, 1819, saying, “This system is the work of demagogues and of the impious to whom France is indebted for so much misfortune.” He said that since 1815 the schools had
been a pernicious influence with terrible results, “in increasing the number of crimes among the young people and also among children.” The article said, “Lammenais wished to organize a crusade ‘against this defective method, defective in its procedures, dangerous for religion and for morals....’

In contrast to the Abbe de Lammenais, according to the Catholic Encyclopedia (1913) article on the Abbe Gaultier, he had been a founding member of the group promoting monitorial schools and the “Lecture” summary had said he contributed to that reading method, but it did not describe his own approach. Gaultier’s method was summarized elsewhere in the article, “Lecture.” The Dictionnaire “Bibliographie” showed Gaultier’s initial work on reading as having appeared about (“vers”) 1788.

“During the first fifteen years of the nineteenth century, they were content in general to re-edit, to the usage of private education, the methods of the preceding century, Le Quadrille des Enfants (see Daubanton) or the typographical bureau. We must nevertheless make a special mention of the procedure of the Abbe Gaultier, which simplified in a favorable fashion the typographical system to use it in the outline of his instructive games. His “typographical box” is a box a foot long by six inches wide; the interior is divided in twenty-four compartments, each composed of two little leaves of cardboard which are joined at the back of the box to form together a right angle, and two other sides which are only vertical separations. The box, placed in one direction or the other, in front of the child, presents him thus with four lines, each offering six little desks, all of which carry one of the twenty-four letters of the alphabet.... When he knows his alphabet well, one makes him compose some syllables, then some words and some sentences.

“The Abbe Gaultier published five volumes of graduated reading, to follow the exercises of the typographical box.”

Presumably it was Gaultier’s five books on reading which were of use in the monitorial schools, as his elaborate typographical materials would have been of little use in such crowded, almost unsupervised surroundings. This description of Gaultier’s method made no reference to Port Royal spelling of letters by their sounds, instead of their names, so presumably such phonics was omitted. The typographical approach has many versions today, one of which is the English Breakthrough to Literacy program, although that takes an analytic approach, moving from whole words to letters. However, what is never mentioned in such accounts of “typographical” methods is the enormous “housekeeping” problems when little children are presented with multiple little cards, all of which must be returned to their proper locations or the materials become utterly useless. Most little children have great difficulty even putting away their own toys, and to teach children properly to use great numbers of separated letter cards requires constant follow-up by adults, or such materials degenerate into meaningless jumbles. One of the strong points of some Montessori programs is that they spend considerable effort training little children to put such “manipulative” materials back where they belong after each use, but the necessity to give such training to little children only confirms the fact that such neat behavior is not the norm.

Abbe Gaultier had endorsed the founding of mutual schools under government auspices, and Pere Girard in Switzerland had promoted monitorial schools which were presumably also government schools. Despite the opposition from clergy such as Abbe Lammenais, Gaultier and Girard were giving an unfortunate legitimacy as respectable clergy to the move from church to government schools. However, a curious reference was made in Girard’s biography in the Dictionnaire de Pedagogie to his possible pro-Kantian views, so Girard’s religious orthodoxy might be questionable.

An 1830 book in English contains these two interesting entries, demonstrating further the bridge between ideas of the French Revolution and ideas in the English-speaking world, including America. In his work, Is Public Education Necessary?, Blumenfeld told of Frances Wright, the public lecturer and advocate of free love, who was active in America about 1829, and who was a close associate of the
socialist/atheist Robert Owen’s son. Writings from both the younger Owen and the woman, Frances Wright, appeared in the following volume, as well as the use of Frances Wright’s married name, which certainly confirms at least one French contact among the change-agents. Note her concern with “national education,” just like the activists preceding and during the French Revolution:

“Wright, Francis (Mme. d’Arusmont)
Address to the Industrious Classes: A Sketch of a System of National Education by Frances Wright, and Address to the New York Periodical Press by Robert Dale Owen, New York, 1830”

An 1829 book was put out on Frances Wright’s lectures, in which she defended the “French Reformers:”

“Frances Wright - Course of Popular Lectures ...(including) A Reply to the Charges Against the French Reformers of 1789. New York, 1829.”

French influences in the early nineteenth century continued to affect the teaching of beginning reading in English. One such program, apparently the source for comments by the American Dwight which will be referred to later, is reviewed in the Dictionnaire de Pedagogie et d’Instruction Primaire, F. Buisson, Editor, Paris: 1887. This excerpt is from page 1546.

“Reading without Spelling, by Messrs. Lamotte, Perrier, Meissas and Michelot. We will finish this chapter by mentioning the attempt made in 1832 by Messrs. Lamotte, Perrier, Meissas and Michelot to create a method of reading which, inspired by experience and good sense more than by more or less hazardous and paradoxical theories, always took into consideration those innovations whose utility seemed confirmed by practice, and which could adapt itself indifferently to mutual instruction, simultaneous instruction or individual instruction. ‘Having been devoted for a long time to the instruction of the young,’ said the authors of the Method of Reading Without Spelling, ‘we had to examine with the greatest care the different methods of reading, to do or to see the experience of the greatest number. It is because none of these of which we know has entirely satisfied us that we decided to compose the work that we offer today to persons who are charged with instructing or the instructors of children or adults who have been deprived of the benefit of education.’

“One commences by the study of the fourteen simple sounds (or vowels) and of the sixteen simple articulations (or consonants); these last are pronounced by means of the e mute; then come numerous tables: simple vowels followed with a simple articulation, simple articulations followed by a simple vowel, equivalent sounds of the simple sounds, equivalent consonants of the simple consonants, etc., etc. The syllables being regarded as the true elements of words, all kinds of spelling are rejected. The classification of the syllables and their methodical distribution in gradual tables, such was the task to perform. ‘The real base of this classification is the more or less great difficulty that the pupils experience in recognizing and in pronouncing the syllables, a difficulty which is dependent on the number of the letters which compose them, on the number of the letters that are not pronounced, or on the alterations that usage has made between the pronunciation of certain letters and also of certain syllables.’ One can regard the arrangement of the syllabaire of MM. Lamotte, Perrier, Meissas et Michelot as achieving certain progress on that of the mutual schools of 1815.”

This last 1832 “syllabaire” may well be the French material which the American Theodore Dwight, Jr., in 1835 said had dropped “spelling,” mentioned later. Yet the 1832 French method was nevertheless still strongly “sound”-oriented, as were the French monitorial school materials and most other French materials after 1800. Despite the fact that the Code l “meaning” method originated in eighteenth-century
France, and that the Code 3 two-step “phony phonics” method also had its origin in eighteenth-century France, France did not itself make wide use of either of those “meaning” methods until after World War I in the twentieth century, beginning to do so in the early 1920’s. However, by about 1950, such a public uproar had arisen in French-speaking areas against the “meaning” approach, called the “global method” in Europe, that it was largely dropped.
Chapter 11
Summarizing the French Influence

The eighteenth- and early nineteenth-century facts concerning reading history, and the people in eighteenth-century France who were so intimately concerned with reading history, are almost totally omitted from the modern literature. In English-speaking countries, when changes in reading methods came in the nineteenth century, almost no histories of previous methods were given in the works promoting those changes, as Neufchateau had done with his own work in France in 1799. As time went on, the “born yesterday” syndrome became the norm in the discussion of reading methods. The past has therefore largely been buried.

The latest “whole language” craze in the English language, world-wide, is an example of the bald ignorance of reading instruction history demonstrated by our “reading experts.” As will be discussed, “whole language” is largely a recycling of the much-publicized approach used in Quincy in 1875 and in Boston after 1878, where Leigh phonics was forced out. It is also largely a recycling of the “natural” method of the Riverside and Heart of Oak materials of the 1890’s. All of these approaches failed. Yet no suggestion is given in today’s literature that “whole language” is indeed, simply a retread of these old, failing programs.

In the few twentieth-century attempts in English to review reading instruction history, Germany has been listed as the primary source of new reading methods. Ickelsamer of Germany in the sixteenth century has been listed as the presumed source for the synthetic phonics method instead of the true source, Blaise Pascal in France in the seventeenth century. It is absolutely incredible that Gedike of Germany in the late eighteenth century has been listed as the presumed source for the whole-word method, to replace the syllable method, instead of the Quadrille “echo” method and de l’Epee, Radonvillier, and Adam in France, and Basedow in Germany, in the eighteenth century.

Gedike’s whole-word method was primarily a spin-off from the German Basedow’s Pascal-phonics whole-word method of 1770, in which Basedow broke up whole words in order to teach all their letter sounds. Basedow had obviously partly based his work on Pascal phonics as reported in the Encyclopedie article, “Syllabaire.” However, Gedike, although a great admirer of Basedow, used single whole words first in order to demonstrate single letter sounds while Basedow taught every letter sound in sample whole words.

Basedow is never mentioned as an important source of reading methods, even though he was, with the originators of the Quadrille “echo” method, and with de l’Epee and Radonvillier, one of the first to move the teaching of beginning reading from the syllable “sound” level to the whole-word “meaning” level. Of course, unlike them, Basedow used Pascal sounding-and-blending phonics at that level.

However, Basedow’s move from the syllable level to the word level had other spin-offs from one-time instructors in his Philanthropinum school, like Wolke’s phonic method, Trapp’s and Wackernagel’s sight-word methods, and Campe’s.

Jacotot in the 1820’s is usually listed as important in the history of reading instruction because of his use of whole words instead of syllables in reading instruction in Belgium. Yet Jacotot’s background as a college teacher during the French Revolution which spent such great effort on studying reading methods, which efforts may well have inspired Jacotot’s method, remains unnoticed. The possibility is never mentioned that Jacotot may have only been adapting the Quadrille “echo” whole-word method, and Radonvillier’s, Nicolas Adam’s, and Basedow’s whole-word work, as well as the work of their early
followers. Yet the “Lecture” article in the 1880’s Dictionnaire commented tartly that Radonvillier and Adam were the obvious source for Jacotot’s “new” whole-word method, testifying that the whole-word method was clearly not Jacotot’s invention.

Gedike’s and Basedow’s late eighteenth-century whole-word approaches in Germany were almost certainly influenced by Abbe Bertaud’s Quadrille early eighteenth-century whole-word materials from France. As A. Demkes stated in the 1880’s concerning the Quadrille approach, quoted earlier:

“This method had a great vogue in the last century. The king of Prussia, who had been struck by the results, had the prince royal, Frederick William, taught to read by this procedure. Like all reading methods without spelling, it succeeds only with those pupils who have, as has been said, the memory of the eyes.”

Therefore, not only was the use of whole words to teach beginning reading known earlier in eighteenth-century Germany before Basedow’s and Gedike’s day, but the method was also known (at least in France) as a defective method, since, “Like all reading methods without spelling, it succeeds only with those pupils who have, as has been said, the memory of the eyes.”

Since A. Demkes testified in the 1880’s that the Quadrille whole-word method “had a great vogue in the last century,” and was even used by the highly visible King of Prussia in Germany for his own son, it is really amazing that it is instead Gedike of Germany who is credited with having initiated the move from the syllable to the word far later, toward the end of the eighteenth century. Truly, reading instruction history is a black hole.

Before the French innovations of the seventeenth and eighteenth centuries, teaching beginning reading had always meant the teaching of the syllabary - fc, fi, fo, fum, and all the other whole and unbroken syllable sounds. No one ever dreamed of the act of reading as being anything except the sequential reproduction of memorized whole and unbroken syllable sounds, which then produced words, just as the sequential reproduction of memorized whole and unbroken syllable sounds produces words in speech.

However, the history of the teaching of beginning reading demonstrates that the moves from the whole syllable to its parts (phonics) or from the whole syllable to its products (words) originated in France. These moves did not originate in Ickelsamer’s Germany in the early sixteenth century or Gedike’s Germany in the late eighteenth century, or with the French Jacotot teaching in Belgium in the early nineteenth century, as the “expert” literature would have us believe. Instead, the switch from the age-old syllable method (“sound”) to phonics on the one hand (still “sound”) or to whole words on the other (“meaning”) originated in France in the seventeenth and eighteenth centuries.

The two versions of the whole-word “meaning” method also originated in eighteenth century France: either Code 1, the pure “meaning” approach of de l’Epee, or Code 3, the Quadrille “echo” approach, which is two-step phonics using parts of memorized meaning-bearing whole words to work out new words.

The benighted two-step, phony-phonics, whole-word method for children with normal hearing compares memorized whole printed words to an unknown word in order to see like parts. That “echo” method was never fully perfected in France, as it was later in the English-speaking world, but it clearly originated in eighteenth-century France.

The effect of one-step phonics in comparison to two-step phonics can be seen on the standardized “California” tests used about 1980 in the primary grades. The phonics in the “vocabulary” test was
divided into two parts: one required simple phonic answers, but the other necessitated comparing whole words to other whole words to see phonic likenesses. It fascinated me to see my first graders’ exceedingly high scores on the first phonic section drop somewhat on the second phonic section. Did such a score profile also demonstrate to the test-makers whether a teacher was, or was not, teaching real, not “whole-word,” phonics?

Various reading methods were a source of intense study during the French Revolution, at the same time that intense study was given to such plans as Condorcet’s for government schools, and the record of this study persisted in printed reports which undoubtedly had wide distribution outside France. Not surprisingly, therefore, activism for new reading methods became the siamese twin of activism for government schools in English-speaking countries shortly after the beginning of the nineteenth century. Yet both the movement for government schools and the movement to alter reading methods in English-speaking countries had their origin in eighteenth-century France. It is therefore impossible to understand the history of the teaching of beginning reading or the spread of government schools in English-speaking countries without first studying the work on both in eighteenth-century France.
PART 4
The First Large-Scale Intentional Move from Sound to Meaning in America Began in 1826
Chapter 12
On Reading Texts of the Eighteenth and Early Nineteenth Centuries, And on the Dame Schools

It is just a fable that the New England Primer Enlarged was the dominant book to teach beginning reading to children in America in the seventeenth and eighteenth centuries. The erratic and unpopular author of the New England Primer Enlarged, Benjamin Harris, did not even arrive in this country until about 1686. The New England Primer Enlarged, which is presumed to have been Harris’s compilation and the New England Primer in the sense it has since been known, was first advertised in Boston in 1690. As discussed elsewhere, it was apparently unsuccessful, presumably because of Harris’s bad reputation. The probability is that the New England Primer was still not really available until 1727, after Harris’s death. Harris had returned to England many years before 1727, where he had continued to publish for years until he died there, and where he never re-published the New England Primer Enlarged. The first surviving copy of the New England Primer Enlarged was printed in Boston in 1727 by another publisher who had no connection with Harris, but that edition appears to have been available only in tiny quantities, since the next surviving copy came out years later. The New England Primer Enlarged was not really widely published until almost forty years later - and even then the record demonstrates that it was not used for the teaching of beginning reading, but only as a religious catechism.

It is obvious that other materials than Harris’s elusive primer must have been in use for the teaching of beginning reading all throughout the seventeenth century, from the arrival of the Pilgrims in Massachusetts in 1620 and from the arrival of the settlers in Virginia, and long before Harris’s 1690 announcement that he was going to print the New England Primer Enlarged. As shown elsewhere, those other materials used in the seventeenth century in Colonial America continued in use for the teaching of beginning reading all throughout the eighteenth century.

According to Clifton Johnson’s Old-Time Schools and School-books, in 1665 or 1666, Northampton, Massachusetts, paid for scholars “such as are in the primer & other English books....” That was about twenty-five years before the announcement that Harris’s New England Primer Enlarged was to be published. Those 1665 New England children could not have been using Harris’s primer, but had to be using some other primers. Yet the children would have used those primers as a second step, since they would have been using horn books or spelling books, and possibly even the 1643 Day speller published in Boston, as the first step in learning to read, just as their parents and grandparents had done in England.

The fact that hornbooks were used as the beginning step in America in 1691, even AFTER the New England Primer Enlarged was presumably finally available, is recorded in Ellen Schaffer’s article, “The Hornbook - an Invitation to Learning,” in The Horn Book Magazine, February, 1971. Schaffer said:

“An entry in the diary of Samuel Sewall in 1691 mentioned a little lad going to school accompanied by his cousin who carried his hornbook for him.... He was not quite three years old.”

The hornbooks had been in use New England long before 1691. Susan Steinfisz, in her interesting unpublished dissertation, The Origin and Development of the ABC Book in English from the Middle Ages through the Nineteenth Century, University of Pittsburgh, 1976, in which I found the above reference, also quoted the following from page 8 of of Beulah Folmsbee’s work, A Little History of the Horn Book. Boston, Horn Book, 1942:
“...Beulah Folmsbee refers to a 1632 statement by one Morton who wrote in his book, New England Canaan, of the Puritan Sectarie who came over to New England and brought ‘a great Bundell of Horne books with him, and careful hee was (good man) to blott out all the cross of them for feare least the people of all the land should become Idolators.’”

That certainly seems to establish that children in New England had been taught to read by the use of hornbooks, not primers, since at least 1632, and that was only 12 years after the Puritans had arrived there.

On page 146 of her book, Dr. Steinfirst wrote:

“In 1647, the General Court of Massachusetts provided for the establishing of reading schools because it was ‘one chief project of that old deluder, Satan, to keep men from knowledge of the Scriptures.’”

The expression, “reading schools,” instead of just the simple word, “schools,” undoubtedly was used in 1647 because “reading” had been taught apart from “writing” in England ever since about the late fourteenth century. “Writing schools” existed apart from “reading schools” as late as the 1790’s in New England.

Obviously, some kinds of texts were needed for such “reading schools” which were officially established in 1647 specifically to teach beginning reading so that children could read the Bible. The texts these schools used must have included imported horn books and imported spelling books, and perhaps even the American-printed Day speller published only four years before, in 1643. Furthermore, it is only reasonable to assume that some such schools must have existed unofficially before the 1647 law made their establishment mandatory. The probability is that they were widespread wherever the size of the local population warranted their establishment, and the large numbers of hornbooks imported in 1632, mentioned above, must have been used not only in private homes but in such schools.

As discussed, the popularity of the New England Primer Enlarged dates only from after 1750. Even after that, it was almost certainly used as a catechism for children and as a religious manual for adults, and not as a beginning reading book. It is interesting that it is not even mentioned in Noah Webster’s anecdotes about schoolbooks used when he was a boy in Connecticut. On March 10, 1840, Noah Webster wrote a letter to Henry B. Barnard, publisher of the American Journal of Education, which letter Barnard published. In it, Webster said:

“When I was young, the books used were chiefly or wholly Dilworth’s Spelling Books, the Psalter, Testament and Bible.”

Webster also confirmed, therefore, that a primer, ANY primer, was not the first book used to teach reading in school when he was a boy. The spelling book was the first book when he was a boy. Noah Webster (1758-1843) would have learned to read about 1764 so his comments concerned the period from 1764.

The eighteenth century was the period when literature for children was increasing mightily in Europe, and surely the increase must have had some impact in America. From that consideration alone, it is astonishingly naive to assume that the New England Primer was the uniformly used reading book for American children until about the nineteenth century. For instance, Mary F. Thwaite wrote the following (in From Primer to Pleasure in Reading, Boston, The Horn Book, Inc.: 1972 - copyright 1963, page 246):
“But children’s book publishing was growing fast in the second half of the eighteenth century in Europe, as recorded by a regular visitor to the Leipzig Book Fairs in 1787. Friedrich Gedike, a Berlin schoolmaster, wrote in the programme of his Gymnasium that year some observations about schoolbooks and other works for children, stating that no form of literary manufactory had become as common as the making of books for youth, often of inferior quality. ‘At every Winter and Summer Fair at Leipzig,’ he wrote, ‘there flows in, like the flood of the sea upon the shore, a countless number of books....”

Thwaite reported that Gedike had said that not much in the way of “pearls or amber” was available, but “mostly mud, or at best painted snail-shells.” Yet there was an astonishing variety of materials for children, such as newspapers, storybooks, poetry, history, travel books, and more, as well as reading books in many languages. Thwaite said that Gedike found fault with the advertising of frequently worthless children’s books as “Christmas Gifts for Good Children. Yet he would hardly have done so unless there was a vast quantity of such material for children being offered commercially.

Not only the European continent but eighteenth-century England was full of popular, cheap reading materials for children as well as adults. Thwaite wrote (pages 39-40):

“...Less reputable publishers... knew what ordinary folk, both young and old, wanted, and they intended to purvey cheap books sure to sell. The unsophisticated masses, encouraged by authority to read, so that they might know their Bible, were as ready to imbibe all kinds of lurid improbabilities in print as they were to enjoy old wives’ tales.... It was these conditions which gave rise to the rapid growth of chapbook literature in the eighteenth century. The lapse of licensing for the printing trade in 1695, and the growing interest in secular literature, were other potent contributory causes.

“Chapbooks were the flimsy little productions sold by the ‘Running Stationers’... and were usually hawked around the countryside at cottage doors, village fairs, and other places where likely customers might be found. The salesmen were itinerant peddlars or chapmen, who usually sold other wares besides penny and halfpenny books. Among the better chapbooks were versions of the old romances already described....

“In style and appearance chapbooks were of inferior quality, though designed always to attract the customer. Another important feature was their illustration....”

Thwaite said further (pages 60-61):

“The spread of cheap literature of an irreligious or subversive nature was looked upon as a real danger to the welfare of society at the end of the eighteenth century....

“‘Vulgar and indecent penny books were always common,’ wrote Hannah More to Zachary Macaulay in 1796, ‘but speculative infidelity, brought down to the pockets and capacities of the poor, forms a new era in our history.”

So large numbers of “the poor” in eighteenth century England were not only able to read the penny books which “were always common,” but had a high enough “reading comprehension” of what was in them that Hannah More thought they could absorb written arguments for “speculative infidelity.” Yet almost the only way “the poor” in England could have learned to read in the eighteenth century was in dame schools, or at home!

“The true chapbook as a common vendible piece of reading matter distinct from broadside ballads, almanacs and the like, really came into embryonic existence in the seventeenth century, and grew up rapidly after the Star Chamber was abolished in 1641. A horde of political and religious pamphleteers fell upon the excited public as soon as they could do so, with reasonable safety. In fact, as Milton, the greatest of all apologists for a free press, complained, they ‘well-nigh made all other books unsaleable.’ But the other - non-controversial - books did appear. Thus there were editions of Guy of Warwick (in prose) in 1640 (licensed, if not published) in 1681, 1685, 1695, 1703, to say nothing of one or two which bear no dates.... The Licensing Act of 1662 did not hinder this stream... but when that Act expired in 1694, the strenuousness of controversy had abated, and fiction - the main [part] of chapbook literature - had a more ample share. The Copyright Acts - the first, ‘An Act for the Encouragement of Learning,’ was passed in 1710 - made no difference to the increasing number of literary pirates, who “encouraged learning” in a manner quite different from that intended by legislators influenced by authors and reputable booksellers. The day of the penny, twopenny, and sixpenny chapbook had dawned, and by the middle of the eighteenth century the grimy little productions were everywhere....

“In short, the chapbook, from 1700 to 1840 or thereabouts, contained all the popular literature of four centuries in a reduced and degenerate form: most of it in a form rudely adapted for use by children and poorly educated country folk.”

While Darton regarded the chapbooks with an obvious contempt, he made it clear that chapbooks were produced in vast numbers from about 1700 to after 1840 for the “mind of humbler England,” such as “children and poorly educated country folk.” The poor during those years were paying out some of their meagre coins to purchase enjoyment - by reading. Darton quoted with contempt from about the mid-eighteenth century what he called a “hotch-potch” version of the old tale of Valentin and Orson. Yet its readability level was very high! No functional illiterate could possibly have handled it. Darton seemed oblivious to the interesting fact - ignored in our era of government schools - that vast numbers of the “humbler” people in eighteenth century England were literate. Darton also produced the interesting fact that the chapbooks, which had been the reading amusement of the poor, were not wiped out by any frontal attack. Darton said the chapbooks were still on the market when Victoria married Albert, which was on February 10, 1840, so they simply died out very silently some time after that date. The chapbooks died out after 1840, not because the poor and the children of the poor had run out of the pennies to buy them, but because so many of the newer generation of the poor, who had learned after 1830 to read by “meaning” instead of by “sound” in government-subsidized schools, could not really read, or at least could not read with enjoyment. (“Psycholinguistic guessing,” the result of the “meaning” beginning-reading method, is a very disagreeable way to have to read.) The chapbooks were killed off after 1840 by the same things that killed so many of our newspapers after 1940: “psycholinguistic guessing” and the educational disease known as functional illiteracy, which are the gifts we can always depend on receiving from our highly-paid “reading experts.”

It is customary to discount the degree of literacy of the poorer classes in England in the eighteenth century, and to attribute increases in literacy to the laudable Sunday schools formed toward the end of the century. Yet, from the vast market for the cheap chapbooks, it seems probable that literacy was far more widespread than is generally acknowledged.
The chapbooks obviously were read in America - and published in America. In the New York Public Library are two copies of Mrs. Barbauld’s Lessons for Children from 4 to 5 years old (New York Public Library Call Number *KVD Barbauld). Both copies are paper covered and are about 2 by 4 inches. On each cover, on what was probably once white paper but is now tan, is a different design in blue, apparently stenciled. Despite the Barbauld content, the little “books” are obviously chapbooks. They were published in Wilmington, Delaware in 1801, “Printed and sold by P. Brynberg,” very likely a descendant of the early Swedish colonists. On the last page is an advertisement for his other publications, and they were obviously largely the chapbooks of the eighteenth century:

“Books Printed and Sold by Peter Brynberg, Market Street, Wilmington, for the Entertainment and Instruction of the Little Masters and Misses in the United States.”

Valentine and Orson
Seven Wise Masters.
Seven Wise Mistresses.
Academy of Compliments.
Arabian Nights Entertainments.
Book of Knowledge.
Universal Dream Book.
Robinson Crusoe.
Deeds of Old
Fairy Tales.
Prompta.(?)

History of Little Jack.
History of Margery Two Shoes.
History of Dick by (?)John.
Entertaining Tales for Children.
The Father’s Legacy to his Daughters.
Little Masters’ and Misses’ Delights.
Gulliver’s Travels.

In 1797, Peter Brynberg had published the Universal Spelling-book, reported by R. C. Alston in Volume IV of his A Bibliography of the English Language from the Invention of Printing to the Year 1800, Printed for the Author by Ernest Cummins, Bradford, 1969.

Teaching children to read by the syllable method is not very demanding, in any event, and that is how children were taught in the dame schools of the eighteenth century. That is how the “Little Masters and Misses in the United States” had learned to read by 1801. They obviously provided a profitable market for Peter Brynberg’s Wilmington output, since it was of a considerable size.

An excellent source on the “curriculum sequence” of the dame schools appears in a child’s story first published in 1765, which story is considered today to be fine literature and is often attributed to Oliver Goldsmith. To show its widespread fame as late as 1801, it was included in Brynberg’s chapbook list as History of Margery Two Shoes. As Thwaite remarked concerning the story about Goody Two-Shoes, (page 51):
“By 1766 it was in a third edition, and although like other Newbery books, Goody Two-shoes bears the marks of its period, its charm of style, humour and feeling ensured it a longer life than its companions on Newbery’s shelves. Its appeal to the discriminating is witnessed by Charles Lamb, who praised it in a letter to Coleridge in 1802, when he lamented that it was almost out of print, banished with other classics of the nursery by ‘Mrs. Barbauld’s stuff’.

“Goody Two-Shoes, still immensely engaging, is commonly considered to have been written by Oliver Goldsmith. Published by John Newbery in London in 1765, he advertised it amusingly with the comments, ‘See the Original Manuscript in the Vatican at Rome,’ and ‘the Cuts by Michael Angelo’” (Thwaite, page 52).

Thwaite described it (page 51):

“The story tells how poor orphan Margery, whose father had died of a violent fever ‘in a place where Dr. James’ Fever Powder was not to be had,’ gets her two shoes instead of half-a-pair, learns to read, becomes ‘a trotting tutoress’ and teaches children, not merely their letters but lessons for the conduct of life....She (becomes) the head of an Academy where the animals she has rescued from cruel boys help her to run the school. At last she wins the reward of all her industry and virtue marrying the Lord of the Manor.”

The story unintentionally reflects mid-eighteenth century life, and not only that the poor were taught to read, but precisely how they were taught to read: by the syllabary and spelling, not by “primers.”

The Heart of Oak Books, Second Book, Edited by Charles Eliot Norton, D. C. Heath & Co., Boston: 1895 (1902) contains a shortened version of Goody Two-Shoes. That some of the students of the trotting tutoress were poor, indeed, is shown by this excerpt (page 145):

“The next place we came to was Gaffer Cook’s cottage. Here a number of poor children were met to learn, who all came round Little Margery at once; and having pulled out her letters, she asked the boy next her, what he had for dinner.

‘Who answered, ‘Bread’ (the poor children in many places live very hard).

‘Well, then,’ says she, ‘set the first letter.’“

She had him spell out “bread,” and then asked the other children the same question. They had happier answers: “apple-pie,” or “potatoes,” or “beef and turnips.” All answers were duly spelled out with the letters.

Goody Two-Shoes traveled around the neighborhood carrying her collection of ten complete sets of the small letters of the alphabet and six complete sets of the large letters, which she had cut herself by her knife out of wood. “And having got an old spelling-book, she made her companions set up all the words they wanted to spell” (pages 141-142). Since Goldsmith came from Dublin, one wonders if he had been exposed as a child to the similar “typographical scrutore” alphabets of Dumas described in Rollins’ book published in Dublin in 1739, referred to elsewhere.

To one little boy, Goody was teaching the basic alphabet. She put down a mixed-up alphabet and he had to name the letters as he picked them up and placed them in alphabetical order. This obviously showed that he had learned his letters.
The next higher achiever had a different task (page 144):

“‘Come in, Madge (Ed.: for Margery Two-Shoes); here, Sally wants you sadly; she has learned all her lesson.’

“Then out came the little one.

“‘So Madge!’ says she.

“‘So Sally!’ answered the other, ‘have you learned your lesson?’

“‘Yes, that’s what I have,’ replied the little one, in the country manner; and immediately taking the letters she set up these syllables:

“ba be bi bo bu, ca ce ci co cu,
da de di do du, fa fe fi fo fu,

“and gave them their exact sounds as she composed them; after which she set up the following: -

“ac ec ie oc uc, ad ed id od ud,
af ef if of uf, ag eg ig og ug,

“and pronounced them likewise....

“After this, Little Twoshoes taught her to spell words of one syllable, and she soon set up pear, plum, top, ball, pin, puss, dog, hog....”

By the four periods following “likewise,” The Heart of Oak version indicates something was left out at that point. Presumably the omitted section in the original story concerned the rest of the syllabary. The story mentioned that Goody had found an old spelling book to use, and spelling books of the eighteenth century gave the whole syllabary and consonant blends (bla, ble, bli, blo, blu, etc.) and then usually began the one-syllable step by sound analogy, such as in “band, hand, land.” Yet, even the portion reproduced in The Heart of Oak version accurately showed that the one-syllable step followed the syllabary. Equally, it showed the two-syllable step at the trotting tutoress’s next stop, at Gaffer Cook’s cottage, where she was working with children on words of two or more syllables (turnips, apple-pie, potatoes). Finally, she went to Farmer Thompson’s, “where there were a great many little ones waiting for her” (pages 145-146):

“They all huddled round her, and though at the other place they were employed about words and syllables, here we had people of much greater understanding, who dealt only in sentences.

“The letters being brought upon the table, one of the little ones set up the following sentence:

“The Lord have mercy upon me, and grant that I may be always good, and say my prayers, and love the Lord my God with all my heart, and with all my soul, and with all my strength; and honor government and all good men in authority.

“Then the next took the letters, and composed this sentence: -
"Lord have mercy upon me, and grant that I may love my neighbor as myself, and do unto all men as I would have them do unto me, and tell no lies; but be honest and just in all my dealings."

The third and the fourth child composed like sentences, deeply religious and of startlingly high “readability” levels. To show how far we have sunk culturally, it is probable that the story of Goody Two-Shoes would be banned from any government school because of its “religious content” - the same government schools that oppose “censorship” of “literature” with obscene content. Of course, most primary grade school children who learned by sight words would be unable to read the religious content of Goody Two-Shoes, anyway, so the “banning” would be rather pointless.

In due course, Goody ceased being a trotting tutoress and became a stationary one (pages 148-149):

"Mrs. Williams, who kept a college for instructing little gentlemen and ladies in the science of A, B, C, was at this time very old and infirm, and wanted to decline that important trust. This being told to Sir William Dove, who lived in the parish, he sent for Mrs. Williams, and desired she would examine Little Twoshoes, and see whether she was qualified for the office.

“This was done, and Mrs. Williams made the following report in her favor, namely, that Little Margery was the best scholar, and had the best head, and the best heart of any one she had examined.

“All the country had a great opinion of Mrs. Williams, and this character gave them also a great opinion of Mrs. Margery, for so we must now call her...”

Note that “All the country had a great opinion of Mrs. Williams....” That certainly implies that dame schools also could be greatly respected in eighteenth century England, in sharp contrast to nineteenth century England when government school activists vilified dame schools.

Goody Two-shoes is not the sole narrative testimony to school practices for beginners in Great Britain in the eighteenth century. Mary F. Thwaite recorded another eighteenth century story concerning the teaching of rural children (page 152):

"An interesting example describing a rural dame school of the period is The Village School (ca. 1783) by Dorothy Kilner. Here Mrs. Bell, ‘a very good woman’, teaches little boys and girls to read, and the girls ‘to spin, knit stockings, and to hem, fell, stitch and mark’. The clergyman, Mr. Right, is much in evidence. He helps to pay for the poor children’s schooling, plays with the scholars at cricket, and helps them to fly their kites.”

In discussing the poetry of the Reverend George Crabbe (1754-1832), Cubberley said:

“The English poet Crabbe was essentially a poet of the homely life of the people. In his description of the Borough, in speaking of the “Poor and their Dwellings,” he pays a passing tribute of respect and gratitude to his first teacher, in the following lines describing the Dame School he attended:
“At her old house, her dress, her air the same,
I see mine ancient letter-loving dame:
‘Learning, my child,’ said she, ‘shall fame command;
Learning is better than house or land -
For houses perish, lands are gone and spent;
In learning then excel, for that’s most excellent.’
‘And what her learning?’ - ‘T is with awe to look
In every verse throughout one sacred book.
From this her joy, her hope, her peace is sought;
This she has learned, and she is nobly taught.
If aught of mine have gained the public ear;
If RUTLAND deigns these humble Tales to hear,
If critics pardon, what my friends approved;
Can I mine ancient Widow pass unmoved?
Shall I not think what pains the matron took,
When first I trembled o’er the gilded book?
How she, all patient, both at eve and morn,
Her needle pointed at the guarding horn;
And how she soothed me, when with study sad,
I labored on to reach the final zad?
Shall I not grateful still the dame survey,
And ask the Muse the poet’s debt to pay?
Nor I alone, who hold a trifler’s pen,
But half our bench of wealthy, weighty men,
Who rule our Borough, who enforce our laws,
They own the matron as the leading cause,
And feel the pleasing debt, and pay the just applause:
To her own house is borne the week’s supply;
There she in credit lives, there hopes in peace to die.”

Cрабbe’s poem is more eighteenth-century testimony on the high public regard given, not only to the English dame school heads, but to the dame schools themselves.

Cubberley said, “Another English poet, Henry Kirke White (1758-1806) also describes his school in a somewhat similar vein:

“‘In Yonder cot, along whose mouldering walls,
In many a fold the mantling woodbine falls,
The village matron kept her little school -
Gentle of heart, yet knowing well to rule.
Staid was the dame, and modest was the mien,
Her garb was coarse, yet whole and nicely clean;
Her neatly border’d cap, as lily fair,
Beneath her chin was pinn’d with decent care;
And pendent ruffles of the whitest lawn,
Of ancient make her elbows did adorn.
Faint with old age, and dim were grown her eyes;
A pair of spectacles their want supplies.
These does she guard secure in leather case,
From thoughtless wights in some unwetted place.
Here first I entered, though with toil and pain,”
The low vestibule of learning’s fane -
Entered with pain, yet soon I found the way,
Though sometimes toilsome, many a sweet display.
Much did I grieve on that ill-fated morn
When I was first to school reluctant born;
Severe I thought the dame, though oft she tried
To soothe my swelling spirits when I sighed,
And oft, when harshly she reproved, I wept -
To my lone corner broken-hearted crept -
And thought of tender home, where anger never kept;
But, soon inured to alphabetic toils,
Alert I met the dame with jocund smiles -
First at the form, my task for ever true,
A little favorite rapidly I grew;
And oft she strok’d my head, with fond delight
Held me a pattern to the dunce’s sight;
And, as she gave my diligence its praise,
Talked of the honors of my future days.”

Cubberley referred to still another eighteenth-century English poet, William Shenstone [1714-1763], who wrote about the dame schools, saying Shenstone:

“has immortalized, in a poem of three hundred and fifteen lines entitled The Schoolmistress, his early dame-school teacher, and has also given a detailed description of the school. This has been said to rank in poetry with the paintings of Teniers and Wilkie for its truthfulness of portrayal....”

Cubberley quoted two verses but said the whole poem had appeared in Barnard’s American Journal of Education, Vol. III, pp. 449-55. The second verse of the two verses Cubberly gave is quoted below. That verse is interesting because it confirms the presence of a dame school in every English village in the eighteenth century, and confirms that the little ones in the dame schools had actual lessons to “con,” which means they were being taught simple reading.

“In every village mark’d with little spire,
Embowered in trees, and hardly known to fame,
There dwells, in lowly shed and mean attire,
A matron old, whom we schoolmistress name,
Who boasts unruly brats with birch to tame;
They grieveen sore, in piteous durance pent,
Awed by the power of this relentless dame,
And oft-times, on vagaries idly bent, ‘
For unkempt hair, or task unconn’d, are sorely shent.”

Such authors had no vested interest in these simple dame schools. They were only telling stories whose settings were in their own time. They therefore unconsciously painted as background their own familiar world. Historically speaking, one of the best sources for facts about a culture are those facts which are mindlessly embedded in the backgrounds of its stories. Using this concept as an historical yardstick, it is reasonable to assume, despite some negative lines in the last poem, that the eighteenth-century dame schools were, generally speaking, pleasant for the students, successful in their teaching, and regarded with respect by the eighteenth-century public. There is hardly a trace of antipathy to dame schools in these contemporary writings.
These English dame schools, so charmingly described in Goody Two-Shoes and The Village School, were also turning out the great number of middle and lower class literates who were buying the eighteenth-century massive production of chapbooks in England. Yet, in less than a century, such dame schools would be described by government-school activists in Great Britain as most commonly being hell-holes in which it was almost impossible to learn. It seems highly improbable that the vast majority of dame schools in the mid-nineteenth century were as those government-school activists described them, since the historical descriptions of dame schools from the eighteenth-century are almost totally contradictory.

Background on Noah Webster’s Synthetic Phonics

In eighteenth century America, Noah Webster was directly concerned with a change in the teaching methods for beginning reading which had come down from antiquity: the memorization of the syllabary as a key to unlock print. Instead, Webster incorporated in the spelling book which he wrote in 1783 the 1655 invention of that French scientific genius, Blaise Pascal. That invention was true synthetic phonics.

True synthetic phonics should be defined. Most consonant sounds cannot exist apart from a vowel; syllables are units composed of a vowel alone or a vowel and one or more consonant sounds. Therefore, the idea of considering consonant sounds separated from vowels (as is the case in synthetic phonics) is only an abstraction, and so is the idea of blending these abstract sounds. The three sounds, “cuh-ah-tuh,” cannot in reality be blended to form the spoken word, “cat.” But it was the conception of abstract consonant sounds (which do not exist) and the concept of blending of such abstract sounds into syllables (which is clearly impossible) that produced that extraordinarily successful teaching technique, synthetic phonics.

It is hardly surprising to discover that synthetic phonics was the brainchild of the scientific and mathematical genius, Blaise Pascal in 1655. Science deals with analysis and synthesis. Reading already had sound “analysis” with the syllable method, in which syllables were arranged in regularly formed sound patterns so that the sounds of consonants and vowels could be analyzed by comparison: ba, be, bi, bo, bu, - ab, eb, ib, ob, ub; ca, ce (s), ci (s), co, cu - ac, ec, ic, oc, uc (and so on). In a truly complete syllabary, all consonants and usable consonant blends were placed before and after all the vowels: bla, ble, bli, blo, blu, etc., and act, ect, ict, oct, uct, etc.). English spelling books containing complicated English spellings extended the method by applying it to spelling analogies: cake, make, bake; find, bind, kind; and eight, freight, sleigh. What Pascal added to the syllable method was phonic “synthesis.” With his method, children had only to learn the relatively few isolated sounds of the letters of the alphabet, (and their variations as with the “s” sound for the syllables ce, ci and other French irregularities) after which they could easily blend the letters to form the long syllable tables which previously had to be learned slowly, by analysis. Synthetic phonics used on the syllable tables placed a far lower load on the memory than the syllable tables alone had done, and it was correspondingly far more successful.

When Pascal’s synthetic phonics method was finally adapted to the reading of English, necessary additions had to be made to make it thoroughly workable: silent letters had to be marked, variant vowel sounds had to be learned (ou, aw, oi, etc.) and so on.

Pascal’s phonics, mentioned in his sister Jacqueline’s letter to him from the Port Royal school of October 26, 1655, and in Antoine Arnauld’s letter of January 31, 1656 (mentioned in the article on Blaise Pascal in the Dictionnaire de Pedagogie et d’Instruction Primaire, Librairie Hachette et Cie., Paris, 1887) appeared in 1664 in the Grammaire of the Port Royal Jansenist school in France, which was written by Antoine Arnauld. As mentioned, the article, “Syllabaire,” in Denis Diderot’s Encyclopedie in France in the mid-eighteenth century praised the method, because it made the learning of syllables so much more
rapid, but the article emphasized that it was still essential to memorize the sounds of all the syllables. Pascal’s idea had lain largely dormant for about a century, with some slight use being made of it in France. This use was described in the article mentioned previously, “Lecture,” in F. Buisson’s 1887 Dictionnaire de Pedagogie et d’Instruction Primaire. It was not until after the mid-18th century that the use of Pascal’s synthetic phonics really spread, influencing possibly the teaching of deaf-mutes. Braidwood’s school with a phonic method began in Edinburgh in 1760 and Heinecke’s in Germany not long after.

An earlier connection in the seventeenth century between phonics for hearing children and phonics for the deaf is suggested by the historical record. It is conceivable that Pascal’s 1655 idea was inspired by a 1620 text for teaching the deaf which appeared in Madrid.

Teaching spoken language to the deaf was first done apparently in the sixteenth century. The pagan “classical world” of the Greeks and Romans had exhibited predictable callousness towards the problems of the deaf and there is no record of deaf education in that ancient world. Yet, as early as the eighth century in Christian England, the historian monk, Bede, told of a manual alphabet used to teach language to the deaf.

The development of the language areas in the brains of American students may have been stunted at the precise ages when those areas of the brain are reported to be maturing (from the ages of about seven to ten years). The stunting may have resulted from the appalling defects in the methods by which the students were taught to read and by the dumbed-down vocabulary and syntax in the textbooks and storybooks given to them to read afterwards. (This is in addition to the vacuous subject-content of the textbooks). The idea of such a critical age for language exposure in brain development is hard to deny. Everyone is aware of how easy it is for a seven- or eight-year old child to pick up a language in a new country with the greatest of ease, while his university-educated, but mature, parents, will have difficulty in acquiring enough language to find and get around in the local buses.

Concerning possible proof of critical ages in brain development, the following appears in Human Neuropsychology, by Henri Hecaen and Martin L. Albert, John Wiley & Sons, New York, 1978, page 418:

“...we wish to make allusion to the unusual case of a child deprived of all verbal communication from 20 months to 13 years of age (Fromkin et al, 1974). Despite the return to a normal life, this child has acquired only a limited amount of language. Dichotic listening studies showed that only the right hemisphere was treating material, verbal or non-verbal. The problem of a critical period of maturation affecting transfer of language representation from one hemisphere to the other may now be posed, in a different manner: perhaps without adequate stimulation during maturation, a preformed cerebral zone may not be able to acquire its functional capacities.”

In the fifteenth century, Rudolf Agricola (1443-1485), the classical scholar, told of a deaf man who had learned to communicate by writing. The beginning of teaching spoken, and not just written, language to the deaf was the work of a Spanish monk, Ponce de Leon (1520-1584). About fifty years after Ponce de Leon’s efforts, a Spanish priest, Juan Pablo Bonet, published a book for the education of the deaf in

---

spoken language which showed the position of the vocal organs when pronouncing each letter. Bonet’s book, published in Madrid in 1620, contained, according to the 1913 Catholic Encyclopedia, “many valuable suggestions useful to modern teachers of articulation and lip reading.”

It is conceivable that Ponce de Leon was influenced by the 1527 book of the German, Valentin Ickelsamer, whose work has been discussed previously, and who had hearing children concentrate on the position of their mouths in forming consonants. Also, it is conceivable that Pascal by 1655 may have seen and been influenced by this 1620 Spanish work for the deaf, when he made his 1655 suggestion to use sounding-and-blending phonics for hearing children. However, just as Ickelsamer’s work appeared to be concerned with analytic phonics - the analysing of sounds in whole words, so may the Spanish work for the deaf been conceived of by its inventors as an analysis of spoken whole syllables. The “synthesis” of individual consonant letter sounds is actually an impossibility because there are no such things as isolated consonant sounds - only isolated vowels or semi-vowels. The imaginary abstraction of isolated consonant sounds, so that “synthesis” of consonants and vowels could aid beginning reading, appears originally to have been solely work of the scientific genius, Blaise Pascal.

After the 1620 Spanish text, the idea of teaching speech to the deaf spread, with other promoters, such as John Conrad Amman (1669-1724) of Switzerland and Samuel Heinecke (1729-1790) of Germany. Thomas Braidwood opened his school in Edinburgh in 1760. That the spread of effective methods for teaching oral language to the deaf followed immediately after Bonet’s and Pascal’s work suggests direct influence from one or both. However, Pascal may have had his phonic influence limited to hearing children with synthetic phonics, and Bonet to deaf children with analytic phonics.

The phonic idea, probably from Pascal, influenced the teaching of elocution. Thomas Sheridan, Jr., (1718-1788), the Anglo-Irish father of the playwright, Richard Sheridan, was himself the son of Thomas Sheridan, Sr., (1687-1738) “a schoolmaster of highest repute,” according to the Encyclopedia Britannica (1963). Thomas Sheridan, Sr., was a close friend of the author of Gulliver’s Travels, Jonathan Swift, and Thomas Sheridan, Jr., in 1784 wrote a Life of Swift. Thomas Sheridan, Jr., therefore, obviously grew up in a very education-conscious and literate household, and would have been exposed to many books, one of which may have been a work by Charles Rollin of France (1661-1741). In 1726, Rollin of France published his Supplement au Traite des Etudes. Rollin spoke with great approval of Dumas’ Bureau Typographique which used little letter cards and holders to teach Pascal’s synthetic phonics. Rollin’s “De la maniere d’enseigner et d’etudier les belles-lettres” was translated into English and published in Dublin, Ireland, in 1738, according to Fifteenth to Eighteenth Century Rare Books on Education of the National Institute of Education in Washington, 1976. Rollin’s Supplement very likely was also available in Dublin in the Sheridan household. Thomas Sheridan, Jr., must have absorbed Pascal phonics through some such source since it is unlikely that he reinvented the idea of synthetic “pronouncing print.” (Sheridan’s dictionary did not, however, follow Pascal’s method for naming the letters, following each with a schwa sound, but instead preceded each with a short “e.” Sheridan obviously did not get Pascal’s material directly but indirectly.)

Rollin said, concerning Du Mas’ materials which used Pascal’s phonics (from pages 6 and 8 of the 1738 Dublin reprint of De La Maniere..., as shown above, Volume 309 in the NIE catalog):

“There has lately been offered to the publick a new method of teaching children to read, entitled, The TYPOGRAPHICAL SCRUTORE, or BUREAU, the invention of which we owe to Mr. Du Mas.... The typographical scrutinore is a table or board, much longer than broad, on which is fixed a kind of shelf, consisting of three or four stories or ranges of little boxes or cells, in which are laid the different sounds contain’d in a language, express’d by characters, single or compounded, on so many cards. Each of these cells has its title, denoting the letters which lie in it. The child ranges on the table or board, the sounds of such words as are ask’d him, by taking
them out of their respective drawers, in the same manner as a printer selects out of his box, the
various letters of which his words are compos’d; and ‘tis for this reason, that the scrutore in
question had the epithet typographical given it.

“This way of learning to read, besides many other advantages, has one which appears to me
very considerable, and that is, its being entertaining and agreeable, without having the least air of
study."

So the idea of Pascal’s synthetic phonics was sown in Dublin in 1738 with the translation of Rollin’s
work describing Du Mas’ use of it. This Dublin reprint was obviously meant to be sold to schoolmasters
like Sheridan’s father.

That 1738 translation apparently influenced the writing of two other books in Dublin. Neither showed
an author, which is intriguing, and both are reported by Alston in his A Bibliography of the English
Language from the Invention of Printing to the Year 1800, Printed for the Author by Ernest Cummins,
Bradford, 1969. In Volume I, English Grammars Written In English, on page 97, Alston showed his entry
No. 475, which was published in Dublin in 1743 by M. Cooper:

Anonymous. A New English Grammar: Containing Such Useful Observations in Spelling and
Amendments in the Sounds of Letters as Will Enable Even a Mean Capacity Soon to Become a
Master of the English Tongue....

Alston described it as follows:

“(pronunciation, accentuation; homophones; prosody.)”

This 1743 book certainly may have been influenced from Rollins’ book published in Dublin in 1738.

In Alston’s Volume IV: Spelling Books, the following was illustrated on Plate LIII, and described
under item No. 422:

“The Irish Spelling Book; or, Instruction for the Reading of English, Fitted for the Youth of
Ireland, ‘in which are set forth many useful Observations in Spelling, Alterations, and
Amendments in the Sounds of Letters, both Single and Double; Exact Formations of both Sorts
by the several Organs of Voice; --- A Discourse on Prosody:--- A large Chapter about various
Quantities of Vowels, Change, and Loss of Letters and Syllables in Pronunciation; ---Rules for
the right Reading of Prose and Verse....’ [etc., but the rest of the title page not dealing with
phonetics] Dublin: printed by and for James Hoy, Printer and Bookseller.... 1740.”

Alston noted under his entry 422 for The Irish Spelling Book of 1740 that its author was unknown,
but that it was discussed by W. Bohnhardt in Phonetische Studien, II, 1889, pages 64-82. It is obvious that
the German author in 1889 recognized The Irish Spelling Book of 1740 as exceedingly important in the
history of phonetics. Alston who also obviously recognized its great importance reproduced the book
elsewhere in its entirety. An examination of one of the copies Alston took the trouble to have reproduced,
which is presently in the British Library, showed it is, among other things, a dissertation on simple,
synthetic phonics for the teaching of reading in English. It is a brilliant and original book.

The first page of the reproduction reads:

“English Linguistics 1500-1800 (Collection of Facsimile Reprints) Selected and edited by R.
Its title page reads:

The following page has this “Note:”

“Reproduced... by permission of the Director of Jena University Library. The author of The Irish Spelling Book has never been identified, but the work remains today an indispensable source of information on the pronunciation of England during the last half of the eighteenth century. As acknowledged in the Preface, the work borrows substantially from Isaac Watts’ The Art of Reading and Writing English (1721), and frequently reprinted throughout the eighteenth century. As with so many early schoolbooks, the text is arranged in a catechetical form.

“Only two copies of the original have been traced - the British Museum copy (in very fragile condition - 12984. aaa. 18) and the Jena copy. For a brief phonological study, see W. Bohnhardt, Phonetische Studien, II, 1889, 64-82. Reference: Alston IV, 422.”

The book itself is 346 pages long. “The Preface” referred scornfully to “idle Romances” then in use in Ireland, (obviously, the chapbooks) and implicitly confirmed that children could, indeed, read them. The author’s major objection to such “idle Romances” was that reading them could do nothing to teach children to pronounce English properly, which was obviously necessary if the children were to prosper in a society dominated by England. The author wrote:

“The children in Ireland are generally train’d up in reading idle Romances, which fill their Heads with wild, and unnatural Fancies, and corrupt their Morals, also... whereas Books, furnish’d with Observations and Rules, setting forth the Nature of the English Language, would, with certainty and expedition, carry them on towards the reading and understanding of it; in the Romances they have no such Instruction: They have nothing to help them, but only the Voice of the Teachers, who themselves are mostly very ignorant and unskilful; and hence their Progress in Learning is very slow, and tedious, and they scarcely ever arrive at any tolerable Knowledge in the Language. Having seriously considered this matter, I made my Address to some Persons of good Figure, and Understanding, with Complaints of such a wrong education, and told them, that if some book were composed, which might be compleat Instruction for Reading, and so order’d, as not to be disagreeable to any Perswasion whatsoever, I believ’d it might be more useful to the Public, than Romances, and also than most of the Spelling-Books we already have.

“By their Approbation of the Thought, and Wishes express’d for such a Book, I was animated to the following work.

“Before the Reader dips into it, I think it proper (according to the custom in Prefaces) to give some short Account of it.

“I have perused many Thoughts both new and old, upon the Subject, and, out of them (as everyone has done from those before him) have cull’d some Things useful for my purpose; and particularly from the ingenious Dr. Watt’s Spelling-Book, which is reason’d to be the best Performance in its Kind, which hitherto we have ever had.

“And yet, whoever compares what is here done, with other Pieces before it, will not find it (some few Things excepted) the same with any of them, but in many things different from all.”
In outlining the book’s contents, the anonymous author said of Chapter IV:

“The Alterations Proposed in the Sound of Letters, may seem a bold Adventure, and yet I presume it is a rational one.”

This establishes that his introduction of Pascal phonics was an innovation in English in 1740, or he would hardly have referred to it as “a bold Adventure.” He said:

“It is odd, that such Names shou’d be given to Letters in most Languages, as do so little exercise the Powers, and Sounds they have to have when joined in Syllables; and it is wonderful, how young children ever learn to spell them at all, even by their Names in English, though generally more... plain than in other Tongues; as for instance, our named Uzzard (z) is so very strange, that I was much puzzled to account for it; till Mr. Samuel Davey, a very ingenious gentleman, convinced me, it was a corruption of (s) hard, as in zone, by way of distinction from (s) soft as in Sam.

“The amendments therefore in that, and other letters, single and double, seem to be proper and convenient.”

The author’s “amendments” in the sounds of consonants were generally to name them in the way Pascal had suggested, which meant to put the consonant sound before or after a muted vowel sound.

In Chapter X, he covered:

“Vowels and Consonants Single and Double With the Sounds, Changes and Loss of Letters and Syllables in Pronunciation...methodically.”

His ‘catechism’ told a lot about prevalent ideas on the nature of reading:

“Q. What is reading?  
A. Reading is the expression of written or printed Sentences with a due Pronunciation.

“Q. What is a sentence?  
A. A sentence is a set or number of words comprehending some perfect sense or sentiment of the mind.

“Q. What is a word?  
A. A word is a sign of a thought expressed by one, or more Syllables in Writing or Speech.

“Q. What is a Syllable?  
A. A Syllable is the sound of one letter or of several letters together; that is of one single vowel or of those vowels called a diphthong with or without other letters called Consonants and utter’d with one Breath; as O-be-di-ent, Book.

“Q. What is a letter?  
A. A letter is a character, or mark, denoting the motion or position of the instrument of speech, to which it belongs, in the Production, or Determination of it’s Sound. What a Vowel, Diphthong, and Consonants are, will be explained in their proper places.

“Q. What is a consonant?
A. A consonant is a letter which cannot give a clear and perfect sound of itself without the help of a vowel; and therefore can never make a perfect syllable.

“Q. How does it happen that a consonant alone cannot make a perfect sound?
A. The very name of the consonants cannot be expressed without a Vowel before or after them to help out its Pronunciation.

“Q. What is the second division of consonants?
A. Into Mute and Semi-Vowels...

“Q. What is a mute consonant?
A. A letter which singly taken, makes no sound at all, unless a vowel be added to it, and therefore is quite mute or silent.

“Q. What is a (Semi-Vowel)?
A. (It makes an) imperfect sound as if it has a short sound of a vowel....”

On page 13, he emphasized the fundamental importance of the syllable in speaking and reading, and equated “spelling” with “pronouncing”:

“A true division of words into their syllables is very necessary to its pronunciation: For, Reading being nothing, but a rapid... Spelling ... whoever spells or divides syllables wrongly must of course read and speak wrongly.... so that without true spelling our very speaking itself wou’d be improper and hardly intelligent.”

We think of “spelling” as naming letters. He thought of spelling as the oral pronunciation of the syllables in a word, which could only be done by properly dividing words into syllables. He discussed on page 15 how to syllabicate correctly.

“The first rule for spelling
Q. What is the first rule for true spelling?
A. When one single consonant goes between two vowels, it is to be joined to the latter as

“abide a-bide parent pa-rent....

“The IId rule
Q. What is the second rule for true spelling?
A. When two or more consonants go between two vowels, as many of them as may well begin a word, a syllable, are to be joined to the latter vowel as

“A-pril bre-thren e-strange - fa-brick e-state au -stere....

“The IIId Rule
Q. What is the third rule for true pronunciation?
A. When two consonants which cannot properly begin a Word go between two vowels... the former consonant is to be (joined) to the former vowel and the latter consonant to the latter vowel as

“dan-ger... mul-ti-tude sel-dom

“NB Consonant X... is always to be joined to the vowel before it as
“ox-en....

“The IVth Rule
Q. What is the IVth rule?
A. When two vowels go together in the middle of a word and do not make a diphthong, they are to be divided and pronounced in distinct syllables, as

“cre-ate No-ah ru-in re-enter mu-tu-al”

He excepted compounded words, such as paint-ed, and made a sub- exception in this class, where letters had been doubled, as in cut-ting.

It was “Chapter IV Alterations in the Sounds of Letters,” that had pure Pascal phonics. It included a table for all the letters of the alphabet, with these headings, under which I have included his notations only for the letters b and c:

<table>
<thead>
<tr>
<th>The Letters</th>
<th>The Common Sounds</th>
<th>Alter’d sounds</th>
</tr>
</thead>
<tbody>
<tr>
<td>“b”</td>
<td>bee</td>
<td>1. Be short sound</td>
</tr>
<tr>
<td>“c soft”</td>
<td>see</td>
<td>2. se short sound</td>
</tr>
<tr>
<td>“c hard”</td>
<td></td>
<td>3. ke short sound</td>
</tr>
</tbody>
</table>

The Irish Spelling Book, which formally introduced Pascal’s synthetic phonics to Ireland in 1740, was almost certainly the source for Sheridan’s own work on synthetic phonics. Furthermore, the motive for the use of synthetic phonics appears to have been the same for both the anonymous author of the Irish Spelling Book and for Thomas Sheridan. They were interested in fostering correct pronunciation. Since the author of the 1740 speller was anonymous, but was most probably a Dublin schoolmaster, could that author have been Sheridan’s own schoolmaster father? (If the “Samuel Davey” the author mentioned could be traced, that might provide a clue to the author’s identity.) For three generations, the Sheridan family was brilliant, with Richard Brinsley Sheridan in the third generation, the playwright and member of Parliament, being the most flamboyant, best known and wittiest. He made remarks in Parliament such as:

“The Right Honorable Gentleman is indebted to his memory for his jests and to his imagination for his facts. (Treasury of the Familiar, Edited by Ralph L. Woods, The Macmillan Company, New York: 1943, page 403.)

Richard Brinsley Sheridan’s grandfather, Thomas Sheridan, Sr., almost certainly had the intellect to write The Irish Spelling Book.

It should be noted that Dean Jonathan Swift, the author of Gulliver’s Travels and a close friend of Thomas Sheridan, Sr., wrote the following charming little poem on the vowels18. Phonetics would seem

---

18 Over a hundred years after Swift’s poem on the vowels was composed, another poem on the vowels was written in France, which was one of a collection of poems, Les Illuminations, by Jean Arthur Rimbaud. Rimbaud’s collected poems caused a sensation in Paris, according to the Encyclopaedia Britannica (1963), when they were published in 1886 by a man named Verlane who had spent two years in prison for seriously wounding the author of the poems, Jean Arthur Rimbaud. This was before Rimbaud dropped out of sight in 1875, turning up many years later in Abyssinia, where he had made a small fortune as a trader in coffee, perfume, gold and ivory, and where he acted as an unofficial government agent working for France outside the civilized world, while living in a hut of palm leaves. Verlane is presumed to have thought Rimbaud probably dead by 1886, and Rimbaud is presumed not to have known of Verlane’s publication of his poems. Rimbaud reportedly stopped writing in 1873, the same year

“As On the Vowels

“We are little airy creatures,
All of different voice and features;
One of us in glass is set,
One of us you’ll find in jet,
T’other you may see in tin,
And the fourth a box within.
If the fifth you should pursue,
It can never fly from you.”

Swift had provided with his little poem an elegant way to identify short vowel sounds: a-glass, e-jet, i-tin, o-box, and, presumably with an Irish accent, u in the first syllable of pur-sue. Swift had no children of his own and was no schoolmaster himself. Did he write this poem for his schoolmaster friend, Thomas Sheridan, Sr., who may have been interested in phonetics?

Thomas Sheridan, Jr., was concerned with elocution as early as 1756. He had apparently completed the foundation of his highly original work on the phonetic principles of English spelling and pronunciation (true synthetic phonics) by the time he started to give his highly popular lectures on elocution in 1758-59 at Oxford and Cambridge, and in 1761 and later in Edinburgh and Dublin. Sheridan published his idea for the first phonetic pronouncing dictionary in the world in 1761 (see Alston, Volume VI, page 72), received a pension from Lord Bute to proceed with it and published the finished work in 1780. Meanwhile, an Edinburgh, Scotland, resident, William Perry, who was obviously exposed to Sheridan’s lectures in Scotland on phonics, published a dictionary with a phonetic key in 1775. From a title in Alston’s Volume V, The English Dictionary, it appears that William Kenrick also did more than show the customary accented syllables in A New Dictionary of the English Language; Containing Not Only the Explanation of Words ... but Likewise their Orthoepia or Pronunciation, London: 1773.

Alston’s chronological listing of dictionaries, along with information from other sources on Sheridan’s life, confirm that Sheridan was the first who conceived the idea of a pronouncing dictionary using Pascal synthetic phonics. The prefaces to Sheridan’s 1780 dictionary are impressive documents of astounding scholarship and originality but were obviously the culmination of years of study. Yet, since Sheridan had been lecturing on phonics since 1758, several of Sheridan’s imitators preceded him in the publication of pronouncing dictionaries. Another competitor was Walker, a fellow actor, who succeeded Sheridan in publication but gave Sheridan only faint praise and a faulty history in the “Preface” which

he published A Season in Hell, which the Encyclopaedia Britannica (1963) said was an allegory based on his experiences with Verlane, with whom the adolescent Rimbaud had traveled after Rimbaud’s involvement in the Paris Commune. It was because of that book that Verlane tried to kill Rimbaud. Rimbaud’s sonnet on the vowels gave each a different color: “A black, e white, i red, u green, o blue vowels.” Even today in continental Europe, vowels are often printed for beginners in a different color than consonants. Therefore, although a man named Chavee published a work in 1873 associating each vowel with a different color (according to “Lecture,” Dictionnaire de Pedagogie et d’Instruction Primaire, Paris, 1887) it is probable that Rimbaud, born in 1854, received his exposure to colored vowels and the inspiration for his poem while sitting in his first-grade class room somewhere in France about 1860. The idea of letters in color turned up again in the twentieth century in Caleb Gattegno’s beginning reading program, which received considerable publicity about twenty years ago, although Gattegno probably was inspired by the colored Cuisinaire rods for teaching arithmetic, on which Gattegno had been a promoter.
Walker wrote. A portion of Walker’s preface is in the 1825 copy of Walker’s Critical Pronouncing Dictionary and Expositor of the English Language, Abridged, printed at Cooperstown, New York, by H. and E. Phinney. It read in part:

“Mr. Elphinston... in his Principles of the English Language, has reduced the chaos to a system, and, by a deep investigation of the analogies of our tongue, has laid the foundation of a just and regular pronunciation.

“After him, Dr. Kenrick contributed a portion of improvement by his Rhetorical Dictionary in which the words are divided into syllables as they are pronounced and figures placed over the vowels to indicate the different sounds. But this gentleman has rendered his dictionary extremely imperfect.

“To him succeeded Mr. Sheridan, who not only divided the words into syllables, and placed figures over the vowels, as Dr. Kenrick had done, but, by spelling these syllables as they are pronounced, seemed to complete the idea of a dictionary, and to leave but little expectation of future improvement...”

As mentioned, although Sheridan was the first to conceive of the idea of a pronouncing dictionary, he was preceded in publication of such a dictionary by competitors such as Kenrick. Walker gave Sheridan no credit for having invented the concept of a pronouncing dictionary but seemed to give the credit to Elphinston and Kenrick. Walker also found fault with Sheridan’s choice of pronunciations. Sheridan had, indeed, aroused some heated opposition by marking some words with an Irish accent. Walker’s defective history, however, including his criticism of Sheridan, may have served as a successful sales tool. Walker’s dictionary was in wide use for many years, and in America was endorsed by the same activists who opposed Webster’s speller, and, along with Webster’s speller, his dictionary, because of its pronunciation and choice of spellings. Years later, Boston “intellectuals” endorsed Worcester’s dictionary and its spellings, instead of Webster’s brilliant 1828 dictionary. It was not until the 1880’s that the Boston “intellectuals” finally stooped to use Webster spellings. (Was it really his spellings to which they objected, or old, conservative, Webster himself?)

The writings of Elphinston, whom Walker wrongly implied was the source for the idea of a pronouncing dictionary, are only listed by Alston from 1787 and afterward, over thirty years after Sheridan started his work. In any event, Elphinston did not even write a dictionary, but was concerned only in spelling reform. Yet Walker omitted mentioning William Perry of Scotland, who wrote The Royal Standard English Dictionary in 1775. Nor did Walker mention William Scott, who published in Edinburgh in 1777 A New Spelling, Pronouncing and Explanatory Dictionary of the English Language.

Sheridan had given the necessary information for pronouncing English words without the need of respelling, although he also respelled words to show pronunciation. Webster had found a way to do away with such dictionary respelling of English words to show pronunciation, simply by the use of his key and his accent marks, and he did not respell words in his 1828 dictionary. It was this simple and brilliant pronunciation tool which made Webster’s speller such a magnificent success for the teaching of reading, but later spellers by other authors altered and spoiled the effectiveness of the pronunciation keys.

Walker implied that the use of numerals in the key and over letters in words to show pronunciation, which numerals were used both by Sheridan and Webster, may have originated with Kenrick. However, whether the use of such numerals did or did not originate with Kenrick is unimportant, because the credit for the idea of a true pronouncing dictionary is obviously Sheridan’s.
Sheridan’s phonics also further influenced the teaching of spelling, as Perry published an excellent phonic spelling book in 1776 in Scotland. Perry did not prosper with his imitation (and criticism of the vowel system) of Sheridan but went bankrupt, although Alston shows Perry’s speller continued to be published in Great Britain. An American publisher, Isaiah Thomas, of Worcester, Massachusetts, in turn, pirated and published Perry’s phonic spelling book in 1785 two years after Webster’s phonic spelling book came out. This was obviously to compete with Webster’s, and it was very popular in America for a great many years, though Perry received none of the proceeds.

The Pascal/Sheridan phonics obviously influenced Noah Webster. Noah Webster wrote his heavily phonic syllabic spelling book, with its keys obviously adapted from Sheridan’s work, in 1783, and it and its imitators were used to teach large numbers of beginners in America to read until it began to fade in use about 1826. As Webster remarked in 1840, in a letter to Barnard, appearing in Barnard’s publication, the American Journal of Education:

“The introduction of my Spelling Book, first published in 1783, produced a great change in the department of spelling; and from the information I can gain, spelling was taught with more care and accuracy for twenty years or more after that period, than it has been since the introduction of multiplied books and studies.”

Webster’s speller written toward the end of the eighteenth century made earlier spellers largely obsolete in America, but there had been many earlier spellers which had followed Coote’s successful speller written in England at the end of the sixteenth century. As Spelling Books, R. C. Alston’s list published in England about 1960 shows, despite Coote’s great popularity, many other spelling books were published in English through the seventeenth century and into the eighteenth.

One such speller was written by the Reverend Isaac Watts, who was famous in his time and who wrote enormously popular religious material for children. His speller, as mentioned, was praised by the anonymous author of the The Irish Spelling Book in 1740. Watts’ spelling book, The Art of Reading and Writing English, or the First Principles and Rules of Pronouncing our Mother-tongue, came out in London in 1721. A copy of the second London edition of 1722 is in the New York Public Library, and other 1722 copies survive elsewhere, as well as multiple copies of the 1721 edition. Note that this speller which is relatively obscure by today’s standards has multiple surviving copies that are six years older than the earliest surviving copy of the New England Primer, the 1727 copy. Yet we are asked to believe that vast numbers of the New England Primer were printed before 1727, but, unlike Watts’ speller,

---

19 James McKeen Cattell’s favorite professor before Cattell graduated from Lafayette College in Easton, Pennsylvania, in 1880 was Francis Andrew March (1825-1911), philologist and advocate of spelling reform, who studied under Noah Webster at Amherst College (from Michael M. Sokal’s book on Cattell, An Education in Psychology). The February, 1882, edition of The Primary Teacher, Vol. V, No. 6, Boston, listed books for primary teachers on page 224, and, under “Reading,” showed March’s ABC Book, available from Ginn, Heath & Co., Boston, for 25 cents. In a later issue, on page 263, the magazine continued the list of books for primary teachers. Under “Method Manuals, Etc., Etc.;” was “March’s ABC Book. Prof. F. A. March. 25 cts. Ginn, Heath & Co.” Ginn, Heath & Co. were Boston publishers. March, a native New Englander, in 1879 left Lafayette in Pennsylvania after 50 years there. He went to Massachusetts to take over the direction of the American work on the Oxford English Dictionary. The Encyclopedia Britannica (1963) article, “Dictionary” referred to the enormous New English Dictionary on Historical Principles, which title was later the Oxford English Dictionary. The encyclopedia article said that the idea of such as dictionary had been arrived at 70 years before it was actually finished in 1928. It included definitions for all words in English that are recorded from the 600’s to the 1900’s. (It is remarkable that this Encyclopedia Britannica article, which includes information on minor dictionaries, does not even mention Sheridan’s landmark work!) No further reference to March’s ABC Book has surfaced. It is not listed in Leyboldt’s American Catalogue of books in print in 1876, or even in the later American Catalogue which listed additional books published up to 1885.
unaccountably all disappeared. Watts’ spelling books were apparently among those spelling books being imported in the United States and must have been popular. Most of Watt’s editions came out in London, England, and some in Dublin, Ireland, but the proof of the popularity of the Watts’ spelling book in this country is that a Philadelphia edition appeared in 1771. The last Watts edition shown by Alston is the twelfth edition in Dublin, Ireland, in 1783.

Alston lists large numbers of other spellers, which cannot conveniently be shown here. However, in 1758, in England, a Frenchman, John Gignoux, published the Child’s Best Instructor, in which, by syllabicating in a different fashion, Gignoux tried to show the pronunciation of English words, which he said were so hard for foreigners to learn. (The “pronunciation” referred to in earlier spellers like Watts’ concerned which syllables to accent, not how to pronounce letter sounds.) An endorsement in the form of a poem to Gignoux’s 1758 speller appeared on page v, comparing his speller to those of “Dyche, Dilworth, Markham, Dean and Fenning,” all of whom must have been popular in 1758 in England or the poet would not have bothered to name them. Dilworth was apparently the most popular in America in mid-century, to judge from Noah Webster’s recollection quoted elsewhere in this text. Gignoux’s work, of course, shows that in 1758 The Irish Spelling Book of 1740 with its true phonics was so generally unknown that there was, effectively, no such thing as “synthetic phonics” in English to help foreigners to learn the language, any more than there was any such thing as a “pronouncing dictionary.” It was, curiously, in 1758 that Sheridan began his lectures on synthetic phonics which ultimately resulted in his pronouncing dictionary and in successful phonic spelling books like Perry’s and Webster’s.

Noah Webster’s The American Spelling Book was written in 1783, and became an immediate success, displacing Dilworth’s and others in America. Webster’s method of teaching spelling with synthetic phonics as well as syllabically was apparently dominant in American teaching of reading - and pronunciation - for beginners until 1826. As J. A. Cummings said in the preface to The Pronouncing Spelling Book, Boston: 1819:

“The principle objects of a Spelling Book are to teach children to read and spell correctly, and to establish as far as practicable, uniformity in pronunciation.”

Nevertheless, not every work used the Webster synthetic phonics. No truly free market ever has uniformity, and the textbook market in those days, unlike today, was truly free. One speller which did not use Webster’s synthetic phonics was Caleb Bingham’s The Child’s Companion, published in Boston in January, 1792. It followed the Dilworth approach, using only analytic phonics, with the syllable tables and the arrangement of words with like sounds, as in “Lesson III. Band hand sand land. Rend mend lend send vend. etc.,... Lesson V. Ground found pound round. Dace lace mace pace face” etc. Bingham did mark silent letters.

Many spellers of the 1790-1826 period did, however, use true synthetic phonics, and almost none lacked at least analytic phonics, the approach Bingham used (band, hand, sand, land, etc., in which children learned to pronounce syllables by their analogy to the sounds of other syllables.) As mentioned earlier, Perry’s was one of the first real competitors for Webster’s speller, being published in Scotland before Webster’s speller but in America after Webster’s speller. Unlike Bingham and Dilworth, Perry’s used a true synthetic phonics approach like that in Webster’s, but it is obvious that Perry was inspired by Sheridan and Sheridan’s Scottish lectures on elocution. Another speller was C. Alexander’s The Young Ladies’ and Gentlemen’s Spelling Book in 1799 which used a true synthetic phonics approach. Webster had so many imitators that he campaigned mightily for copyright laws to protect his own work.

One of the early spelling books which competed with Webster’s was written in 1804 by Lindley Murray. Lindley Murray, (1745-1826) according to John Alfred Nietz, (page 66 and 67, Old Textbooks, University of Pittsburgh Press, Pittsburgh, Pennsylvania: 1961) was born, reared and educated in
America, where he had been rather successful in business. Yet Murray moved to England in 1784, where he taught for a period before he began to write textbooks. Murray’s textbooks were very successful in England, and were widely used in the United States in the first part of the nineteenth century. Murray’s first textbook was published in 1799, *The English Reader, “or Pieces in Prose and Poetry, selected from the best writers, designed to assist young persons to read with Propriety and Effect... to inculcate some of the most important Principles of Piety and Virtue.”* Nietz said that the Sequel to Murray’s *English Reader* was published in 1800, and his text titled the *Introduction to the English Reader* came out in 1801. In 1804, Murray published *The English Spelling Book with Reading Lessons*, meant for beginners. In the 1801 volume, Nietz stated:

‘...it has been his aim to form a compilation, which would properly conduct the young learner from the Spelling-book to the English Reader.’

“(Rochow’s) book contained about eighty separate selections, mostly of a didactic and religious character, interspersed with interesting bits of information concerning the earth and nature. It was the first step toward secularizing the course in reading in the German elementary schools, and the first school reader in the modern sense of the term. This book was approved by Protestants, Catholics and Jews alike, and was used in the schools of Germany for nearly a hundred years.”

The inspiration for Rochow’s reader was probably derived from Johann Bernard Basedow’s more elaborate *Elementary Book* published in 1774 for Basedow’s controversial Philanthropinum school at Dessau, Germany, and from Comenius’s 17th century *Orbis Pictus*. Yet Rochow’s 1776 reader, and those such as Murray’s 1799 reader, were never meant to teach beginning reading, but only to practice reading once it had been learned, just as the medieval primers and the Psalms had been used for the same purpose. These authors did not produce readers whose purpose was to teach children HOW to pronounce print. Such readers were unheard of until 1826 in America, as will be discussed.

Those people who are unfamiliar with the period might surmise that books for very little children written in the late eighteenth century by Mrs. Barbauld and Lady Eleanor Fenn were beginning reading books, to be used in place of syllabic spellers. Yet through most of the eighteenth century, as in the sixteenth century, little three-year-old children were first given the horn book, not story books. By mid-eighteenth century, the battledore, which included a pictured alphabet and syllabarium, began to replace the horn book. After using either, children still had to study the speller. In the speller, they repeated the alphabet and syllabarium before learning words usually arranged in sets of three-letters, and then of four-letters, and so on, once Dilworth had introduced those stages in his 1740 speller. All that Lady Fenn produced were stories meant specifically to match these three-letter, four-letter, and so on, stages of the post-Dilworth spellers. She obviously thought the material could be covered by children from three to five years old. (The numbers of failures must have been pathetic.) Mrs. Barbauld’s probable intent also was to have her book used with the battledore and speller. What appears certain, however, is that neither Lady Fenn nor Mrs. Barbauld ever recommended dispensing with the alphabet, syllabarium and spelling, which would have been revolutionary, indeed, in English in the eighteenth century.

That Lady Fenn and the other authors like her, Barbauld and Sarah Trimmer, never meant to throw out the speller for beginners is indicated by entries in R. C. Alston’s *A Bibliography of the English
Language from the Invention of Printing to the Year 1800, Volume IV, Spelling Books, “Printed for the Author by Ernest Cummins, Bradford, England, 1969.” Alston’s bibliography of known spelling books shows that Fenn and Trimmer actually wrote spellers themselves for little children, and the probability is Mrs. Barbauld would have approved of their spellers which are listed below. The numbers Alston gave their items are shown before their titles. However, Alston did not capitalize the titles as has been done below.

“No. 863 (Fenn, Lady Eleanor) A Spelling Book, Designed to Render the Acquisition of the Rudiments of Our Native Language Easy and Pleasant.... by Mrs. Teachwell, London, J. Marshall, 1787.

Note that “Part I” of Lady Eleanor Fenn’s last work listed was “spelling” - considered the first step.

Mrs. Barbauld apparently never wrote a spelling book, but the actual content of her book quoted below proves her intention was that spelling should precede reading. Mary F. Thwaite wrote the following in From Primer to Pleasure in Reading (Boston, The Horn Book, Inc.: 1972 - copyright 1963, page 189):

“A landmark in the approach to the reading of the very young child is the little work Mrs. Barbauld composed for her infant nephew - Lessons for Children (1778-1779). Part one was for children between the ages of two and three, the next two parts for those of the riper age of three, and the fourth for children of four years old. It was perhaps less intended for infants to read, and more as a book to be read to them, although at the very beginning Charles is bidden ‘Make haste, sit in Mamma’s Lap. Now read your Book’. Simple little phrases are intended to arouse interest in everyday things a tiny child might observe or understand....”

Mrs. Barbauld’s 1778 book was published in 1843 by A. Phelps of Greenfield, Mass. and sold by Gould, Kendale & Lincoln and Crocker and Brewster of Boston; F. J. Huntington & Co. and Mahlon Day, of New York; Oliver Steele of Albany, Belknap & Hamersley of Hartford “and the principal Booksellers generally.” By 1843, however, other sources show the book would have functioned as a straight sight-word book, since the syllabary and the spelling book were no longer given to beginning readers. Yet eighteenth-century readers would have taken it for granted that the “Advertisement” at the beginning of the book was meant only to apply to children who had learned the alphabet and syllabary. In the academic twilight of 1843 brought on by educational activists, which will be discussed, the “Advertisement” was assumed to apply to rank beginners.
“Advertisement. This little publication was made for a particular child, but the public is welcome to the use of it. It was found that, amidst the multitude of books professedly written for children, there is not one adapted to the comprehension of a child from two to three years old.... Another great defect is the want of good paper, a clear and large type, and large spaces. They only who have actually taught young children, can be sensible how necessary these assistances are. The eye of a child and of a learner cannot catch, as ours can, a small, obscure, ill-formed word, amidst a number of others, all equally unknown to him. To supply these deficiencies is the object of this book...."

It is obvious, however, that this was NOT meant to be the child’s first introduction to print, because the very first page included the request to “Charles” to “Spell that word.” Obviously, Charles could not “spell” (name the letters) in the word being pointed at unless Charles had already learned his alphabet! Therefore, Charles would already have studied his hornbook or battledore. The first page read:

“Barbauld’s Lessons. Part I. Come hither, Charles, come to mamma. Make haste. (Ed.: Each sentence is on separate lines.) Sit in mamma’s lap. Now read your book. Where is the pin to point with? Here is a pin. Do not tear the book. Only bad boys tear books. Charles shall have a pretty new lesson. Spell that word. Good boy. Now go and play. Where is Puss? Puss has got under the table. You cannot catch Puss. Do not pull her by the tail, you hurt her. Stroke poor Puss. You stroke her the wrong way. This is the right way. But, Puss, why did you kill the rabbit?”

That unfortunate final remark may have left the poor over-stressed three-year-old child emotionally upset, despite the misled good intentions of Mrs. Barbauld.

Under the pseudonym “Mrs. Teachwell,” Lady Eleanor Fenn published Cobwebs to Catch Flies in 1783. It was (Thwaite, page 72):

“A system of graded reading ‘in short sentences adapted to children from three to eight years’....”

Thwaite added (page 190):

“The first volume consisted of ‘easy lessons in words of three letters up to six letters’ for children of three to five years old.”

Therefore, Lady Fenn’s book certainly appears to have been meant as a reader, but in 1778 and 1783 when Mrs. Barbauld and Lady Fenn wrote, no English writer had ever suggested jettisoning the alphabet and syllabary. As mentioned, the spellers which appeared after 1740, when Dilworth had initiated the practice, were usually arranged in the same three, four, five, and so on, letter sequence which Lady Fenn was using. Children were probably expected to read her “stories” to match whatever level which they had reached in their spellers. The spellers normally included periodic reading selections but with more difficult content than her stories.

With the exception of materials like Lady Fenn’s and Mrs. Barbauld’s, obviously to be used with the speller, most readers in English were written to be used after the spellers.

Murray’s was not the only reader in English. Noah Webster published An American Selection of Lessons in Reading and Speaking in 1785, and it was America’s first school reader. Caleb Bingham published The American Preceptor in 1795 and The Columbian Orator in 1797, and there were an increasing number of other readers in English starting in the late eighteenth century. Since the names of these English-language books emphasized the training of the voice in public speaking or elocution, the inspiration for their compilation probably did not come from the German sources mentioned above but

293
from the influence of Thomas Sheridan, whose lectures developed a great interest in elocution and public speaking in Great Britain, starting about 1758.

Shortly before he died in 1788, Sheridan himself published a reader. It is described in R. C. Alston’s A Bibliography of the English Language from the Invention of Printing to the Year 1800, Volume VI, Rhetoric, Style, Elocution, Prosody, Rhyme, Pronunciation, Spelling Reform, “Printed for the Author by Ernest Cummins, Bradford, England, 1969.” The title of Sheridan’s book has been capitalized below, which was not done by Alston. Alston wrote that Sheridan’s text concerned both spelling and pronunciation, and that it had been reproduced in facsimile by “Menston” in 1968.

Menston was a press used to make reproductions listed by Alston. It appears almost self evident that arranging to make those reproductions (as with the Irish Spelling Book) was Alston’s own idea. Today’s “intellectuals” may not appreciate the contributions of Thomas Sheridan (and the Irish Spelling Book), but it is obvious that Alston certainly did

“No. 503 Sheridan, Thomas - Elements of English: Being a New Method of Teaching the Whole Art of Reading, Both with Regard to Pronunciation and Spelling. Part the First. London, C. Dilly, 1786.”

The first organized set of readers in America was that of Noah Webster (1754-1843). Yet when Noah Webster produced his school series which started with a speller in 1783, he was apparently only following a norm which had already been established in Great Britain. For instance, William Enfield (1741-1797) had a series of at least two books. It consisted of a speller, A New Introduction to Reading; or, A Collection of Easy Lessons....., and The Speaker, or Miscellaneous Pieces Selected from Various Authors, and Disposed under Proper Heads, with a View to Facilitate the Improvement of Youth in Reading and Speaking. To which is Prefixed an Essay on Elocution, which was obviously a reader. Although their original date of publication in England is unknown, the first is known to have been reprinted in America in 1797 and the second is 1799. Also, William Scott’s Introduction to Spelling and Reading, a speller, was meant to precede his Lessons in Elocution, both originally printed in Edinburgh. (Enfield’s and Scott’s books are listed in Appendix B.)

Webster’s first reader was published in 1785, the Third Part of a Grammatical Institute of the English Language. The First Part was his speller, and the Second Part his grammar. His reader was titled, An American Selection of Lessons in Reading and Speaking. In 1790, Webster wrote The Little Reader’s Assistant to come after his speller, which speller included reading selections, so his series, in effect, had three books to practice reading.

The second organized set of readers in America was that of Caleb Bingham (1757-1819), whose The American Preceptor was published in 1794, followed by the Columbian Orator in 1797. Bingham also published a speller which included reading selections, meant as the first book.

The third widely used series in America, although not written here, was produced by the American, Lindley Murray (1745-1826), writing in England. Murray’s first book, The English Reader, was published in 1799. Murray also wrote a speller and other readers, which in effect formed a series, as the previous quotation from Nietz pointed out.

Other isolated reading texts were published in America before 1826 which shared one of the main purposes of the upper levels: to practice elocution, very important in both Great Britain and America from the last half of the eighteenth century. As indicated above, Thomas Sheridan, who almost certainly originated the interest in elocution (but obviously not rhetoric), wrote such a book. However, it appears not to have been popular in America. Alston lists many such texts published before 1800 in A
Bibliography of the English Language from the Invention of Printing to the Year 1800, Volume VI, Rhetoric, Style, Elocution, Prosody, Rhyme, Pronunciation, Spelling Reform, “Printed for the Author by Ernest Cummins, Bradford, England, 1969.”

Among such books in use in America were Nathaniel Heaton’s The Columbian Preceptor of 1800 (and he also wrote The Columbian Spelling Book of 1799), Daniel Staniford’s Art of Reading of 1802, published by West and Richardson in Boston in 1814, School Dialogues, First Hallowell Edition, published by Ezekial Goodale in 1814, Dr. Jonathan Barber’s Exercises in Reading and Recitation, published in York, Pennsylvania in 1825, and T. W. Strong’s Young Scholar’s Manual or Companion to the Spelling Book, published by Denio & Phelps in Greenfield, Massachusetts in 1821 and copyrighted there in 1819, a subject matter book not for beginners. Strong also wrote another book listed below. These are available in the Harvard library but possibly not Heaton’s speller nor the second book by Strong.

Nietz listed before 1826 (page 101) Daniel Adams’ The Understanding Reader, or Knowledge before Oratory, Being a New Selection of Lessons (1803), T. W. Strong’s The Common Reader (1818), and John Walker’s Elements of Elocution (1810). (Like the actor, Sheridan, and the schoolteacher, Webster, the actor, Walker, also wrote a pronouncing dictionary, which like Webster’s was inspired by Sheridan’s work.) Nietz showed on page 62 H. Gaine’s The Art of Speaking, printed in New York in 1785, Alexander Thomas’s The Orator’s Assistant; Being a Selection of Dialogues, 1797, and William Scott’s Lessons in Elocution (1814). Nietz stated on page 67 that Scott’s book had been used in the Boston schools, but John Pierpont “succeeded in having the School Committee of Boston adopt (his 1823 The American First Class Book; or Exercises in Reading and Recitation) to replace Scott’s Lessons.”

It should be noted that the publisher, Phelps, in Greenfield, Massachusetts, was apparently already minimizing the influence of the spelling book on younger children by 1819, with his publication of T. W. Strong’s Young Scholar’s Manual or Companion to the Spelling Book, mentioned above. It was “published by Denio & Phelps” in Greenfield, Massachusetts in 1821 and copyrighted there in 1819 (a subject matter book not for rank beginners). It was preceded by the publication of T. W. Strong’s The Common Reader (1818), also mentioned above, which was listed by Nietz. Early American Textbooks, 1775-1900, shows that a copy of The Common Reader is available in the Department of Education Library in Washington. It is a second edition published in Greenfield by Denio & Phelps in 1819. It would be worth while to research the history of “Ansel Phelps” of Greenfield who became the publisher of the critically important The Franklin Primer in 1826.

Nevertheless, despite these isolated readers and various series, the most important reading material in most schools in America before 1826 was the Bible, particularly the Psalms and New Testament.

The first major addition to reading series used in America after Webster, Bingham and Murray came in 1817, when Samuel Wood, a highly successful and deeply religious New York publisher who had previously put out a four-book series of spellers, put out a series of readers in that year. Samuel Wood’s readers were meant to follow his spellers and not to be used to replace beginning “sound” with “meaning.” Wood, who had been a schoolmaster before he was a publisher, did not use synthetic phonics in his books, however, but syllable tables and sound analogies, so his spellers were weaker. However, by 1819, Samuel Wood joined the synthetic phonics group by publishing a Code 8 phonics speller, the North American Spelling Book by R. Wiggin. Its preface read, (the compiler) “considers it a complete pronouncing Spelling-Book.” Obviously, the intent was that the child should be taught how to pronounce all the words in the spelling book by himself.

It was in 1804 that Lindley Murray wrote (at Holdgate, near York, England, according to his “Introduction,”) An English Spelling Book with Reading Lessons, a Code 7 book. He also reproduced the first part of it as A First Book for Children. His comments (and other indications) show that the first part
of such spelling books were used by beginners, who then repeated the first part again when they had achieved success. The older students, however, used the latter part of the spellers. Murray reproduced the first part of his speller as *The First Book for Children* as an aid to teachers and mothers with little ones. This is, of course, more confirmation that the speller was the beginning book, and that a “primer” was not. Murray said, on page vi.

“It is proper to observe, that some of the reading lessons are taken, either wholly or partly, from the writings of Barbauld; and a few, from those of Trimmer and Edgeworth.”

Murray had the good manners on some selections to admit his sources; many authors of spellers and readers did not. In such children’s books in America, the early nineteenth century was a period of wholesale plagiarism. However, Noah Webster later claimed, apparently with good reason, that Murray had plagiarized him in a wholesale fashion on his grammar. (Webster told of this in “A Philosophical and Practical Grammar of the English Language, - Advertisement,” following the section, “Introduction,” in Noah Webster’s First Edition of an American Dictionary of the English Language, published by Foundation for American Christian Education, San Francisco, California, 1983. The Foundation’s edition is a remarkably fine book with excellent prefatory material, besides being remarkably handsome, and they should be congratulated for publishing it. Webster’s original edition of his final dictionary had come out in 1828.)

Murray’s story of the fly caught in the milk (page 43) is presumably from one of the authors Murray mentioned:

“There is a poor fly in the milk.  
Take it out. Put it on this dry cloth.  
Poor thing! It is not quite dead. It moves;  
it shakes its wings; it wants to dry them;  
see how it wipes them with its feet.  
Put the fly on the floor where the sun shines.  
Then it will be dry, and warm.  
Poor fly! I am glad it was not dead.  
I hope it will soon be well.”

Leaving out the question of hygiene, it is a little story likely to develop compassion, and I can recall no such stories in the controlled vocabulary readers I was forced to use in teaching the primary grades for twenty-three years. This little story was copied in other spellers in the early nineteenth century.

Murray, who had plagiarized Webster, was himself also plagiarized. He had written for reading practice, on page 29, after the child would have been in the book perhaps a few months:

“In a few weeks, I hope to read well. I will make the best use of my time.”

In only casually glancing through some pages photocopied from some spellers published in the next twenty years after Murray’s 1804 spelling book came out (in which spellers the “fly” story sometimes appeared), I ran across two which copied Murray’s words as quoted above exactly.

Elihu F. Marshall’s *A Spelling Book of the English Language*, a Code 8 book written at Saratoga Springs in 1819, has on page 23:

“In a few weeks I hope to read well. I will make the best use of my time.”
The Primary Instructor and Improved Spelling Book, Being an Easy System of Teaching the Rudiments of the English Language in Two Parts, a Code 8 book written by Jasper Hazen, Windsor, Vermont, 1822, has on page 86:

“In a few weeks I hope to read well. I will make the best use of my time.”

Jasper Hazen’s reading selections are all at the end of his book and his spelling lists at the beginning, which is why this appears on page 86.

Presumably there are other spellers with the same quotation. Yet, interestingly, that showed that Murray and his plagiarizers were agreed on a very basic fact: children who had only begun school a few months before, should “in a few weeks... hope to read well.” In those days, they learned to read by “sound” from a speller, and almost all spellers rated a Code 7 or above on a scale from one for pure meaning to ten for pure sound. It was exactly as old William Scott Gray admitted in the Bloomfield classroom about 1940 (as quoted earlier from Mitford Mathews Teaching to Read, Historically Considered, The University of Chicago Press, Chicago and London, 1966):

“(Gray) explained to the other visitors that what the children were doing was in no sense remarkable. He said that reading experts had long known that children could rather quickly be taught to pronounce words with remarkable glibness....”

Murray said he only used words in his reading selections which had been taught in his spelling lessons, so his material was, surprisingly, “controlled.” Since his spelling lists became very long, very soon, the final effect on vocabulary totals was quite different from the “deaf-mute” controlled vocabulary approach of Gallaudet. On the average, Gallaudet limited the introduction of new words to less than ten per cent of a selection.

The tone of Murray’s speller formed a contrast to Webster’s. While almost all spellers included such little paragraphs as given above for reading practice, many of these paragraphs had a religious tone, which was not true in Murray’s A First Book for Children. Webster’s opening reading lesson, for instance, on page 43 of his book, after children had worked their way through spelling many words, read:

“No man may put off the law of God:
My joy is in his law all the day,
O may I not go in the way of sin!
Let me not go in the way of ill men.”

Besides including a great deal of additional religious reading, Webster also included little secular selections, probably from the same kind of sources as Murray’s, but heavy with “morals” as were Murray’s.

Dilworth’s speller, which had been so popular in America, and which Noah Webster said he had used as a boy in the 1760’s, taught reading by analytic sound: first the syllable tables, and blends, and then words largely arranged by analogy to show similar sound spellings: “Cub, rub, tub,” etc. Dilworth rated a Code 7 in reading ratings. However, the Revolution sparked American substitutions for Dilworth’s speller, of which Webster’s 1783 synthetic phonics speller, a clear Code 10 on the scale from “meaning” to “sound,” is the most famous.

Another apparent substitute for Dilworth’s speller after the Revolution began was The American Primer, for which title Heartman shows many entries from the critical Revolutionary date of 1776 to 1830, probably covering unrelated books with the same title. In 1813 Mathew Carey published The
American Primer, an analytic phonics Code 7, a copy of which is in the New York Public Library rare book collection, and Alston lists an 1800 edition. The only reference in print I have found to any speller attributed to Mathew Carey other than in Volume IV - Spelling Books of R. C. Alston’s bibliography, referred to elsewhere, is a quotation from an 1805 book by an Englishman, John Davis, Travels of Four Years and a Half in the United States of America, republished by Henry Holt & Co., Inc., in 1905.

Davis’ book is referred to on page 56 of Readings in American Educational History, by Edgar W. Knight and Clifton L. Hall, Appleton-Century-Crofts, Inc., 1951, republished in 1970 by Greenwood Press, Publishers, New York. According to the Englishman Davis’ anecdote which he dated to 1797 in his 1805 book, he was being considered for a job as a family tutor in South Carolina. Davis built a word-picture of two appalling people, a Southern planter and his wife in Charleston, South Carolina, in which the following appeared:

“Planter. ....What spelling-book do you use?

“Planter. Ah! I perceive you are a New England man, by giving the preference to Noah Webster.

“Planter. Well, no matter for that, - but Mrs. H____, who is an excellent speller, never makes use of any other but Matthew Carey’s spelling book. It is a valuable work, the copyright is secured.”

The anecdote just quoted in which the Englishman said, “What spelling-book, Sir? Indeed - really - upon my word Sir, - any - oh! Noah Webster’s, Sir,” showed that many spelling books were available in 1797 and that the English tutor knew it!

R. C. Alston’s list of spelling books published before 1801 makes it superabundantly clear that many spellers were available at that time. His Spelling Books, Volume 4 of A Bibliography of the English Language from the Invention of Printing to the Year 1800, showed three entries for Carey: The Columbian Spelling and Reading Book, (1798?), The American Primer; or an easy introduction to spelling and reading, (1800), and The Child’s Guide to Spelling and Reading (1800). (A copy of the last is in the Library of Congress rare book collection.)

The South Carolina planter’s question showed the planter also knew that many spellers were available, just as his later remark showed he knew of Noah Webster’s 15-year-old speller originating in far-off New England. However, the anecdote proves Carey was publishing a speller BEFORE 1797, so presumably the (1798?) in Alston’s list should be replaced by (1796?) or even earlier. Fifteenth to Eighteenth Century Rare Books on Education, published by the National Institute of Education in Washington, D. C., in 1976, is, astonishingly, useless as a resource for reading instruction history, yet it does list non-reading books published by Mathew Carey of Philadelphia in 1787, 1792 and 1794.

The New York Public Library copy of Mathew Carey’s 1813 speller is entitled The American Primer, “printed and sold by Mathew Carey, No. 121 Chestnut Street, Philadelphia,” “The Fourth Improved Edition...” Carey’s 1813 edition of The American Primer, like Dilworth’s which it resembled, probably rates a Code 7, because, despite its defects, it is strongly phonic in total effect.
Curiously, the ultimate replacement for Mathew Carey’s “sound”-based spellers was probably the “meaning”-based The Clinton Primer, published in 1830, a copy of which is in the Library of Congress rare book collection. It was written by M. R. Bartlett and published by “Carey & Lea in Chestnut Street, Philadelphia,” who were most probably successors to “Mathew Carey of No. 121 Chestnut Street, Philadelphia.” The Clinton Primer of 1830, is a terrible publication, typically post-1826 with its emphasis on “meaning,” and rated as high as Code 4 only because of some inadequate phonic attempts. The effect of The Clinton Primer, of course, reached far beyond Philadelphia, just as Noah Webster’s had reached far beyond New England.

Webster’s was unquestionably the most popular speller in that early period, and Nietz refers to an 1809 edition of Webster’s published in Philadelphia, titled the “Thirtieth Revised Impression” with a footnote stating over 3,000,000 copies had been sold. This number should be compared to the tiny population of the United States in 1809. Population figures for the United States cited in the Encyclopedia Britannica (1963), Volume 22, page 814 are:

<table>
<thead>
<tr>
<th>Year</th>
<th>Population</th>
</tr>
</thead>
<tbody>
<tr>
<td>1790</td>
<td>3,929,214</td>
</tr>
<tr>
<td>1800</td>
<td>5,308,483</td>
</tr>
<tr>
<td>1810</td>
<td>7,239,881</td>
</tr>
</tbody>
</table>

Nietz also stated on page 14 of his text that most of the more populous states provided copyright protection so Webster received an income to support his family while he wrote his 1806 and 1828 dictionaries. However, as proven by the Englishman Davis’ anecdote about the Charleston planter, South Carolina had been buying Philadelphia school books such as Carey’s in 1797, and it is certain that many other areas were still buying Philadelphia school books in 1832 when the appalling Clinton Primer was published there. This shows that by 1832 the teaching of reading all over America was being effectively sabotaged by the newly organized “experts” who were endorsing such monstrosities as The Clinton Primer.

It is commonly held that books were only printed for local consumption in that period in the United States, and not sold outside their areas, so the influence of school books like those printed by the Carey company would not have been widespread. Yet the Englishman Davis’ comments proved the contrary, as long ago as 1797. Looking at the title pages of other spelling books before 1826, it is astonishing to see the numbers of companies and distributors which are often listed. School books DID travel widely in those day, but this is only what we should have expected.

The following list of titles of spelling books can be given as proof that spellers were meant as the first book for children up to the nineteenth century, even though at that time some spellers called themselves “primers.” These spellers printed from 1784 to 1801 and their description are only samplings for those years from R. C. Alston’s A Bibliography of the English Language from the Invention of Printing to the Year 1800, Volume IV, Spelling Books, “Printed for the Author by Ernest Cummins, Bradford, England, 1969.” Alston did not capitalize the titles, but that has been done below.

“No. 848 Ross, Robert A New Primer, or Little Boy and Girl’s Spelling Book. Bennington, Haswell & Russell, 1784.

“No. 853 Ross, Robert The New American Spelling Book; or a Complete Primer:....New Haven, Thomas & Samuel Green, 1785.

“No. 949 Heaton, Benjamin The Columbian Spelling-book; Being an Easy Introduction to Spelling and Reading,... Wrentham, the Author, 1799.

“No. 950 Anonymous. The American Primer; or an Easy Introduction to Spelling and Reading. Philadelphia, Mathew Carey, 1800.

“No. 952 Anonymous. The Modern Primer, or a New and Easy Guide to Spelling and Reading,... Elizabeth (Hager’s Town), Thomas Grieves, 1800 (Alston noted that no copy had been located).

“No. 958 Reed, Abner The First Step to Learning: or, Little Children’s Spelling and Reading book. Printed at East-Windsor by Luther Pratt for the Author in 1800.”

Most of these clearly state they are meant to be a child’s first book, and Alston confirms they were all spellers, though sometimes called primers. This sampling of Alston’s entries is taken from his list after 1784, but many others could be given from his list before that date which also establish that the speller was meant as a child’s first book before the nineteenth century, and that the word, “primer,” sometimes only meant “speller.” By the eighteenth century, the speller had replaced the ABC book and eventually even the horn book. The true primer/catechism was not normally the first book at any time.

I find it puzzling that anyone could ever seriously have considered that the New England Primer was meant as the very first reading book, particularly since its title page announced it was meant to help in the “art” of reading, which was how upper level reading material was described in the late eighteenth and early nineteenth century. Its abbreviated material which concerned teaching reading (spelling) was squashed into a few pages at the very beginning, where it could serve as a review of hornbook or speller material, and the rest of the primer was all catechetical material of a very high readability level, including even the rhyming pictured alphabet at the beginning.

Although Alston’s record of spelling books is breathtakingly complete, it is lacking an American one which is mentioned in the Catholic Encyclopedia (1913), article, “Doctrine,” on page 80 of Volume V:

“The first to edit a catechism [Ed.: in the United States], so far as is known, was the Jesuit Father Robert Molyneux, an Englishman by birth and a man of extensive learning, who till 1809, laboured among the Catholics in Maryland and Pennsylvania. Copies of this work are not known to exist now, but, in letters to Bishop Carroll, Father Molyneux mentions two catechisms which he issued - one in 1785, “a spelling primer, for children with a Catholic catechism annexed”.

Therefore, in 1785, Father Robert Molyneux issued a spelling primer, with a Catholic catechism attached, of which no copy is available today. Yet like so many others in the seventeenth and eighteenth centuries, he also apparently used the word, “primer,” as synonymous with “speller.”
Mathew Carey, who published the three spelling books referred to earlier, was a very interesting publisher/bookseller/author, and is credited as having been a co-founder of the earliest Sunday Schools (schools to teach reading) in America. This is the probable reason for Carey’s having published so many different spellers at such an early date. The Parson Mason Locke Weems fable of George Washington and the cherry tree, and the book containing it, The Life of George Washington, were first published by Mathew Carey. Carey himself had been an employee of Benjamin Franklin in Paris, and had been set up in business in Philadelphia by the Marquis de Lafayette. Elizabeth Peabody wrote of Carey’s later welcoming Lafayette when Lafayette returned to America in 1824, by which time Carey had become a rich man (Letters of Elizabeth Palmer Peabody, Edited by Bruce A. Ronda, Wesleyan University Press, Middletown, Connecticut: 1984, page 71). Carey’s biography is given in The Catholic Encyclopedia (1913) (Vol. III, p. 346):

“b. in Dublin, Ireland, 28 January, 1760; d. in Philadelphia, U. S. A. 15 September, 1839. He was the first Catholic of prominence in the publishing trade in the United States, and brought out in 1790 the first edition of the Douay Bible printed in America.... in 1779 (Ed.: in Ireland) he published a pamphlet on the ‘Urgent Necessity of an Immediate Repeal of the Whole Penal Code Against Roman Catholics.’... Carey escaped to France where he remained a year. While there he met Lafayette and worked for a time in the printing office of Franklin at Paris. After his return to Ireland he conducted the Dublin ‘Freeman’s Journal.’... On 5 April, 1784, an article attacking Parliament and the Premier was published... He... left Ireland in disguise and emigrated to America, landing in Philadelphia.

“Lafayette visited him in Philadelphia and gave him $400 to establish the ‘Pennsylvania Herald.’ He began to publish the debates of the House of Assembly in 1785 from notes he took himself, and as this was an innovation in the newspaper business in America, the paper immediately had a large circulation.... In 1796 he was engaged with several others in founding the ‘Sunday School Society,’ the first of its kind established in the United States....”

Sunday schools of the period in America and Great Britain were primarily schools to teach reading to the disadvantaged, and not schools to teach religion, as we know them to be today. As mentioned, Carey’s publishing of a speller as early as about 1796 may have been in connection with the Sunday schools.

According to Lawrence A. Cremin in American Education - The National Experience - 1783 - 1876 (Harper & Row, Publishers, New York: 1980, pages 66-69, the idea of Sunday schools arose in England during the 1780’s and was then used in this country in the following twenty years or so in Philadelphia, Boston and Pawtucket. In the first part of the nineteenth century, the Sunday school was numbered among other types of schools such as church schools, charity schools, private schools, and various incorporated schools. The Sunday school existed originally to teach reading and writing on Sunday to children who worked during the week, and it was also intended to keep them off the streets on Sunday. In 1815, Sunday schools were few and were meant for poor children. Yet, by1830 they had changed into institutions that catered to all children and whose purpose was primarily to teach religion..

Cremin said, however, that such Sunday schools frequently preceded the establishment of common schools in new towns. Cremin quoted the following from the Indiana Sabbath School Union in 1827:

“Let Sabbath schools be established wherever it is practicable. They will answer the double purpose of paving the way for common schools, and of serving as a substitute till they are generally formed.”

Cremin stated that in 1817 the American Sunday-School Union put out its first book, Mary Butt Sherwood’s Little Henry and His Bearer. That was a sad story about an English orphan who taught the
Bible to another child in India, which story had originally been published in England. An astonishing total of over 6 million copies of similar stories had been printed by the American Sunday-School Union for Sunday school students by 1830.

Cremin said that another organization which had been founded in 1825, the American Tract Society, put out 3 million such works in the following five years, and by 1865 had published 20 million bound books, each of which had 12 or more such tracts, and it also had put out about 250 million single pamphlets.

It is clear that developments in the “Sunday schools” paralleled developments in the government schools. Starting in 1817, the once unorganized and independent Sunday schools appear to have been taken over by the same kind of highly organized activists, and a review of Sunday school reading texts shows the same shift from “sound” to “meaning” that is to be found in the texts that were used in government schools. Moreover, it is found very early. The American Sunday School Union, Philadelphia, published in the critical year 1826 the Union Spelling and Reading Book, which rates only a Code 4 on a scale from “meaning” to “sound” of one to ten.

That activists for government schools first used the Sunday schools as an entering wedge for government control of education is confirmed by the clear admission quoted above by the Indiana Sabbath School Union in 1827:

“Let Sabbath schools be established wherever it is practicable. They will answer the double purpose of paving the way for common schools, and of serving as a substitute till they are generally formed.”

That they were the initial step in most places is further confirmed by Nietz’ comment on page 27. He reported that the only public schools in existence in 1825 when the American Sunday School Union was formed were in New England and New York State.

Fine points concerning Nietz’ statement about the existence of government school in 1824 other than New England and New York State could be argued, of course, because schools certainly existed all over the United States. However, since they were schools with local control and not legislative control, they were not government schools. For instance, about 1803 on River Road in Lyndhurst, New Jersey, a local man set aside some of his land for use by a neighborhood school, asking a token rent of peppercorns each year. That land was used for a town school until about twenty years ago, when the Little Red School House was turned into a museum, being the third schoolhouse on the land, built in the early 1890’s. (My father attended the second schoolhouse on that land in the 1870’s and 1880’s). Yet the original use of the land for a schoolhouse in the early 1800’s was local and free and not controlled by legislation. Since New Jersey state legislation on education did not appear until many years later, the use of that land for a local school therefore did not originally qualify as government education but only as local choice.

The religious materials in Scotland showed the same effect as those in America in moving from “sound” to “meaning.” Key to the First Step in Teaching Children to Read, According to the Lesson System of Education, First American edition from the third Edinburgh edition, published by Jonathan Leavitt, New York, in 1830 and 1831, had as its content religious material and Scripture study, yet it rates only a Code 1. However, following the Sunday school history would add too much to this present history. It should be noted, however, just from the figures quoted by Cremin for Sunday school books for the nineteenth century, that the fable that McGuffey’s shaped the mind of America is ridiculous.
Cremin commented (page 70) that some publications of both groups were also meant to be used for reading instruction, as a series of reading books, and both groups published primers. He thought that their reading materials were just as graded in difficulty as the McGuffey readers.

However, in mentioning McGuffey’s series, Cremin acknowledged that it was only one of many American series of the time, and that it was used for the most part only in the Ohio Valley and in parts of the South. In the general literature, I have found no one, other than Cremin, who has ever acknowledged that fact. The fact that Cremin took the time to debunk the McGuffey Myth is greatly to his credit.

Cremin cited in a footnote that the large sales quoted for McGuffey’s were estimates provided by Louis M. Dillman, president of American Book Company which had been publishing the McGuffey series since 1890. Cremin said that Dillman’s estimate had appeared in Harvey C. Minnich’s book, William Holmes McGuffey and the Peerless Pioneer McGuffey Readers published at Oxford, Ohio by Miami University. However, Cremin gave the publishing date as 1929 when it actually was 1928, according to the Cumulative Book Index, 1928-1932.

“Estimates” of sales about 1927 by the president of American Book Company which had swallowed up the original publishers of McGuffey’s almost forty years earlier lack credibility. Those figures are discussed later in this history. The figures of Henry H. Vail in A History of the McGuffey Readers, The Burrows Brothers Co.: Cleveland: 1911, on the McGuffey Readers did not lack credibility, as Vail had been with the former company and never claimed that McGuffey’s blanketed the United States but only that it had been enormously successful in parts of the Midwest and South, despite constant competition. The McGuffey Myth belongs with the New England Primer Fable and the Piltdown Man on history’s long list of academic embarrassments. Its continued existence serves as testimony to the incompetence of those “intellectuals” who are presently writing articles and serving on commissions concerned with America’s reading problem.

“Samuel Wood was born on Long Island in 1760. He was a schoolmaster until the age of forty, when he found that he could not support a family on a teacher’s pay, and went into the second-hand book business. His experiences led him to believe that many children’s books were unsuitable for young readers, and so he decided to print children’s books which he himself had written or compiled. The first of these, The Young Child’s ABC, or, First Book, was published in 1806, and by 1813 he had nearly ‘50 kinds of little books of his own printing’... The children’s books published by Samuel Wood were distinctly moral in tone, and were generally illustrated, some of them selling for as little as three cents a copy. In general they lacked the attractive qualities of fairy tales and old romances, and bore a somewhat depressing similarity to the books which were popular in England at this time, written by the imitators of Hannah More and ‘the cursed Barbauld Crew, those Blights and Blasts of all that is Human in man and child,’ as Lamb characterized them.”

Many of the terrible selections appearing in spellers of this period, like Murray’s, remain as testimony to Lamb’s good judgment. Mrs. Barbauld’s were sometimes offensively preachy or surprisingly insensitive, one telling, for instance, of a bad little lamb that managed to get eaten alive by young wolves - hardly the kind of story to make little six-year-olds sleep well at night, particularly if they were convinced that, like the bad little lamb, they were themselves “naughty.” But many of the other selections were a decided improvement compared to “Look, Spot, look!” In many spellers, as in Webster’s, the tone of some of the other reading selections was truly religious, but far gentler and lovelier than the first Webster selection quoted earlier.
By 1810, the following were advertised in a brochure now in the Harvard Library, entitled School Books, Printed and Sold by Samuel Wood at the Juvenile Book-Store, No. 357, Pearl-Street, New York (Harvard Call No. Educ 2199.01 bx):

- The Young Child’s A, B, C or First book
- The New York Primer, or Second Book
- The New York Preceptor, or Third Book
- The New York Spelling Book, or Fourth Book

The names of these books, by today’s standards, would indicate a child was given three books before he was taught to spell. The facts, however, are otherwise.

By 1817, Wood was producing The New York Readers, No. 1, No. 2, No. 3. In the “Preface” to his 1826 edition of The New York Reader, No. 1, he said:

“Having had an opportunity of judging of the public opinion with respect to the practical advantage of conducting children through their first literary pursuits, by a connected series of small books regularly adapted to their early progress, the publisher now ventures to lay before the instructors of youth his first Reader.

“The cordial reception which has been given to the Spelling-Books and their introduction into many of our schools, afford encouragement to hope, that a similar success may attend the application of the same principle to the art of Reading. This principle is founded on that love of variety, and those gratifications with novelty, which are inherent in the youthful mind: to neglect which, in the course of education, would be as unreasonable, in the teacher, as it would be in the gardener to neglect the proper distribution of warmth and moisture, from which his early hopes derive their principal support.

“A frequent succession of books, regularly adapted to the child’s progress, not only gratifies him with what is new, and strengthens his confidence in his own efforts, but it enables the teacher to more readily distribute his pupils into classes exactly suited to their individual attainments. A steady, judicious regard to this principle will, it is believed, lead a child further on his way in three months, than, under ordinary circumstances, he would reach in six months, upon the formal plan of one book, so often practiced in schools.”

I have not seen a copy of Wood’s The Young Child’s A, B, C, or First Book, but have seen The New York Primer, or Second Book, (an 1837 version) and The New York Spelling Book, or Fourth Book (an 1822 version). Both are simply spelling books, and both have the syllable tables, word lists, and short reading selections inserted. They are not good spelling books, since they omit teaching the special vowels except by grouping words together which use them, and do not use synthetic phonics. Also the “cuts” showing pictures for words in the 1837 version might cause problems as the children might learn to read those words for meaning instead of sound. Yet the books are, overall, spelling books endorsing “sound,” not “meaning” and rate a Code 7. But to judge solely from their titles, without having Wood’s honest admission just quoted in which he clearly called them the “Spelling-Books” which he published before his Readers, their nature might easily be misinterpreted.

In 1809, James Pike found fault with the current spellers because they had reading selections included. He showed the following testimonial to his own book on page 1 of his Code 10 book, The Columbian Orthographer, or First Book for Children:
“Recommendations

...To give a death wound, therefore, to the painful, incorrect practice of directing children to read lessons, before they are able to spell and accent common words of three syllables, we cordially recommend the COLUMBIAN ORTHOGRAPHER. This work we approve, because it is, as the first school book ought to be, merely a spelling book....”

This was signed by twelve names, presumably well known at the time, eight of whom have “Reverend” as titles.

All of these sources indicate that the speller, either with or without reading selections included, was definitely the child’s first book in the English-speaking world in the first part of the nineteenth century.

Yet Rudolph R. Reeder, in his 1900 book, The Historical Development of School Readers and of Method in Teaching Reading, The Macmillan Co., New York: 1900, claimed that the Pickets of this period published in 1818 a series of seven books, of which the primer was first and the speller next. He was wrong in his interpretation of this particular series of books by A. Picket, but strangely right about the Pickets themselves. As will be shown, they were highly active in promoting government schools for many years so are associated with the related change in beginning reading methods that arrived in 1826, moving from “sound” spellers to “meaning” primers. In the original Picket books, however, they probably closely paralleled Wood’s four early “sound” spellers. Wood later published in addition a reading series, to be used after his spellers. However, the Picket materials in later versions probably switched from being dominantly a spelling series for beginners to being dominantly a reading series, even for beginners. Obviously, however, this surmise could only be confirmed by a close examination of all the Picket materials. Nevertheless, they do appear to have been only a spelling book series in the earliest versions.

The Picket spellers and readers are almost unknown today but were of real importance. They were widely used for many years, apparently in different Eastern and Midwestern versions, and were written by prominent government school activists. In an attempt to provide background information, all the date available on various editions is summarized in Appendix B at length under an apparently pivotal date for the material of 1815. A brief discussion is given below.

It seems probable that Picket’s original primer was largely an ABC book meant primarily to teach the alphabet, which material had always been the beginning part of spelling books. Some “primers” meant largely only to teach the alphabet were a later development in the so-called “primers” and were in place after 1826. However, the date of Picket’s primer is unknown, but it was probably far earlier and may well have paralleled in intent and design of the first book in Wood’s four-book spelling series, published by 1810. Wood had broken the standard spelling book down into four little books. His first book apparently largely contained the “alphabet” material which had always been at the beginning of the spelling books. In publishing that little “primer” as the first book in spelling, Wood may well have initiated the practice in America of publishing such simple beginning books, and Picket may well have been imitating Wood. (Wood himself may have been inspired in part by Lindley Murray, who had already published the first part of his speller in England as a separate little book for beginners, but it was longer than Wood’s first book. Wood may also have been influenced by the women writers in England whom the famous author, Lamb, called “that cursed Barbauld crew,” such as Lady Eleanor Fenn, who prepared little spellers and readers for beginning readers, as discussed elsewhere.)

Yet the title of Picket’s 1830 revision suggests that Picket may have been conforming by then to the 1826 shift from “sound” to “meaning,” making his introductory book into one of the new “primers” that taught beginning reading by whole words and meaningful stories. What the original date of Picket’s first primer was is unknown, but it presumably was some time after he published his first speller in 1805.
Picket’s spellers were still on sale in New York in 1837, as shown by Mahlon Day’s 1837 book store
textbook list, mentioned in Appendix B.

A. Picket’s earlier book (copyrighted in 1814, with a Preface for the February 1815 revision written at
Manhattan School, New York, and published again in 1821) was The Juvenile Spelling Book: Being an
Easy introduction to the English Language, Containing Easy and Familiar Lessons in Spelling, With
Appropriate Reading Lessons, The Picket speller was a beginning book and rates a Code 8. In this 1814
edition, however, the attitude of this period is demonstrated by the Preface:

“Not a word or sentiment has been intentionally inserted, which is not consonant with the
purity of religion and morality, and calculated effectually to impress upon the tender mind the
love of virtue and goodness, and to form a taste for reading.”

Picket’s 1814-1815 book also had the “fly” story on page 27, as well as a lot of other little inserts
which are very moral.

An 1841 reprint of Picket’s later 1823-copyrighted Picket’s Juvenile Spelling Book, or, Analogical
Pronouncer of the English Language by A. Picket - Last Corrected Edition sounds like the particular
version to which Reeder referred.

This 1841-reprinted 1823 speller begins with four pages taken from the Juvenile or Universal Primer
which preceded it. They are exactly what was appearing on battledores of the period: words for every
letter of the alphabet, with pictures for each word: “Antelope. Bull. Cat. Dog.”, etc. The advertisement
inserted for the reading series on the fly leaf had as the first item in the series:

“The Juvenile or Universal Primer; being a First Book for young children: introductory to the
Juvenile Spelling Book.-48 pages.”

Reeder had said the compilers of the 1818 series were A. and J. W. Picket, principals of the
Manhattan school, New York, and cited the journal, The Academician, 1818, pp. 12-14, as his source,
presumably for their identity. Yet the 1823 spelling book shows it was written only by A. Picket, and it
was copyrighted by Charles H. Picket. This 1823 edition reprinted in 1841 advertised six books, not
seven. Yet Reeder had called it a seven-book series, presumably meaning that a dictionary should
complete it, from a comment he quoted, that the books “form a systematic gradation from the alphabet to
Walker’s Dictionary.” The probability is that in the circa 1815 form, the material was more of a spelling
series, somewhat like Samuel Wood’s circa 1808 four-book spelling series, but in the circa 1823 and later
form, the material became more of a reading series, like the reading series Samuel Wood published in
1818 in addition to his spelling series, which he continued to publish.

According to C. W. Bardeen’s The School Bulletin, Syracuse, New York, July, 1893, The
Academician was published semi-weekly in New York City from February 7, 1818 to 1819, for a total of
25 issues. Albert Picket was president of the Incorporated Society of Teachers, and John W. Picket was
corresponding secretary of the group. The publication carried a series of articles on the Lancastrian and
Pestalozzian methods, among other things, before the Pickets abandoned the work. Bardeen included this
information in a paper he gave at the 1893 Chicago World’s Fair, which paper was an excellent history of
educational journals in New York State. It is very clear that educational journals were widespread in the
nineteenth century, being published in many other states after 1840, but The Academician was apparently
the first educational journal in America, and it failed, presumably because of a lack of interest.

The date of the paper’s publication suggests that the first real push for government control of private
education had begun by 1818, and that the Pickets were associated with it, apparently along with someone
named Fiske, from the very beginning. That both Fiske and A. Pickett independently wrote spellers, and that the Pickets retained their interest in education after dropping publication of The Academician, is obvious from comparing two statements, one below by John A. Nietz (in Old Textbooks, University of Pittsburgh Press: 1961, page 18) and the other by H. H. Vail in 1911, quoted later:

“Fiske’s (1803 speller) was followed by several different spellers written by A. Picket. The Union Spelling-Book printed in New York in 1805 was already the third edition.... A second one was The Juvenile Spelling-Book... followed by a much larger and more advanced book entitled, The Juvenile Expositor, or Sequel to the Common Spelling Book.... Incidentally, later in life Fiske went west and helped found The Western Literary Institute and College of Professional Teachers in Cincinnati. This organization did much to advance and improve education in the Ohio Valley.”

Henry H. Vail, in A History of the McGuffey Readers, Cleveland: The Burrows Brothers Co., 1911, adds additional information which seems to confirm that the Pickets were very important early organizers along with Fiske of those peculiarly un-American institutions, government schools.

“While Dr. McGuffey was still at Oxford, Ohio, he took part in the formation of probably the first extended Teachers’ Association formed in the West. There had been a previous association of Cincinnati teachers organized for mutual aid and improvement. This was about to be given up; but at their first anniversary on June 20, 1831, Mr. Albert Pickett, (sic) principal of a private school in Cincinnati, proposed a plan for organizing in one body the instructors in public and private schools and the friends of education. Circulars were sent out and the first meeting of the College of Teachers was held October 3, 1832. A great number of teachers from many states (in) the West and South attended these meetings and took part in the proceedings. Through its (continuance) Dr. McGuffey took an active part in the work. (pages 30-31)

“Cincinnati, in 1837, was the largest city in the West excepting New Orleans and was the great educational center of the West.... The public schools of Cincinnati were then more highly developed than those of any other city in the West. (page 34-35)

“At no time in the history of (the McGuffey) readers have they been without formidable competition. Pickett’s (sic) Readers were published in Cincinnati as early as 1832. Albert Pickett was at one time president of the College of Teachers and his books were published by John W. Pickett (sic), who was probably his brother.... The Pickett Readers, Cobb Readers, Goodrich Readers... were all swept out of the [Ed.: “Western”] schools by the superior qualities of the McGuffey Readers and the persistent energies of their publishers.

“In these books the publishers found space for a little advertising of their wares. In Pickett’s Readers there is printed conspicuously at the top of a page a warm commendation of Pickett’s Readers, written in 1835 by William H. McGuffey, Professor at Miami University, in which he “considers them superior to any other works I have seen. That was before he made his own readers. Mr. Smith [Ed.: McGuffey’s publisher] responded by publishing a strong commendation of one of his books signed by Mr. Albert Pickett. (pages 61, 62, 63)”

As will be shown, it was through the kind of massive organization that was taking place in Cincinnati that the syllabic spellers were pushed out of first grades and replaced with whole word primers starting in 1826.

It was in 1823 that Joshua Leavitt copyrighted in Vermont his Easy Lessons in Reading; for the Use of the Younger Classes in Common Schools. The changes that had been gathering noticeable momentum
since at least 1817 can be detected in his carefully worded preface. Years later, in 1847, a man named Joshua Leavitt wrote a primer which was “broadminded” concerning the use of some “sound” for beginners and it was probably the same man. The 1847 book made room for whatever method a teacher preferred: whole words to letters, letters to whole words, or syllables, easy words and spelling. It had an incomplete syllabary, but to have any syllabary at all by 1847 was unusual, and by the standards of books available in 1847, his was conservative, but it was a pathetic substitute for Noah Webster’s Code 10 synthetic phonics speller that had still been in wide use for beginners in 1826. It should be mentioned that in 1831, Jonathan Leavitt of New York published Key to the First Step in Teaching Children to Read... first published in Edinburgh, Scotland, in 1830, and it was a ghastly Code 1 text. That change-agent publisher, Jonathan Leavitt, was possibly a relative of Joshua Leavitt.

Joshua Leavitt’s carefully phrased plea for change in his 1823 text read:

“The compiler has been excited to the present undertaking, by the representations of several parents and instructors, that there was no reading book to be found at the bookstores, suitable for young children, to be used intermediately, between the Spelling-Book and the English or American Reader. The Testament is much used for this purpose; and, on many accounts, it is admirably adapted for a reading book in schools.... But it is respectfully submitted to the experience of judicious teachers, whether the peculiar structure of scripture language is not calculated to create a tone? I would by no means exclude the Testament from our schools, but am persuaded it would be better to place a book in the hands of learners, written in a more familiar style, until they have formed a habit of correct reading.

“Such a work, I flatter myself, will be found in the following pages....

“Good reading approaches near to the style of graceful and animated conversation...

“It has long been an opinion, with many judicious persons, that children are commonly put forward too fast in their reading. They should be kept at their spellings, until they can readily pronounce common words, at first sight. They will then be prepared to read without that dronish tone, which it is so difficult to unlearn....

“If sufficiently encouraged to proceed, the Author intends, at a future day, to publish a book of ‘Lessons in Elocution,’ on a new plan....”

These quotations were taken from the fifth Edition of this book, published at Keene, N. H., in 1826. Leavitt had copyrighted his book only three years before in Vermont. His plea for “spelling” should not be considered a plea for “sound.” Even Gallaudet’s Mother’s Primer included spelling of words learned for meaning, not sound (as in “see-aye-tee, CAT.”) However, the quotations provide sharp proof that the spelling book was the first book for children in New England immediately before 1826. His “easy” book, one of the opening wedges for educational change, would rate perhaps a sixth-grade level today. On page 143, mixed in with a story on George Washington, appeared Parson Weems’ fable, easier than much of the other material in the book:

“When George was about six years old, he was made the wealthy master of a hatchet! of which, like most boys, he was immoderately fond, and was constantly going about, chopping every thing that came in his way.”

Of course, Parson Weems’ delightful fable could not find its way into our third grade reading books today, and certainly not our second grade books, unless it were emasculated of all its low frequency words and complex syntax, which would take all of the poetry out of it.
Printed at Mt. Pleasant, Ohio, in 1824, for the author, Daniel Williams, was The Explanatory Reader for the Use of Schools, Containing a Selection of Easy Lessons in Prose and Verse, Adapted to the Juvenile Capacity. Williams said in his preface concerning his book that it was

“...adapted to the capacity of pupils from five to ten years of age; and (it) may properly occupy a place between the Spelling book, and Murray’s Introduction to the English Reader.”

By today’s standard, his book might be at eighth grade level. His book was also one of the things being blown in by the winds for change, but it is useful to remember that textbooks, if successful, produced profits for the author. Profit may have been his most driving consideration.

The 1818 curriculum for the first primary grade schools in Boston, in which the oldest pupils were the First Class and the youngest the Fourth Class, is quoted in Superintendent Philbrick’s “Report” in the Annual School Report for Boston of 1874, pages 374-375):

“That those who read in the Testament shall be in the First Class; those in easy reading, in the Second Class; those who spell in two or more syllables, in the Third Class; those learning their letters and monosyllables, in the Fourth Class; and that the books be the same in every school, for each pupil hereafter entering.”

Philbrick added this further quotation:

“A card, a small spelling-book (Kelley’s) and the New Testament were the books originally used.”

It is evident that the “easy reading” was to be the short selections routinely included in the spelling books (although a later edition of Kelley’s speller which is available indicate it was inferior to Webster’s). The “card” most probably was like the battledores then in use in England, which were folded cardboard sheets, elaborations of the syllabic horn book. What the quotation makes very clear, however, is that a primer was not in use in Boston primary schools in 1818 to teach children to read, but beginners were given the syllabic spelling approach in a spelling book before any real reading was to be attempted. It should also be noted that the first real reader, as had been the case with Locke and Webster, was part of the Bible. That was soon to change.

Some few books which were essentially spellers, like the Lafayette Primer and New Jersey Instructor, by Edward C. Quin, published in Caldwell, New Jersey, in 1824, did move much closer to “meaning” with a greater emphasis on words, but these few texts were apparently not very influential. (They will be discussed later.) However, it is interesting that Quin thanked others for their suggestions, which suggestions apparently helped to push him closer to this “meaning” emphasis in 1824. As will be discussed, the public school activists who were also promoters of “meaning” in reading began their work in earnest about 1817, and the results showed up sporadically in places until the critical year of change, 1826. Quin may well have been in contact with such people.

Very clear proof on beginning teaching methods to 1817 is provided by a book by James Kelly published in Philadelphia in 1817, entitled:

An Improved Method of Education Instituted by Dr. Bell... Also Joseph Lancaster’s Method of Teaching,...
Kelly was not the Kelley who wrote the Boston speller in 1818 but was one of the immigrant Irish schoolmasters, who probably himself had learned to read in an illegal hedge school in the late eighteenth century. He minutely described the methods he used first in Ireland in a Lancastrian school with Lancaster’s charts (unobtainable now) and then in Philadelphia in a Bell school. The methods matched the make-up of the beginning portion of the spelling books of the period, further proof that children were learning to read by syllable sounds in 1817, even in the new monitory schools. (Kelly omitted any mention of Bell’s “unreiterated spelling” which is discussed later.) However, Kelly recorded that the Philadelphia school in 1817 was using Comly’s speller. According to Clifton Johnson (page 205), Comly’s speller first appeared in 1806. The 1820 revised copy which I saw rates a Code 7, and a further revision of 1842, signed by John Comly himself, rates only a Code 6. It is curious that Comly’s weak speller should have been one of the few texts which survived the 1826 shift to change, which stronger spellers often did not. As shown elsewhere, the 1826 shift weakened Webster’s position and pushed the use of his speller out of beginning reading classes, and it apparently also forced its revision, although Webster’s probably still rated a Code 10 until the last, and appalling, revision after Webster’s death. Yet, astonishingly, Leypoldt’s American Catalogue showing books in print in 1876 listed a version of Comly’s relatively weak speller as still available, seventy years after it reportedly first appeared!

On John Franklin Jones’ Code 7 Analytical Spelling Book, copyrighted in 1822 and published again in 1824 by E. Bliss and E. White, New York and Albany, Jones said, on page 9, “The first part of a spelling book is generally worn out, while the last is hardly soiled.” The first part had the alphabet and syllabary, and usually heavy drill on words with short vowels - which meant heavy concentration on “sound.” Despite its inadequate syllabary, Jones’ book rates a Code 7, heavily “sound.” Jones therefore confirmed that, prior to 1826, children were concentrating most on that part of the spelling book which most taught them to read by “sound”: its beginning.
Chapter 13
The Roots of the 1826 Move from Sound to Meaning, and the Status of
Literacy Before that 1826 Programmed Change in Teaching Methods

Of 48 beginning texts available for study which were written apparently by 48 different authors and published (or republished) in America from 1702 through 1825, a clear move from “sound” to “meaning” showed up in only seven, all seven of which rated below Code 7. A curious increased emphasis on “meaning” also showed up in some Code 7 or higher texts, starting in 1802, some of which will also be discussed. The 48 copies of beginning texts (spellers) published in America from 1702 through 1825 on which I had the opportunity to examine editions (a 1737 edition was the earliest I actually saw) were coded from Code One to Code Ten to show the relative emphasis on “meaning” (Code One) or “sound” (Code Ten). These 48 spellers are probably a representative sampling of the numerous spelling texts published or sold in America in that 124-year period. (Not included in this listing of 48 spellers is the Code 10 widely used English speller, Coote’s, dating to the late sixteenth century, nor some other widely used English spellers on which I have not seen copies.)

It is true that some seventeenth century spellers, and possibly some eighteenth, rate a low code because of an inadequate “sound” treatment, but this inadequacy was the apparent result of incompetence, not a deliberate move towards “meaning” and away from “sound.” For instance, this was the case with The Fannatick’s Primer written by Henry Adis and given a probable publishing date of 1661. Concerning its odd title, a quotation from Pepys’ diary in Bartlett’s book of quotations shows the “Fannaticks” were a religious sect:

“October 31, 1662: Great talk among people how some of the Fanatiques do say that the end of the world is at hand, and that next Tuesday is to be the day.”

However addled the Fannaticks may have been on other matters, there can be no doubt that Henry Adis’ intentions were pure concerning teaching reading by sound, as he said at the beginning of The Fannatick’s Primer:

“For if children should be perfectly acquainted with a syllabolical Spelling, and distinct Pronunciation in their first learning, it is that which will conduce much to their future benefit.”

Yet the speller he wrote rates, at most, a Code Six.

A New Primer, or Methodical Directions to Attain the True Spelling, Reading and Writing of English was written by F. D. Pastorius and printed in 1698 by William Bradford in New York. Its “sound” intentions were obviously good, too, but it only rates a Code Five. The difference between these few early inept spellers which rate low codes and those which appeared after 1800 was the fact that the post-1800 spellers were obviously making a deliberate, and not accidental, move away from “sound” towards “meaning.” However, these two inept seventeenth century spellers were in sharp contrast to Coote’s speller which was used massively all through the seventeenth century and which rates a Code 10.

It may be meaningless, and SHOULD be meaningless, yet I have actually heard twentieth century comments to the effect that “phonics” is for rigid conservatives (rightists), and “meaning” in beginning reading is for enlightened liberals (leftists)! It is therefore embarrassingly tempting to tie the deliberate shift in methods in teaching beginning reading after 1800 (such as the Belgian Jacotot’s methods) into the political chaos and widespread sedition in the Western World following the French Revolution, and to
assume that the shift to “meaning” in reading was a leftward one, while a shift to “sound” would have been a rightward one.

As an examination of those texts published after 1825 showed, the switch to “meaning” texts for beginners had become pronounced by 1826 and by 1830 had reached a flood-tide, with some texts rating as low as Code One. Yet only seven of the 48 beginning texts published in America from 1702 through 1825 on which I examined editions rated below a Code Seven, and before 1822 only three rated below a Code Seven. All three of those earliest ones published before 1822 turned out, upon further examination, to have been written by probable change-agents, even though all three authors carried a title quite properly revered by conservatives: “Reverend.”

One of the most spectacular of the change-agents was Reverend Abner Kneeland (if, indeed, as appears probable, the Abner Kneeland who wrote the book described below is the Abner Kneeland discussed by Blumenfeld). Kneeland was the first to move from “sound” toward “meaning” in a speller with a code below seven, and the early date of his book, 1802, suggests that the deliberate movement from “sound” to “meaning” was far older than might otherwise appear.

A late-eighteenth-century practice in English had been to teach children the spelling book, and then the dictionary. (Other languages did not have or need such spelling books for teaching children to read.) When older children studied the English dictionary, they had to memorize not just spellings but whole definitions. It was a ridiculous practice, because vocabulary should be increased through meeting new words in spoken or written contexts, not from the dead columns in the dictionary. Abner Kneeland “improved” this ludicrous practice even further by adding definitions (“meaning”) to a spelling book for beginners. Kneeland published his American Definition Spelling Book in 1802, which was revised in 1813 and was republished at Concord by George Hough significantly in 1826. In 1802, spelling books had to concern themselves with “sound” so Kneeland’s made a pretense of being phonic. It did a very inadequate job, though it included a vowel key almost exactly like Webster’s, and began with the syllabary. Overall, however, it rates at best only a Code 6.

Yet Kneeland’s book appeared to be not too influential (though it is interesting that it was republished in the critical year 1826). However, the appearance of his book suggests that the roots of the deliberate switch from “sound” to “meaning” may lie before 1802. As will be shown, the highly influential Scottish philosopher and psychologist Dugald Stewart, in the 1790’s, was criticizing the presumed psychological damage he felt resulted from thoughtless, careless reading, and pronouncing columns of words in spellers was certainly thoughtless. There may very well have been influence from that source, as Stewart is known to have been influential on reading practices later. Stewart was opposed to the extremists of the French Revolution, and gave lectures at the University of Edinburgh also in the 1790’s in opposition to their atheism. Yet Stewart later was in open sympathy with the later, less controversial but leftward-veering change-agents such as as Victor Cousin, which will be discussed.

Blumenfeld wrote (pages 94-95):

“Among clergymen drawn to Owenism were Abner Kneeland (1774-1844), and Orestes A. Brownson (1803-1876). Kneeland, a Universalist minister from New England, became intimate with (Robert Dale) Owen and (Frances) Wright in New York, contributed frequently to The Free Enquirer, then moved to Boston, where he became the leader of a group known as the First Society of Free Enquirers, and in 1831, began publishing his own weekly, the Boston Investigator. In 1835, he was tried and convicted of blasphemy, whereupon a group of noted Unitarians, including William E. Channing, Theodore Parker, and Ralph Waldo Emerson, protested in his behalf. Kneeland, however, served sixty days in jail, after which he emigrated to Iowa to start a communal settlement which never materialized.”
Kneeland’s association with that flamboyant woman and public speaker, Frances Wright, would have outraged conservatives even more than his association with the socialist, Owen. Frances Wright was an outspoken supporter of “free love,” which was hardly the community norm in the New England of the 1830’s. It seems appropriate that the initial entrance of “meaning” into the teaching of beginning reading in America should have been the work of such a spectacular misfit as Abner Kneeland.

Curiously, two other texts came out in the early year of 1802 which veered towards “meaning,” though both rate a Code Seven. The other two carried no author’s name, although one has subsequently been identified as written by Reverend Samuel Willard. He wrote The Franklin Primer of 1802, which will be discussed more at length later. The Franklin Primer included some columns of words under “meaning” categories: birds, fishes, insects, etc., which was apparently an unusual practice in beginning books. However, it also showed clearly in another way in an 1803 edition, presently in the Library of Congress, and possibly in the original edition of 1802, that it was endorsing “reading” habits as opposed to “spelling” habits. Word lists in the early pages of that 1803 edition did not go down the page in the customary spelling-column fashion, but across the page in the fashion of a connected reading text. By the time of the 1808 edition, presently in Harvard, the words were, however, arranged in the customary spelling book columns.

Another 1802 speller showed that same unusual direction, across the page instead of down, in its word lists. That was the Code 7 text, The Child’s First Book, Being an Easy Introduction to Spelling and Reading, which showed no author but only that it was published by Lincoln and Edmunds, Boston, in 1816, and that it had originally appeared in 1802. The text had a syllabary, and words were arranged in lists by sound analogies instead of by reference to a phonic key, both of which were common approaches. Yet, although the book made no comment on the unusual arrangement, its lists of words ran across and not down the page. Nor was that the only unusual bow to “meaning” in this book. Without specifically saying so, the book rejected the sounding out of words by sequential sounding and blending of phonemes. Instead, it endorsed working out unknown words by their analogy to known whole words, which is, of course, phony phonics. Although it is startling to see the practice recommended in a modified form as early as 1802, it is a fact that by 1840 such “phony phonics,” the comparing of one whole word to another whole word to see like parts, had become the norm in Great Britain and America. Page 9 carried this comment:

“In teaching the monosyllables, I would recommend a different method than is usually practiced, viz., Should the child hesitate at the word preach, instead of asking What does p, r, e, spell? the question should be, What does e, a, c, h, spell? Then r, e, a, c, h.; then p, r, e, a, c, h.”

This was an enormous bow to “meaning” in beginning reading as early as 1802! Nevertheless, despite the entrance of such whole-word “phonics,” note that it still was the norm in 1802 for a child to work out the word for himself. Yet in 1890, a New York City teacher said to Dr. Rice, words to this effect: “How can a child know what a word is if he never saw it before?”

The next speller that rated only a Code 6 (only at its beginning, but a pure Code 1 towards its end) came out in 1815, titled Pennsylvania Spelling Book, by “An Association of Teachers.” It was copyrighted by Maskell M. Carll and Daniel L. Peck, who were most likely among the compilers mentioned in the preface who felt “some improvements might still be made” in spellers. “The following pages are the result of some twenty years’ practice,” but whose practice is not mentioned.
A Reverend M. M. Carll showed up, very probably the same man, in 1830 at the Franklin Institute in Philadelphia. New York Public Library Volume cpv 1262 contains:

On page 32, it stated:

“The bills are specifically calculated to provide for the education of every child and youth from two to twenty-one years of age.”

The statement appeared elsewhere that it was the most important public measure “since the achievement of our national independence and political freedom.” If this was the same Maskell M. Carll who copyrighted with Daniel L. Peck in 1815 the Pennsylvania Spelling Book, by An Association of Teachers, then it is certain the co-author of that book was one of the movers-and-shakers working for government schools.

The following remark in A Report.... was, I believe, Reverend Carll’s:

“Our children are growing up unprovided with the mental cultivation which is so essential to the formation of character to withstand the temptations to which they must be exposed.”

Yet another remark, made about the same time in Philadelphia which is quoted elsewhere in this history of reading, commented on the high achievement of children at that time!

A book by an M. M. Carll, very possibly the same man, is listed in the American Book Publishing Record - Cumulative 1879-1945, R. R. Bowker Co., 1980. Under the entries for the number code 372 appears;

Whatever the “Alphabet of Nature” was is unknown, as is the original date of publication before the “Fourth Edition Improved and Enlarged” came out in 1845. However, it is highly likely that the “300 Cuts” were used to teach sight words.

The name, M. M. Carll, showed up again on a book published by A. S. Barnes in 1870, Child’s Book of Natural History. If that book had originally been written by Carll, it was another nice tie to the activists: they loved natural history because it was “science,” and “science” was foolishly expected to disprove traditional religion.

Only one other text rated below Code 7 before 1822. That was The Columbian Spelling Book and Children’s Friend, by “A Friend to Youth,” published by Miller and Hutchins, Providence, Rhode Island, and copyrighted March 2, 1819. It rates a Code 5. (“Columbian” was frequently used in titles. It is obviously necessary to compare the authors, publishers and dates to sort these texts.) “A Friend to Youth” was the same signature Reverend Samuel Willard had used on The Franklin Family Primer of 1802 which rates a Code 7. The Franklin Primer of 1826, also attributed to Willard, rates a Code 4 in the earliest
available edition, although one later edition rates a Code 2. The 1827 sequel to The Franklin Primer was entitled Secondary Lessons, or the Improved Reader and is also attributed to Willard. It is signed “A Friend of Youth,” a variant of “A Friend to Youth.” The Columbian Spelling Book... originated in Providence, Rhode Island, instead of Massachusetts since its author signed its Preface “Providence, April 19, 1819,” later than the copyright date of March 2, 1819, and the title page carries no penciled-in notation by a librarian in the Harvard library that its author was Reverend Samuel Willard, as was done on the 1826 and 1827 texts. Nevertheless, it seems likely The Columbian Spelling Book was also written by Reverend Willard. This is not only because of the signature, “A Friend to Youth,” but primarily because its “meaning” approach, almost unheard of at that early date, agrees with that of The Franklin Primer of 1802 by using the same “meaning” device of listing phonetically dissimilar words in “meaning” categories: Plants, Apparel, Eatables, Utensils. Such category lists had been present in The Franklin Primer of 1802, but not the New England Primer, after which the 1802 text pretended to be modeled. It is true such categories had been used as long ago as some eight hundred years or so before in the teaching of Latin, but not in the teaching of beginning reading. Such categories clearly concern a language’s meaning, and not its sound.

In the “Preface” to The Columbian Spelling Book, the author, “A Friend to Youth,” said:

“The writer of the following pages has no other apology to offer for intruding this work upon a discerning publick, than a desire to facilitate the progress of the infant mind.

“All that can be attempted with young children, is to inculcate the leading principles, and awaken the curiosity to farther inquiry.

“The ease with which young pupils have been observed to come forward by the practice of uniting pleasing reading with spelling lessons, affords a striking proof of its utility. But one great inconvenience attending this practice, is, the method with which spelling books are generally arranged.

“The writer, therefore, offers this arrangement as one, thought to be well calculated to instruct in this way....

“Many of (the selections) are in style of dialogue, as this species of writing is generally more pleasing to children than any other. “The Cobweb to Catch Flies,” a work of this kind, and from which many of the following lessons are selected, has been used to very great advantage in alluring young pupils to a love of reading. Sketches of Grammar and Geography have also been thrown into this form; not for this reason only; that it is more interesting to children, but that it in some measure prevents their reading fast, and with that monotony, which the young learner often acquires, and which is so difficult to be corrected in after years....”

After years of teaching second and third grade children who had learned to read with the “meaning” method, I can agree with “A Friend to Youth” that the “meaning” method certainly stops children from “reading fast,” but it also just as certainly sharply increases their monotonous droning.

The author left no doubt that he was endorsing learning to read by “meaning” as the superior - but new - approach: “The ease with which young pupils have been observed to come forward by the practice of uniting pleasing reading with spelling lessons, affords a striking proof of its utility. But one great inconvenience attending this practice, is, the method with which spelling books are generally arranged.”

A generous rating on the Columbian Spelling Book... is Code 5, because it at least began with the alphabet and syllable tables on pages 5, 6, and 7, but then the bottom of page 7 had four sentences, such
as “Am I to go up?” Page 8 had the normal sound blends for the spellers, “bla, ble, bli, blo, blu,” etc. Pages 9 and 10 (which may have covered short vowels, and therefore been more favorable to “sound”) were missing. But page 11 contained more whole-word “meaning” sentences, and page 12 contained word columns arranged by “meaning” categories, not “sound”: “Plants, Apparel, Eatables, Utensils.” Page 13 contained more sentences. Page 14 contained single syllable words, with only some arranged by sound analogies. The book continued in this fashion with heavy quantities of reading selections in comparison to word lists, through two syllable words, with only occasional arrangement by sound analogies, no phonics unless it received some treatment on the missing pages 9 and 10, and only one religious reference on the bottom of page 98.

The original Franklin Primer of about 1802 had been extremely religious, and announced that its intention was to replace the New England Primer, since it stated it was meant as:

“...a substitute for the old Primer, which has of late become almost obsolete.”

This was a bizarre and manifestly untrue statement, as Heartman’s checklist showed enormous numbers of editions of the New England Primer were being produced from the latter part of the eighteenth century until at least 1830. The statement therefore sounds like disinformation, which is a typical tool of change-agents when they are promoting their own materials for their own purposes. Reverend Willard’s works showed a sharp drop in religious emphasis in the 1819 and later works (if, indeed, he wrote the 1819 speller as well as the 1826 and 1827 texts). This certainly suggests Reverend Willard was not a typical old-fashioned New England minister who thought children should be drilled in and memorize the catechism. Willard’s motive in making such a bizarre statement in his highly religious 1802 primer can, of course, only be surmised. Perhaps his highly religious 1802 primer was only meant to weaken the market position of the hopelessly conservative and highly religious New England Primer, which was actually a catechism meant to teach religion to children, and not a beginning reading book. To some extent, Willard must have been successful in doing so, since his 88-page primer of 1802 had come out in seven more editions apparently all of 84 pages by 1807. It also came out in an “Improved Edition” of 72 pages by Manning & Loring of Boston in 1812, which revision I have not seen.

The Columbian speller, obviously, was very different from earlier spellers and shows multiple signs of change-agent thinking, whether it was or was not written by that curious man, Reverend Samuel Willard. Reverend Willard appears in his own way to have been as far from being a traditional minister as Reverend Abner Kneeland and Reverend M. M. Carll, Kneeland being the author of the first low code text just described, and Carll probably being one of the authors of the second text described. “Reverend” before their names, as with Reverend Gallaudet, served to disarm the religious American public and to make it receptive to their ideas. The American public was accustomed to give great respect to the title “reverend,” but these activists very possibly did not deserve such respect.

I found only four beginning reading texts or spellers below Code 7 which appeared between 1822 and 1826. One was a toy book, The American Primer, rating a Code 6, in 1822, which it is unlikely would have been used as a school book, and another in 1822 was the Child’s Instructor, a Code 3, showing real influence from the change agents. (Clifton Johnson quoted on pages 235-239 from an 1808 The Child’s Instructor, published in Philadelphia, which had some of the same content. Yet, from Johnson’s over-all description which is not too explicit, the 1808 volume does not sound extreme but more like a Mrs. Barbauld-type reader. The 1808 volume, of course, would have to be seen before it could be given a “Code” rating or before it could be identified as an earlier edition of the 1822 work, which 1822 work strongly shows the influence of the change-agents.)

For 1824, I found two others below Code 7. As mentioned elsewhere, Edward C. Quin was the author of the 1824 Code 3 or 4 The Lafayette Primer. It suggests by some of its content that Quin may have been
one of the schoolmasters emigrating from Ireland. The title page on the 1824 Lafayette Primer stated, “Without the Repetition of the Alphabet; Peculiarly Adapted for the Use of Primary and Lancastrian Schools.” With some use of the syllabary, the book rated between Code 3 and 4. It did use separated syllables on words. However, to drop the memorizing of the alphabet and to learn letters only from syllables and words was certainly a major move towards meaning. Quin thanked unnamed others for their assistance, who presumably gave him his “advanced” ideas, and those people very probably were among the activists. Yet there is no way to confirm this. Nor is there any way to find the background on the curious Code 4 1824 The Catholic School Book, which may have been written with similar “assistance” or may not have been meant as a beginning book at all, but possibly only meant to review some of the speller content which a child already may have covered before moving into much catechetical material, in a fashion not unlike that of The New England Primer. Except for a few pages at the beginning, the book is a reader of largely religious material, just as The Franklin Primer of 1802 had been.

Curiously, the 1824 The Catholic School Book included lists of words by “meaning” categories in the beginning portion of the book. Such “meaning” categories had not been used in the New England Primer but had been used in Reverend Willard’s The Franklin Primer of 1802 and in the anonymously written The Child’s First Book…. of 1802, as well as in The Columbian Spelling Book of 1819.

The presence of such category lists and the low code number on The Catholic School Book tend to suggest that activists were giving their “assistance” to Catholic publishers as well as to the “lucky” Protestant groups before 1826. It was disturbing to have found that the material published for Protestant Sunday school societies by 1826 had switched to a “meaning” emphasis, as discussed elsewhere, and the same influences may have been at work on the Catholic publishers.

The four lower-than-Code-7 texts published in the four years between 1822 and 1826 very possibly all received influence from activists. That is because such probable influence is so readily identifiable on the three lower than Code 7 texts which have been described which were published in the nineteen years between 1802 and 1821.

Other spellers after 1818 were far weaker and may have had ties to the activists, even though they rated Code 7 or above. These spelling books imitated Webster in teaching sound and in giving a pronouncing key, but they also usually implicitly denigrated Webster by endorsing Walker’s orthography and phonics key instead of Webster’s. The phonic keys on the post-1818 spellers were sharply inferior, as discussed later. Certainly questions exist concerning Cobb and his spellers of 1821 and 1825, discussed later, and concerning some other spellers listed along with Cobb’s. However, almost all of these spellers published after 1818 simply chipped away at the strengths of Webster’s speller without actually dropping below a strong Code 7 or higher.

The movement from “sound” toward “meaning” in beginning reading instruction was obviously originating in a small group of people who consistently showed ties to the Owenites and to the other activists for government schools. That movement from “sound” to “meaning” only became decisive, however, in 1826. Before that date, the use of “sound” for beginning readers was overwhelmingly dominant.

The Status of Literacy Before 1826

Wide testimony has been printed concerning the high literacy in America in these early years. It resulted from teaching beginning reading by “sound” instead of “meaning.” One unwitting testimony appears in, of all places, Reverend Samuel Willard’s 1826 The Franklin Primer. A portion of one of the narrative selections reads on page 36:
“Hark! What sound is that? The stage is coming. Ask George to go for the newspaper. I hope I shall have a letter from your Aunt Mary. It is more than a month since I wrote to her.”

Before 1826, therefore, ordinary American families were buying newspapers which were regularly delivered by stage-coaches with the rest of the mail. Ordinary American families were reading and sending periodic letters the same way, by stage-coach mail. The “readability level” of the newspapers and letters of that stage-coach period is breathtakingly high.

Willard’s was not the only children’s reading book with a selection referring to the regular delivery of newspapers to ordinary American families in the early nineteenth century. Clifton Johnson included the following selection in his book, Old-Time Schools and School-Books, published by The Macmillan Company in 1904 and reprinted by Peter Smith, New York, in 1935. The selection Johnson quoted on pages 298 and 299 of his book was from The Monitorial Reader by Adams published in Concord, New Hampshire in 1839. From other parts than those shown below of the selection which Johnson quoted, it was obviously about rural American families some time before 1839. Since the selection concerned adults with half-grown children in 1839 or before, the adults all would have learned to read more than thirteen years before, which means before 1826. That was the critical date at which change really began in the method for teaching beginning reading, when “sound” was dropped and replaced by “meaning.” The pertinent part of Johnson’s selection reads:

“After all, the lowest, the most degraded class of borrowers, are NEWSPAPER BORROWERS; fellows who have not soul enough to subscribe for a newspaper, yet long to know its contents; who watch with lynx-eyed vigilance for the arrival of the mail, and when their more generous neighbor receives his paper, send their boys with messages like the following.

“Mr. Borrowall wishes you would be kind enough to (give) him your paper for one minute. There is something particular in it, that he wants to see; he’ll send it back before you want to read it.”

Yet “reading expert” ignoramuses in the 1920’s, trailing meaningless university degrees, claimed illiteracy was widespread in America at that time, as will be referred to elsewhere. Even a scholar of the stature of the philologist, Mario Pei, of Columbia University was misled by their disinformation in his book, The Story of Language, (J. B. Lippincott Company, Philadelphia, 1949; Mentor Books, 1960). Incredibly, Pei said (page 241):

“In our own land, a population that was barely twenty per cent literate at the time of the Revolution was still only forty per cent literate in 1840.”

Mario Pei was unparalleled as a scholar of language. (His lucid and useful writings on language appear to have been largely suppressed, casualties of the ongoing war against language skills and real learning, or “truth,” that has been carried on by Paul Johnson’s kind of “intellectuals” since before the French Revolution). However, for Mario Pei’s information on education, he was obviously depending on academic “experts,” and he was predictably misled. In total contradiction to the disinformation he was given is the following comment by John Adams in 1765, quoted by John W. Whitehead in Parents’ Rights, Crossway Books, Westchester, Illinois: 1985. Who could know more about the status of literacy in America in 1765 than John Adams who lived in America then? Whitehead took the quotation from The Works of John Adams, Charles Adams, III, Ed., Boston, 1851.

“(A) native of America who cannot read or write is as rare an appearance... as a comet or an earthquake.”
Mario Pei’s being misled about literacy levels in America in the eighteenth and early nineteenth century was no accident. The rationale for government schools was that they were essential in order to cure cultural ailments like illiteracy. Therefore, unsettling testimony like President Adams’ that illiteracy in America in the eighteenth century was as rare as a comet had to be buried, to be replaced with the lie that literacy in America was rare before the advent of the glorious government schools. What the government schools actually succeeded in doing after 1826 was to turn vast numbers of literate America’s children into functional illiterates.

It should be mentioned here that Mario Pei fell victim to other disinformation or historical “unthink,” outside his field of specialty, which was languages. When it came to an historical framework in which to place his study of languages, he was apparently at the mercy of the same kind of “experts,” which would account for the following extraordinarily ignorant comment from page 350 of the same text:

“The Middle Ages, concerned with eternal, not temporal things, gave the problem of language no thought, save where a language served as a tool in the great process of spreading religious propaganda. It remained for the Renaissance to resume speculation on language with the help of a new, eclectic, empirical, inductive point of view.”

Such an error from a scholar like Pei is startling. Furthermore, Pei contradicted himself on page 75, when he said:

“Another variant of the Greek alphabet was adapted for the use of the Goths by their bishop Wulfila in the fourth century.... Still another version of the Greek alphabet was devised by two bishops from Constantinople, Cyril and Methodius, for the Slavs to whom they brought Christianity in the ninth century.... The result was the Cyrillic alphabet used today by... Russians, Ukrainians, Serbs and Bulgars.”

Pei apparently did not know that the Irish monks about the seventh century turned Gaelic into a written language and shortly after the English monks turned Anglo-Saxon into a written language, the first two written languages in Western Europe based on the Latin alphabet. (Ogham and runes had not been based on the Latin alphabet.) The Christian Irish and English monks were hardly giving the “problem of language no thought” except for “religious propaganda.” This is not only because their newly invented vernacular writing was not normally used for religious texts which were in Latin, but because the Irish monks used their newly invented Gaelic writing to record ancient Celtic pagan tales, and Anglo-Saxon monks used their newly invented Anglo-Saxon writing to record their pagan tale, Beowulf! Furthermore, concerning the “problem of language,” as the Celtic pagan tales were copied in the following centuries, the Irish scribes were careful to retain the archaic Gaelic in the tales, even though it was becoming almost like a foreign tongue. That they did so has not only been an enormous help to modern scholars but obviously indicates the old monks had a great interest in “the problem of language.”

On page 362 and 363, Pei had said very reasonably:

“The grammatical order prevailing in Greek and Latin, and passed on by those languages to those of the modern western world is to some extent symbolical of mental and even of social order. Most of the sloppy and confused thinking of today can be traced to the abandonment of the principles of order in the teaching of languages (particularly English) in the schools. The trained, logical minds of the past, which we occasionally admire and the absence of which we occasionally deplore, were firmly anchored to principles of order, in sociology as well as in language.”
The concern of the literate Christian Irish in the seventh century with the grammar which Pei felt was so important was so intense that they wrote many Latin grammars, discussed by Louis Holtz in Donat et la Tradition de l’Enseignement Grammatical, Centre National de la Recherche Scientifique, Paris, 1981. Furthermore, a complex parody on Latin grammar, highly original, was written in that period and is generally attributed to an Irish Christian, Fergal. How many grammar parodies do we have today, and how many people would read or understand them even if they existed? In addition to those and to the Donat grammars, major and minor, attention to the many-volumed Priscian grammars was intense in the period before 900. It was in the margins of some of these Latin Priscian works that Irish monks at St. Gall Monastery, Switzerland, wrote in Gaelic before 800 A.D. such comments as, “It is very cold,” and “Nightfall and time for supper,” which comments have been quoted elsewhere in this history. After 1,000 A.D., the study of Latin grammar remained the backbone of education, and even the cultural degeneracy in the universities in the late Middle Ages was primarily a degeneracy in the study of grammar, which had been perverted from its real purpose. By the late Middle Ages, even vernacular grammars were being prepared. Yet Pei accepted the description of this enormously long period from the fall of Rome in the fifth century to the Renaissance in the fifteenth century, ONE THOUSAND YEARS, as one which gave “the problem of language no thought,” until the “Renaissance” arrived. What the “Renaissance” scholars did was to pillage the old monasteries for their copies of Priscian’s grammars and Quintilian’s rhetorics (more “language”), which they announced they had “discovered.”

The following is one more of the hosts of historical sources which testify to high literacy in America up to the early 1830’s. It is taken from a pamphlet in the New York Public Library, Call Number cpv 1265, An Address Delivered at the Request of the Members of the Apprentices’ Library Company of Philadelphia, 23 November, 1832, by John Sergeant, LL.D, President of the Institute in Philadelphia. It was printed by James Kay, Jun., & Co., and the quoted remarks are from pages 5 to 9:

“The progressive dissemination of knowledge is a marked characteristic of the age we live in. It distinguishes especially the country in which our lot is cast…. Of the truth of this general assertion no one who looks around him can entertain a doubt. Advert for a moment to a single proof. The ability to read, as has been intimated, was once a mark of uncommon learning; the want of it is now a mark of extraordinary ignorance.

“This may, at first view, appear to be a minute circumstance; but the contrast is immense between ages characterized by the possession or the want of even so simple an attainment. When every child is taught to read, when every apprentice to a mechanic art has a claim upon his master by his indentures to be instructed in this humble element, and even considerably more; when, as may almost be said, every man, woman and child is accustomed in some degree to the use of books, has the capacity to consult them, and to draw knowledge from them; when books are actually published for persons of all ages and all conditions, and of every variety of taste and inclination; it requires no depth of reflection to perceive, that an intellectual condition must exist, very different from that of a period when none but clerks could read, and when, to the very body of mankind, all books were but sealed books.”

This American, who had no reason to dissemble, testified that literacy was almost universal in America for all classes of people in 1832. However, by 1832 the change in beginning reading instruction which had started in 1826 was well underway. America was therefore about to be swamped very soon with “functional illiterates,” the newly invented and expensive products of the change-agents and their newly established government schools.

Conditions among the poorer classes were not so good in England and Wales as in America. Although they were still generally using the syllable “sound” approach before 1826 in England and Wales, some children of the poor in these countries received no schooling at all. Yet general literacy was
far better there than is often acknowledged, undoubtedly because it is possible to learn to read with the syllable “sound” method rather rapidly so that elaborate schooling was not necessary to produce basic literacy. The following quotation is from page 338 of George Birkbeck, Pioneer of Adult Education, by Thomas Kelly, Liverpool, At the University Press: (some time after 1956), concerning over-all literacy in England and Wales in 1840:

“...on the average about three quarters of the adult population had some knowledge of reading....”

As is referred to elsewhere, the huge sales of penny literature in England before 1800 are a mute testimony to widespread literacy among the English poor in the eighteenth century.

Additional testimony on literacy and attitudes towards literacy in England in the eighteenth and nineteenth century are given in “Literacy and Education in England 1640-1900” in Past and Present, Number 42, 1969, the periodical of the Past and Present Society, Oxford, England. The article, which has been discussed earlier, was written by Professor Lawrence Stone of Princeton University in the United States.

Stone wrote on page 93 that the quick increase in population and the heavy movement into urban areas about 1800 strained the existing education facilities in England. Investigations in the early 1800’s claimed that almost a third of poor children in the urban slums in England never entered a school, and the existing schools were not only inadequate but overcrowded. He added however, concerning those contemporary claims:

“Statistical evidence of the effect of these conditions in depressing the level of urban literacy is at present almost non existent....”

Stone’s comments, turned inside out, provide the astonishing statements that more than two-thirds of the urban slum poor in England in the early nineteenth century did attend a school at some point, since less than one-third did not, and that there is absolutely no statistical evidence of any kind confirming urban illiteracy in England in the early nineteenth century, before the establishment of the government-supported schools that were supposed to cure that never-confirmed illiteracy!

As referred to earlier, the attitude of the privileged classes towards education of the poor was often negative. Writing and reading had been taught separately for centuries. While teaching a little “reading” might have been acceptable for the poor, teaching “writing” was often frowned on by their “betters,” obviously because it gave the poor too much power.

Stone wrote on page 89 that, in order to defuse the opposition to her Mendips school, Hannah More said,

“I allow of no writing.”

He added that, when the National Society associated with the Anglican Church began to promote elementary education, it also made the comment:

“...it is not proposed that the children of the poor be... taught to write and cipher”

Stone said that the Wesleyan Methodists had completely banned writing from their schools.

Stone wrote on page 130:
“As late as 1839 it was estimated that two-thirds of the Bradford weavers could read, but only a quarter could also write. In the coalmining district of northeast England in 1858, 78 per cent of the colliers could read, but only 64 per cent could also write - mostly only their own names. In private weekly schools at that time, 93 per cent of the students were learning to read, but only 43 per cent to write.”

As has been discussed elsewhere, the lack of ability to “write” in the absence of having been taught to write does not indicate illiteracy. As the above quotation confirms, it is possible to know how to read without knowing how to write.

Concerning the literacy in Scotland, Kelly also quoted (pages 338-339) R. K. Webb’s writings, E.H.R. LXV, 349-50, and “Literacy among the Working Classes in Nineteenth Century Scotland,” in Scottish Historical Review, XXXIII (1954) l00-14:

“‘the commonest figure of literacy (i.e. ability to read) for the ‘forties would seem to hover about two-thirds to three-quarters of the working classes, perhaps nearer the latter than the former.’

“In the rural areas of the Lowlands, where the Scottish tradition of universal literacy still held sway, the position was better. ‘The crucial elements of the working classes,’ Webb concludes, ‘- the artisans, mechanics, and skilled labourers - were almost universally literate and of a fairly high degree of attainment.’

It is obvious that the only reason that one-quarter of the working class could not read was that they had never been taught, since those in the “rural areas of the Lowlands” and the “crucial elements of the working classes” “were almost universally literate,” just like the Americans discussed by the 1832 speaker who is quoted above. The literate Scottish adults in the ‘forties would have been taught with the syllable method before 1830. By contrast to this relatively high degree of literacy before the spread of government schools, note in a later section of this history the appalling literacy results achieved in the government schools in England by the 1870’s, at which time compulsory attendance laws had almost all children in school at least for several years and the “meaning” method had replaced the “sound” method in the teaching of beginning reading.

The condition of beginning reading instruction in Ireland at the turn of the nineteenth century is particularly interesting, since education for the Catholic Irish had been outlawed by the Penal Laws since the 1690’s until shortly before 1830, but had been carried on anyway in the furtive “hedge schools.” Note in the following quotations the mention of the “spelling book” which was taught by the “sound” of English, and of students becoming fluent in Latin, which they undoubtedly also learned to read by “sound.” Those Irish “hedge schools” of the eighteenth century and early nineteenth century exported to America numbers of schoolmasters proficient in Latin. During that period, many “hedge schools” were undoubtedly still teaching in Gaelic. Yet enough were teaching in English or teaching in English after starting in Gaelic to show that literacy in English was no problem for the Irish when they used the English spelling book based on the syllabarium, and when “sound” was used in teaching that spelling book. However, under the appalling and degrading social circumstances that resulted from the Penal Laws, which laws debased far more than education for the Catholic Irish, illiteracy must have been common, but so was a high degree of literacy for many. That literacy grew from the firm foundation of learning to read by “sound,” not “meaning.”
A mocking commentary on these effective hedge schools was given by W. B. Yeats, in Representative Irish Tales, who was quoted in the article, “William Carleton,” (1798-1869), in Irish Literature, Bigelow, Smith & Company, New York: 1904, Justin McCarthy, Editor.

“His education, such as it was, was beaten into him by hedge schoolmasters. Like other peasants of his time, he learned to read out of the Chap-books - ‘Freney, the Robber,’ ‘Rogues and Rapparees’ or else, maybe, from the undesirable pages of ‘Laugh and Be Fat’.... He sat under three schoolmasters in succession.... They were a queer race, bred by Government in its endeavor to put down Catholic education. The thing being forbidden, the peasantry had sent their children to learn reading and writing, and a little Latin even, under the ‘hips and haws’ of the hedges. The sons of plowmen were hard at work construing Virgil and Horace, so great a joy is there in illegality.

“When Carleton was about fourteen, he set out as ‘A Poor Scholar,’ meaning to travel into Munster in search of more perfect education. ‘The Poor Scholar’ was then common enough in Ireland. Many still remember him and his little bottle of ink. When a boy showed great attention to his books, he would be singled out to be a priest, and a subscription raised to start him on his way to Maynooth. Every peasant’s house, as he trudged upon his road, would open its door to him, such honor had learning and piety among the poor. Carleton, however, plainly was intended for nothing of the kind. He did not get farther than Granard, where he dreamed that he was chased by a mad bull, and taking this for an evil omen, went home.”

A less mocking account is given by Henry Giles (page 1280, Volume IV,) in the article “The Irish Intellect.” Giles had been born in County Wexford November 1, 1809. Though born a Catholic, he became a Unitarian minister and died at Quincy, Massachusetts, in 1882, having come to America in 1840. This is an excerpt from a collection of his works published in 1845:

“The Catholic Irish in those hard times when education was thus forbidden them, carried their literary studies into the silent fields, and amidst bushes and brambles conned Homer, Virgil, Euclid or the spelling book; and this was the origin of what has been called ‘the hedge-school.’ The old Irish hedge-school should be held in immortal honor, as the last refuge of a people’s mind and as the last sanctuary of persecuted intellect. The Irish who dared all penalties for their faith, dared no less for their understanding. They were as zealous martyrs for scholarship as for conscience. Even while the penal laws were still in force, peasants who spoke Latin could be found among the hills of southern Ireland, and at all times classical studies have been popular among the Irish.”

John O’Keeffe (1747-1833) (Vol. VII, Irish Literature, p. 2770 and following), wrote this in From the Recollections of John O’Keeffe, 2 vols., 1826. O’Keeffe had been a writer of successful plays who tragically had gone blind in mid-life:

“In my early times, all the great outlets from Dublin had, inside the hedges, parallel footpaths with the road, and the stile, where the hedges divided the fields, were models for stiles all over the civilized world... in my time, the word village was not known, but every group of cabins had a piper and a schoolmaster, and before every cabin door, in fine weather, there was the Norah, or Kathleen, at her spinning wheel (no woman ever worked out of doors, or in the fields).”

The result of these hedge schools, which by Giles’ testimony used the spelling book, was a large degree of literacy. This is evident from the quotations which follow from the article, “Irish Fairy and Folk Tales,” by Charles Welsh (Vol. III, Irish Literature, pages xii-xxi):
“...The very first collections of fairy tales and folk tales are, of course, to be found in the old Chap-books. ‘They are,’ says Mr. W. B. Yeats, ‘to be found brown with turf smoke on cottage shelves, and are, or were, sold on every hand by the peddlars, but cannot be found in any library of this city of the Sassanach (London). The Royal Fairy Tales, The Hibernian Tales, and The Legends of the Fairies are the fairy literature of the people.’

“Of a certain volume, The Hibernian Tales, Thackeray writes pleasantly in his Irish Sketch Book, remarking, ‘So great is the superiority of the old tales over the new, in fancy, dramatic interest, and humor, that one cannot help fancying that Hibernia must have been a very superior country to Ireland.’

“‘These Hibernian novels, too,’ he continues, ‘are evidently intended for the hedge-school universities. They have the old tricks and some of the old plots that one has read in many popular legends of almost all countries.... The Black Thief is worthy of the Arabian Nights...’ And after telling us the Chap-book version of the story of Hudden, Dudden, and Donald, and of the Spaman, he says, ‘And so we shut up the hedge-school library, and close the Galway Nights Entertainments....’

“It is significant of how Ireland’s contribution to English literature in every department has been ignored by the English, and in consequence by the entire literary world, that in the... great collections of Chap-books made by the elder and the younger Boswell, which are now in the library of Harvard University, there are scarcely any of Irish origin, though England and Scotland are fully represented; and yet during the period covered by these collections, as these remarks by Thackeray and W. B. Yeats would indicate, the output of this literature was as large as, if not larger than, that of either England or Scotland. If it had not been for a certain purchase made by Thackeray at Ennis when on his tour through Ireland, and for a certain rainy day in Galway about 1830, the English people would probably never have known that the Irish people had their chap-books from the fifteenth to the nineteenth century....”

Thackeray and Yeats were talking about Chap-books in English, and their wide Irish market not only before government schools spread but even earlier when the government had forbidden the existence of schools for Catholics. Furthermore, there was no mention of teaching to read by “meaning” in any of these excerpts concerning the hedge-schools, but only of the spelling book. Yet a high degree of true literacy existed in that period in Ireland when the emphasis in teaching beginning reading in English was on “sound,” and not on “meaning.”

Eventually the Penal Laws were repealed and government schools were established in Ireland, presumably producing the same percentage as in England of that newly invented category, the “functional illiterates.” “Functional illiterates” arrived on the scene at the same time as the teaching of reading by sight-words and “meaning.” These government schools, however, mandated that Irish beginners be taught only in the English language, so they did “achieve” something else. The Gaelic language which was in wide use in Ireland in 1800 and which had survived for over two thousand years was almost wiped out by 1900 through these government schools. With the near disappearance of the Gaelic language, much of its written literature disappeared as well.

To summarize, a high degree of literacy was generally and easily obtainable all over the English-speaking world in 1800 when children were taught to read by the syllable “sound” method. At that time, only two conditions were recognized concerning print, and those conditions were “literacy” and “illiteracy.” “Functional illiteracy,” the result of being able to remember only a limited number of whole sight-words by their “meaning” and being unable to “listen” to the sound of print, did not yet exist in the
English-speaking world. In 1800, “sight-words” learned for their “meaning” instead of their “sound” did not yet exist anywhere in the teaching of reading in English, even for the deaf.
Chapter 14
That First Group of Activists

In 1826, a group of scientists and educators with futuristic ideas and activist inclinations arrived together at Robert Owen’s socialist utopia in New Harmony, Indiana, which property Owens had acquired in 1824. It was in that critical year for activists of 1826 that Noah Webster’s synthetic phonics spelling method to teach beginning reading was simultaneously challenged by three new books for beginners. These three new “whole word” primers, challenging not only the phonic syllable method but the speller itself, showed New Harmony themes. All three showed strong ties to activists for government schools, and one of the three showed a great preoccupation with “science.” Government schools, and that kind of “science” which appeared to emphasize the senses so as to de-emphasize the soul, were both very high on New Harmony’s agenda.

Further, none of these three 1826 primers showed any genuine concern for religious themes. Yet religious themes had been very evident in many of the reading selections in the spelling books that the new “primers” were attempting. The omission of such material could hardly have been accidental.

It should clearly be kept in mind that, almost from the beginning of Christianity, little children had practiced the sounds of their newly learned syllables by reading religious material, such as the Psalms, or the Pater Noster, Ave Maria and Credo. Much later, spelling books in English routinely included some short religious paragraphs among their reading selections. Yet, in less than ten years, this practice of almost two millenniums, of giving beginning readers religious material to read, was to fade, “accidentally.”

Samuel Blumenfeld’s original historical research, reported in his book, Is Public Education Necessary? The Paradigm Company, Boise, Idaho, (1981, 1985) traced the roots of government education in America to three dominant sources. (The Massachusetts colony schools were NOT the dominant source. Schools which descended from that source were effectively dying out when these three groups revived them.)

One source was the Owenite socialist activists who arrived openly on the educational scene after the failure of Robert Owen’s New Harmony utopia about 1828.

Another source was those Boston Unitarians who were determined to improve America because they were sure only they knew best how to do so - the same group who came to the defense of Abner Kneeland when he was tried for blasphemy. Through control of schools, they thought they would be able to shape and improve the minds of the population. They had been hard at work since about 1817, since by 1818 they had forced the founding of the Boston public primary schools, which, as Blumenfeld showed, were totally unnecessary because of existing facilities and the resultant high literacy level in Boston.

The third source was originally independent of either of these. As Blumenfeld showed, many of the Protestant clergy of the time were openly opposed to government schools like those being promoted by some Boston Unitarians. Nevertheless, some narrow-minded members of the Protestant churches were concerned about the heavy immigration of Catholics. Those people believed government schools could act as a Protestant influence on Catholic children. They were ultimately to get a very unpleasant surprise. The government schools for which they had worked did not only outlaw Catholic influence on children, but Protestant influence as well!

The above inadequate summary, of course, cannot do justice to Blumenfeld’s extraordinarily important Is Public Education Necessary? which reports on his research.
However, as Blumenfeld showed, immediately after the failure of the New Harmony utopia in 1828, a great and purportedly “spontaneous” flowering of interest in public education sprang up all over the United States. Yet it was obviously not spontaneous, but was instead the result of organized Owenite activities and of the Boston-Brahmin (largely Unitarian) influence. There were very, very few government schools in America in 1826, and yet, as shown by incontrovertible historical evidence from the period, the vast majority of the population was not only literate (as the result of the existing private educational facilities) but was surprisingly well informed. No need existed at all for the “public education” that the activists had started promoting in 1818, which promotion moved into high gear in 1826 and which then exploded after 1828.

The Franklin Primer of 1826

Blumenfeld reported that the New Harmony experiment did not get really underway until January 18, 1826, when what was called the “Boatload of Knowledge,” filled with scientists and educators of the period, arrived at New Harmony, Indiana, after having traveled from Pittsburgh down the Ohio and up the Wabash rivers.

Only shortly after, on May 25, 1826, an education convention met in Franklin County in western Massachusetts. This was one of many organized groups in education that proliferated in the United States after the arrival of the “Boatload of Knowledge” at New Harmony, Indiana. The Franklin convention approved the Code 4 Franklin Primer, obviously named after Franklin county, copyrighted on June 29, 1826. No copy of the first edition has ever been located, but only the second and some later editions, as recorded by Heartman in his listing of non-New England primers. Yet it is self-evident that the 1826 primer could not have been written by a convention, but only approved by a convention. The author of the 1826 primer can be identified as “A Friend to Youth,” since he wrote its sequels. As discussed earlier, Reverend Samuel Willard who wrote the 1802 Franklin Primer named after Benjamin Franklin is credited as being “A Friend to Youth.”

William Russell, the editor of the American Journal of Education, praised the Franklin Primer in October, 1826 (page 638) and in doing so made it clear that the push for government schools was, indeed, tied to the push to replace the spellers’ “sound” approach with the new primers’ “meaning” approach. He referred to the Franklin County convention which had adopted the reader, and identified it as a convention of “school committees,” which were boards of education for such tax-supported schools as existed:

“Amidst the indications of approaching legislative measures for elevating the standard of instruction in common schools, it is gratifying to observe the spirit of improvement at work in narrower spheres, and a county convention of school committees taking the business of practical reformation in their own hands.... The method adopted in the Franklin Primer is simple and natural. We have here no useless columns of rare and hard words, which the scholar will hardly meet again in the course of a lifetime’s reading.... This little book is one of the most ingenious improvements in this branch of instruction, that has hitherto been recorded in this Journal....”

Russell praised the Franklin Primer because it would “enable the child to commence with reading and descend to spelling.”

“The infant does not learn to recognize a tree as such by studying first the roots, then the trunk, then the twigs, then the branches, then the leaves. His eye and his mind grasp the whole object, and do not descend to particulars till afterward: he does not analyze until compelled to do so....
“To apply the principle involved in this illustration to the business of teaching reading, is no new thing in some countries; and in these this method has been found invariably successful. A fondness for system is now fast displacing it, but the more modern plan neither teaches faster nor more thoroughly.”

In this, he was probably referring to two groups: to the followers of Jacotot in Belgium and to the followers of Johann Bernard Basedow in Germany. Starting in 1770 with his own daughter and in 1774 in his famed Philanthropinum school, Basedow had moved the teaching of reading up from the syllable to the word but used phonics when doing so, which is discussed in one of my previous unpublished books, The Case for the Prosecution (1981). One of Basedow’s followers was Friedrich Gedike, who used whole words for an analytic phonic approach in 1779, and implicitly endorsed guessing! Gedike’s writing is quoted at length by Mathews, pages 39-41 of Teaching to Read, Historically Considered, University of Chicago Press, 1966. Mathews reported that Gedike was followed by Ernst Christian Trapp and Philip Wackernagel who did use straight sight words. Basedow had many other followers using analytic phonics on whole words, out of whom eventually developed the German analytic synthetic phonics method.

Russell was definitely referring to the Belgian, Jean Joseph Jacotot, whose work has been discussed previously. The Catholic Encyclopedia, 1913 (Volume VIII, pages 265-266) gave a brief biography of Jacotot (1770 - 1840):

“A member of the House of Representatives during the Hundred Days, he expressed his preference for the empire, and, at the time of the Second Restoration, his hostility to the Bourbons made it necessary for him to leave France.”

The article said Jacotot had taught in the college of his native city since 1789, and, after leaving France for Belgium:

“...taught privately at Mons and Brussels, and in 1818 was appointed professor of the French language and literature in the University of Louvain. The Revolution of 1830 allowed him to return to France.”

Jacotot’s works carried the common title, Enseignement Universel. The first was Langue Maternelle published in Louvain in 1822. Jacotot believed that knowledge in any area was a key to other subjects, and said:

“All is in all.”

Jacotot’s philosophy emphasized “wholes” and affected his ideas on teaching reading. Jacotot was the first true “whole language” advocate, with his recommendation that children learn to read by dealing with the “whole” of Fenelon’s Adventures of Telemaque. Jacotot had taught his Dutch-speaking students at the University of Louvain in 1818 to speak French by having them simultaneously memorize a French book while translating it into Dutch. According to Mitford Mathews, Jacotot and his method became famous with the publication of Jacotot’s Universal Instruction and The Mother Tongue. Jacotot explained that he believed children should also begin with a “whole” just as his Dutch students at the university had done. (Reading troubles which were originated by university “intellectuals” have a long history!) Mathews had stated that Jacotot expected children to go through the whole of Les aventures de Telemaque and then probably to repeat it in order to learn to read, but an 1887 article in the Dictionnaire de Pedagogie reported otherwise, saying that Jacotot wrote that a child need cover only six lessons and fifty lines of text to learn to read, analyzing them phonetically as he progressed.
Obviously, Jacotot was a charlatan, but he was a highly successful and very famous one, and certainly one of the principal subjects of Russell’s remarks, the other probably being Gedike. Jacotot’s work is described at length in the Dictionnaire de Pedagogie et d’Instruction Primaire, Librairie Hachette et Cie., Paris: 1887, in the article “Lecture”, by J. Guillaume, page 1545:

“Jacotot presents to his pupil the first sentence of Telemaque: ‘Calypso was inconsolable over the departure of Ulysses.’ The teacher reads aloud; the pupil repeats; then he is made to write this sentence, and one verifies that he distinguishes all the words, all the syllables, all the letters. One keeps the pupil on this first lesson until he knows it perfectly. One passes next to the second sentence, then to the third, that the pupil studies in the same manner ...Six lessons and fifty lines of Telemaque are sufficient for teaching reading....”

Jacotot’s method was ludicrous and obviously based on “meaning,” but it had not abandoned sound, although his eighteenth-century predecessors in France, Nicolas Adam in 1787 and the Abbe de Radonvillier in 1768, as discussed elsewhere, appear to have done so. Gedike of Germany in the late seventeenth century had not abandoned “sound” either, though he is often wrongly credited with having done so, and though two others of Basedow’s followers did, Trapp and Wackernagel. Therefore, very few of the known methods of teaching reading of alphabetic print up to 1826, and none of the widely used methods, had abandoned “sound” for a total emphasis on “meaning,” as was being done now in English.

The 1826 Franklin Primer was obviously popular, since it had at least 24 editions by 1840. The American Antiquarian Society in Worcester, Massachusetts, has a 24th edition that was put out in 1840. This 54-page 1840 copy lists three companies as publishers: Phelps & Ingersoll, Greenfield; Crocker & Brewster, Boston; and Mahlon Day, New York. The use of the book was therefore obviously widespread for a long period of time, far outside of Franklin County and the place where it was originally printed, Greenfield, Massachusetts. The Library of Congress has an 1830 ninth edition in which the syllable tables were replaced with syllabicated whole-words as examples of only some syllables: “ba-by, la-zy,” etc. That change increased further the move away from “sound” and toward “meaning” for teaching beginning reading, and it qualifies that particular edition for the even lower rating of Code 3.

Harvard has an 1843 copy of the pure sight-word book, Mrs. Barbauld’s Easy Lessons, also put out by A. Phelps of Greenfield, Massachusetts, the probable successor to the 1840 Phelps & Ingersoll just mentioned. Easy Lessons contained Mrs. Barbauld’s “Charles” stories. Yet, as mentioned earlier, Mrs. Barbauld’s material could never have been meant as straight sight-word material when it was written in 1778.

What is particularly interesting about this sight-word 1843 text is the advertising it carries on its cover for the series of readers beginning with the Franklin Primer:

‘In these Books the Author has carried forward his plan of facile instruction more completely than is done in any similar book in our language which has come to our knowledge.’”

In addition, the whole back cover of this 1843 book advertised these “New and Popular School Books.” Yet the Franklin Primer was seventeen years old by 1843, and the second book in the series, The Improved Reader or Sequel to the Primer, was only a year younger. The advertisements were probably almost as old as the readers themselves, and were simply being reprinted just like the readers themselves.
The advertisements on the back cover read:

The FRANKLIN PRIMER, designed as a primary book for children.
The IMPROVED READER, or Sequel to the Primer.
The GENERAL CLASS-BOOK. This is designed as a reading book for the higher classes.
The POPULAR READER, intended as a Reading Book for the first classes in Schools and Academies, throughout the United States.

“The object of these four books is to impart to the child by an easy and gradual process (commencing with the alphabet) such a knowledge of the English language as will enable him to read with propriety, understanding and grace, in every book written in a style either simple or elegant.

“These Books have also received the approval of a Convention called for the purpose of promoting the cause of Education in Common Schools. This convention was largely attended, and consisted of Teachers and Delegates from five states. They have also been favorably noticed by many of the most distinguished Professors and successful Teachers in New England. The following notices are subjoined, which are but a small part of those which have been received.

“They have been lately reviewed and noticed with approbation in the ‘Revue Encyclopédique,’ (published in the city of Paris) one of the most distinguished Scientific Journals published in Europe. The following is an extract. ‘Cette serie de lectures est faite dans un excellent esprit, et par une personne, qui a evidemment etudie, et approfondi le sujet qu'elle aborde.’

“‘We can say with truth that they (the Primer, Reader and General Class-Book) are certainly well adapted to the purpose for which they are intended.’ - North American Review.

“‘They are intended to obviate prevailing evils in the manner of teaching the English language, and though susceptible of some improvement, are on the whole, excellently adapted to their object.’ - American Journal of Education.

“‘I found them so peculiarly adapted to the wants of children in the early stages of education, that I recommended their introduction into our schools at once.’ - Hon. W. B. Calhoun, late Chairman of the Committee on Education in the Legislature of Massachusetts, and Speaker of the House.

“The Franklin Primer. - A writer in the Christian Register, while recommending the American Lyceum, speaks incidentally of this book as follows: - ‘That excellent little book, the best perhaps of its kind, in the English language.’“

The approval of the Franklin Primer in the same review which approved the American Lyceum is intriguing. Samuel Blumenfeld outlined the background of the American Lyceum in Is Public Education Necessary? (pages 111-112):

“At about the time that the socialists decided to make public education the primary instrument of their efforts to reform the character of man preliminary to their radical reform of society, American educators began to organize into substantial pressure groups in favor of public education. The man most responsible for this development was Josiah Holbrook, founder of the American Lyceum movement. A plan for the Lyceum organization, originally conceived as a
‘society for mutual instruction,’ was first made public by Holbrook in a letter to the Editor in the October 1826 issue of the American Journal of Education. Holbrook wrote:

“Each board of delegates shall appoint a representative, to meet representatives from other boards who shall be styled the Board of Mutual Education for a given State, and it might be advantageous to have also a General Board embracing the United States.”

Blumenfeld wrote, on page 124, that the following appeared in the September 1828 American Journal of Education:

“The fifty or sixty branches of the American Lyceum already established, contemplate a National Institution for the diffusion of knowledge, and the introduction of a uniform and improved system of popular education.”

Blumenfeld commented further on page 125:

“In the spring of 1829, Boston formed its Lyceum under the name of the Boston Society for the Diffusion of Useful Knowledge. Its statement of purpose was signed by William E. Channing and twenty-nine other members of the Boston elite... In February, 1830, delegates from fourteen county Lyceums met in Boston to form a Massachusetts State Lyceum... Holbrook had also called a teachers convention in conjunction with the Lyceum meeting... At that convention a vote was passed ‘recommending that a general association of persons, engaged and interested in the business of instruction, be formed.’ The result was the American Institute of Instruction, the first academic organization of its kind in America...”

Holbrook’s letter of October, 1826, resulted in a network of such groups throughout the United States, capped by a national “lyceum” by February, 1830, only three years and four months after he wrote his letter!

Blumenfeld added, on page 138 and 139:

“With the new Pennsylvania school law passed in 1834, Holbrook spent the following year organizing the teachers of that state into Lyceums and countering attempts to repeal the law. His efforts were successful. At about this time, Holbrook thought of organizing a Universal Lyceum with Lord Brougham, the British liberal Parliamentarian, as president. Lord Brougham had been a friend of Robert Owen’s for years, and Holbrook’s idea is another of these tell-tale clues that suggest strongly that Holbrook was a covert Owenite. The idea, however, never got off the ground.

“In any case, by 1835, largely through the untiring work of Josiah Holbrook, the educators of America had been organized into a solid body of support for public education. In state after state, legislatures began to establish the foundations of tax-supported public educational systems...by 1835, American educators were looking toward Prussia for their model of a perfect state-controlled system. Selling this system to the American people, who were so very satisfied and comfortable with their educational freedom and private institutions, would take another ten years.”

It was common practice in that period to print endorsements of school books on their covers, and sometimes the endorsements even included well known names, but such endorsements were commonly vague and read something like this: “In the time available to examine this book cursorily, I have concluded that it is a fine school book.” (Endorsements sometimes came perilously close to Abraham
Lincoln’s famous endorsement which ran about like this: for those who like this kind of a book, this is the kind of a book they will like.) Most commonly, endorsements were only from other school personnel.

The contrast between such routine endorsements on other school books and the kind received for the Franklin Primer is therefore spectacular! For instance, this is the first record I have turned up of political clout (Calhoun’s in Massachusetts) being used to force a change in reading methods. It is even more astonishing that reading books first published in rural Greenfield, Massachusetts, should be praised as the best reading series in English in a magazine published in Boston, Liverpool and London. However, it is absolutely mind-boggling that a series of beginning reading books from a small town in western Massachusetts should be praised in “one of the most distinguished Scientific Journals published in Europe,” in Paris (though that reviewer assumed the author was a woman.) The author of The Franklin Primer must have had powerful friends. A tie to Josiah Holbrook’s burgeoning American Lyceum which was promoting public education is also suggested by the review in the Christian Register which mentioned and praised both.

Perhaps the French journal read the preface to the second book in the series, portions of which are quoted below. What the author, listed only as “A Friend to Youth,” proposed was the reading methods with which America has been saddled since 1826: a total shift from “sound” in beginning reading to “meaning,” and the dropping of the speller for beginners.

In the “meaning” method after 1826, the whole words were pronounced for the child, so he did not “hear” the individual sounds of the letters. Yet Gallaudet’s version of the “meaning” method in addition (or instead) used a frustration level. About ninety per cent or more of the words in the selection were already known, so the “meaning” of the unknown ten per cent or so could be guessed from the context, without “frustration.” Therefore, the unknown words did not have to be “heard” at all to determine their meaning. Gallaudet’s sight-word method promoted context guessing far more than earlier sight-word methods. That is why, in the readers produced since 1930 which use the Gates and Gray deaf-mute-method approach of 1930, which is actually Gallaudet’s “frustration level” approach, such words as “pony” are far more likely to be misread by a synonym such as “horse.” Children are heavily drilled in their school materials in the use of such context guessing. It is true teachers using the Gray and Gates approach do pronounce new words first at the blackboard. Yet even the initial introduction of a new word promotes context guessing, since a new word is commonly introduced only in the context of a sentence. The teacher passes her hand under the sentence while reading it, which obviously keeps the sentence’s “meaning” paramount.

The author of the Franklin Primer did endorse “spelling” of the words to be met in the “stories,” but this only meant naming letters in sight-words. As his preface will show, that had nothing to do with decoding words by sound. See-aye-tee spells the printed word, cat, but it does not suggest its sound. Even Gallaudet’s deaf-mute students learned to spell words by their letter names, but they never were taught to speak.

The “Friend to Youth” who wrote the 1826 Franklin Primer and the 1827 Improved Reader was probably Reverend Samuel Willard. He clearly explained his aims on the title page of the Improved Reader, using as a slogan almost the same words as had been used on Samuel Putnam’s Analytical Reader of 1826, which the 1827 “Friend to Youth” attributed to St. Paul:

“I would rather speak five words with my understanding than ten thousand words in an unknown tongue.”

This recalls another oft-repeated saying, that the Devil knows how to quote Scripture.
“A Friend to Youth” enlarged on the “experts’” common 1826 theme, turning it to his own purposes, in his preface:

“If a common spelling-book is ever to be used, it is not, I think, to be either the first or the second (book to be put) into the hands of a child.

“It is the opinion of some, who speculated much on the subject, and who are entitled to great respect, that reading should commence with the pronunciation of sentences, while spelling is made a subsequent business. That this theory is incomparably better than that, which has come down from our fathers, and which has hitherto controlled our practice, there is perhaps no reasonable doubt. The author must be allowed to believe that there is an intermediate course far better than either. For him, it is hard to conceive, how the child is to arrive at such a ready distinction of one word from another, as even tolerable reading must require, without meeting and surmounting the principal labors and difficulties of spelling. To distinguish cat from rat, for instance, he must observe the diversity of the letters c and r in the two words: to distinguish eat from ate, he must observe the different arrangement of the letters; that is, he must spell mentally, if he does not do it orally.... those who have read volumes and libraries without first learning to spell, are generally bad spellers and bad readers through the whole of their lives...

“The exercises in this book, however, will perhaps be found equally well adapted to the views of those, who would have the sentences read before the words are spelled, and of those, who prefer the opposite method; and the author is perfectly willing both experiments should be made, though he is satisfied that orthography should in general, if not always, precede sentential reading. In either case, it is hoped, the book will not be laid aside, till the learner is able to spell every word it contains.

“For the convenience of pupils and teachers, points are prefixed to such words as require most attention.... These words it may be well to have read in syllables, before the sentences are read, and afterwards spelled with closed books.

“A formal treatise on pronunciation, or any scheme of notation for the different sounds of letters, appears to be unreasonable in the first, or second book in the course of education. Doubtless it is a matter of great importance, that the child should acquire and fix in his mind a correct pronunciation of words, as fast as he has occasion to use them. But this may be most readily learned from the voice of the teacher; who, if not thoroughly acquainted with this branch of instruction, should have a dictionary always before him, to which he may look, as a guide to guiding others. If it be thought, this would require the same words to be often pronounced in order to fix the pronunciation in the mind of the child, it may be observed that the task will be greatly facilitated by the obvious signification of the words, which are already familiar to the ear, and by the analogous sounds of letters, which will be in some measure perceived by the pupil, long before he is capable of comprehending the whole system.

“The leading design of this compilation is to introduce the child, by an easy and gradual progress, to an acquaintance with the most important words; to an acquaintance with their meaning, as well as their visible forms, that he may early acquire a taste for reading, and be more incomparably capable of oral instruction than he would otherwise be. With this in view, the exercises in general have been so selected and arranged, as to bring forward a moderate number of new words in each lesson. These words are defined and illustrated....

“Other lessons, while they illustrate the use of words, and train the eye and the voice to reading, are calculated to... store the mind with... useful information. The author pretends to no
great originality either in the design, or the execution. He hopes, however, that some material improvements have been made on the best books of the kind before extant...."

Buried in his wordy explanation is the precise recipe for the basal reader sight-word method, except that his approach included “oral spelling,” i.e., naming all the letters in sight-words to be memorized, which refinement was later called the ABC method. Note the claim to some vocabulary control in this second book of the series: “to bring forward a moderate number of new words in each lesson.”

The first book in the series, the 1826 Franklin Primer from Franklin County, Massachusetts, should not be confused with the far newer and totally different, widely used and heavily advertised The Franklin Primer of 1873, a sight-word book, also called in a later edition the Webster-Franklin Primer, because it used Webster instead of Worcester orthography. This was written by G. S. Hillard and L. J. Campbell. Yet, in Nila Banton Smith’s “history,” she completely omitted the widely used 1873 Franklin Primer and instead claimed one of its authors, G. S. Hillard, wrote an 1831 Franklin Primer of which no record can be located. When the 1826 primer from Franklin County was published, Hillard, who was born in 1808, would have been only 17 or 18 years old! The 1831 book Smith claimed to have seen could have been a later edition of the 1826 primer from Franklin County, Massachusetts. Yet Smith claimed on page 57 that Hillard wrote all the readers from Franklin County: The Franklin Primer, The Improved Reader, The General Classbook, and The Popular Reader. Smith then described on pages 57 and 58, as the beginning content of that elusive 1831 Franklin Primer, the beginning content of the 1802 Samuel Willard primer named after Benjamin Franklin and not Franklin County, on which Heartman showed no later edition than 1812!

This suggests it would be a waste of time looking for an 1831 “Hillard” primer, as there probably really is no such thing. However, I have found Nila Banton Smith’s “confusions” sometimes seem to serve very clear purposes and the purpose in this case seems to be to bury Hillard’s widely used 1873 Franklin Primer. It obviously played an important role in the switch back from “sound” to “meaning” in Boston in 1878 which was the work of activists, as will be discussed later.

The 1826 Franklin Primer immediately became popular as a replacement for the spelling book for beginners. Edgeworth’s 1799 primer had apparently not been successful, so the 1826 Franklin Primer was apparently the first really successful story-book “primer” opposition to the syllable-method spelling book for beginners. The 1826 Franklin Primer jettisoned most of the spelling book syllable “sound” approach for the whole word “meaning” approach, even though it began with an introductory syllable table. The Franklin Primer showed the influence from “whole word” enthusiasts in Great Britain who were opposing the syllable method, the spelling book, or both, such as John Wood of the Edinburgh Sessional School in Scotland about 1826, Andrew Bell of the monitorial schools before 1823, and Richard Edgeworth in Ireland in 1798 and 1799.

However, Richard Edgeworth had said in his 1798 “Practical Education” that he endorsed phonics, even though he rejected the syllabary and the spelling of whole words. His “phonics” therefore had to have been analytic phonics, in which whole words are not broken apart. What kind of analytic phonics Edgeworth used, and how effective it was, could only be determined from examining the “primer” that Edgeworth wrote a year later, in 1799, which Alston significantly did not include in his volume on spelling books, but in another volume. By doing that, Alston confirmed that Edgeworth did not use the spelling to teach beginning reading.

According to the article on Maria Edgeworth in the Dictionnaire de Pedagogie et d’Instruction Primaire, what Richard Edgeworth used in his 1799 “primer” was “direct syllabication.” The Dictionnaire article said that Edgeworth had recommended that in one of the portions that he contributed to the 1798 book, Practical Education, on which his daughter, Maria, was a co-author:
“The chapter on tasks outlined the method of direct syllabication for teaching of reading.”

To the Frenchman who wrote that Dictionnaire article, and who was used to the term in France, that would have meant that Edgeworth only taught whole syllables (ba, be, bi, bo, bu) without having a child spell the syllables as he recited them (b-a, ba, etc.) However, since Edgeworth is known to have jettisoned the syllabary, that means that Edgeworth’s kind of “immediate syllabication” had to have been on whole words, without “spelling.” Edgeworth reported in his 1798 book that he did use phonic markings on words, but, since children were not supposed to “spell” the words in his 1799 primer either by sound (cuh-ah-tuh) or by letters (c - a - t,) that meant that they used only whole word, analytic phonics, which is the comparing of whole words to each other.

Despite the fact that it used purely analytic phonics, Edgeworth’s 1799 “primer” may have been an adequately phonic text from its description in A Bibliography of the English Language from the Invention of Printing to the Year 1800, Volume VI, Rhetoric, Style, Elocution, Prosody, Rhyme, Pronunciation, Spelling Reform, “Printed for the Author by Ernest Cummins, Bradford, England, 1969.” Richard Edgeworth claimed in the 1798 book, Practical Education, that he had originated his own phonetic markings for words before he ever saw Thomas Sheridan’s phonetic scheme. However, as discussed elsewhere, because of puzzling remarks attributed to Edgeworth, who was the very first person writing in the English language to drop the spelling book for beginners, he may have made a pronounced move from teaching by “sound” to teaching by “meaning” in that 1799 “primer,” despite his analytic phonics. To judge from any records that I have ever seen, Edgeworth was certainly the first English author to drop the spelling-book syllabary and then to attempt to teach beginning reading in a book teaching whole words, which he labeled a “primer.”

Yet I have turned up no reference to Edgeworth’s 1799 “primer” having been in actual use anywhere, while it is obvious from materials published in the early nineteenth century that Edgeworth’s 1798 Practical Education was widely read. The failure of Edgeworth’s 1799 “primer” to show up in the writings of the time certainly suggests that there was something very wrong with that “primer.”

Although it is true that the 1826 Franklin Primer, at least initially, did include a syllabary, “primers” without any syllabaries had become the norm to teach beginning reading in English, instead of spelling books, on both sides of the Atlantic not long after 1826. The record demonstrates that the massive sea-change in beginning reading methods, the dropping of the “sound” syllabary spelling method that had been used to teach beginning reading by “sound” instead of “meaning” for more than two thousand years, and the replacement of that ancient, successful method by whole-word “primers,” which were NOT successful, had most probably been initiated by Edgeworth, himself, in 1799. Despite the fact that his 1799 “primer” does not appear to have been successful, Edgeworth’s whole-word “primer” method that he introduced for beginning reading in that book was in almost universal use in the English language before 1830, except in poverty-stricken or backwoods areas, although the oral “spelling”of sight-words persisted until about 1870. That certainly suggests that Edgeworth had enormous influence.

Although no attention at all has ever been given to it, it seems very likely that Edgeworth was ultimately more influential, in a negative way, on the teaching of beginning reading in English, than Noah Webster was influential in a positive way. (The title of the Edgeworth book has been capitalized below, which was not done by Alston.) Alston’s description of the Edgeworth text is quoted below.

“No. 514. (Edgeworth, Maria, & Richard Lovell) A Rational Primer. By the Authors of Practical Education.... Bristol, Biggs & Cottle for J. Johnson (London), 1799. (Pronunciation; phonetic spelling.) The pagination is erratic. Pronunciation indicated by the use of diacritical marks.”

335
Because of Richard Edgeworth’s intense aversion to the use of the syllabary in beginning reading, as expressed in his 1798 book, Essays on Practical Education, it is highly probable that he did not include the syllabary in his book, A Rational Primer. However, Edgeworth certainly must have included directions for pronunciation, so he was not totally avoiding “sound” as John Wood did. It would be of great interest to see Edgeworth’s 1799 book, to determine whether or not it was the first story-book beginning reading book in English. It almost certainly was the first to omit the spelling-columns introduction to the beginning reading of English that had been uniformly used until then. The fact that Alston did not include Edgeworth’s 1799 work on pronunciation with his lists of spelling books, when he did include Webster’s and Perry’s works on pronunciation on that list, certainly raises unanswered questions about the nature of Edgeworth’s 1799 “pronunciation” material. Edgeworth’s 1799 book was apparently the very first whole-word, probably “story-book primer” approach to the teaching of beginning reading in English, and it must have been of far more long-term influence than has been recognized.

Only two years after the 1826 Franklin Primer was published (or possibly earlier) John Wood of the Edinburgh Sessional School published by 1828 a whole-word primer, called The First Book, which will be discussed later. This clearly and totally crossed the line from “sound” to “meaning” which the Edgeworth 1799 work did not, since it included diacritical marks. Even the Franklin Primer had not totally moved from “sound” to “meaning.” Nor did Andrew Bell’s circa 1823 inferior materials move totally from “sound” to “meaning.” Bell’s materials are discussed in Part 6 which concentrates on developments in Great Britain.) The 1828 Wood text was in no sense one of the old spellers, but instead one of the first of the new totally “meaning” primers. (Possibly in an unlocated edition earlier than 1828 it was the very first, earlier even than the 1826 Worcester primer discussed below which had also totally crossed the line from “sound” to “meaning.”) The Wood text intentionally dropped the syllable method, and, with it, all reference to “sound,” and it made no use of diacritical marks. Wood’s primer was reprinted in Boston by 1830.

The Franklin text showed the influence of the dreadful conversational-style books for little children like Mrs. Barbauld’s which became popular in England towards the end of the eighteenth century. Those books were utterly silly, boring and empty, particularly of religious content. Yet no child’s book published in Massachusetts in 1826, of course, could be totally devoid of religious content, so The Franklin Primer had a very minimal amount. The essential change, however, was dropping the phonic syllabic spelling book word-list approach with its emphasis on “sound” for beginners and replacing it with whole-word narratives with the emphasis on “meaning.” The Franklin Primer did, however, list the “new” words used in its “stories.”

It is recorded that an “Easy Reader” was introduced in the Boston primary schools eight years after they were started in 1818 (from Superintendent Philbrick’s Boston 1874 Annual School Report, pages 374-375). The introduction of an “Easy Reader” would therefore have been in 1826, and very possibly it was The Franklin Primer.

Those who believe that building a better mouse trap automatically brings the world to your door will have no trouble in accounting for the rapid success of the Franklin Primer. However, those who believe in the value of advertising will suspect that the rapid success was more likely the work of dedicated promoters.

Samuel Worcester’s Primer of 1826

The second successful whole word book appearing in that critical year of 1826 was more daring than the Franklin Primer and totally dropped the ancient syllabary. It was Samuel Worcester’s A Primer of the
English Language for the Use of Families and Schools, a clear Code 1. It was copyrighted in Boston on October 9, 1826, by its publisher, Hilliard, Gray, Little and Wilkins.

The reference to the publisher, “Hilliard,” suggests a tie with someone at Harvard with this 1826 primer, just as such a tie is suggested with the 1877 Franklin text, as will be discussed later. Between 1800 and 1802, William Hilliard founded his privately owned company, later owned jointly by him and others, known as University Press. This privately owned company was the printer for Harvard’s material for most, or possibly all, of the nineteenth century. (Harvard University Press is now the press of Harvard.) After Hilliard relinquished ownership of University Press, it passed in 1842 into the ownership of Charles R. Metcalf and others, then in 1859 into the ownership of Welch, Bigelow and Co., Cambridge, and by 1878 into the ownership of John Wilson & Son, Cambridge. Publishers Book Bindery, Inc., Winchester, Massachusetts, were, I believe, the publishers of Stephen Daye and His Successors (on which I do not know the date). Pages 22 to 25 give the history on University Press until 1895, and the sequence of owners (although they give the Wilsons’ arrival as 1879, while a copy of a text in the Harvard library shows the Wilsons were printing as the University Press by 1878). A text by Zachos published in 1864 shows that John Wilson & Son who acquired the University Press in 1878 were in business in Boston as early as 1864. As is proven by a Harvard copy of the Hillard and Campbell Franklin Primer (completely unrelated to the 1826 Franklin Primer), John Wilson & Son took over University Press by 1878, not 1879 as stated in the above history. It therefore appears probable that Wilson bought out Welch, Bigelow and Co. during 1878.

However, if Hilliard were already in control of the company acting as Harvard’s press in 1826 when the Worcester reader was published, and even though it is probable the commercial publisher Hilliard was also routinely printing non-Harvard materials as well, a possible tie exists between the introduction of the radical “meaning” approach Worcester reader printed by one of Hilliard’s companies in 1826 and some person or persons at Harvard. The influential Worcester series remained in print until it was replaced by the first series of G. S. Hillard (not Hilliard) in the late 1850’s, who was the same Hillard who later wrote the 1873 Franklin Primer with L. J. Campbell. The 1873 Franklin Primer was therefore in a very real sense the “descendant” of the 1826 Worcester primer.

In 1844, William Russell, the activist/editor/elocutionist, whose biography is discussed elsewhere, wrote Primer, or First Steps in Spelling and Reading, a Code 4 “meaning” text, and Spelling Book, or Second Course of Lessons in Spelling and Reading. Published by Charles Tappan, Boston, the books were part of “Russell’s Elementary Series,” which also included Russell’s Primary Reader and The American Common School Reader and Speaker. In Russell’s speller, on page 8, he said he was using Worcester’s orthography, which was “being sanctioned by the University Press of Cambridge.” (That “orthography” was from the Worcester who wrote a dictionary in competition with Noah Webster’s, not the Samuel Worcester who wrote the primer.) The University Press was therefore highly influential in 1844, and was probably so eighteen years earlier when one of its owners, Hilliard, was associated with the printing of the Worcester primer.

The 1826 Worcester reader was a pure sight-word text, despite its using uncontrolled vocabulary, and despite its requiring oral spelling of letter names in whole words. It totally omitted phonics and the syllable tables, and, most meaningfully, it contained NO SYLLABICATION. It also contained only one religious reference, but gobs of natural history, and even a story on a visit to a museum. There is no question that Worcester meant the book to be a radical change, as his opening paragraph in his “Directions to Teachers” said:

“In order to teach this PRIMER, it will be absolutely essential that the instructor should abandon the common method of teaching children to read and spell.”
The Worcester text met the unqualified endorsement of William Russell in the American Journal of Education in June 1826, (page 379, Volume I, No. VI) before Worcester’s book had even been published:

“Reading Book for Infants - It is with uncommon pleasure that we inform our readers of the above publication. It is now in preparation by Mr. Samuel Worcester of Gloucester, Massachusetts, a gentleman eminently qualified for the undertaking.

“This proposed book is to contain a series of reading and spelling lessons combined. It will embrace all or most of the valuable improvements suggested by the recent English publication on the instruction of infants.... From what we have seen of the manuscript, and the designs, we have no hesitation in recommending it as the most ingenious and practical volume which has yet appeared, for the purposes of domestic instruction or of primary schools.”

What “the recent English publication on the instruction of infants” was is unknown. It must have endorsed throwing out the syllabary and syllabic spelling book and teaching whole words for “meaning,” and it also appeared to be tied to infant schools, suggesting the Owenite influence. It would be of great interest if it could be located.

According to Blumenfeld, one of the public school activists was George B. Emerson, a graduate of Harvard in 1817, principal of Boston’s first public high school in 1821 and prominent as an activist for public schools in the 1830’s and 1840’s. (Such American “high schools,” were meant to be government-controlled, like the primary schools which were under government control from their inception. High schools in America were one of the innovations of the activists and were ultimately to take the place of the privately owned academies, as well as most of the Latin grammar schools, which were not grammar schools as we know them.) It is of interest that the activist Emerson wrote the following endorsement for Worcester’s books in 1841, reprinted in a copy of Worcester’s Second Book:

“Ever since I first became acquainted with Mr. Worcester’s books they have seemed to me better adapted, than any other series that has come to my knowledge, to the capacities and wants both of learners and teachers of the Elementary Schools.”

Worcester’s dreadful sight-word book prospered mightily and was used in the first permanent state normal school training classes, at Lexington, Massachusetts, in 1839. Private normal schools had existed prior to 1839. Blumenfeld reported (page 133) that Samuel R. Hall’s popular book, Lectures on School Keeping, was published in 1829 and that Hall became the director of Phillips Academy’s new seminary for teachers at Andover when it opened in September, 1830, the first of its kind in America. J. Orville Taylor, a public school activist who published the Common School Assistant starting in January, 1836, advertised in his February, 1839, issue his own private six-months training school for teachers from May 1 to October 31, 1839, and said “The class of fifty which went through this course last summer are now receiving, on an average, $30 per month and board, for teaching. The coming class will be limited to one hundred.” Whether Taylor’s 1838 class was his first is not known, but it would have received the “best” in training: in Taylor’s October, 1837 issue, he said Rev. T. H. Gallaudet’s sight word The Mother’s Primer:

“...is the best manual we have seen for teaching children the first steps in spelling. This little work, and Town’s Spelling Book are the best helps a child can have, during the first stages of an education.”

Not surprisingly, Taylor himself published Town’s Spelling Book which taught meanings along with spellings. Noah Webster took the time to denounce Salem Town’s work as incompetent. Its wounded publisher, Taylor, referred to this comment of Webster’s in Taylor’s periodical, the Common School
Assistant. But Salem Town prospered, despite Webster’s denunciation, writing a reading series in 1844 and appearing as the senior author later on the highly successful The Progressive Series with Nelson M. Holbrook, which was being published by 1855 and still being printed in the late 1860’s.

After 1839, state-supported normal schools for teachers began to multiply, such as the normal school in Lexington, Massachusetts, using Worcester’s book. So did the teachers’ periodic institutes in most of the United States which demonstrated the “best” in methods, and Worcester’s was acknowledged as using the “best.” Teachers’ institutes had begun as temporary normal schools in 1837 (or possibly before) and assumed the “institute” form in 1843 in New York State 20, after which they proliferated almost everywhere in the United States and reached a vastly greater teacher population than the relatively costly normal schools. Huge numbers of teachers attended these institutes for short periods in the summer or during released time in the school year. Such attendance led to job approval or advancement. “Institutes” are discussed further later in this history. These job-qualifying mechanisms apparently served as the ultimate pipeline for moving whole-word teaching such as that in Worcester’s primer into American schools as the standard method. Such teachers’ “institutes” were enormously widespread and influential in America until the twentieth century, although reference to them has also dropped into education history’s “black hole.” While it does not give education credits, the New Jersey teachers’ convention which has been held each November since the early years of the century, during which all New Jersey public schools close, and which has large numbers of workshops for teachers, is an obvious outgrowth of such institutes.

The parallel to present practice from these nineteenth century institutes which promoted the “best” methods is obvious. A teacher can be certified by the state in which she teaches as a “reading specialist” only if she submits to wholesale propaganda in state-approved courses, the content of which always favors the deaf-mute method. I speak from personal experience, as after obtaining a master’s degree in natural history, I had gone about half-way through a program for a master’s degree in reading instruction in New Jersey when I dropped out because of that kind of appalling content. It is curious that no one has ever challenged such government “certifications” as un-Constitutional infringements on the Bill of Rights.

Dr. John M. Keagy’s Primer of 1826, and Its Multiple Relationships

The third radically different 1826 reading book for beginners was copyrighted in Harrisburg, Pennsylvania, on December 21, 1826, (on the opposite, eastern side of the mountains from the Pittsburgh/Ohio River jumping-off place for the 1826 Boatload of Knowledge).

That 1826 book, in its preface for teachers, showed the clearest agreement with the ideals of that New Harmony Boatload of Knowledge, although much of its text for children was not new, as its author felt the time for his implementing all his ideas for teaching beginning reading had not yet come. The book was written by a medical doctor who had practiced only a few years, John M. Keagy (1792-1837), who had been born in Strasburg, Lancaster County, Pennsylvania. Keagy had become involved in education because of his interest in the new Lancastrian and Pestalozzian movements, and in the new concern about the training of teachers.

Yet Pestalozzi had not really been an innovator. His ideas were only a development in a straight line from the seventeenth century English philosopher, John Locke, through the German founder in 1774 of the Philanthropinum School, Johann Bernhard Basedow. Both of the latter taught that things must be known before they can be named. That idea flowered (or, too frequently, deteriorated) into the massive “object teaching” of the 1800’s, and it is such “object teaching” which is associated with Pestalozzi’s

20 Source: The School Bulletin, Syracuse, N. Y., May, 1876, page 177
name. Object teaching had many forms, some of which seem to have had some worth, but most of which seem to have been bad. One of the worst - and apparently prevalent - forms is demonstrated in the 1862 text, Object Lessons Prepared for Teachers of Primary Schools, by A. S. Welch, A. S. Barnes & Co., New York and Chicago. That appalling book is discussed later. However, Keagy thought, like Pestalozzi, that things must be known before they can be named. That will become obvious from the quotations from Keagy'preface which are given later.

In discussing Keagy’s critically important preface, it is necessary to give considerable biographical information on certain people and to give information on their ideas. Most of these people appeared to be intimately associated with the changes in education which were taking place: the move to government schools, and the move to “meaning” in place of “sound” in beginning reading. Such information, therefore, is not digression but is necessary background, particularly since these people are almost unknown today. They can best be described as a trans-Atlantic intellectual clique, informal members of which included the New England intellectuals and Owen, Brougham, Stewart, et al in Great Britain. The background on some of these men will be discussed later.

Keagy first taught school at the Asbury College in Baltimore in 1818. It is recorded that he later taught at the Classical Academy, Harrisburg, in 1826, and at the Penn Charter School, Philadelphia, 1830-35. Yet Keagy must have been in Harrisburg as early as 1824, as he published an earlier book there that year, which was an essay and not a textbook. Curiously, in this 1824 essay, Keagy publicly declared war on the old-spelling book in words that suggested already planned group action. What else could his words, the Engine of Reform” imply, except the pre-existence of a group determined to act? Voices crying alone in wildernesses do not speak of “Engines of Reform” but only of hopes of recruiting the support which is presently non-existent.

As Mathews showed in his bibliography (page 212), Keagy said that his 1824 work was an extract of articles he had “written some years ago, and first published in the Morning Chronicle of Baltimore, in the Spring of 1819.” He would have been about 27 in 1819. Mitford Mathews (page 81) wrote concerning Keagy’s 1824 book, An Essay on English Education Together With Some Observations on the Present Mode of Teaching the English Language, the essence of which Keagy said he had written as early as 1819:

“In this he commented on the ‘absurdity of teaching by Spelling Books,’ believing that this prevented children from thinking of what they were reading. He said: ‘Our language is generally taught in such a way as to establish habits of reading without thinking.’ He thought when the ‘Engine of Reform’ was set in motion ‘the present spelling book system, the unlucky invention of ignorant and barbarous times, will then no more paralyse the energies of the youthful mind.’”

Therefore, Keagy’s use of the phrase, the “Engine of Reform” apparently dates back to 1819.

A variation of Keagy’s “Engine of Reform” phrase was used by the Scot, Brougham, in 1825, who spoke of “setting in motion the great engine of instruction.” Brougham’s work in England is discussed at length later. Brougham said in the last paragraph of his famous and widely read 1825 Practical Observations: “Never was the disposition more universal among the rich to lend the requisite assistance in setting in motion the great engine of instruction....”

Keagy was openly recognized as an activist by 1826, as shown by the following remark from William Russell’s American Journal of Education, pages 672 and following (I believe the November, 1826, issue):

“The following article is extracted from the Christian Monitor, published at Harrisburg, Pennsylvania and edited by J. M. Keagy, M.D., a gentleman who is extensively known as a
zealous friend to the improvement of education. The Monitor is one of the papers I have mentioned as containing a distinct department for the subject of education.

"The usual plan of teaching to read without thought, has the origin in the use of spelling books and all this is the greatest barrier now existing to intellectual improvement...."

No doubt can exist that Keagy was a member of activist groups seven years later, as in 1831 he was chairman of a committee of the Philadelphia Association of Teachers. In 1835, Keagy:

"...led in calling the State Educational Convention at West Chester, which effected a permanent organization, of which he was made vice president, having as its stated purpose the 'advancement of education throughout the State, especially through the medium of schools and lyceums, and to cooperate with other lyceums in the diffusion of useful knowledge.' To promote the same end, Keagy assisted in founding and contributed to the Monthly Journal of Education, (January, 1835), which became the Schoolmaster and Advocate of Education in 1836.... Keagy was a man of practical piety, a worker in the American Sunday School Union, and a devout Methodist.... His death, caused by pulmonary consumption, occurred in his forty-fifth year."

The year of Keagy’s death was 1837. The fact that Keagy was active in the American Sunday School Union, presumably for years prior to his death in 1837, may account for the fact that Sunday school materials also shifted heavily towards “meaning” about 1826.

In James Pyle Wickersham’s History of Education in Pennsylvania... From the Time the Swedish Settled on the Delaware to the Present Day, Inquirer Publishing Company, 1886, page 220, he gave a brief biography of John M. Keagy, M. D. The differences in this account from the earlier accounts may simply concern exact names for the various schools in which Keagy taught. Wickersham said that Keagy:

"...was born in Martic Township, Lancaster County, about the year 1795. He was of German descent. He studied medicine but relinquishing the practice he opened a school in Harrisburg in 1826. A building was soon erected for the school and planned to suit the master. The school room was arranged for one hundred pupils, fifty of each sex, separated by a partition placed in the middle longitudinally, and composed of a series of long blackboards sliding vertically in posts to the ceiling to admit of turning the room into a single whole when required. The manager and his assistant occupied the space at each end of the dividing blackboard and had the entire school in view. The desks were shaped like the letter u with the openings toward the wall. In each opening there was a single desk for the monitor who sat facing 9 pupils who occupied seats at the desk in his immediate front. This arrangement was according to the Lancastrian plan. After teaching very successfully in Harrisburg for several years, he was elected to a position in the Friends’ Public School, Philadelphia, and subsequently to a professorship in Dickinson College; the latter he did not live to fill. While in Philadelphia, Dr. Keagy was an active member of the Philadelphia Association of Teachers and in 1831 his name appears as the chairman of a committee of that body, appended to a circular, doubtless the product of his pen, addressed ‘To Teachers and Friends of Education Throughout the State of Pennsylvania’ urging them among other things to investigate those principles appertaining to the philosophy of the mind, its faculties, and arrangement, the [relationship]... between the moral, intellectual and physical powers and the best method of development. ‘To awaken public attention to the importance of education is to [discuss] existing systems and methods of instruction, by instituting a series of lectures on the
subject, and the publication of a ... periodical devoted to those interests and [to promote] annually a general convention of teachers...."

Wickersham included more on Keagy’s later activities and mentioned both Keagy’s 1819 and 1824 papers and his 1826 book.

It was in the year 1818 that young Dr. Keagy started teaching, and it was in that same school year (1818-1819) that he wrote the newspaper articles published in the spring of 1819 on which his 1824 book was based. The 1819 articles also presumably attacked the spelling book as an anachronism.

The year 1818 was also the year that the Boston primary schools were started, as the result of the work of activists, even though the extraordinarily high literacy in Boston demonstrated no need for public primary schools (as discussed in Is Public Education Necessary? by Samuel Blumenfeld). Boston already had, of course, its grammar schools for older children who could already read.

The year 1818 as well as 1826 therefore appears to have been a critical one for education activists. This is evident, for instance from the peculiarly different spelling book copyrighted on March 22, 1819, by Miller and Hutchens in Providence, Rhode Island, The Columbian Spelling Book, which is discussed elsewhere, and which obviously must have been written in 1818. The Columbian Spelling Book was a sharp departure from the Webster “sound” approach and was heavily geared to “meaning,” with much “entertaining” content but almost no religious content. Although it had syllable tables, it had no vowel markings and almost no phonetic arrangement by sound analogies on the word lists.

It was in 1818 that Lord Brougham was energetically working in Parliament for government-supported education in England, as discussed elsewhere.

It was also in 1818 that the Pickets started the first American education periodical, referred to elsewhere. As mentioned, the Pickets were later involved in activist groups after their move to Ohio in the 1830’s.

It was also in the year 1818 that Joseph Lancaster came to this country, to promote his “monitorial” education scheme, the credit for the invention of which was disputed by Andrew Bell of England and himself. The truth is that the monitorial system (in which older pupils teach younger pupils, to cut down on the need for adult instructors) is as old as humanity itself. But Lancaster and Bell carried that method which is natural in private families to ridiculous limits in organized schools.

On Reverend Andrew Bell

The Encyclopedia Britannica, 1963, Volume 3, page 439, spoke of Andrew Bell (1753-1832) as a pioneer in the monitorial school movement. A native of Edinburgh, Scotland, and a graduate of a school there, Bell was reported to have made a very great deal of money in Virginia growing tobacco, where he had gone after graduation to work as a tutor. He was (apparently later) ordained in the Church of England and left for Madras, India, where he used his monitorial school idea in an orphan school. In 1797, he returned to London and published a book, An Experiment in Education, on his monitorial system. Bell’s approach did not become popular until Joseph Lancaster adapted it in a school Lancaster began in 1801 in Southwark, but Lancaster and Bell had an apparently-bitter falling out. Robert Owen also used Bell’s ideas in his school in New Lanark. In 1811, a society to use Bell’s ideas was formed, the National Society for Promoting the Education of the Poor in the Principles of the Established Church, and Bell became its superintendent. When Bell died at Cheltenham on Jan. 27, 1832., he left a great deal of money to back educational programs in Scotland. As the source for its biography on Bell, the Encyclopedia cited J. D. Meiklejohn, An Old Educational Reformer (1881).
It is curious, however, that Bell made his “fortune” in America during the Revolutionary War!

The activities of Andrew Bell are discussed at length in Part 6, on developments in Great Britain.

On Joseph Lancaster

It was recorded in Readings in American Educational History, by Edgar W. Knight and Clifton L. Hall (Appleton-Century-Crofts, Inc., 1951 and Greenwood Press, New York, 1970), page 134, that Lancaster claimed in his advertising of his monitorial school method that:

“...often a lad from fourteen to eighteen years of age, can be rendered competent to the government of a school containing from 200 to 1000 scholars. The expense of Education for each individual will also diminish...”

Lancaster was widely known, since his work was extensively discussed in the widely-read Edinburgh Review. Relatively rapid communication was possible even in the early nineteenth century among activists in Scotland, England and America because of such publicity in widely-read publications, particularly in the highly influential journal, the Edinburgh Review. As discussed elsewhere, Lord Brougham had been one of the founders of the Edinburgh Review. Knight and Hall in Readings in American Educational History recorded:

“After Lancaster fell out with the British and Foreign School Society, which had been established in 1808, he came to this country in 1818, visited and lectured in the principal cities of Virginia....”

Yet Alec Ellis in A History of Children’s Reading and Literature, Pergamon Press, Oxford (et al): 1968 (page 2), said the British and Foreign School Society was founded in 1814, growing out of the earlier Lancastrian Society, so the society’s name in 1808 was not correctly shown by Knight and Hall.

Lancaster did not lecture solely in Virginia. In his letters to his daughter quoted by Knight and Hall, Lancaster showed his great concern with raising money from those to whom he gave lectures. He wrote her from Richmond, Virginia, October 18, 1819:

“My Dear Child,

“I lectured twice at Fredericksburgh - only 84 people attended, but the produce was 42 dollars....

“...The people here are not like the Bostonians; they do not put in buttons - bad silver and copper - forged notes and bits of tin; but they pay their 50 cents each and call it cheap....”

Lancaster had obviously lectured in Boston earlier than October, 1819, but, in defense of the majority of those old Bostonians, it was a minority of Bostonians who attended Lancaster’s lectures, and they would have been the same activists who pushed in the unnecessary primary schools in 1818.

Just as we can depend on the government officials of today to endorse idiotic education schemes like Lancaster’s monitorial schools, Knight and Hall recorded that Lancaster had the support of Governor Clinton of New York, Governor Wolcott of Connecticut, and Archibald D. Murphey “‘father of the public schools of North Carolina.’“ Knight and Hall stated:

“...many other intelligent people advocated the [Lancaster monitorial] system.”
Intelligent?!

Knight and Hall recorded that North Carolina had a Lancastrian academy by 1814, and Philadelphia in 1817. Keagy obviously opened one in 1826, based on Lancaster’s approach. Boston certainly had “monitorial” schools at least by 1823, perhaps based on both Lancaster’s and Bell’s approaches. William Bentley Fowle, who became the second publisher of Horace Mann’s The Common School Journal, copyrighted the following book in 1839 (republished in 1858):

“The Bible Reader, Being a New Selection of Reading Lessons from the Holy Scriptures, for the Use of Schools and Families, by William Bentley Fowle, Author of the Primary Reader and Various Other School Books.

“....Whence is it that the Scriptures are so little read in our schools when the conviction is so general that the Bible ought to be a school-book, if it be not that a suitable selection could not be found? After reading the Scriptures more than seventeen years in his own school, where are female children of all ages, and of every denomination of Christians, the compiler has endeavors to meet his own wants....”

In The Bible Reader, Fowle claimed 17 years teaching experience in 1839 (and claimed that at least he had continued to teach the Bible in his school). On the spelling book Fowle wrote in 1824, The Rational Guide to Reading and Orthography, he described himself as “Instructor of the Monitorial School, Boston.” He was later “Principal of the Female Monitorial School in Boston” (from the title page of the 1849 reprint of his 1842 The Common School Speller). According to the American Journal of Education, Volume I, 1826, page 165, the monitorial school in Boston opened on October 14, 1823, with eight scholars “under the care of William B. Fowle.” (In the September, 1826, issue of the Journal, Russell recorded that Fowle’s speller had previously been adopted in the city of Boston, so Fowle had influential friends.) Presumably Fowle had taught somewhere for about a year before that. However, the reference establishes that Boston had a monitorial school by 1823, but that there was so little need for it that it could enroll only eight pupils!.

On Infant Schools

Besides the idea of monitorial schools, of which Keagy’s and Fowle’s were examples, the other wild enthusiasm of the period in education was the infant school. However, the infant school idea was NOT a wild enthusiasm with the general public but only with the activists.

Infant schools had been originated by the Scottish socialist, Robert Owen, in the very late eighteenth century, and he had been involved with others like Lord Brougham, who will be discussed, in promoting infant schools in England by 1818. However, infant schools did not begin to spread in America till after 1826.

It was in the environment of such “improvements” in education: government primary schools, monitorial schools, and infant schools where toddlers from two to seven were separated from their homes, that many of the reading “improvements” began to flourish like mushrooms after a deluge. These “improvements” will be better understood, however, after describing the last of the three major textbook “departures” of 1826: the Keagy primer, which was copyrighted immediately after the Franklin and the Worcester primers.
On the Content of Keagy’s Primer

Keagy’s book, The Pestalozzian Primer, with its December 21, 1826, copyright, was published in 1827. In his comments addressed to teachers at the end of this book, Keagy revealed that he was very widely read in natural science and philosophy. That was only to be expected. The Dictionary of American Biography had stated that although Keagy thoroughly knew many languages, French, German, Hebrew, Latin and Greek, his real interest was science. From 1833 to 1835, he was a trustee of Dickinson College, where, at the time he died, he had just been appointed the professor of natural science.

The opening two pages of the introduction to Keagy’s 1826 book can only be described (astonishing at that date!) as pure psychological theory. Considering his overall views, Keagy may be considered a trans-Atlantic devotee of Dugald Stewart of the University of Edinburgh, a “philosopher” who was effectively writing on psychology and apparently expressed opinions on reading as early as 1793, which will be discussed later.

The highly intellectual Keagy may also have been reading a newly available book about 1818. According to William S. Sahakian, (History of Psychology, F. E. Peacock Publishers, Inc., Itasca, Illinois, Revised Edition, 1981, page 451), the first textbook on psychology had become available in 1816 in Germany. In Sahakian’s section, “Landmarks in the History of Psychology,” he showed for 1816:

“Publication of the first textbook on psychology, A Textbook of Psychology, by Johann Friedrich Herbart (1776-1841), the father of experimental pedagogy and the founder of mathematical psychology.”

Therefore, Keagy may have been influenced by Herbart, as well as being influenced by the Scottish philosopher/psychologist Dugald Stewart to whom he referred in 1832, as will be shown. However, I do not know whether Herbart discussed reading in his work, but, if so, his comments would have been some twenty years later than Stewart’s.

Keagy mentioned in his introduction that he was influenced in his ideas on education by Francis Joseph Neef, who had studied under Johann Pestalozzi before coming to America. Keagy said he named his book after Pestalozzi because that “celebrated reformer in Education, who is still living in Switzerland...” began by using sensible objects and oral explanations. The theme of Keagy’s book was knowledge of real things, through the senses. But Keagy said the only books in education that he drew on were “Murray’s spelling book and Neef’s method of teaching” although he commented that his book was very different from either of those. It should be noted that the date of the copyright of his book, December 21, 1826, was not very long after the January, 1826, arrival of the celebrated “Boatload of Knowledge” at New Harmony. Could Keagy have been with Neef, whom he admired, and the other educators in January, 1826, when they arrived at New Harmony, not so very far from Harrisburg? One thing is certain from reading Keagy’s book: none of the educators on that Boatload of Knowledge could have been more knowledgeable on the current educational theories than Dr. Keagy! However, it is extremely puzzling that so little attention has previously been given in the literature on education to complex, active Dr. Keagy who so obviously affected American educational history.

What is so astounding about the book Keagy wrote in 1826 is that in his introduction he recommended the pure DEAF-MUTE sight-word method of teaching reading to hearing children as IDEAL and did so because it protected meaning! He even recommended the use of high-frequency (familiar) words! It had only been in 1817 that Gallaudet had started a small American school in Connecticut for deaf-mutes which used that method.
Apparently the only two texts which had ever before deliberately recommended beginning with pure sight words without spelling for hearing children were printed in France in the previous century.

According to the article “Lecture” in the Dictionnaire de Pedagogie et d’Instruction Primaire, referred to previously, a short article by the Abbe de Radonvillier in 1768 had recommended the use of whole words to teach reading because he felt the approach (Code 1) did not demand so much intelligence as the syllable approach. It is likely that the Abbe de Radonvillier was influenced by the Abbe de l’Epee’s school for deaf-mutes founded in Paris about 1760. A more systematic work by Nicolas Adam in France in 1787 had also endorsed sight words in teaching reading (Code 1) for the same reason. He felt it was easier.

In Germany, in 1779 and 1791, Friedrich Gedike, Johann Bernhard Basedow’s disciple, had used a whole-word method with some analytic phonics to teach reading, probably influenced both by Basedow and the French 1744 Quadrille approach discussed previously. Basedow had been one of the first, in his Philanthropinum school in 1774 and earlier in 1770, with his own daughter, to move the teaching of reading up from the syllable level to the word level, as discussed at length in my 1981 book, The Case for the Prosecution. Basedow, however, used Code 10 Pascal phonics on words (as described in the article “Johann Bernhard Basedow and the Philanthropinum” in Henry B. Barnard’s, American Journal of Education, 1857, which was unconnected with the earlier journal of that name). Although Gedike’s approach appears to have been inadequate, he was not ignoring letter sounds. Nor was Jacotot in Belgium in the early 1820’s. Jacotot endorsed reading by “whole words” but drilled on every single letter in every single word.

Therefore, the only two programs before Keagy which had endorsed teaching pure Code 1 sight words to beginners with normal hearing were the 1768 method of Abbe de Radonvillier and the 1787 method of Nicolas Adam. Yet neither had used whole words for beginning readers to INCREASE understanding. They were, therefore, NOT endorsing “meaning” as opposed to “sound” but were simply trying to make learning to read easier. How, then, did Keagy come up with his idea to endorse the deaf-mute sight-word method because it presumably protected “meaning” which “sound” presumably did not? Keagy also, astonishingly, correctly equated the sight-word method with Chinese characters! Since de l’Epee apparently thought that his method protected “meaning,” as shown by his comments which been quoted elsewhere, it seems highly likely that Keagy had read de l’Epee’s writings.

Possible Sources for Keagy’s Adoption of the Deaf-Mute Method

William Channing Woodbridge

Biographical material given in Samuel L. Blumenfeld’s Is Public Education Necessary? (The Paradigm Company, Boise, Idaho - 1981, 1985) suggests a possible connection between Keagy and Gallaudet, who used de l’Epee’s “meaning” sight-word approach. The connection exists in the person of William Channing Woodbridge (1794-1845). Woodbridge was very involved in activist circles in the 1820’s such as those in which Keagy moved.

Blumenfeld recorded (page 135) that Woodbridge:

“...was a cousin of William Ellery Channing and had gone to Yale with Holbrook. He was therefore susceptible to the influences of both men.”

Woodbridge had graduated from Yale in 1810 with Josiah Holbrook, and from 1808 to 1810 Gallaudet had been a tutor at Yale, according to Gallaudet’s biography by William Andrus Alcott, referred to elsewhere in this text. It is therefore probable that a friendship or at the least an acquaintance
among these three men, Gallaudet, Woodbridge and Holbrook, dated back to 1808 and that the senior and therefore authoritative member of the group from that point on was Gallaudet. Woodbridge later was employed at Gallaudet’s Hartford Asylum for the Deaf and Dumb from 1817 to 1821, so Woodbridge obviously would have been subservient to Gallaudet at that point.

In August, 1830, Woodbridge acquired the editorship of the American Journal of Education from William Russell but renamed it the American Annals of Education. In Woodbridge’s very first issue of August, 1830, he published a letter from Gallaudet recommending the deaf-mute method for hearing children (although Gallaudet did not state openly that it was the deaf-mute method). Woodbridge must have strongly supported the deaf-mute approach, therefore, in 1830. At the very least, Woodbridge certainly must have realized, from his own four years of employment in Gallaudet’s Asylum, that what Gallaudet was recommending for hearing children in 1830 was the same approach that had been used for deaf children.

As will be shown, Gallaudet had used the method informally with the little deaf-mute girl, Alice Cogswell, before he went to Europe in 1814, and had been given a copy of de L’Epee’s work by her father at that time. Gallaudet may, of course, have known of de l’Epee’s method before 1814.

These educational “movers and shakers” of the 1820’s were a relatively small group. Keagy is recorded as a public school activist by 1826 in the American Journal of Education, referred to elsewhere, but was writing to “improve” education as early as 1819, so he might be considered an activist from that date. It is possible Gallaudet’s ideas had percolated through this relatively small activist group between 1821 and 1825 through the agency of Woodbridge and ultimately reached Keagy, before Woodbridge went to Fellenberg’s Hofwyl in 1825. Gallaudet had been teaching his own children by the deaf-mute method since 1823, only two years after Woodbridge left his school. Gallaudet said on August 6, 1830 in a letter to an editor (quoted by Mitford Mathews, pages 55-56) that he had used the method with his own family for seven years. Gallaudet’s children must have been too young to be taught reading while Woodbridge was still at Gallaudet’s asylum in 1821, but Gallaudet must already have had the idea of using the deaf-mute method with hearing children. Furthermore, as will be shown, Gallaudet had been lecturing in many states since about 1818 to raise money for his school, and this could have been a source of Keagy’s knowledge of methods for teaching the deaf.

Blumenfeld wrote (page 136):

“In 1825, Woodbridge went to Europe, visited Hofwyl and got to know Fellenberg. He became a convert to the agricultural school idea. In 1828 and 1829, Woodbridge spent about a year at Hofwyl studying its operations in detail.”

Blumenfeld discussed Hofwyl on page 88, which had become renowned as:

“...the experimental school at Hofwyl, Switzerland, founded in 1809 by Emanuel von Fellenberg, in which manual labor, for the first time, was combined with literature and science to form a unique curriculum. All four of Robert Owen’s sons had attended Hofwyl....

“The senior Robert Owen had visited Hofwyl in 1817 and converted Fellenberg to his way of thinking. In his autobiography, Owen wrote: ‘I agreed to send my sons and place them under M. de Fellenberg’s especial care and direction. I have ever remembered this visit with unmixed pleasure, from the gratification I experienced in the friendly, frank, confidential communication of mind to mind on all subjects, enhanced by the mutual confidence each had in the other.’"
The past had, indeed, been buried when early nineteenth century intellectuals could believe that Fellenberg’s was the first (“unique”) institution ever to combine manual labor and intellectual activity. It is true that classical Rome had contempt for manual work. Yet, since at least the sixth century A.D., Christian monks thought very differently with their Latin motto meaning, “Work, study, pray.” Fellenberg’s followers were obviously leaving out the last admonition. St. Columbanus of Ireland, who founded monasteries in Europe, the last of which was Bobbio in northern Italy about the end of the sixth century, did manual work in the fields, wearing white gloves while he worked so that his hands would not be soiled when he said the Mass. Yet St. Columbanus is also renowned for his knowledge of the classics, so he combined manual labor with literature in the sixth century, as, indeed, did other monks in Italy and elsewhere. Labor and learning were combined in monasteries some thirteen hundred years before Fellenberg arrived on the scene, with his “new” idea of combining labor and learning.

The ties among all these activists are numerous: besides Woodbridge’s undisputed long-term contact with Gallaudet, Woodbridge had gone to Yale with Holbrook, and Holbrook had opened a school modeled on Hofwyl on his farm in 1819. This may have given Woodbridge, Holbrook’s ex-classmate at Yale, the idea to go to Hofwyl himself. Keagy in his activist work on education would have been associating with such people who were also doing activist work on education, all of whom showed many intertwining relationships. That is shown further by the following facts.

William Andrus Alcott

According to *ZAN-180 Reel 293-294, in the New York Public Library, on American Annals of Education from 1826 to 1839 (which began as the American Journal of Education), William Andrus Alcott (1798-1859) became the editor in 1837-38, and Fordyce Michael Hubbard (1809-1888) was the editor in 1839. By 1840, since Horace Mann’s Common School Journal promoting government schools was successful, the need must have no longer existed for American Annals, which presumably is why it was eventually permitted to expire.

William Andrus Alcott, the third editor, had been a school teacher who eventually became a medical doctor, apparently some time after 1839. He was the cousin of Bronson Alcott “with whom, in early life, he had travelled in Virginia and the Carolinas,” according to page 15 of F. B. Sanborn’s Bronson Alcott, at Alcott House, England, and Fruitlands, New England 1842-1844. Bronson Alcott wrote from England on June 30, 1842, to his cousin, William Andrus Alcott, when Bronson Alcott spent four months there and visited Alcott House near London, the school that had been named after him, so the 1842 letter indicates that the cousins had remained friends over the years (and also confirms Alcott’s influence in England). During his time in London, Bronson Alcott:

“...called on [Robert] Owen, Carlyle, George Thompson, and other friends, to whom Emerson and Garrison had given him letters...” (pages 15 and 24 of Bronson Alcott etc., by F. B. Sanborn, The Torch Press, Cedar Rapids, Iowa: 1908).

This, of course, establishes probable ties between the Americans Emerson and Bronson Alcott and the Scottish socialist Robert Owen. Ties among such people are multiple and confirm the existence of the informal trans-Atlantic intellectual clique.

Bronson Alcott, the cousin of the third editor of the journal, William Andrus Alcott, was, as shown elsewhere, also a very close associate of William Russell, the first editor of the American Journal of Education. Josiah Holbrook’s ex-classmate at Yale, William Channing Woodbridge, was the second editor.
Bronson Alcott and his cousin, William Andrus Alcott, the third editor of the publication, had been touring in Virginia and the Carolinas, next door to Georgia, “in early life,” as stated by Sanborn, above. Russell had a tie to Georgia. When the penniless Russell first came to America from Scotland, he came to Georgia, then briefly returned to Scotland, and then came back to Georgia, as discussed below. Concerning Russell’s ties with possible activists, Barnard’s American Journal of Education, No. VIII, March, 1857 (which had no connection with the earlier journal with that name), said in a biography of William Russell that he had been a tutor in the family of a “distinguished Georgia statesman.” Barnard also recorded that when Russell was in New Haven, he taught in the New Township Academy and the “Hopkins Grammar School - the preparatory classical seminary connected with Yale College.” Gallaudet, Woodbridge and Holbrook all had ties to Yale. The Yale grammar school had very possibly been named after someone in Gallaudet’s mother’s family, the Hopkins.

As discussed, Woodbridge, the next editor after Russell, had graduated from Yale with Josiah Holbrook, who was an arch-activist. (See Is Public Education Necessary? by Samuel Blumenfeld). Woodbridge worked later for Gallaudet in his school for the deaf. As mentioned, Gallaudet was a tutor at Yale in 1808 and therefore must have known both Woodbridge and Holbrook ever since they had been students at Yale.

Not only was Editor Woodbridge a close associate of Gallaudet, but so was Editor William Andrus Alcott. William Andrus Alcott’s close association with Gallaudet dates from possibly 1825 and definitely from early 1826 in promoting public schools, according to Alcott’s own testimony, quoted later. Gallaudet resigned from the asylum in 1830 because the work was supposed to be too demanding. Yet, according to William Andrus Alcott, Gallaudet had done more than possibly anyone else to work for public schools in the years from 1825 to 1835. That raises the question of what was first in importance on Gallaudet’s agenda in 1830 when he chose to resign from the asylum.

William Russell (1798-1873)

William Russell’s October, 1826, issue of the American Journal of Education carried a letter from Josiah Holbrook suggesting the formation of “associations for mutual instruction” which became the American Lyceum movement (Blumenfeld, pages 111-112). It was at an American Lyceum meeting that Keagy endorsed the deaf-mute method, citing the writings of the Scot philosopher, Stewart, as justification. As Blumenfeld recorded (page 113), Holbrook who had graduated from Yale in 1810 was still attending lectures there before 1819 on geology which were given by Professor Silliman, a friend of William Maclure. Maclure had jointly founded the New Harmony socialist community with Robert Owen about 1824.

Furthermore, it is obvious that Russell in 1826 was at first only someone’s hireling as an editor, as Barnard’s article recorded, concerning Russell’s move to Boston from New Haven:

“Soon after this change of occupation, he was invited to take the editorial charge of the American Journal of Education published in Boston, first by Mr. Thomas B. Wait(sp?), in 1826, and next by Mr. S. G. Goodrich, and subsequently by Messrs. Carter and Hendee. Mr. Russell continued to conduct this periodical for nearly three years from the date of its publication.”

Since Russell was “invited” to be the journal’s first editor, it is certain that he did not found - or fund - the new journal. Some unknown other person or persons did. The “publishers” to whom Goodrich referred were almost certainly only the printers. Therefore, the actual founders of the journal are unknown.
When Russell fled Boston, as recorded elsewhere in this history, apparently abandoning not only his wife but his bills, he was replaced as editor by Holbrook’s classmate and William Ellery Channing’s cousin, William Channing Woodbridge, who had worked with Gallaudet in teaching deaf-mutes.

Samuel Griswold Goodrich (1793-1860)

The second printer (not editor) of the American Journal of Education, S. G. Goodrich, was the publisher/author Samuel G. (Peter Parley) Goodrich, who also put out a successful four-book sight-word series of readers, the first book of which was Parley’s Picture Book: Or, First Reader, and the second, Parley’s Little Reader (copyrighted in 1836). (A revised version of that series was still in print and for sale in 1928, according to the United States Catalog.) The series was very popular in the Midwest, and, according to Vail’s history of the McGuffey readers, had been a very powerful competitor in the early years.

According to Mary F. Thwaite in From Primer to Pleasure in Reading (The Hornbook, Inc., Boston, Massachusetts: 1972, first published in Great Britain in 1963, page 98), when Samuel G. Goodrich was ten years old, he had admired Hannah More’s The Shepherd of Salisbury Plain. Mrs. Thwaite wrote:

“Twenty years later, in 1823, already an ‘instructor of youth,’ [Goodrich] visited (England) and met (her).... Inspired by the example of Hannah More in writing and publishing her tracts, he set up his own publishing business in Boston in 1826....”

Goodrich’s rapid and great success as a publisher after 1826 paralleled the astonishing success of John Newbery (1713-1767) in England after 1745 and Isaiah Thomas (1749-1831) in New England after 1775. Those three publishers achieved their massive successes in markets that had already been filled with other publishers when they arrived. Yet none of those pre-existing publishers ever experienced the good “luck” experienced by the magical three, Newbery, Thomas and Goodrich. Admittedly, those three were very competent publishers, but they certainly were not the only competent publishers in their eras. Did those three publishers just have better “luck” than the other publishers, or was their “luck” the result of the endorsement of interested and powerful people who could promote their wares?

Goodrich’s setting up his publishing business in Boston in 1826 is just one more publishing event that occurred in that critical year of 1826, besides the founding of the American Journal of Education, the founding of the American Lyceum movement, the arrival of the “boatland of knowledge” in New Harmony, and the publishing of the first three primers in the history of the English language to endorse the sight-word “meaning” method for beginning reading, the Franklin, the Worcester, and the Keagy primers. (However, the Keagy primer only endorsed the sight-word method but did not use it. Keagy said in his introduction, quoted at length later, “Ten or fifteen years hence may be the time for publishing a work modelled on these principles....” which would be after what Keagy called the “engine of reform” did its work)

According to the Encyclopedia Britannica (1963), for the most part Goodrich was self-educated and first became a book-seller and publisher in Hartford, Connecticut. Goodrich had been born in Ridgefield, Connecticut, on August 19, 1793, so that means that before his arrival in Boston in 1826, at the age of 32 or 33, this self-educated (and therefore originally impoverished) young man had already been a school teacher (according to Thwaite), a bookseller and publisher in Hartford, Connecticut, and a tourist in England by 1823 at the age of 29 or 30.

Where did Goodrich, the originally impoverished young “instructor of youth” get the considerable amount of money that it took to visit England in 1823? Where did Goodrich get the money to set up his own publishing business in Hartford and then to set one up in Boston in that critical change-agent year of
1826? Gallaudet’s trip to England and France in 1815 to study the teaching of deaf-mutes had been underwritten by others, and so was Gallaudet’s school for the deaf. Were the originally impoverished young Goodrich’s obviously expensive activities up to 1826, before Goodrich was 32 or 33 years old, also underwritten by others who were dedicated to “change,” the same kind of change that Goodrich is known to have promoted later?

Concerning Gallaudet’s probable ties to Samuel G. Goodrich, William Andrus Alcott, in his biography of Gallaudet, quoted more at length later, wrote:

“The list of [Gallaudet’s] labors in the cause of education might be greatly extended. I might speak of his connection with the American Lyceum, which held some of its meetings in Hartford; and of his labors in behalf of the Goodrich Association, as it was then deemed....”

So there was something called the Goodrich Association (presumably after about 1830) which was concerned with “education” and Gallaudet labored “in behalf” of it. Had that Goodrich Association that was concerned with education been set up by Samuel G. Goodrich?

Another possible tie between Goodrich and Gallaudet concerns a play about the Abbe de l’Epee that was already mentioned in Part 3. The Thompson English translation of the French play, The Abbe de l’Epee by Jean Nicolas Bouilly (1763-1842) reportedly had an 1818 edition published by S. G. Goodrich of Hartford. That means that Goodrich was already publishing materials in Hartford by 1818 when Goodrich was only 24 or 25 years old. Woodbridge, the second editor of the Journal of Education in 1830 in Boston (while Goodrich was presumably still the printer of the Journal of Education in Boston), had been working in Gallaudet’s school for the deaf in Hartford in 1818 when Goodrich published the translated edition of that play in Hartford. Gallaudet had founded his school in 1817 after returning from France with the deaf-mute Clerc who had been trained by Sicard, de l’Epee’s successor. Since the translated play’s preface had been written by the deaf-mute and teacher of the deaf, Clerc, whom Gallaudet had brought from France only two years before, there is a possible and surprising connection between Gallaudet and Goodrich as early as 1818. Both Gallaudet and Goodrich were then near the beginning of their highly successful careers. However, Goodrich’s publication of the translated play about de l’Epee also clearly identified Goodrich, like Gallaudet, as one of the widespread promoters of de l’Epee’s “meaning” work for the deaf.

Goodrich also certainly endorsed the “meaning” method in beginning reading for hearing children, since he wrote and published his own sight-word, “meaning”-method reading series, as discussed elsewhere. Goodrich also took the time to belittle Noah Webster’s once massively used “sound” spelling book for beginners. In Goodrich’s story, “A Talk About Books,” on page 11 of the second book of Goodrich’s reading series, a child said to Mr. Parley:

“Now there is old Mrs. Birchwhip, the school mistress, down at the North-End; she is always cross, and somehow or other, whenever I think of her, I think of an old spelling book, on brown paper, with a blue cover and frightful pictures.”

Peter Parley answered:

“So you think a disagreeable teacher, is like an old spelling book?

The child responded:

“Yes, and I had rather not learn to read than learn of Mrs. Birchwhip, who looks like an old book....”
The “old spelling book... with a blue cover” was obviously Noah Webster’s, and Webster was the father-in-law of S. G. Goodrich’s cousin. Some of Webster’s enemies were among those closest to him. Goodrich expanded his own sales - and the sight-word method - in 1836 at Webster’s and the spelling book’s expense, so it was not surprising that he should been chosen as the second publisher (printer) of the Journal/Annals.

John Braidwood

Keagy, however, may very well have been aware, additionally and perhaps independently of possible association with Woodbridge, et al, of the conflict concerning methods for teaching the deaf, which was so acute between the Abbe Charles Michel de L’Epee and Samuel Heinecke. (Blumenfeld lists as a relatively recently-printed source concerning that conflict The Exchange of Letters Between Samuel Heinecke and Abbe Charles Michel de l’Epee by Christopher A. Garnett, Jr., New York: Vantage Press, 1968.)

Keagy may have built his ideas for teaching reading to hearing children by the deaf-mute method on the ideas behind that conflict: the virtues of teaching by “meaning” vs. the virtues of teaching by “sound.” Early American Textbooks - 1775-1900 published by the National Institute of Education in Washington, D. C., lists as one of the books in their library The Method of Educating the Deaf and Dumb; Confirmed by Long Experience. London: George Cooke (etc.), 1801, by Abbe De L’Epee. This 1801 English translation which contains the famous exchange of letters between de l’Epee and Heinecke may very well have been made available for young American medical students like Keagy after 1801, because of the fact that in the future they might very likely have to deal with the problem of deafness in some patients. That 1801 translation might also, of course, have been available to Gallaudet and provided the ideas which he used in teaching little Alice Cogswell to read sight words, even before Gallaudet had gone to study in Paris.

Concerning the actual contents of the book, the National Institute of Education publication, Fifteenth to Eighteenth Century Rare Books on Education lists a copy of the Abbe de L’Epee’s book in French and Latin and stated it “Contains a lengthy argument in Latin, among schools for the deaf and dumb, concerning methods of education.” Anyone reading de L’Epee’s book, available in English after an 1801 London printing, would have been well aware of the different methods and of the nature of the arguments for and against phonics or sight words in teaching the deaf. (The 1801 English translation is discussed further in Chapter 8 and Appendix E.)

But there is an additional reason for thinking Keagy may have been well grounded in current methods for teaching deaf-mutes. An earlier phonic approach for teaching the deaf, before Heinecke of Germany started his work, was the work of Thomas Braidwood of Edinburgh, Scotland, who opened a school for the deaf in 1760. Alexander Graham Bell gave a paper, “The Growth of the Oral Method in America,” on October 10, 1917, at the fiftieth anniversary of the Clarke School in Northampton, Massachusetts. In it, he told of the arrival of John Braidwood, the black-sheep grandson of Thomas Braidwood, to America in 1812, “with the object of founding in this country a school for the Deaf....”

American Efforts to Teach the Deaf Before John Braidwood’s Day
By Francis Green and Dr. William Thornton

An even earlier attempt to teach the deaf to speak had been made in America, according to the Catholic Encyclopedia, 1913, Volume V, page 317:
“Francis Green, a native of Boston, 1742, whose son was a deaf-mute, was the earliest advocate of deaf-mute education in America. In his ‘Vox Oculis Subjecta,’ published in London, 1783, he describes the method by which the deaf-mute may be taught to speak.”

Green’s additional efforts concerning the teaching of the deaf are referred to later.

A further concern for teaching the deaf before Braidwood arrived in America in 1812 was shown by one of the most fascinating of our early patriots, who is almost unknown today. Again, Alexander Graham Bell is the source for the information on this man, Dr. William Thornton, and his plan for teaching the deaf. Thornton’s method was based on an amended alphabet to represent “sound” more perfectly, to be used by everyone, both the hearing and the deaf. It is curious that such a remarkable and once-famous personality as Bell described, who also totally endorsed “sound” as the method to teach reading for both the hearing and the deaf, has almost totally dropped out of our history books.

On December 9, 1916, Alexander Graham Bell presented a paper before the Columbia (?) Historical Society, “A Sketch on the Life of Dr. William Thornton and His Essay on ‘Teaching the Deaf or Surd, and Consequently Dumb, to Speak. ‘It was reproduced in Records - Volume 20, Columbia (?) Historical Society, Washington, D. C., which was printed in 1917 by the Press of the New Era Printing Company, Lancaster, Pennsylvania. It is presently available at the New York Public Library under Call Number NYPL IAA 20-1917. The paper read in part:

“William Thornton * the author of the first American publication upon the teaching of the deaf, was born in the West Indies in 1761. His parents were English and he himself was sent to England to be educated. He studied medicine in Edinburgh under Dr. Brown (?), graduating in 1784, and then continued his study in Paris. He also traveled extensively in Europe but while still a young man he came to this country and the year 1793 found him married to an American and settled in Washington, D. C. He was already a doctor of medicine, an architect, a painter, a writer, an inventor, and a philanthropist. An old notice says of him that, ‘He was a scholar and a gentleman, full of talent and eccentricity....’

“As an inventor, he was much interested in all machines worked by steam, and he experimented with Fitch upon steamboats before Fulton began his work. Thornton also contrived a means of converting sawdust into planks, an invention which has recently been revived.

“At the end of the last century, such men as Franklin and Noah Webster were interested in the project of a phonetic reform of the English language, and, in 1793, Thornton published his views upon the subject in (an)... essay entitled ‘Cadmus.’ ** The appendix to this is upon ‘The Mode of Teaching the Deaf or Surd, and Consequently Dumb, to Speak,’ and is, as before mentioned, the first publication of its kind in America. (Ed.: This is not strictly true: As mentioned, the American Green published a book, in London on the topic in 1783.)

“In this same year, 1793, Thornton’s plans for the Capitol then about to be built in Washington were accepted by the President and work on it commenced at once. Thornton received for his designs 500 dollars and a lot in the city. In 1814, the British burnt the still unfinished building. The new Capitol afterwards erected was on a far grander scale than the old one had been, although from drawings still extant, it seems probable that the central portion of the present capitol was built somewhat on the lines of Thornton’s plan.

“In 1791, the President had appointed the commissioners to lay out the city of Washington, and to attend to the construction of Government buildings. In 1794, Thornton was made one of these officers. From the records, it appears that a decided improvement was noticed in all the
business of the commissioners after Thornton’s appointment. It also appears that Thornton himself insisted very strongly that grandeur was necessary in the capitol city of the United States, and it is greatly due to his efforts that Washington is the beautiful city we now know.

“In the early days of the republic, all patents had to be examined by the Secretary of State and two others of the cabinet officers. A little later, the secretary of state was in sole charge, but in 1803 *** it was necessary to have a special superintendent of patents.” Thornton was the first to occupy this position, and to him is due, in a great measure, the present patent system of the United States. The value he set upon the department under his charge is shown in the account of what happened during the invasion of Washington by the British in 1814.

“Thornton, seeing that a British gun was being aimed at the patent office, rode up to the enemy’s ranks, and placing himself in front of the gun, called out, ‘Are you Englishmen, or Goths and Vandals? This is the Patent Office, the depository of the inventive genius of America, in which the whole civilized world is concerned. Would you destroy it? If so, fire away, and let the charge pass through my body.’ By this effort, the records and (models)... of the patent office were saved. Thornton carried them off to his country home where he kept them until peace was firmly established.

“Thornton died in 1828, leaving no descendants. He was buried in the Congressional Cemetery with the honor paid to senators and representatives, his body being followed to the grave by the President of the United States and members of his Cabinet.”

Bell said in his footnotes:

*“The writer is chiefly indebted for information to an article on Dr. Thornton by Gloria Brown in the Architectural Record of September, 1896. See also Annals (I, 90) and Cyclopedia of Political Science for Political Economy and United States History, edited by John J. Halor, 1884, Volume III, p. 126, MHGB.”

****”Miss Brown gives this date as 1803 in MHGB.”

Alexander Graham Bell then outlined Thornton’s ideas on teaching the deaf to speak with an expanded alphabet. Thornton had said:

“When he has learned the true sounds of the 30 letters in the English language, he will be capable of reading as well as of speaking and ought to have a catalog of objects designed or represented that he may assess proper ideas to proper (things). Thus a child may be taught to read, to speak, to understand others, to write and obtain knowledge of things at the same time.”

Thornton wanted the deaf to be taught to speak by showing them how to make sounds with their mouths. He said:

“As the pupil will be taught to read, to speak, to write and understand things at once, the teacher should force him to leave no name unpronounced....”

Thornton was introducing the deaf to language through “sound,” not “meaning.”

The Unfortunate History of John Braidwood (17??-1820)
The first organized attempt to teach the deaf in America dates from the time when John Braidwood arrived in Baltimore in 1812, and it was in Baltimore that Keagy started teaching in 1818 at the age of 26. Keagy was probably living not far from Baltimore in 1812, presumably still in Lancaster County in Pennsylvania. When Braidwood arrived in Baltimore in 1812, Keagy would have been an impressionable 20 years of age, probably studying medicine at that time and possibly familiar with the Abbe de L’Epee’s book. Alexander Graham Bell said the following about Braidwood in his 1917 paper:

“Upon his arrival in America (Braidwood) advertised extensively that he would open a school for the Deaf in Baltimore on the first of July 1812; and Colonel William Bolling, who proposed to send his deaf son to him, advanced six hundred dollars to help him start the school. Unfortunately this had the very opposite effect: The school was never opened, and Braidwood started off on a wild course of dissipation until the money was exhausted and he landed in jail. Col. Bolling had to advance another six hundred dollars to get him out of jail; and in return for these accommodations Braidwood agreed to reside with Col. Bolling as tutor to his children... in Virginia....”

So Braidwood, who endorsed phonics for the deaf, “advertised widely” in Baltimore in 1812 and then became notorious for his misbehavior. His spectacular behavior must have attracted much attention, and hardly reflected favorably on his ideas - including “phonics” for the deaf. But it is easy to see that Keagy may very well have been exposed to what is, for most people, the unfamiliar subject of methods for teaching the deaf. Keagy’s ideas on teaching hearing children in the same way that De L’Epee taught deaf children may have grown out of this exposure.

John Braidwood was certainly known outside of Baltimore after he arrived in America in 1812. In 1815, he referred to a letter written by Reverend Thomas Gallaudet of Connecticut from Edinburgh, Scotland, on September 22, 1815. Gallaudet was in Edinburgh at a school licensed to use the Braidwood method, and Gallaudet was also attempting, unsuccessfully, to get a license to use the Braidwood method from the Braidwood family which held the rights.

“I have been corresponding with Mr. Thomas Braidwood on this subject.... This morning I received a positive refusal to my application. The reason for this which Mr. Braidwood assigned is that his brother, Mr. Jno Braidwood is in our country - the same gentleman of whom we heard as being in Virginia. The truth is he left this place a few years since in disgrace.... He conducted (a school) so badly and contracted so many debts that he was obliged to abscond. What dependence can be placed on such a character.”

The 1815 letter shows that Gallaudet and his associates in Connecticut had been familiar with the Braidwood method, so much so that Gallaudet went to England to learn it, and also that John Braidwood was “the same gentleman of whom we heard as being in Virginia.” Informed people in Connecticut in 1815, therefore, not only knew Braidwood was in America, but that Braidwood had left Baltimore for Virginia. Since Gallaudet’s circle knew of Braidwood’s work and movements in 1815 in far-off Connecticut, Keagy might certainly have known of them in Pennsylvania.

John Braidwood was still attracting attention in America in 1817, according to Alexander Graham Bell’s 1917 paper. Braidwood’s friend, Colonel Bolling, arranged for a school for the deaf to be opened on June 20, 1817, in connection with the Classical School of Rev. John Kirkpatrick in Manchester, Virginia. Bell wrote:
“All went well during the rest of the year 1817, and the school attracted a great deal of public attention. In 1818, however, by the middle of March, Braidwood’s numerous ‘irregularities’ compelled Kirkpatrick to sever all connection with him.”

By 1819, Kirkpatrick dropped his work with the deaf, and John Braidwood died, “a victim to the bottle,” in the autumn of 1820, in Manchester, Virginia.

The point is that Braidwood’s school in Virginia was attracting “a great deal of public attention” in the school year 1817-1818, as his proposed, but never-opened, Baltimore school had in the year 1812, and young Dr. Keagy started teaching himself in 1818. Keagy might have been well aware of the unfortunate Braidwood enterprise.

Keagy’s citing Neef and Murray as helpful seems very strange, when it is a fact that both wrote books to teach spelling and reading which were totally phonic and syllabic in their approach. Keagy’s odd new idea of using the deaf-mute method to teach hearing children to read certainly did not come from either of these two sources but must have come from knowledge of methods of teaching the deaf. Such knowledge could have come from news reports on Braidwood. It could also have been obtained from reading about Gallaudet’s work in America after Gallaudet returned in 1817 or from meeting someone who had been in contact with Gallaudet. Gallaudet is recorded as having toured to raise support for his school over a period of many years starting about 1818, and this public activity of Gallaudet’s is, of course, a very likely source for Keagy’s idea. Possibly, Keagy’s idea grew from all these sources. In addition, Keagy may have developed the idea of teaching hearing children to read by the sight-word deaf-mute method from his reading of the works of the Scot philosopher, Dugald Stewart, which, as will be discussed, implicitly support that idea. It is conceivable - even likely - that Stewart himself made the explicit suggestion somewhere in his writings that children be taught to read by “meaning” instead of “sound,” although I have been unable to find it.

Keagy’s Specific Recommendations

In the following quotation from his 1826 book, Keagy actually refers to the:

“...manner that some teachers of the deaf and dumb commence the reading business with their pupils.”

The fact that Keagy qualifies the word, “teachers,” with the word “some” is proof that he was aware there was not a uniformity of methods.

On page 10 of his introduction, Keagy wrote:

“After a child has been about two years exercised in a thinking and oral course, he may be taught reading. And here he should not be taught his letters at first; but whole words should be presented to his eyes, after the same manner that some teachers of the deaf and dumb commence the reading business with their pupils. This is the surest method of making them learn to read understandingly. The most familiar words should be given him.... It is better not to give him words of more than two syllables. These lessons should be read as if they were Chinese symbols, without paying any attention to the letters, but special regard to the meaning. When the child can read whole words with facility, then, and not till then, let him be taught his alphabet, and syllabic spelling.... The reason why we have not followed this course in the present work is, that the public is not yet ready for receiving such views with a favorable eye, much less for acting on them. Ten or fifteen years hence may be the time for publishing a work modelled on these principles....”
What was to be done, and to what was Keagy referring, which would alter the public’s attitudes “in ten or fifteen years”? Was the “Engine of Reform” to which he referred elsewhere supposed to achieve its purposes by that date, more or less on schedule? It is of great interest that it was almost exactly ten years later, in 1835, that the Reverend Thomas Gallaudet published The Mother’s Primer, a book using the pure deaf-mute approach of his school but meant for beginning readers with normal hearing. That was probably the kind of deaf-mute approach, with no “sound” teaching whatsoever, that Keagy said the public was not ready for receiving in 1826.

While it is true that the sight-word method first arrived in America in 1826, the same year that Keagy wrote his book, and while it is true that the sight-word method almost immediately took over beginning reading instruction in America, it still did not use the pure deaf-mute approach which Keagy was apparently endorsing. In the pure deaf-mute approach, the meaning of words is implied only by pictures and context, and no “sound” teaching is used at all, such as lip reading. The pure deaf-mute method for deaf-mutes does employ finger spelling of words (from its beginning, as by de l’Epee, but apparently only after a basic sight-word vocabulary, as by Gallaudet). Yet finger-spelling of words does nothing to demonstrate “sound” any more than did the oral naming of letters in the sight-words in Gallaudet’s book for hearing children. When a child using Gallaudet’s book recited the letters in a sight word (such as reciting “see-aye-tee” for the word, “cat”), the child was not using any more of the real sound of that word than a deaf-mute did who finger-spelled the same letters in that word instead of reciting them.

By contrast to the true deaf-mute-method used in Gallaudet’s 1835 The Mother’s Primer, in the sight-word methods that took over after 1826, “new” words had to be pronounced aloud first by teachers. That was presumably to aid “elocution,” which was the great change-agent enthusiasm of the day, promoted primarily by William Russell after 1826, which enthusiasm lasted until the 1870’s. Yet the real reason for the teachers’ pronouncing all the “new” words was that the children would have been unable to read new words by themselves once the “sound” spelling book for beginners had been dropped. Therefore, because of the 1826 “elocution” approach in which the teachers had to pronounce all the new words aloud for the children, the sight-word method of 1826 was definitely not the total deaf-mute approach that Gallaudet used in his 1835 primer, even though sight-words were certainly part of that deaf-mute method. By contrast, in Gallaudet’s primer, pictures at the beginning, and then the context of sight-word selections later on, were supposed to demonstrate the meanings of all new words for the children, so that teachers did not have to pronounce any of those new words first. However, it should be noted here, as elsewhere, that Gallaudet openly admitted that it would take longer for children to learn to read if they used The Mother’s Primer!

Gallaudet’s 1835 book was highly successful and was endorsed, with vehemence, by Horace Mann. As mentioned elsewhere, J. Orville Taylor, of New York State, recommended Gallaudet’s The Mother’s Primer glowingly in his Common School Assistant issue of October, 1837. The Mother’s Primer used a very carefully controlled sight-word vocabulary. When I analyzed the introduction of new words in the sight-word reading selections in The Mother’s Primer, I found that they usually comprised ten per cent or less of each selection. The use of such a “frustration level” assured that learners could guess the meaning of the new words embedded in the context of previously-learned sight words. Gallaudet’s unacknowledged but apparent use of a “frustration level” was the most virulent idea in The Mother’s Primer. It is only such a strictly controlled vocabulary which makes the use of the pure deaf-mute “guessing” method possible for hearing children. Gallaudet had the children “spell” the sight-words (i.e., name the letters) after the beginning portion of the book, in which only sight words were taught, from which sight words they eventually learned the letters. Gallaudet’s deaf children, however, at the same stage of learning, undoubtedly would also have had to “spell” the words, or to name the letters, but they would have done so by finger-spelling. Gallaudet’s use of “spelling” for hearing children was exactly comparable to the use of finger “spelling” for deaf students.
Of course, Gallaudet’s pure deaf-mute sight-word method using a “frustration level” could only be used in the first or second grade in those days on very simple selections for hearing children. That is because “experts” did not yet have Thorndike’s list of the 10,000 commonest words which makes it possible to avoid sound altogether and to depend solely on guessing to work out the meaning of new words. Therefore, even with Gallaudet’s pure deaf-mute sight-word method, some “sound” had to be used in the higher grades for hearing children since the teacher had to read aloud the new words which could not be guessed. Furthermore, in all sight-word programs for hearing children, “sound” entered through spelling and elocution in the upper grades for those who stayed in school that long.

Even with the late introduction of some sound, the disabled readers turned out by The Mother’s Primer, and other sight word books such as Cobb’s and Angell’s, must have been legion. Yet, just as today, they were largely hidden, because most readers had achieved at least the state of “functional illiteracy,” a condition which can only result from the fakery of teaching alphabetic print like Chinese characters. Once functional illiterates know the three hundred commonest words composing about seventy-five per cent of most reading materials, or the thousand highest frequency words composing ninety percent of most reading materials, or the three to nine thousand composing about ninety-eight percent, they can GUESS, GUESS, GUESS their way through simple material. Their difficulty only shows up when they are faced with the most important lowest frequency words which they cannot “hear.”

Keagy even endorsed the sentence method of teaching reading, forty-six years before Farnham introduced it in Binghamton, New York. As mentioned, Jacotot had used the “sentence” as the reading unit in Belgium, on which he had children analyze the words, syllables, and letters. However, unlike Jacotot, Keagy anticipated to some degree William James’ sentence/stream-of-consciousness ideas. Keagy said on pages 9-11 of his introduction:

“Here, it may be stated that we think in whole phrases as well as in single words, just as we think in whole scenes as well as in individual pictures, and parts of a scene.... It is indeed not enough that the individual words should be understood, but the whole scene represented by a phrase must be realized by the pupil. A very simple and effectual way of leading him to do this, is to ask him how he would draw a picture of what he has read, on his slate. He will instantly catch the clue and give you the full sense of the sentence. This exercise we have made use of with... singular success....”

Unfortunately, Keagy does not say who “we” were or when “we” used it. Keagy wrote his book in 1826, the same year he opened his school. Had the approach been used in Keagy’s brand-new school? Or did he know about Gallaudet’s use of sight words since 1823 with Gallaudet’s own family, and had others in Gallaudet’s and Woodbridge’s circle been trying the deaf-mute sight-word method? Or was Keagy referring to practices in one of the Owenite infant schools or in John Wood’s Edinburgh Sessional School?

Keagy spoke with approval of the infant schools of Wilson and Wilderspin in London, the last only begun in 1824, the same year Owen acquired the New Harmony community, and Keagy was writing his book only two years later! The first infant school, of course, had been Robert Owen’s in Scotland. The whole idea of infant schools (the taking of toddlers from their mothers to subject them to institutionalized training) was the socialist Owen’s, as Robert Owen felt “socialized” character could be most effectively shaped by starting in infancy. John Dewey’s “socializing” ideas reach at least as far back as Robert Owen. Both the socialist-atheist Owen and the socialist-atheist Dewey would be delighted if they could see our present-day rush toward government-licensed nursery schools which, mandating a separation of church and state, must be devoid of any religious influence.
Keagy’s knowledgeability by 1826 on such matters as Owen’s invention of infant schools suggests another possible tie to the Boatload of Knowledge, as his “sentence” ideas may have referred to work in Owen’s schools in Great Britain. It is interesting that English infant schools use the sentence/picture approach even today. When touring English “open-classroom” schools in 1972, I saw the sentence/picture approach in wide use for beginning readers. Commonly, the teacher wrote a sentence, and the child illustrated it, or the child copied the teacher’s sentence and illustrated it. An English reading program was even built on the idea: Breakthrough to Literacy (also published in this country, but I do not recall the publisher.) High-frequency word-cards were filed in a little folder, and a child selected words from the folder (which obviously had initially to be read to him) and placed the words in the slot in a little plastic stick to form a sentence for himself. The sentence could then be copied on a sheet of paper and illustrated. Keagy’s “drawing” idea may have come from the infant schools in England - or possibly vice versa. It is also conceivable the sentence ideas grew from the eighteenth century “Typographical Scrutore” of Du Mas discussed previously. Keagy’s sentence ideas, however, have no apparent connection to Farnham’s 1870 sentence method, which was handled differently.

Six years after copyrighting his primer, in 1832, John Miller Keagy gave an address before Holbrook’s American Lyceum. Portions are quoted in Mitford Mathews Teaching to Read, Historically Considered, The University of Chicago Press, 1966, page 65:

“It is in the spelling book that the almost universal habit of reading without thinking is acquired, the tendency of which, says Dugald Stewart, is to abolish the intellectual faculties.... the child... should by no means be taught his letters, or spelling at first, but whole words should be presented to him, to be pronounced at sight. This is the surest method of learning to read understandingly and speedily. He should read his lessons as if the words were Chinese symbols, without paying any attention to the individual letters, but with special regard to the meaning. When the little pupil can read a series of such lessons with facility, then, and not till then, let him be taught to analyze his words or name his letters, and learn to spell.”

Keagy was referring to the fact that the Scottish philosopher and psychologist Dugald Stewart (1753-1828) had stated, probably first during the 1790’s, that habits of reading without thinking which had been acquired in childhood caused an atrophying of intellectual power. Whether Stewart applied this idea himself to the spelling book for beginners is unknown, but certainly the spelling book for beginners was a natural target for anyone who held such views.

The other two 1826 American authors discussed who wrote the Franklin and Worcester primers made no mention of the deaf-mute method or the fact that learning “whole words” without dividing them into syllables was just like learning Chinese. Yet Keagy discussed both of these ideas very precisely, but also said the public was not yet ready to introduce beginners to reading solely by “meaning” and without any “sound.” However, he believed the time would come in about ten or fifteen years to teach by the pure deaf-mute “meaning” method. It seems hardly coincidental that it was almost ten years later that Gallaudet’s deaf-mute “meaning” method 1835 Mother’s Primer was published!

The Influence of John Wood on American Instruction

The open attack on the syllable method in Stewart’s Scotland did not materialize until John Wood, whose first book or primer has already been mentioned, published in 1828 the Account of the Edinburgh Sessional School. The second edition of this was reprinted by Munroe and Francis in Boston in 1830. Whether Stewart influenced Wood, or whether Keagy and Worcester influenced Wood, is unknown, but it is certain that Wood’s beginning reading textbook, First Book of the Edinburgh Sessional School, almost immediately hopped the Atlantic from Scotland to America. In their 1830 reprint of Wood’s Account..., Munroe and Francis were advertising:
"LEE’S SPELLING BOOK... By THOMAS J. LEE, esq. This work was written in 182l....

"PRIMARY SCHOOL BOOK. A spelling book for small children; being an abridgment of the preceding work for Primary Schools, and adopted by the School Committee of Boston, &c. Fourth edition; to which is added the First Book of the Edinburgh Sessional School.

"We venture to pronounce this the cheapest Spelling Book extant... having, in addition to the original, the whole of Wood’s First Book, so largely spoken of in this volume.”

Lee’s 1821 speller did an inferior job of teaching by sound; its “abridgement,” an 1832 copy of which is at Harvard, is atrocious for beginners. Yet it is interesting that the “adopted” speller is apparently complete in this old 1832 copy, which suggests the speller section did not get heavy use, but most of Wood’s reading material, Wood’s “First Book,” which was bound before the speller is missing; it was apparently worn out by poor little Boston children of 1832, who were forced to recite its sight-word content without being taught really to read. However, it must have been a great consolation to their parents to know that the “School Committee of Boston” had approved their beginning textbook as thorough and efficient, and to know that their textbook would have delighted the American activist, Keagy, and probably the Scot philosopher to whom he referred, Dugald Stewart.

Munroe & Francis of Boston also had an office in New York, listed as “C. S. Francis.” Reprinting Wood’s First Book and his Account of the Sessional School was not their only change-agent activity. They also printed in 1829, a copy of which is in the American Antiquarian Society Collections in Worcester, Massachusetts, the Boston School Primer; or First Book for Children, with Watts’s Catechism. The cover carries the date 1829, but inside is the date 1831. The first half of the book is apparently the catechism: straight text, which a beginning reader would be incapable of reading. The portion, Boston School Primer, begins about halfway through. Munroe & Francis put out another 1831 edition which is in the Harvard collection. It lacks the beginning material on the Worcester copy, which was presumably Watts’ catechism, though it is not identified as such inside. The title page of the Harvard copy reads only, Boston School Primer, or First Book. The alphabet is omitted at the beginning. The first page consists of two-letter whole words, and sentences built from them. The top has a picture of an apple, with a sentence next it, and the large and small “a”, and a picture of a bear with such a sentence and large and small “b.” Each page introduces two letters of the alphabet at the top. By the time “o” and “p” are reached, the rest of the page is running text. On a scale of 1 to 10, with pure “meaning” rating a Code 1, and pure “sound” rating a Code 10, this 1829 Boston book scores a straight Code 1.

Both the Boston and the American Antiquarian copies of the Boston School Primer have the same “Preface.” Since Munroe & Francis’ speller had been adopted by the Boston School Committee, it seems only reasonable to assume that The Boston School Primer was adopted as well, particularly in view of the book’s name. The “Preface” shows the kind of activism that Webster was up against:

“In Dr. Wood’s account of his school in Edinburgh, the excellent management of which has drawn forth so much praise from all the Journals acquainted with its arrangement, he says that he has thrown out of his system the old practice of learning children to sing or say unmeaning syllables.

“After the child has mastered the alphabet, he is immediately instructed in the reading of WORDS of two letters. It will be remarked, that we have here used the term words and not syllables.
In most other schools, it is the practice to make the pupil rhyme over every possible combination of two letters into syllables, whether forming words or not; e.g. ba, be, bi, bo, bu, by; ca, ce, ci, co, cu, cy; da, de, &c. &c. through all the combinations of a vowel with a consonant prefixed; and afterwards in a like manner, ab, eb, ib, ub; ac, ec, ic, oc, uc; ad, ed, &c. &c. through all the combinations of a vowel with a consonant subjoined. With the exception of the alphabet, no part of the children’s education was found so dull, and irksome, as this; while they were, during the whole of this long preliminary process, kept quite in the dark with regard to its ultimate object. The conductors of the school were so sensible of these objections, that they felt an anxious desire to see this part of its procedure either abridged or enlivened. The present one had undoubtedly the merit of being founded on systematic principles, and had possibly, they conceived, been dictated by necessity.

“To carry the experiment into effect, an elementary book was prepared, containing no unmeaning sounds, but words only which were familiar to the children, and which they were called upon to explain. No sooner was it introduced, than its good effects in inspiring animation and activity, where all had hitherto been cold and spiritless, were immediately apparent. The pleasure, which the children experienced in finding themselves already able to read the words, which they had been accustomed to speak, was not unlike the delight of the infant in his first attempts to pronounce those words, which he has been accustomed to hear. And, when they were desired to explain them, or rather to give examples of their application, the whole assumed the appearance, far more of an amusement, than of a task; and the only difficulty was to restrain them, so as to allow each to give his answer in his turn.”

“We have, in our Primer, introduced Dr. Wood’s plan, and the reading lessons are all adapted to infant minds.”

(Picture of a hand and pointing finger) Munroe & Francis have published “Wood’s Account of the Edinburgh Sessional School.”

The cheery tone of Wood’s comments is depressingly familiar. It sounds like the article, “The Child’s Reading Steps Made Easier,” that appeared in the New York Times, in March, 1932, announcing Arthur I. Gates’ deaf-mute-method Macmillan readers. That article did not mention, of course, that Gates’ readers for hearing children were intentionally based on a method that had been used to teach deaf-mutes written language for almost two centuries. Today’s “whole language” reading method is getting the same kind of publicity: that it developed from an enormous concern for the welfare of children, because teaching children to read by phonics (“sound”) instead of the “meaning” of the “whole language” in print is supposed to lower their reading comprehension. As my mother was fond of saying, and as her parents said to her, “Paper never refuses ink.”

What Wood never alluded to was the curious fact that, since about 800 B.C. in ancient Greece, the syllable method had been used successfully and almost uniformly for 2,600 years for hearing children all over the Western World. The word method had almost never intentionally been used for hearing children till the 1820’s. A minor exception was the use of the French Quadrille method which did have some acceptance in the eighteenth century in France and Prussia, as discussed elsewhere. Concerning other promotions of the word method, however, almost no one in the eighteenth century paid any real attention to the Abbe de Radonviller and his follower, Nicholas Adam, when they recommended teaching by words, nor did almost anyone pay attention to Gedike’s disciples, Trapp and Wackernagel. Gedike, himself, taught a kind of analytic phonics instead of sight words. Earlier, in the seventeenth century, the use of whole words in beginning reading by John Bunyan and some others seems to have resulted from ignorance. They seemed to be unaware that they were doing something different from what had always been the norm.
Why, then, did the 2,600-year-long almost-uninterrupted practice of teaching children to read by memorizing the sounds of printed syllables suddenly become intolerable in the 1820’s in Scotland and America, and specifically because it interfered with “meaning”? None of the few, earlier sporadic uses of the whole-word method had been promoted because they protected “meaning,” and yet the protection of “meaning” was the rationale for introducing the sight-word method in the 1820’s.

Plato, Aristotle, Julius Caesar, Quintilian, St. Augustine, St. Jerome (the great translator of the Bible), St. Thomas Aquinas (the great philosopher), Geoffrey Chaucer, William Shakespeare, the presumably unknown authors of the King James translation of the Bible, Leonardo da Vinci, etc., etc., all learned to read by the syllable “sound” method, because no other method of teaching reading was known in their days. Are we seriously to question whether or not they got the “meaning” of what they were reading?
Chapter 15
The Wrong Use of Pictures Entered the Newfangled Primers and Promoted Conflicting Reflexes

Another development arrived with the “whole word” approach and it was definitely related to Gallaudet’s approach. Almost the only way his deaf students could learn the meaning of whole printed words was with pictures, and a great emphasis on pictures, as definitions for printed whole words, appeared at this time. But eye movements used in studying pictures are very different from eye movements used in following print, and it is probable that using pictures at the beginning of reading instruction to identify printed words interferes with proper conditioned reflexes in reading print. (Obviously, the use of pictures solely to arouse a child’s interest would not do so, as such pictures would not become part of the reading act itself. They would be as extraneous to the print as other objects or pictures in the classroom. In my opinion, removing all pictures from children’s primers is not only unnecessary but undesirable.)

Guy Thomas Buswell of the University of Chicago wrote How People Look at Pictures, A Study of the Psychology of Perception in Art, The University of Chicago Press, Chicago, Illinois: 1935. In his “Acknowledgment” dated February, 1935, Buswell said, “The investigation reported in this monograph was made possible by an appropriation from the Carnegie Foundation for the Advancement of Teaching. This grant was supplemented by a small sum given by the Social Science Research Committee of the University of Chicago.” Buswell said (page 9):

“Ordinarily a person is entirely unconscious of the characteristics of these tiny movements of his eyes and it is entirely impossible for him to describe them accurately even when he gives his close attention to them. Eye movements are unconscious adjustments to the demands of attention during a visual experience.”

Since before 1922, Buswell had studied eye movements in the act of reading. Not surprisingly, he found “the demands of attention” were vastly different when reading than when looking at pictures. Eye movements in reading alphabetic print move from left to right, and then drop to the beginning of the next line, repeating the left to right movement. This left-to-right movement is rhythmic for a good reader, with fixations at a few points along the line. The time spent at each pause is also fairly rhythmic. Good adult readers grasp a little more than an averaged-size word in each fixation. But eye movements when examining a picture are random: up and down, left and right, from one corner to another, with long fixations in one spot, but short in another. Such movements, of course, have no pattern and no rhythm and are obviously not automatic conditioned reflexes but are dependent on the wanderings of attention.

Dr. Hilde Mosse in The Complete Handbook of Children’s Reading Disorders, Human Sciences Press, New York: 1982, Volume I, pages 132-139, referred to the rhythmic movement in reading as a conditioned reflex. She said “linear dixlexia” could be the result when young children were obsessed with comic books, because the comic-book pictures with their randomly placed text in balloons interfered with acquiring the automatic movements needed in reading.

In their book, Inside the Brain, A Mentor Book, New American Library, New York and Scarborough, Ontario: 1980, Dr. William H. Calvin and Dr. George A. Ojemann made the following statement on page 30:
“An occasional reading deficit follows left-frontal-lobe damage, above the frontal language area. There the defect seems to be in tracking the printed words, as that area of brain is also involved in voluntary control of eye movements.”

Obviously, they were distinguishing in this remark between movements which were involuntary, the automatic conditioned reflex used in the reading act, and movements which were not, the “voluntary control of eye movements” that is the result of the wandering conscious attention used in looking at pictures.

What has this to do with the period immediately after 1826, when American reading skills were being systematically damaged by teaching for “meaning” instead of for “sound” and the “sound” spellers were being replaced with “meaning” sight-word primers for beginners? The question of the proper automatic conditioned reflexes for eye movements when reading directly concerns the arrival, en masse, of “pictorial primers” for little children just learning to read, starting in 1828, one of which was The Christmas School Primer passed over as unimportant by Nila Banton Smith.

Of course, for a hundred years or so before 1826, children’s books had illustrations, but they were not used to identify printed words. Illustrations had gradually increased in quantity and quality. Some of the most delightful (which children would enjoy today) are found in The Butterfly’s Ball and the Grasshopper’s Feast, by William Roscoe (1753-1831). He was:

“a Member of Parliament and a Liverpool banker, who went in for serious authorship. He had written this trifle for his own son, and it soon won outstanding and enduring popularity.”

The Butterfly’s Ball and the Grasshopper’s Feast was first published by John Harris on January 1, 1807, with engravings by William Mulready (1786-1863), and sold for “a shilling plain or one and sixpence coloured.” Still, the illustrations in such books were largely meant either for children who could not read - and so would have the story read to them - or for children who could already read very well - so the illustrations would have no influence on their reading skills. It was only after 1826 that pictures were included, in huge quantities, for children who were just learning to read, which pictures were meant to help in identifying words. The multitudinous pictures would interfere with acquiring proper left-to-right eye movements because of the constantly wandering eye movements needed to study them.

It is true that pictures were present in the cardboard battledores to demonstrate letter sounds (such as “a” for apple). Pictures were also present in the New England Primer, and in spellers. Yet their purpose was not to identify words. Their use was only incidental to the reading of text.

An unusual speller, with an unusual number of pictures, called, Oram’s American Primer, was copyrighted in the 36th year of independence, or 1811 or 1812, and was not surprisingly reprinted in 1829, by George Long in Philadelphia, when the emphasis on pictures increased. A copy of this is at the Library of Congress. The 1829 reprint may have varied from the 1811 or 1812 original, but it still followed the old spelling book pattern, although it pictured objects for the letters of the alphabet before it covered the syllabary. However, it also had illustrations on the top of some pages, as the mammoth on one page, with a discussion in small print underneath that it is obvious a child was not expected to read: “The bones of this great animal have been found in different parts of the United States and Siberia. A skeleton of one exhibited at Philadelphia Museum was of the following dimensions: height of shoulder...” given in feet and inches! It is obvious the information was for an adult to use to amuse the child looking
at the picture, which might make the child more willing to deal with the book’s spelling lists of words like, “bad, bag, ban, bar...” for the reading of which, obviously, the pictures could be of no help!

Samuel Wood used pictures in his four spelling books, in print by 1809. The highest was the New York Spelling Book, or Fourth Book. His purpose was obviously to remove the tedium of spelling. On the side of some pages ran a list of words, which were pictured, “boy, bat, cow, dog.” The vast majority of words had to be learned without pictures. Although his book was inadequately phonic, it began with a syllabary and arranged many words by phonetic analogies. He was therefore obviously not trying to demonstrate words by picturing them, either in his Fourth Book or in The Young Child’s ABC or First Book.

Samuel Worcester in his 1826 primer was the first deliberately to teach whole words from pictures, but he limited it, although, if phrases are included which were only partially illustrated by pictures, ten pages in his book contain this kind of treatment. The bulk of his book, however was handled differently.

The first book that taught words heavily from pictures was The American Primer, Designed as the First Book for Children, published at Brookfield, Massachusetts, by E. and G. Merriam in 1828. (As mentioned elsewhere, it seems likely E. & G. Merriam were the forerunners of G. and C. Merriam of Springfield, Massachusetts, who copyrighted The Easy Primer; Containing Children’s First Lessons in Reading and Spelling in 1833. This company copyrighted the revision of Webster’s spelling book in 1857, which revision was also copyrighted by Webster’s children. The revision gutted Webster’s speller so that it could no longer function as a phonic text. The same firm also, of course, published Webster’s dictionary, called later the Merriam-Webster Dictionary.)

The pattern of The American Primer, Designed as the First Book for Children, was definitely not that of the old spellers, although it started off with the alphabet on pages three and four, with the letters in mixed arrangement on five, followed by an abbreviated syllabary at the top of page six and long sentences on the bottom, obviously for the child to repeat: “The eye of God is on us all the day,” and so on. On the next page were pictures of a hat, a dog, an ox and an owl with the words next to them, and more whole sentences for the child to repeat, obviously after someone else had read them to him. Page 8 picked up the rest of the syllabary and three-letter blends (These were parts of words which were usually included after the syllabary, such as bla, ble, bli, etc.) This was followed on page 8 with three-letter short vowel words for a, e, and i. The picture treatment resumed on page 9, with pictures for a cat, a rat, a leg, a bee and a spoon, with the words next them and sentences. The picture/word treatment, continued, with sentences on the same page, and short o and u words appeared, plus “silent ‘e’” patterns. The sentences gradually became longer and the pictures faded. Little phonic arrangement occurred in most of the book, despite the short-vowel and “silent ‘e’” word patterns, until the end, when words were arranged by sound analogy. The analogy phonics was introduced too late to be of much use, and the book rates only a Code 3. It included very sparse references to religion, which may have been meant to disarm buyers in the highly religious Massachusetts of the 1820’s. Just enough moral references were inserted to deflect criticism.

Merriam’s book had been relatively tame, even though it was a parody of the old spellers. It was Jonathan Lamb who plainly stated the “meaning” case, in The Child’s Primer, or First Book for Primary Schools, published in Burlington, Vermont, in 1830 by Chauncey Goodrich, but copyrighted on November 4, 1828. (Noah Webster’s son-in-law was named Chauncey Goodrich. It is an unusual name, but the two were only distant cousins. However, Noah Webster’s son-in-law, Chauncey Goodrich, had a cousin known as “Peter Parley,” the prolific and enormously successful textbook author/publisher, Samuel G. Goodrich (1793-1860), mentioned earlier, for whom Nathaniel Hawthorne had written a text.)

In his “Advertisement” at the beginning of The Child’s Primer, or First Book for Primary Schools, Jonathan Lamb said:

“As the author has not designed the many cuts he has placed in his book as mere embellishments for pleasing children, he ventures to premise the following directions for their use.

“Direct the child’s attention to the cut, and explain its parts and its use. Exhibit, in the next place, the word representing the name of the object, and require the child to repeat the letters which compose that name, first by looking at them in the book, and afterwards, either from memory, or by selecting and putting together the proper letters from an alphabet prepared for the purpose, by pasting each letter on a separate piece of wood or paste-board.”

In theory, Lamb was dumping sound. Yet he began his book with a complete alphabet and syllabary, and arranged his pictures under vowel categories, the first being “Section IV. the various sounds of the vowel ‘a.’” The words ran down one side of each page, and the matching pictures on the other. If the pictures were disregarded, Lamb was teaching by relatively heavy sound, and the book might then rate a Code 6. What was critically different was the massive introduction of pictures at the very beginning stage, which provided no reason for a child to form the habit of moving from left to right in his eye movements or to practice phonetic word attack, despite the phonics. By page 35, Lamb introduced phrases, “The sun” and a picture of a sun, and by page 37 longer phrases and sentences: “A new hat. It will keep your head warm,” next to a picture of a hat. At this point, left-to-right movement began, and by page 39 Lamb introduced short paragraphs.

Since Lamb’s book was 72 pages long, some of the damage done to eye movements by its pictured beginning was probably repaired.
Chapter 16
Sanity Re-entered “Reading Instruction” in 1829, In the Person of the Anonymous Scottish Schoolmaster

The sudden appearance in 1826 of at least three texts advocating teaching children by “meaning” instead of “sound,” the Franklin, the Worcester and the Keagy, (even though Keagy did so only in his preface), indicates that the idea was shared by some common group of people. The record indicates that the group was trans-Atlantic, involving persons in Scotland, England and America. Besides the Scot, John Wood, of the Edinburgh Sessional School, the group probably included Lord Brougham, George Birkbeck, Robert Owen and Reverend Andrew Bell (all Scots who ended up in England), the Scot, Dugald Stewart, who was Brougham and Birkbeck’s ex-professor at the University of Edinburgh, the Scot, William Russell, and most of the Boston intellectuals named by Blumenthal in his book, Is Public Education Necessary?.

Another Scot, Professor Pillans, was advocating in public lectures by Christmas, 1827, the methods in use in John Wood’s Edinburgh Sessional School. Wood’s 1828 reading text discarding the syllabary had been based on the actual practices Wood had used in his school for some time previously. Wood’s 1828 text was described by the anonymous Scottish Schoolmaster who is quoted below. The Scottish Schoolmaster either saw that 1828 text or an earlier version, possibly when he visited Wood’s school in 1826. A description of that reading text in use in Wood’s school appeared in the Schoolmaster’s book published in 1829.

This very interesting 1829 book which attacked John Wood’s Edinburgh Sessional School was compiled by a Scottish parochial schoolmaster who had been teaching in the Scottish elementary schools of the Church of Scotland for 30 years. Because of his long experience as a schoolmaster, he was a supremely competent judge of what the highly praised Sessional School was actually achieving in the teaching of elementary school students. His book was entitled, Letters Addressed to the Parochial Schoolmasters of Scotland, Concerning the New Method of Tuition. Containing Strictures on Professor Pillans’ “Principles of Elementary Teaching”.... “By a Schoolmaster,” Edinburgh: 1829. The book was a collection of letters published between November 30, 1827, and August 15, 1828, with additional material after that written by the Schoolmaster. The Schoolmaster was responding to Pillans’ remarks in his lectures and book vilifying the Church of Scotland Presbyterian parish schools (page 48):

“He seems to consider all seminaries of this description, under which almost every respectable school in our country may still be ranked, as nurseries of vice as well as ‘slaughter-houses of intellect,’ which he has elegantly designated them in another part of his book; and he appears to be as firmly persuaded that the new mode of training will ultimately eradicate every evil propensity from the infant mind, as the benevolent Owen of New Lanark was....”

The “new mode of training” was the revived monitorial approach, in which older pupils taught younger ones under a schoolmaster overseeing all. The Scottish Schoolmaster discussed the approach, about whose previously ill-fated history he was well informed (page 20-23):

“You may remember that I formerly hinted that the most prominent part of the Professor’s plan for the reformation of our schools is the introduction of the monitorial or Lancasterian method of tuition....”
The Schoolmaster reviewed the history of the conflict between Dr. Bell and Joseph Lancaster concerning each one’s version of monitorial schools in the early 1800’s:

“...The Whigs...took the part of Lancaster. The Edinburgh Review was loud in his praise, and held up to public admiration the merits of the plan, which the writer alleged was destined to banish ignorance from the face of the earth. * The Quarterly, as in duty bound, decried the methods of Lancaster, and extolled those of Dr. Bell: by such a conflict, the public mind was highly excited... philanthropists stepped forward and made large advances for the discharge of (Lancaster’s) debts....

From some passages in the ‘Letters to Mr Kennedy,’ (Ed.: by Professor Pillans) it is presumed that the articles alluded to were written by the same individual that penned these letters.

“Lancaster, now exonerated from all concern about money matters, set about the promulgation of his system in good earnest. Provided with pictures representing the old school in all its deformities, together with splendid drawings of the several positions of the class according to the new mode, he itinerated through all England.... One evening that I was present at his lecture, he hazarded the attempt of substituting living subjects instead of pictures; but finding the perverse urchins much more unmanageable than his inanimated figures, he abruptly dismissed them, and continued to descant on the orderlines (sic) of the painted little fellows on the board. From England, he extended his peregrinations to Scotland and Ireland, and latterly to America, where, I believe, he is still labouring....

“No scheme was ever concerted for the improvement of our species that obtained a fairer chance of success than the one in question: it had kings and nobles for its nursing fathers, learned doctors for teachers, and the periodical press to proclaim its merits throughout the world; and what, let me ask, has been the effect of this highly favoured and widely promulgated system?.... Every unprejudiced person... cannot fail of being convinced... it has proved a complete failure.... yet, strange to tell, it is lauded by its advocates, and other vague declaimers that they enlist in their service, as the source of incalculable good to mankind; and in their ravings about the rapid diffusion of knowledge, they characterize it as one of the chief agents in accelerating the march of mind....”

Note that the change-agents who were promoting monitorial schools were also characterized by “their ravings about the rapid diffusion of knowledge.” This suggests they were associated with Brougham, Birkbeck, et al whose use of that phrase, “diffusion of knowledge,” will be discussed. Note that Lancaster had, 20 years before, received the endorsement of Brougham’s Edinburgh Review, which will also be discussed, and that publication was to a large extent the source of Lancaster’s fame.

The Schoolmaster further discussed the monitorial method (page 48):

“The Professor has furnished us with specimens of the method of communicating knowledge practised in the Sessional School of Edinburgh, which, in his estimation, is the very beau ideal of scholastic discipline. You all know that in this school the great mass of young creatures that attend it are parcelled out into sections and subdivisions, and placed under the tuition of monitors, the duty of the master being chiefly the preservation of order, and the hearing of appeals. What can there be in the nature of this classification and mode of tuition calculated to produce such wonderful effects?.... It is painful to be compelled, by the provoking humbug of the sticklers of the new school, to speak slightingly of the unpaid labours of this worthy man[Ed.: John Wood], whose personal exertions in the cause of the education of the children of the poor are above all praise.
(Page 4) “The Professor refers not to Circus Place School, where your masters and misses are taught after the new plan, but proposes to lead his pupils to witness the wonders performed at the Davies Street and Market Street Schools, where the children of the poor are instructed. In August 1826, I had occasion to be in Edinburgh, and hearing much said in praise of the method of tuition practiced in the Sessional School (Market Street), I prevailed upon a friend of mine to accompany me to see it, that I might make myself acquainted with their method of communicating instruction. On entering, our ears were assailed by the clamour of monitors and the clattering of slates: but we had scarcely time to look around us, when a young man walked up to us and civilly intimated that strangers were not admitted on that day, but if we would call to-morrow, at a certain hour, we would be shewn the whole operations of the school. When we arrived, next day, at the time appointed, the whole concern wore a different aspect; several visitors, besides ourselves, had just popped in; the monitors were on the alert; and all was going on quietly.

“Mr. Wood, a gentleman well known for his philanthropic exertions in the cause of the education of the lower orders, and who is, in reality, willing to spend and to be spent in this good work, received us very politely, and presently proceeded to make the farthest advanced classes go on with some of the exercises of the day.... upon the whole, the exhibition was respectable.... But my wonder on this score was considerably abated, when informed, by my companion, that Mr Wood, himself, was in the habit of employing several hours each day in instructing the class alluded to, while the ordinary teacher was superintending the general business of the school....

(Page 6) “We went round and surveyed the many little classes in the background, who were employed under the direction of their respective monitors. This great mass of little creatures served only to invest, with a kind of magnificence, the ostentatious parade of showing off the acquirements of their more highly gifted and better taught school-fellows. To the uninitiated spectator the machinery seems to move as if it worked well, but, to use the words of the poet,

“...‘Tis like a watch that wants both hands,  
As useless when it goes as when it stands.’

“I enquired at several of the boys in the junior classes how long they had been at school, and learned that they had attended long to little purpose....

(Page 7) “Instead of the Professor being mortified, as he says he is, that the parochial teachers have not adopted the plan of teaching propagated by Bell and Lancaster, he ought rather to applaud their self-denial in not having followed it; for no plan was ever formed that tends more to their elevation. Instead of a teacher having his bodily and mental energies cramped, by leaning over a desk, for hours together, attempting to make his chuffy-cheeked disciples distinguish f from long s, &c., the teacher, after the new plan, is raised, as it were, from the teasing occupation of a drill-sergeant to that of a brigadier-general, while he stands erect on an elevated situation, eyeing, with elation of heart, his numerous divisions and subdivisions marching and counter-marching in the vale below.”

The emphasis was on the “intellectual” approach. In essence, that meant disposing of anything which had to do with memorizing texts and rules, and replacing it with endless discussion of “meaning.” Of course, the syllabary and “sound” in reading were anathema: whole words had to be learned instead for “meaning.” (It should be self-evident to any competent teacher that very little learning was going to take place under these “improved” conditions, just as it was self-evident to the Schoolmaster.)

The Schoolmaster made a pertinent comment about holding schools responsible for the level of a child’s intelligence instead of a child’s learning (page 15):
“If the lathie Jock be not quite so bright in his ideas as could be wished, the blame will be laid to the charge of the dominie’s want of skill in ‘the cultivation of thought,’ or his want of energy in producing ‘mental activity.’”

He commented further on the “intellectual plan” (pages 38-39):

“The method of teaching grammar without making the learner commit the rules to memory is, to say the least of it, very uncertain....

“Another obvious deficiency of the intellectual plan is, that it leaves nothing for the learner to do when out of school. To commit to memory elementary rules or passages of poetry, &c. would, it is said, tend only to load it with words, without imparting ideas to the understanding. These innovators never seem to reflect, that such employment of their leisure hours at home has a powerful effect in improving the memory of children, a faculty not only of the utmost advantage in the acquirement of a good education, but also of inestimable advantage in the common concerns of life....”

In endorsing the memorization of texts by children, the Scottish Schoolmaster was only following in the footsteps of the ancient Roman schoolmaster, Quintilian, who had said in Book One of The Institutio Oratoria (as translated by Charles Edgar Little, George Peabody College for Teachers, Nashville, Tennessee, 1951, page 26):

“In the earliest writing exercises time should not be wasted on ordinary words, but upon those chosen for the knowledge they give of the inner meaning of his native tongue. At a slightly later stage the maxims given to copy should be of moral value. This again suggests the wisdom of making children learn by heart such thoughts expressed in prose or poetry, and this will also strengthen the memory.”

But the “movers and shakers” not only thought they knew more than the Scottish Schoolmaster, but than Quintilian!

In Letter VII (page 32), the Schoolmaster wrote:

“But in reality, if a teacher has to subsist by his profession, he has no choice with respect to his mode of procedure for he will speedily find, if he attempts the Intellectual Plan, as Pillans pompously terms it, he will find it totally impracticable in a public school; so that he will be forced to revert to what our author elegantly denominates, ‘The no-meaning Plan,’ or fall, as the sailors say, quite aback. The new method is not more at variance with nature than it is with the common practice of mankind in every species of instruction.”

The Schoolmaster quoted Pillans (page 44):

“...the extraordinary success attending the benevolent exertions of Mr John Wood has diffused... a spirit of imitation and improvement among the teachers of Edinburgh and its neighbourhood....”

To this, the Schoolmaster responded:

“Now, this is the veriest fudge that ever was penned. I have it from authority that can be most confidently relied on, that no teacher of any repute in Edinburgh has made the most remote
approximation to the new plan. The local schools, indeed, established in that city for the instruction of the children of the poor belonging to each parish, and public hospitals, being under the superintendence and direction of the principal promoters of the new scheme, are of course conducted upon this principle; but exhibit no flattering results....”

In making a point about something else, the Schoolmaster unintentionally described what was the routine achievement of children in reading up to that time, when learning by “sound” had not yet been questioned (page 106):

“Can it be supposed for a moment, that the progress of knowledge and of taste, in a child, is in any respect commensurate with the advancement he can make in acquiring the art of reading? Between the age of five and eight, a child may be taught to read, with fluency, any of our best authors in prose or in verse....”

The Scottish Schoolmaster (who certainly should have known what he was talking about) added his testimony to the flood of testimony before that time that there was nothing at all difficult in teaching almost any child to read fluently by a very early age by “sound.” The Schoolmaster had obviously never heard of “functional illiteracy.” Functional illiteracy is the memorization by the “meaning” method of such a limited number of sight-words that a “psycholinguistic reader,” who is unable to read by “sound,” cannot even make accurate context guesses on unknown words.

The Schoolmaster criticized Professor Pillans’ first principle, which is quoted below (from pages 31-32 of the Schoolmaster’s text):

“The first of these principles, which I consider as laying the foundation of all good teaching is, that a child in being taught to read, should be taught at the same time to understand what he reads.”

To this, the Schoolmaster answered:

“That the principle laid down, however rational it may appear to those who have never been engaged in teaching, nor have ever reflected on the subject, is self-evident, or even practicable, I deny.... The imitative powers of a child of four years old, especially with respect to sounds, are exceedingly acute; whereas the reasoning faculty is as yet in nonage, or, at the best, so feeble, as to be incapable of successful tutorage. Is it not wise, then, for a teacher to follow Nature rather than anticipate her - to endeavor to obtain a correct pronunciation of words before he makes any attempt to explain their meaning?”

In his criticism of Professor Pillans, the Schoolmaster said this about the teaching of the alphabet and what immediately followed (pages 32-34):

“What a fuss about teaching the A B C; a part of education that, in general, may be completed in half-a-dozen of lessons, even in the common way. As soon, however, as this is accomplished, he plunges at once’ says the Professor, ‘in medias res.’

“He (the pupil) is not detained long after the Alphabet is known in pronouncing b a, ba, &c. but begins to spell, pronounce and give the meaning of such words as be, me, he, ox, ax, &c. Thus from the very outset, he is accustomed to attach ideas to words. For example, take the first word named, when the child says b-e - be; and the question being asked what he means by be, answers, “I am,” or, “if I be good, I shall be happy” - hence we obtain an assurance that he has an idea corresponding to the term.”
“O! Mr Pillans, great you may be as a Latinist - eminent you may be as a teacher of grown-up lads - but, surely, you have never filled the humble office of an ABCDarian, else you would know that a little chuffy disciple of four years of age, on being asked the meaning of be, previous to any parrotical tutoring on the subject, would neither answer ‘I am,’ nor say, ‘If I be good, I shall be happy’ - but he would stare! ay, stare with open mouth, till the answer be put into it by the teacher; and, in that case, what ‘assurance has he that the pupil has an idea corresponding to the term?’

“In such a monosyllable as ox, each will describe or characterise the animal according to the circumstances in which he has been accustomed to see it....’

“Now, what useful purpose is served by thus puzzling infants of four or five years old with matters that they will most certainly know at ten, without any other help than their own observation....

“Do not suppose, however, that I consider the definition of words an unnecessary part of education; on the contrary, when the proper time arrives for acquiring it by the scholar’s own exertions, I consider such a training indispensable to the acquirement of a good education. The explanation, too, of the meaning of difficult passages as the learner advances in his reading, I hold to be of the utmost importance.”

Letter II (on pages 9 and 10) in the Schoolmaster’s book was written by his opponent who defended Professor Pillan’s ideas on education, and, with them, Wood’s school. Its author wrote, approvingly:

“The system is that of which, for several years, the Edinburgh Sessional School has been regarded as the model. The characteristic object of this system, besides communicating more useful knowledge to the young than the old method, is to cultivate thought, and produce mental activity. Adapted to this system, a set of books was drawn up by Mr Wood .... The arrangement of the old books merely accomplished the object of teaching the children to read, and in Mr Wood’s books this object is judiciously attained. But in addition to this, and beyond the contemplation of the old plan, the simplest word, the shortest monosyllable, in his first book, embodies an idea which easily admits of an explanation, at once intelligible and interesting to the humblest child that has just mastered the alphabet.... From the beginning of the first book to the end of the set, not a word or idea is permitted to pass without an explanation from the master or monitor, and without that explanation being fully digested in the mind of the pupil....”

Note the use of the words, “useful knowledge,” suggesting influence from Brougham’s group, which will be discussed. Letter III on page 13 was the Schoolmaster’s response to Letter II from his opponent. He referred to the remark by the author of Letter II, concerning Wood’s book for beginners:

“Would not any one, on perusing this sentence, be led to believe that Mr Wood’s first book for children differed greatly from other initiatory manuals, and that his system must in some measure be developed in it? On examining the book, however, he will find it exactly similar to other Reading made Easies of the old school.”

As discussed elsewhere, variations on the words “reading made easy” as a title originated on spelling books as early as the seventeenth century. By the nineteenth century\(^\text{21}\), the “easy” element was the

\(^{21}\) According to Dr. H. B. Wilbur on pages 27 and 28 of his book, Suggestions on the Principles and Methods of Elementary Instruction, Albany, 1862, referred to elsewhere in this text, the Home and Colonial Society of
controlling of words by letter length: first two-letter words, then three, and so on, which approach had first been used by Dilworth in his spelling book of 1740. At some point in the nineteenth century, the words began to be introduced in context, rather than in lists, which was, of course, a critical change, as it promoted context-guessing.

Whether the earlier books arranged on word length to which the Schoolmaster referred had used only these context selections, not preceded by word lists, is unknown. Yet the Schoolmaster confirmed that the earlier reading-made-easies all had begun with the syllabary, so they would still have had a firm “sound” basis. The Schoolmaster indicated in a footnote on page 17 what was the really meaningful change in Wood’s book: the omission of the syllabary. Yet what is startling is that the Schoolmaster himself did not seem to realize that an enormous change had occurred: moving totally from “sound” to “meaning.” But then, how could he realize its import? The move from “sound” to “meaning” had never been intentionally taken before, ever since the alphabet was first completed in Greece about 800 B.C., except for de L’Epee in his school for deaf mutes. The Abbe de Radonviller, Nicolas Adam, Gedike, Wackernagel, Trapp and a few others who promoted teaching by whole words did not say that they were moving from “sound” to “meaning.” But Wood did grasp the fact that he was moving from “sound” to “meaning,” even though the Schoolmaster did not.

“The only difference in point of arrangement, between Mr Wood’s first book and the little manuals generally used in the old schools, consists in his having discarded the ba, be, method of exercising the learner in the name sounds of the letters; and though he has been much lauded for so important an invention, it is doubtful whether it be in reality an improvement.”

The Schoolmaster continued in Letter III:

“But lest this should not be credited by those who have not seen the little work in question, I shall extract a few short sentences from it at random, as a specimen of Mr Wood’s manner of ‘embodifying ideas,’ as your correspondent expresses it: - ‘Try it; ply at it.’ ‘If I pry, I am a spy.’ ‘Fly up to the sky.’ ‘The ox, the ass, and the elk.’ ‘Did you see the Tay or the Dee?’ ‘Who go in, and who go out?’ ‘My gig was in the bog.’ ‘God sets a door as it were on the sea, and says to it, - Thus far must thou come.’ ‘The sun set in a dim ray,’ &c. Now these sentences are very simple to be sure; but there is only one of them self-explanatory, and that is the second. What connection is there between a gig and a bog? The sun setting in a dim ray, is as Polonius would have said, a ‘vile phrase;’ and as to the door on the sea, it is I presume intended as an exercise on the figurative.”

In Letter VIII (pages 35 and following), the Schoolmaster discusses “Wood’s Method of Exercising his Advanced Classes...”

“As this extract (of questioning of an advanced class in grammar and vocabulary) is quoted by Mr. Pillans from the report of a deputation of intelligent persons sent by the Town-Council of Dundee to Edinburgh, to collect such information as might be useful in improving their own

England recommended a “Reading Made Easy” method to make “the threshold of knowledge, no longer a source of continual sorrow and disgust.” Wilbur, the Superintendent of the New York State Asylum for Idiots, who unfortunately endorsed the teaching of sight words, called theirs “a rather clumsy phonic method.” Since E. A. Sheldon of the Oswego Normal School modeled his object lessons on the Home and Colonial Society’s work in England, he presumably modeled his so-called “phonics” reading method on their approach. Sheldon’s method was sight words with phony phonics, and so, presumably, was the method of the Home and Colonial Society of England. Obviously, the term, “Reading Made Easy,” never had any firm meaning at any point in time, any more than the term, “phonics,” had had.
schools, it may reasonably be concluded that it affords the very best specimen of the attainments of the pupils of Mr Wood in grammar and verbal criticism. Now, what is there in all this that deserves the epithet new? Is it not the mode of questioning practised by every teacher of English in exercising his farthest advanced classes? O, but, says Mr Pillans, all this instruction is imparted merely by viva voce communication, without having recourse to grammars and dictionaries. So much the less does it tend to the improvement of the learner, as it precludes the necessity of any application on his part. If this observation be just, as I verily believe it is, it follows that the new method is the least useful in training boys to habits of diligence and activity that has ever been devised. Instead, therefore, of its deserving the epithet intellectual, its application should be the parrotilc method of teaching; for certainly, no plan of communicating instruction to the young can be more mechanical or superficial; and, I am firmly persuaded, that had a poor dominie, instead of John Wood, Esq., Advocate, and Sheriff of Peebles-shire, attempted to bring such a scheme into general practice, both he and his plan would have been treated with contempt by the learned and influential classes, and would have been laughed to scorn by the very vulgar...."

Note that those associated with a town (i.e., government) school were visiting and that the Schoolmaster had said Wood’s method was most in practice in such town schools in Edinburgh. Here, again, is the association of “government” schools and the move from “sound” to “meaning” in reading. In a broader sense, as can be seen from the comments above, the move was away from establishing conditioned reflexes (learning) by real teaching and replacing it with endless wheel-spinning activities called “intellectual.” The parallel to the late Middle Ages is obvious: real study of grammar, logic and rhetoric was replaced by “disputations,” which were endless verbal arguments, and academic achievement plummeted.

From the Schoolmaster’s comments, John Wood was obviously a man of some social standing in Edinburgh, and presumably a lawyer (being referred to as an “advocate”) as Brougham himself was. Since Wood’s school had been in operation “several years” by 1828, he was possibly in the same age-group as Brougham and Birkbeck. Had Wood gone also to the University of Edinburgh, studied under Stewart, and possibly met Brougham and Birkbeck there?

At the very least, both Stewart and Brougham are quoted by a contemporary as having given “approbation and patronage” to Wood’s school. One of the letters the Schoolmaster included was by someone who had defended John Wood’s Sessional School, written apparently shortly after November 30, 1827:

“...(the school’s) practical results have commanded for it the approbation and patronage of such men as Professor Stewart, Brougham, Malthus, and Hume.”

Obviously, this would not have been David Hume (1711-1776), but very possibly Malthus was Thomas Robert Malthus (1766-1834), the English economist who invented the theory that population is supposed to outstrip resources. Professor Dugald Stewart of the University of Edinburgh and the Scot Brougham, a member of the British Parliament, will be discussed more fully later. The parochial Schoolmaster replied in the next letter, presumably early in 1828:

“As to the parade of great names that my opponent brings forward to vouch for the excellence of the new method of teaching, they weigh no more with me than if he had substituted in their stead Shadrach, Meschach, and Abednego; for although Stewart, Brougham, Malthus, and Hume be very eminent men in their own vocations, they might nevertheless prove but indifferent schoolmasters.”
It is of great interest that the defender of Wood’s school which was introducing the “meaning” method in reading specifically mentioned that Professor Dugald Stewart of Edinburgh University, who was concerned with reading only for understanding, was one of those who gave the Edinburgh Sessional School his approval and patronage. However, that Brougham was more closely associated with the Edinburgh change-agents than the other “greats” quoted is suggested by the mocking answer to the Schoolmaster by his opponent in Letter IV, when this time the Schoolmaster’s opponent brings up only Wood’s and Brougham’s names:

“Yes, Sir, Wood is a quack, and Brougham is easily gulled, their names are a shadow - their philanthropy is a dream - “

The Scottish parochial Schoolmaster had made the following statement in his first letter of November 30, 1827, “On the Announcement of Professor Pillan’s Lectures to Teachers” and the remark certainly suggests the lectures were connected with organized activity for educational “reform:”

“...first, it may be necessary, for the information of those of you who do not visit Edinburgh annually, to remark, that there has sprung up, in that city, a new species of illuminati, who entertain notions concerning the instruction of children that, I fear, can never be realized, till the order of nature be reversed, and the ‘infant of days’ exceed, in mental capacity, the bearded man - in short, till old heads grow upon young shoulders.... I believe, their intentions are in the highest degree laudable.... The fact is, that this band of worthies includes in it several of the most respectable public men in the city, almost all that portion of the clergy who style themselves par excellence Evangelists, and many of their followers. One of the chief agitators in this respectable body is Professor Pillans....”

The following pamphlet was filed with others in a book available from the general stacks of the New York Public Library at 42nd Street. The title page read:

The following page reproduced Trimmer’s “Protest” which began with the same title as Wood quoted in the above and then read,

“For the following reasons: -

“Because the said books do not contain the doctrine of the Trinity, neither acknowledging the essence of the Holy Ghost, nor the Godhead of the Son.

“Because no allusion is made in them to either (Ed.: in his church) of the Christian Sacraments, no mention of the Resurrection, Christ, or of his coming to judge the world.

“Because though mention is soon made of the ‘Evil One’ assuring Eve she shall not die, it is no where hinted that the temptations of Satan are continued to the descendants of Eve.

“Because there is an assertion that a certain man and woman ‘told a lie to Saint Peter,’ which is not a fair account of that portion of Scripture; the children ought to be instructed that the lie was told not unto men but unto God.
“Because in the Scripture History department of these books unwarranted liberties are taken with the authorized version of the Scripture. - thus, for example, the ‘burnt-offerings’ of Noah are merely called his ‘vows.’

“Because in these portions of Scripture History, which are extended to many pages, a Scriptural style is adopted, and the words of Scripture often borrowed, but the one not distinguished from the other, so that the children will be able to know (which they ought to do) when they are and when they are not reading the words of Scripture.

“Because most of the leading doctrines of Scripture are withheld; that such a system of religious instruction is highly objectionable, and the assurance that the children will be taught the absent doctrines not at all satisfactory.

“Lastly, Because it is absurd to teach pauper children in an agricultural district, and whose occupations are for the most part those of crow keeping, pig minding, and turnip pulling, that minerals are, as the case may be, ‘brilliant,’ ‘opaque,’ ‘malleable,’ ‘ductile,’ or ‘fusible;’ and because such a system of education is not suited to that situation in which it has pleased Providence to place the agricultural poor.”

Note the teaching of what passed for “science” in Wood’s material, particularly concerning “geology,” the great enthusiasm of the change-agents of the period.

That was all Wood reproduced of Trimmer’s pamphlet, but he answered it with his “letter,” dated “Edinburgh, May 23, 1836.”

“...I observe it stated by my opponent, much to my surprise, that he has actually succeeded in inducing other clergymen of the district to subscribe his Protest.”

Wood then attempted to show that he, himself, was in very good standing with the Church of Scotland. Yet all that is certain from his remarks is that he was in good standing with a small Committee of that church. Change-agents, then as now, apparently insinuated themselves into such positions of influence:

(Page 9) “Among the other measures resorted to by the Committee of the General Assembly of the Church of Scotland for the diffusion of religious Education, they have very lately availed themselves of an advantageous opportunity of acquiring from its former directors the Edinburgh Sessional School with a view of converting it into a seminary for the training of teachers. Among the inducements to this arrangement, they have paid me the compliment to include a desire to obtain my services in the superintendence of that establishment.... They (refer to) what appears to them ‘the unspeakable importance of having such an establishment in connection with the religious institutes of the country, and of its operations being commenced under the inspection of an individual of Mr. Wood’s ...qualifications.’“

This quotation gives background information on what was happening to the Edinburgh Sessional School in 1836, only about eight years after it had become famous on both sides of the Atlantic. John Wood referred to the Committee of the General Assembly of the Church of Scotland. Activists always operate through grabbing control of organizations at the top through committees, and activists know how to get themselves appointed to run the committees. Note that this “Committee” was interested in “the diffusion of religious Education,” and “diffusion” was an activist buzzword at that time. Wood mentioned “an advantageous opportunity of acquiring” the Edinburgh Sessional School “from its former directors,” so
that teachers could be trained, obviously in Wood’s methods, as he said the committee “desire to obtain my services in the superintendence of that establishment.” Furthermore, it would influence all Scotland, as “an establishment in connection with the religious institutes of the country....”

Considering the gullibility of many of the “liberal” clergy in all religious denominations in the twentieth century, it is not surprising that they had their counterparts back then, too, in the Church of Scotland. As quoted elsewhere in this history, Orestes Brownson testified that the intent of American activists in 1829 and 1830 was to establish government schools with compulsory attendance laws, and to undermine religion without making an open attack on it. The same drive appears to have been under way in Scotland, and may very well have originated in Scotland. From statements already quoted, it is certain Brougham and Stewart were interested in the Edinburgh Sessional School. Therefore, were Brougham and Stewart, or their associates, possibly among the directors who were making such an “advantageous” offer to turn the Sessional School over to the Church of Scotland so that future teachers could be trained to teach in the exact same “meaning” way that Wood did?

Wood produced the disturbing fact that his terrible reading books were also in use in English schools in Norfolk county, run by the National School system associated with the Church of England, which at that time used Dr. Andrew Bell’s version of the monitorial system.

Wood said (page 11) that his Edinburgh monitorial school used “much” from Bell’s monitorial system:

“But Sir, believe me, nothing can be further from my wish than to place myself in an attitude of hostility to the National School system. Much have we borrowed from Dr. Bell and his system....”

Wood then discussed his reading books which taught sight-words for “meaning” but which no longer taught children to read independently. With these remarks, he was attempting to justify the way in which he taught religion. Wood said, since his books started simply, so, therefore, did the religious teaching. His argument is worthless: children had gone from the speller to the Psalter - and the whole religious catechism - for generations, and so earlier children had obviously not needed his “vocabulary control” nor his “simple” religious teaching. Yet after Wood threw out the speller with the “sound” approach for teaching reading, children could no longer really read so they certainly could not read the catechism or Psalter.

However, Bell’s use of the term, “National School system,” should certainly also be duly noted. The term, “National” education, had first appeared in Chalotais’s famous 1763 work proposing state control of education, which was discussed in Part 4. Ever since 1763, the use of the term, “National,” had been almost guaranteed to be paired with the word, “education” in any work written by change agents such as Bell. Not surprisingly, therefore, “National” education, although non-existent in 1763, is in place virtually everywhere in the world today. Chalotais, of course, thought that how much education and what education people had should be controlled by the state, but he also thought that most people should be denied even simple literacy or they might be too hard to keep in their places. Chalotais made that aim very clear in his scheme for “National” education, a portion of which is quoted elsewhere. Therefore, Chalotais’s “national” education was actually intended to suppress education for most people, instead of to promote it. He was intensely opposed to the Christian Brothers’ and others then-widespread education of the poor, and it was precisely that opposition which had inspired his proposal for “national” education.

Wood justified his empty books, devoid of really meaningful religious content, with these remarks (page 12):
“On the contrary, as in teaching our children the art of reading, we have begun with the shortest words, so also we have taught that by means of the simple truths of religion they should be gradually led to those that are more abstruse... Now it cannot be alleged that, either in the Sessional School, for whose use the books in question were framed, nor in those, into which they have been adopted, the great doctrine of the Trinity is left untaught....

“Suffer me then to enable you to furnish those who wish for it with an explanation of their nature and construction. The first of them is literally a simple Primer beginning with ABC and ending with words of six letters. In it immediately after the alphabet follow words of two letters, accompanied with such short detached sentences as so slender materials could enable me to frame. Hitherto no attempt is made by means of reading to convey to the pupil religious instruction... (He mentioned the book next covered three letter words.) No sooner, however, is the pupil able to master words of four letters, and thus to read a whole lesson connected with religious instruction, than this is in our little Primer straightway presented to him....”

For generations in Scotland and England, children had been expected to be able to move from the Psalter into the whole Bible, of which, of course, the Psalter is a part. What is more, children had done so at a very early age. But Wood said (page 16):

“As the pupils, when commencing their Second Book, are not yet capable of reading the Bible for themselves, I have in the beginning of this Work continued my Scripture lessons.”

It was these “Scripture” lessons, so badly written, to which Reverend Trimmer objected. If the children had not been limited to a sight-word book like Wood’s, they could have been reading the actual Bible, instead of his objectionable paraphrases.

Yet the Reverend Trimmer, like the Scottish Schoolmaster, did not realize in 1836 the harm that would come from the Edinburgh Sessional School texts by their dropping of “sound” as the initial step and their replacing it with “meaning.” Most people did not even realize it was happening. The fact that it is possible to read by “meaning” without the use of “sound,” as a deaf-mute can read, apparently never occurred to almost anyone outside the activists’ groups until after the damage was done, in the 1840’s. Even then they did not clearly understand why reading ability had dropped so sharply, any more than most people today understand why we have a massive reading problem. The “teaching for meaning” poison in first grade reading, to the unwary, sounds persuasive, just as it does today with the “whole language” poison in first grade. The speller was widely dropped as a beginning book after 1828. By 1848, the Scottish Schoolmasters realized that harm was being done with purely “meaning” whole-word primers and prepared a phonic whole-word “primer,” discussed elsewhere. What is disturbing is that it took about twenty years before the harm Wood was doing to reading was realized by others concerned with the schools. Yet they realized far sooner the harm being done to religion.

Centralized, government control of education would make it possible for such change-agents as Brougham to get themselves appointed to exercise that control. Change-agents would then be in a position to “improve” society when they could take the control of children’s minds away from their parents and their churches, which tend to be stubbornly opposed to the kind of “progress” endorsed by change-agents. It is therefore interesting that the high-minded activist, Professor Pillans, endorsed centralized government control through “legislation.” The Schoolmaster wrote (pages 29-30):

“Let it also be understood, that whatever I may advance in praise of the modicum of instruction communicated in our parish schools, I do not by any means wish to contend that they are not, in general, susceptible of considerable improvement: my sole object in the present remarks is to shew, that the plans proposed for their reformation by Professor Pillans, would, if
adopted, have a contrary effect. ‘A cursory review,’ says he, ‘of the history of our parish schools might justify, at the very outset, some suspicion of imperfection and abuse.’ What is there, you may ask, in the history of our schools, calculated to create such a suspicion? ‘The want of legislative interference,’ says our author. ‘But might not this circumstance,’ you reply, ‘which arouses his suspicions, be quoted by those who are of a different way of thinking as evidence of the fidelity with which the persons invested with the management of them had discharged their duty; since in so considerable a portion of time no legislative interference was deemed necessary.’ The Professor appears, however, to entertain suspicions of every institution, how excellent soever it may be, that is old and unreformed.....

“There is one general argument continually in the mouths of the advocates of the new scheme, which they conceive ought to have considerable weight in exploding the old method, and that is, its want of adaptation to the present advanced state of civilization: ‘when so much improvement has been made in arts and manufactures,’ say they, is it not a shame that so very little alteration has been effected in the method of instructing our children?’"

This exact argument occurred in the preface to the first book of Oliver Angell’s 1830 series of readers in America, a Code I text clearly modeled on the Franklin Primer of 1826. But the Schoolmaster (that delightful man!) made an appropriate reply:

“These sticklers for improvement in the method of teaching seem never to reflect that there exists a very material and obvious distinction between the process of storing a boy’s head with ideas and that of the manufacture of the bonnet that covers it.”

What is most notable about this little 1829 publication is the learned, charming sanity of the statements of the parochial Scottish Schoolmaster, compared to the vacuous, pompous statements of his opponent who was defending Professor Pillans, and to the quotations of Professor Pillans himself.

The parochial Scottish Schoolmaster’s comment on August 15, 1828, on the book, Letters to T. F. Kennedy, Esq., M. P., which had just recently been published by Professor James Pillans, would apply equally well, however, to the current wordy promotion of “whole language.” He said:

“...we have now a complete development of the Professor’s views, in his Letters lately published, addressed to T. F. Kennedy, Esq., M. P.... These letters contain many hints that may be useful to teachers, as well as much mummery that they would do well to reject. In fact, one may justly say of this publication what Sheridan once said of the speech of a political opponent in Parliament, ‘that it contains much that is new, and much that is true; but unfortunately, what is new is not true, and what is true is not new.’“

Actually, over-emphasis on “meaning” is as fallacious in all subjects as it is in reading, but a reasonable emphasis on “meaning” improves learning. Dr. Hilde Mosse in her great work, The Complete Handbook of Children’s Reading Disorders, (two volumes, 1982, Human Sciences Press, Inc., New York) quoted Dr. Wilder Penfield, the famous neurologist/brain surgeon, concerning the fact that we can learn (“condition”) only those things on which we focus conscious attention at the time they are being learned. Understanding the meaning of a new subject permits the conscious mind to organize that new material logically and to associate it with previously learned (“conditioned”) material.

The conscious mind uses only that part of the brain that Dr. Wilder Penfield, in his book, The Mystery of the Mind, Princeton University Press, Princeton, New Jersey, 1975, named the “higher brain mechanism”) After gaining an understanding of new material, the “higher brain mechanism,” which is conscious, can then file that new material efficiently in the brain’s memory banks, but they are
unconscious. Dr. Penfield named those unconscious memory banks the “automatic sensory motor mechanism.”

To the extent possible, therefore, all new material should be presented in a meaningful framework so as to facilitate this conditioning (learning). But we should never lose sight of the fact that this discerning of “meaning” is carried out by the conscious mind only in that part of the brain called the “higher brain mechanism,” and it is incapable of storing “conditioned” or learned material.

In computer terms, the material brain is what the conscious human soul (which is immaterial) uses as its computer to interface with the material world. A computer is “hardware” and it employs “software.” The human soul can only discern “meaning” through that conscious part of the brain that is like the computer hardware (the part of the brain that Dr. Penfield called the “higher brain mechanism”), and it can only store learned material on the unconscious part of the brain that is like a computer’s software (the part of the brain that Dr. Penfield called the “automatic sensory motor mechanism”). Anything the brain “learns,” therefore, is like the data that a computer (the hardware) records on its software (its floppy disks or its hard-drive).

Endless discussions of “meaning” which do not introduce any new material to be organized and learned (filed) is analogous to turning on a computer (the hardware), banging on the keyboard for a few hours, and then turning off the computer without “saving” or filing anything on its software.

Because of its very nature, the “thinking” or conscious higher brain mechanism cannot be “conditioned” (cannot store data or skills). Therefore, it cannot be “taught” to perform “higher level thinking skills,” the teaching of which is the current time-wasting nonsense in American schools. The term “thinking skills” is the ultimate oxymoron, actually a contradiction in terms.

Yet the computer analogy is insufficient, since a computer is lifeless and incapable of growth. In contrast, it does appear probable that the higher brain mechanism (through which the conscious mind “sees” the world) can be strengthened through general education exactly as a muscle is toned, thereby improving the mind’s ability to view the world. But, as a muscle cannot be “conditioned” to perform any particular act, neither can the higher brain mechanism be “conditioned” to perform a particular act.

It is interesting that experiments with rats in deprived and enriched environments have shown that those in the enriched environments developed brains which weighed more. The analogy to increasing brain function and increasing muscle function through exercise therefore appears possible. But such development is generalized. It is unlike the teaching (or conditioning) of skills and information which are specific, discrete and non-transferable. (From my own experience, I know that conditioned skills are non-transferable. After having been a rapid touch-typist for some forty years, I was astonished to find that I had a very limited visual memory of the keyboard. When away from the typewriter, if I tried to visualize the keyboard, I had to reach with my fingers for many letters to “see” where they were located. My “touch” memory obviously had not transferred to my “visual” memory.)

When reading the following, keep in mind the nature of learning: it is the storing of conditioned reflexes in the brain’s unconscious automatic sensory motor mechanism. In order to learn anything (or to “condition” it), it is true we must focus conscious attention (“thinking”) on it while it is being learned, and, in addition, practice is usually necessary to retain most learning. Yet reasoning, or “thinking” itself cannot be learned, but only such material as discrete facts and the intellectual framework or scaffolding in which to place such facts, as well as physical movements such as typing, dancing, or driving. Language itself is based on automatic conditioned reflexes (“learning”). The brain stores the syntax of a language, its word syllables and its word meanings. A little child beginning school has already acquired his own language through imitation and practice and should at that point be using it unconsciously and
automatically. He should not constantly be asked to focus conscious attention on the automatic act of speech by asking him the meanings of ordinary words already in his working vocabulary. It seems probable that the focusing of conscious attention on what should by then be his automatic language could result in stuttering, among other things.

Key to the First Step in Teaching Children To Read, According to the Lesson System of Education, First American from Third Edinburgh Edition, published by Jonathan Leavitt of New York, obviously grew out of the influence of the Edinburgh Sessional School. It is impossible to describe the appalling material. In the Scottish “religious” school which produced this text, the Bible itself was being dispensed with, because it was felt previous generations of Scots had reached the next world ignorant of the meaning of the Bible they had read all their lives since they had lacked the wonderful Lesson System to teach them to read it for meaning. (!) The ghastly lessons, a kind of child-torture, are based on Bible content, and were supposed to make it possible for future generations of Scots to avoid the error of reading without concentrating on “meaning.” Yet these “lessons” concentrated on defining basic words and syntax and might have caused language problems in little children, since those little children were already using those words and that syntax completely automatically to clothe their conscious thoughts.

If the wording of the text’s title (“lesson system”) had been original in Edinburgh, then the Edinburgh “improvements” apparently spread later to Glasgow, and then, of all places, to Portland, Maine. If that is what actually happened (which does appear likely), it demonstrated the enormous influence of the circa 1818-1840 activists. In 1836, J. U. Parsons, “Late Principal of the Indiana Teachers Seminary,” was the author of the Analytical Spelling Book published by William Hyde, of Portland, Maine, the apparent successor to Shirley and Hyde of Portland. Shirley and Hyde in 1828 had published Infant Schools - Infant Education, “By a Friend to the Poor,” which had been written in May, 1827. Since Hyde’s company published the “infant school” material in Maine as early as 1828, it is probable that Hyde was an activist publisher. Parsons’ Analytical Spelling Book was not a beginning book but, from the description, his beginning book sounded like Code 1 material. It was the credit Parsons gave for his beginning book, Parson’s Analytical Primer, that was interesting. Parsons said his ideas for it came from something called “Gaul’s Lesson System of Glasgow.” That title suggests a possible inspiration from Edinburgh’s appalling “Lesson System” and that it had spread as far as a teacher’s college in Indiana (presumably the state of Indiana) in which Parsons taught before 1836!

The “Lesson System” concentrating on “meaning” that had reached America was an extension of Wood’s ideas. Wood’s influence from Edinburgh traveled in the opposite direction, also, to Germany. Barnard’s Journal translated the article, “Catechism on Methods of Teaching,” by Dr. Herman Wimmer of Germany, from Diesterweg’s Alman Jahrbuch for 1855 and 1856:

“Why is it important never to read meaningless syllables and unintelligible words?

“Because the pupil will read in future as he is taught. Therefore, he ought to get accustomed from the beginning to seek in all that he reads a proper idea.”

Wood’s ideas also traveled to Holland. An article in Barnard’s Journal in 1860, entitled “Primary School at the Hague” reported on methods there with the Prinsen reading series, described as a phonic method to spell words. The article said of the Prinsen system:

“All the combinations of letters used form words, as in Mr. Wood’s plan, and the teacher is careful to require an explanation of every word as it occurs.”

Wood had said in 1836 that his Edinburgh school was to become a teacher’s college, and it apparently became the Scotland Training College of Edinburgh. James Carrs(?) of the Scotland Training College,
Edinburgh, wrote an article in the September, 1860, Barnard’s Journal, on page 277, “Subjects and Methods of Early Education.” His article demonstrated that Wood’s ideas were still dominant in the college in 1860:

“Lessons consisting of columns of single words, and much more of columns of syllables or parts of words, are not suitable.... (The pupil) should be engaged in a conversational lesson on the subject he has been reading about, which shall embody the words he has read. This will give a practical aspect to all he reads, and secure from the beginning the habit of reading with understanding.”

The author went on to recommend that children of four and a half be taught to read, beginning with short two- and three-letter English words, which were to be learned as wholes because the spellings were irregular (obviously being learned by “meaning” and not by “sound”). Later, he recommended teaching diluted phonics and word-attack skills. He showed as a reference for his ideas:

“The reader will find the argument for carrying the child’s understanding along with what he reads, and the manner of doing so, fully stated in Pillan’s First Letter on the Principles of Elementary Education.”

Yet the “improvements” of the “intellectual” plan of Professor Pillans of the University of Edinburgh had resulted in throwing out of school most of those things which can be learned: the “sound” pronunciation of words and the rules of grammar, which had been taught by professional teachers like the parochial Schoolmaster with his thirty years of experience. Instead, children were plagued by being asked to define the meaning of the ordinary words in their working vocabularies, which they already knew or they could not have been able to speak their own languages. They were not eventually to be taught grammar from a grammar book. Their time was spent on essentially meaningless verbal discussion, called the “Intellectual Plan,” instead of being spent on acquiring the automatic conditioned reflexes which underlie skilled reading and the knowledge of grammar.
Chapter 17
Concerning the Trans-Atlantic Movers-and-Shakers

The “new method” concerned emphasis on “meaning” in all areas. Dugald Stewart’s ideas on reading for “meaning” had formed the rationale for the switch from “sound” to “meaning,” as specifically mentioned by Keagy. Stewart was also in general sympathy with the intellectual climate of the elite, praising, at the end of his own life, the work of pantheist/statist Cousin who was a darling of the Boston intellectuals, and the work of Birkbeck and Brougham’s “societies for the diffusion of useful knowledge.” Furthermore, Stewart was involved in a long controversy in the early 1800’s, (see A Letter to Rev. Ingles and what followed) which resulted in many people besides himself writing essays, concerning the influence of ministers in the appointment of professors at the University of Edinburgh. This at least suggests the possibility of his hostility to established religion. That hostility was characteristic of “liberals” in the early nineteenth century.

The very reasonable objection will be made that, if there were a group consciously cooperating with each other to install government education and “improvements” in reading on both sides of the Atlantic, they should have left some clear, written account of their conscious association. Yet that is not necessarily the case, as is demonstrated by the autobiography of Orestes Brownson. Orestes Brownson testified that he personally had helped to organize a secret group whose object was to control education and to oppose traditional religion, which will be discussed later. Brownson’s testimony cannot reasonably be doubted. Yet he was the ONLY one who ever referred to the existence of that large group. Brownson’s brief testimony provides the ONLY record of that obviously influential secret group’s existence!

On Henry Lord Brougham, and His Work on Education and Infant Schools

Brougham in an anthology of his writings for the Edinburgh Review chose to omit ALL his writings on education, which is very curious since his work on education is acknowledged to be among his most important activities. Is it possible that he was really trying to bury the record? The reason he gave for omitting that material is anything but persuasive. In the Preface to Volume I, signed “Cannes, November, 1855,” of Contributions to the Edinburgh Review, by Henry, Lord Brougham, in 3 volumes, (Richard Griffin and Co., Publishers to the University of Glasgow, 1856), Brougham said:

“The reason for omitting in this publication almost all the papers on the slave trade, slavery, charitable trusts, or education is that the greater part of the measures discussed have long since been adopted by the Legislature, and that the measures connected with Education which unfortunately have not yet been adopted, or consistently supported in Parliament (are covered) by the papers in the Review, so that the Author’s speeches contain both the doctrines and the arguments which would be found in these papers.”

The “charitable trusts” issue was the smokescreen Brougham had used in 1818 to cover his push for government schools. His work on that sounded like extreme McCarthyism, and reviving what happened might have been embarrassing. But that he should also totally omit his writings on education and his push for government schools defies a reasonable explanation.

Brougham’s autobiography, The Life and Times of Henry Lord Brougham, Written by Himself, in Three Volumes (William Blackwood and Sons, Edinburgh and London, 1871) contained nothing at all on education that I could find in a quick perusal except a little material on Brougham’s being appointed Rector at the University of Glasgow by the students in 1825, and a little material on his founding of the secular London University. That he chose to omit mention of his promotion of government schools in his
own THREE-VOLUME autobiography, as well as in his collection of Edinburgh Review articles, was clearly deliberate.

However, that Brougham spent his time before 1834 as a change-agent is proven by his own testimony in his letter to Edward Lytton Bulwer, Esq., M. P., sent from Paris on March 12, 1834:

“...my life, except four years, was continued sacrifice of interest to my principles as a Reformer and friend of liberty....”

That remark has overtones of the French Revolution that took place some forty years before and that did a lot of reforming in the name of liberty.

Only passing mention is made in most present-day sources concerning the educational climate of Brougham’s time. Therefore, it is necessary to provide background material on the great push being made at that time by organized groups to take over the education of the young, to shape the teachers of the young and to control the textbooks for the young. By then, government schools were firmly in place in France, having been one of the first fruits of the French Revolution, and were also in place in Prussia, where the minds of children were being shaped by the state. The following background material is quoted from an 1877 or earlier source, and, incidentally, confirms Brougham’s intense involvement with the education of the very young.

The material appeared in an article discussing the education of young children in Sonnenschein’s Cyclopaedia of Education, published by Swan Sonnenschein & Co., London, 1877(?) and 1889, and by C. W. Bardeen, Syracuse, New York. Infant schools were discussed on page 519, the remark being made:

“The first infant school in the United Kingdom, (was) that at New Lanark, by the falls of Clyde....” [in Scotland].

The article stated that David Dale and Richard Arkwright had set up a cotton mill there in 1783, and eventually opened a school at the cotton mill for child workers. Robert Owen was Dale’s son-in-law, and was among those who took over the mill when Dale retired. Owen added to the school already in existence a school for little children. Pastor J. F. Oberlin in northeast France had formed before this time a famous school for children from two to six in his parish, in which he taught children reading and showed them pictures and maps. Oberlin’s school was obviously a refinement of the centuries-old practice of pastors assuming some responsibility for the basic education of the young in their parishes, such as seeing that they learned the catechism and how to read. It was Owen’s aims which were so different from those of parish schools: he was intentionally trying to mold children’s personalities. Robert Owen’s was the first true infant school in the world. Until the atheist/socialist Owen appeared on the scene, no one had ever questioned that the molding of the personality of “infants,” or children under six years old, was the responsibility of their own parents, principally their mothers. Owen put his infant school under the charge of James Buchanan. The article stated further:

“In June 1816, Mr. Owen, describing the schools as they then were to a Committee of the House of Commons, said: - ‘The children are received into a preparatory training school at the age of three, in which they are perpetually superintended to prevent their acquiring bad habits, to give them good ones, and to form their dispositions to mutual kindness and a sincere desire to contribute all in their power to benefit each other. These effects are chiefly accomplished by example and practice, precept being found of little use and not comprehended by them at this early age. The children are taught also whatever may be supposed useful that they can understand.... In this training school the children remain two or three years... in the superior school... they are taught to read, write, account, and the girls, in addition, to sew.’
“As the fame of the reforms accomplished in New Lanark spread, thousands of tourists visited the place, and the more enlightened went away desirous of copying elsewhere some at least of Mr. Owen’s plans. Thus Brougham, Lord Lansdowne, John Smith, James Mill, Joseph Wilson, and others, in 1818, opened an ‘asylum for infancy’ in Brewer’s Green, afterwards removed to Vincent Square, Westminster, and borrowed James Buchanan to conduct it. In London Buchanan made the acquaintance of Samuel Wilderspin, then clerk of the New Jerusalem Church, Waterloo Road, to whom he taught his methods of dealing with young children. Seeing the success of the Westminster school, Mr. Wilson, in 1820, opened one in Spitalfields, and on the recommendation of Buchanan gave the charge of it to Wilderspin. When the new master, accompanied by his wife, appeared on the scene of his labours, he found the room filled by a crowd of little boys and girls, running, laughing, and shouting. He tried to get silence, but his commands were not heeded, and indeed not heard. Each group that he quieted broke into disorder as soon as he left it. At last, almost in despair, he snatched off the bright cap which his wife was wearing and dangled it at the end of a pole. This aroused the curiosity and arrested the attention of the young mob, and the battle was won.

“By altering Buchanan’s methods a little (sometimes for the better and sometimes for the worse), and by drawing a distinction between infant asylums and infant schools, Wilderspin persuaded himself that he was the founder of the latter, and, what is more to the purpose, he persuaded the Prime Minister, and got placed upon the civil list.

“Wilderspin was never skillful in the organization of a school, but he was a good gallery teacher and a good missionary. The zeal and activity which he displayed in promoting the establishment of infant schools brought him into notice, and he was made superintendent of the Dublin model schools of the Irish Commissioners. His attainments, however, were too humble for him to retain the post.”

Wilderspin’s school received far more complimentary treatment in a book written in America in May, 1827. Harvard library has a copy of an 1828 edition published by Shirley & Hyde, Portland, entitled on the cover, Infant Schools, and on the title page, Infant Education, “By a Friend to the Poor.” The book appears to have been Owenite propaganda. It cited Wilderspin’s school at Quaker Street, Spitalfields, which it said was opened on July 2, 1820. The book outlined the nature of Wilderspin’s ridiculous “teaching.” After discussing Wilderspin’s school, it discussed the Bristol School, run by a man whose name was blurred (possibly Goyder). The reading methods at that Bristol School were described: an incomplete, alphabetically mixed syllabary, a vowel table omitting diphthongs, a picture alphabet with non-phonic examples (owl for o, ship for s, and wheel for w), and sight-words given for numerals at the beginning of the book along with the digits (one, two, three, etc.), something which is characteristic of a “meaning” method but which is never done with a “sound” method. By the 1820’s, it is obvious the infant schools had moved from “sound” towards “meaning.”

However, the record shows that Brougham (and others, including James Mill who presumably was the Mill who had praised his Edinburgh professor, Dugald Stewart) had imported Owen’s infant school to London as early as 1818, and had even obtained Owen’s teacher, Buchanan!

The push for organized education and for controlling the education of toddlers was also carried on by others in Scotland, and resulted in one of the world’s first normal schools by 1827. The Sonnenschein’s Cyclopaedia of Education 1877(?) and 1889 article mentioned David Stow, born at Paisley, Scotland, in 1793, who with his “fellow workers” set up Sunday Schools in the city between 1817 to 1824 for about nine thousand children, followed by a weekday school. The Cyclopaedia article quoted Stow:
“‘Prevention is better than cure,’” was our motto’ says Mr. Stow, ‘and to begin well we cannot begin too early. My first object, therefore, was to begin with children under six years of age, before their intellectual and moral habits were fully formed.’”

The article stated further that the teacher of the weekday school was David Caughie, and continued:

“Other schools for infants and for older children followed, and in 1827 the Glasgow Normal Seminary was formed. Here Stow’s ‘training system’ was fully developed and exhibited, and here persons came to learn it....

While the Glasgow merchant was working out one system of education in the dirt and squalor of a great industrial capital, an English clergyman was exemplifying another system in the rural quiet of a Surrey village. The Rev. Charles Mayo, D.D., was one of the many visitors to Yverdun whose enthusiasm was kindled by the enthusiasm of Pestalozzi.... Aided by Miss Mayo, his sister, he set up a school at Cheam for the children of the upper classes, and thence from time to time issued little books of ‘Lessons’ on the method of the master. The interest which Mr. John Stuckey Reynolds felt in the establishment of infant schools brought him into contact with the Mayos, and in conjunction with them he conceived the idea of applying the principles of Pestalozzi to the schools of the poor. The result was the establishment in 1836 of the Home and Colonial School Society for the purpose of supplying infant school teachers.”

The shortcomings in the Mayo approach are discussed later in this history. Furthermore, biographies of Pestalozzi suggest that his reputation is considerably overblown. (H. B. Wilbur’s 1862 book, referred to elsewhere, is an excellent partial critique of Pestalozzi’s faulty methods, particularly as ludicrously practiced by the Mayos in their “object lessons.”)

Pestalozzi is, however, on a straight line with all the “improvers” in education. All of them have received vast numbers of visitors and vast publicity. “Tourists” flocked to de l’ Elee’s school in Paris, and to Owen’s school at New Lanark, just as they flocked to John Wood’s school in Edinburgh, and to Colonel Parker’s schools in Quincy, Massachusetts, and Chicago, Illinois. Mayo, therefore, after having visited Pestalozzi, ended up by 1836 founding a training school for infant school teachers, just as Stow founded a normal school at Glasgow in 1827.

All of these events served to make it respectable for outside organizations to replace parents in the training of their little toddlers. Instead of having the freedom to move about in their own homes, the toddlers were crammed into galleries in a totally unnatural, organized fashion. To treat toddlers in such a regimented way, as so many sardines in a can, was something that had never happened in the history of the world before, except perhaps in Sparta. The “dame schools” never had such large groups of children and followed no such organized programs, any more than mothers do in their own homes. But Brougham not only approved of regimented infant schools but helped to found what was probably the first regimented infant school in England!

No doubt can possibly exist of Brougham’s great interest in education. In 1825, he published Practical Observations upon the Education of the People, Addressed to The Working Classes and Their Employers. It was circulated in vast numbers and endorsed the founding of libraries and the publishing of books for working people, as well as the formation of study groups for them, such as resulted in the founding of the Society for the Diffusion of Useful Knowledge. These were seemingly worthy aims. A copy in the New York Public Library makes it clear some of the publishing expense for his Observations was underwritten by others, and not paid for by the purchasing public. The New York Public Library copy was printed in Manchester:
Since this was a 26-page pamphlet, it must have been a considerable expense in that day for that newspaper. Did the newspaper pay all the cost?

Brougham dedicated this ultimately famous publication “To George Birkbeck, M.D., F.R.S., President of the London Mechanics Institution.” Brougham’s remarks printed immediately under that 1825 dedication are illuminating:

“As I have chiefly in deference to your opinion, sanctioned by that of our fellow-labourers in the North, undertaken to make the following pages public at the present moment, I beg leave to inscribe them with your name.”

By fellow-labourers in the North, did he mean Scotland as well as Manchester? At the very least, this comment confirms group action by 1825. Brougham continued:

“You are aware that they contain a portion of a larger discourse, which more pressing but less agreeable pursuits have long prevented me from finishing, upon the important subject of Popular Education, in its three branches, Infant Schools, Elementary Schools (for reading and writing,) and Adult Schools. It is only with the second of these branches that the Legislature can safely interfere. Any meddling on the part of Government with the first would be inexpedient; with the last, perilous to civil and religious liberty. In conformity with this opinion, I have brought the question of Elementary Education repeatedly before Parliament, where the lukewarmness of many, and the honest and by me ever to be respected scruples of some, have hitherto much obstructed my design: the other two branches belong to the country at large. Having, in concert with those friends who hold the same doctrines, endeavoured to establish Infant Schools, it seems to follow from the same view of the subject, that I should lend any little help in my power towards fixing public attention upon the Education of Adults; by discussing the best means of aiding the people in using the knowledge gained at schools, for their moral and intellectual improvement.”

I could find no trace of his ever having published his book on “Popular Education, in its three branches” on which he said he had been working for a long time. Brougham’s remarks, establish, however, beyond any possible doubt that he had actively concerned himself with elementary education for a long time before 1825, since it was one of those “three branches” of that “larger discourse” he had been writing, which he had been “long prevented” from finishing. It is also a clearly established fact that Brougham’s interest in infant schools dated at least from 1818. He continued:

“A considerable portion of the Observations was inserted in the Edinburgh Review, together with a good deal of other matter, and with one or two statements in which I do not altogether concur.”

Brougham had very much concerned himself with primary education, and in doing so endorsed the infant schools founded by the socialist/atheist Robert Owen at Lanark, and opposed the teaching of reading to young children in the manner used by Bell and Lancaster. Lancaster used the “sound” method, and Bell had used the “sound” method to a large extent initially although he eventually replaced it with an atrocious “improvement” (as discussed elsewhere). Brougham’s opinion appears in a speech he gave before the House of Commons on June 29, 1820. It was reported in The Pamphleteer, Vol. XVI, No.
...He anticipated that dame-schools would get into better hands, and be better conducted. One school of that most interesting class was but a short walk from where he now stood. If a child was neglected till six years of age, no education afterward could recover it.... But if dame schools were better regulated and adapted to the example of the school in Westminster and the examples of Fellenberg and Lanark... (etc.) (Ed.: to the effect that poverty and crime in England would be greatly reduced). But learning was not all, nor the principal consideration - moral habits were acquired, they were kept out of nurseries of obscenity, vulgarity, vice and blasphemy.”

Brougham was equating being raised in poverty to being raised surrounded by “obscenity, vulgarity, vice and blasphemy.” The upper classes were apparently willing to accept this description which served Brougham’s infant-school purposes so conveniently, but it is highly improbable that it was generally the case, since it is natural for parents to show loving care for their children, whether the parents are poor or rich. Notice also that it is implicitly an attack on the integrity of the family, which attack has been so successful in the twentieth century.

“The ages at which they attend in Westminster were 3, 4, and 5 to 7. Nothing was required in such a school but a steady, sober, and even temper. With that learnt, more or less was of little consequence; the moral discipline was the great consideration. The great objection made by his friend, M. Fellenberg, to the Lancaster and Bell systems of education, was, that children learnt too rapidly - that they became machines. There were one hundred of the children in the School at Westminster who did little more than attend to the discipline of the School, and even by this much good was done.... Who could deny, that children thus educated were prepared, though not perhaps, fully prepared, to defy the shocks and buffettings of the world infinitely better than they whose progress was more showy but who became only educated machines..... Once more he apologized (loud cheers) and moved for leave to bring in a bill for the education of the poor in England and Wales.”

From this, it is obvious that Brougham disapproved of the fact that both Lancaster and Bell tried to teach children to read. Brougham’s argument is a familiar one. Teaching young children to read is supposed to be bad for them. Teach them instead to socialize. Brougham sounded like John Dewey.

Brougham did include in one of his books an article on the subject of reading, but I do not know the date he compiled the book. That book of Brougham’s was included in 1876 in The American Catalogue, under the Direction of F. Leypoldt, Subject Entries of Books in Print and for Sale (Including Reprints and Importations) July, 1876, “Compiled by Lynds E. Jones.” It showed, on page 359 under “Reading” and its listings for A. Potter, that Potter’s “Observations on Reading” was part of Lord H. Brougham’s Discourses on Science and Literature, which book Harper had for sale in 1876 for 75 cents. The probability is that it concerned only the kinds of books to read, and not how to teach reading. As referred to elsewhere, Harper’s had published material by Brougham as early as the 1820’s and perhaps this was a reprint of that early material. A. Potter was most probably Rt. Rev. Dr. Alonzo R. Potter, who wrote with George B. Emerson The School and the Schoolmaster, published in Boston in 1843. Samuel Blumenfeld mentioned Potter on page 230 of Is Public Education Necessary? 1982, 1985, The Paradigm Company, Boise, Idaho:

“In May 1842, (Horace) Mann was the principal speaker at the New York State Convention of School Superintendents at Utica. The convention was attended by such luminaries in the public school movement as Joseph Henry, Alonzo Potter, John Griscom, George B. Emerson, and Thomas H. Gallaudet, father of the whole-word method of reading instruction. The main theme
running through the convention was that the non-sectarian common school was replacing the church as the instructor in morality.”

That Brougham included Potter’s material in his book is not only additional confirmation of Brougham’s interest in the topic of reading materials, but that strong ties existed between government school activists in Britain and government school activists in America.

Brougham had certainly written, somewhere, about Dugald Stewart’s psychological explanation for the actions of an orator. That Brougham had written such material was mentioned in an article which also concerned Dugald Stewart’s psychological explanation for the act of reading. The article appeared in Volume II of Proceedings of the Royal Irish Academy, 1844, on pages 217 and following. It was a summary of a paper by Rev. J. Wills, read by Dr. Anster (which will be quoted at greater length later):

“(Rev. J. Wills) then went at considerable length to apply the same reasoning to the case of the orator, as adduced by Mr. Stewart, and more fully described by Lord Brougham....”

Brougham had “more fully described” Stewart’s ideas on the psychology of oratory, and Brougham may very well have done the same for Stewart’s ideas on the psychology of reading. This might be confirmed if only Brougham’s article referred to by “Rev. J. Wills” could be located.

Brougham certainly aroused opposition. Concerning his so-called drive against “charitable abuses” and presumed misuse of charitable funds, in the New York Public Library volume, Biography AN pv 184, is a pamphlet, Brougham Reviewed, Especially with Reference to his Conduct in Parliament During Last Season, in a Letter to the Editor of the Westmorland Gazette by A Loyal Independent - Kendal, Printed by Airey and Bellingham, 1818.

“(Mr. B. is an unfit person to represent any county whatever....

“(Brougham) is now directing public attention to his Bill for appointing a Commission to enquire into the Abuses in Charities connected with the Education of the Poor. With regard to the purpose of this Bill, there can be but one opinion and one sentiment. Great abuses, there is much reason to believe, do exist and the correction of them is earnestly to be desired - every man will rejoice to see Charitable Funds restored to the Poor which may have been diverted, by whatever means, from their original destination, especially when the funds were designed for the education of those who might otherwise have been destitute of that inestimable benefit. The object was truly deserving the attention of Parliament. But, in this, as in every other act of legislation, the rules of prudence are to be attended to with a care proportionate to the magnitude of the good proposed. Among these indispensable rules, is (not) to resort to powers which cannot be called into action without the sacrifice of a principle more valuable than the one we are laboring to establish.

“(The legislation) proposed to enact that certain Commissioners should be appointed, empowered to split and divide themselves, and prosecute their inquiries, each portion having the same powers as were vested in the whole; that it should be lawful for them to hold their sittings where they chose, and to command the attendance of whom they chose; examine upon oath “touching any matter or thing relating to estates or funds, as aforesaid, or to the state of education of the classes aforesaid; and in case he or she should refuse to answer to and before the said Commissioners” (in such a manner, no doubt, as they might deem satisfactory), then they “are authorized to take and apprehend such person, and commit him or her to such prison as, in their judgment, shall be most proper or convenient, and to remain without bill of mainprize until he or she &c.”
“Great wits are said to be closely allied to madmen; not so much, however, it should seem, as strenuous reformers to rigorous enslavers.

“Over whom were these inquisitors to have this monstrous power? Over everyone in England and Wales, including more especially the Trustees of Charitable Schools, far the greatest proportion of whom, among us, are respectable Yeomanry.”

Under “reformers” like Brougham, no one was to have the luxury of “Taking the Fifth,” any more than he could have done under Hitler, Stalin or Genghis Khan. Yet this was the man whom Holbrook found so admirable that he wanted him to head up a Universal Lyceum (Blumenfeld, page 138), in effect a world Society for the Diffusion of Useful Knowledge.

Brougham’s own writings condemn him, as pages 23 and 24 from his Practical Observations upon the Education of the People (1825) prove, which were based on his 1818 “charitable abuses” red herring. As instances of such “abuses,” he wrote that other people in England (not himself) had donated money to set up such charities as an orphanage for 65 girls and clothing for 101 destitute boys. He said he thought that money (not his own) would have been better used founding infant schools. Kind-hearted Brougham said:

“The immediate consequence of such provisions is, to promote idleness and poverty.... It is therefore a sacred duty which everyone owes to the community, to refrain from giving contributions to begin such funds; and if he has already become a yearly contributor, it is equally his duty to withdraw his assistance, unless one condition is complied with, - namely, that no new objects shall be taken into the establishment.”

The long period from about 1818 when Brougham started his “charitable abuses” campaign till after the mid-nineteenth century was the setting for Charles Dickens’ stories concerning the appalling poverty of some groups of people in England. Yet Brougham thought, not only that aid to the poor should not increase after 1818, but it would have been better never to have started it! Brougham obviously had his eyes on the huge private contributions for charity from the compassionate in England, which he wanted to turn to his own uses. What he tried to do in the early nineteenth century was achieved in the early twentieth century in America, when some privately funded charitable “foundations” fell under the control of the kind of “liberals” who have used those huge funds ever since to promote their own agendas. Of course, Brougham’s variety of “liberal” was one of the early nineteenth century kinds, who endorsed “laissez faire” economics, the rationale for his callous and un-Christian approach to the poor. Most of our present-day “liberals” are at the other end of the spectrum. Instead of endorsing no economic controls whatsoever, they endorse the antithesis: economic tyranny.

One of the speeches which Brougham omitted from his biography and collected works is in the New York Public Library, Pamphlets- *c.p.v. 716, Mr. Brougham’s Speech on the Education of the Poor. The Speech of Henry Brougham, Esq., M. P., in the House of Commons, May 8, 1818, on the Education of the Poor, and Charitable Abuses. London: Printed for James Ridgway, Piccadilly, 1818. Although portions of that material are not quoted here, the very existence of this New York copy demonstrates that by 1818 such a pamphlet was being circulated. The printing of the copy proves that Brougham’s campaign against private education (i.e., “charitable abuses,”) and in favor of government education (i.e., “education of the poor,”) was in full swing by 1818, and undoubtedly reaching America in the form of such pamphlets.

As the previous quotation makes clear, Brougham had been speaking on the subject in Parliament since 1817. “Reform” began showing up in America just about the same time, in 1817, with the campaign for Boston government primary schools, founded in 1818, also based on the presumed need to educate the poor. (Samuel Blumenfeld’s Is Public Education Necessary? proves that there was no illiteracy problem,
for the poor or any other group, in Boston at the time.) It is interesting that the penniless Russell first arrived in Georgia from Scotland in the same year of 1817, and within the next year made another expensive round trip to and from Scotland, certainly suggesting that he might have been a courier. The House of Commons has always been awash with speeches, just as has the U. S. Congress. Yet few of these speeches ever get distributed as Brougham’s were, so he and his cohorts were obviously carrying on an organized (and probably expensive) publicity blitz of huge proportions by 1818. Yet, about forty years later, Brougham chose to suppress ALL of his material which had been used to promote government schools! Did he and his cohorts have something to hide?

J. P. Morgan made the remark:

“A man always has two reasons for doing anything - a good reason and the real reason.”

The quotation is from The Treasury of the Familiar, Ralph L. Woods, The Macmillan Company, New York: 1942, page 660. Brougham and Birkbeck’s Society for the Diffusion of Useful Knowledge certainly had such a good reason: the spread of knowledge to all people. Yet the following quotation raises the possibility that there were separate “real” reasons. It is from the St. James Chronicle, May, 1825, and was quoted in John George Goddard’s George Birkbeck, The Pioneer of Popular Education, C. W. Bardeen, Publishers, Syracuse, New York (and London), 1884 (page 73-74). It was also quoted in George Birkbeck, Pioneer of Adult Education, by Thomas Kelly, Liverpool, At The University Press: 1957 (pages 106-107). The underlined portions are some of those that appeared in the longer 1884 quotation but were omitted in the quotation from after 1956. Such remarks tend to be filtered out of material published after 1920.

“A scheme more completely adapted for the destruction of this empire could not have been invented by the author of evil himself than that which the depraved ambition of some men, the vanity of others, and the supineness of a third and more important class of men, has so nearly perfected. It is nothing to the purpose to tell us that Mr. Brougham, or Dr. Birkbeck or Mr. Huskisson cannot design the ruin of the country..... We say that whatever their motives may be, every step which they take in setting up the laborers as a separate or independent class, is a step taken, and a long one too, toward that fatal result. Sylla, Cataline and Caesar, had all different objects, but they pursued their objects by the same means, the severing of the lower classes from their superiors.... Mr. Brougham wishes, perhaps, for merely political purposes, to count a noisy mob on his side; Dr. Birkbeck’s motive may be purely professional; Mr. Huskisson’s no more than innocently pedantic; they are all three, however, scattering the seeds of evil, the extent of which the wisest among them cannot anticipate.”

Kelly added following this quotation (pages 107-108):

“What lay behind this hostility? In the first place there was the fear among property-owners that any kind of education was a threat to their possessions.... But there were many, and particularly among churchmen, who while not opposed to education as such were opposed to this particular kind of education. To them, the movement smacked of Whiggery, Radicalism, Benthamism, rationalism, and Unitarianism. They were particularly alarmed at the prominence of Brougham. ‘Much, undoubtedly, of the alarm which those institutions have occasioned, and of the opposition they have experienced,’ wrote the Quarterly Review, ‘is to be attributed to the patronage and advocacy of (Mr. Brougham). It is his singular infelicity to prejudice every cause which he undertakes to advance. * Another critic, while admitting the sincerity of Birkbeck in disclaiming all political interest, declared that through his associates the Institution had become the tool of a party. ‘Liberty and independence were the themes of every harangue, and violent party spirit pervaded every meeting.
There was more here than mere political or religious prejudice. Birkbeck and his friends believed that education would necessarily make men more virtuous: their opponents argued that mere intellectual education, without moral education, was bound to have immoral tendencies. The case was moderately argued by the Quarterly Review:

"But, we shall be told, that if these lectures do not teach religion, which is no part of the business of Dr. Birkbeck or his coadjutors, they do not unteach it: while the habits of attention, sobriety, and the general elevation of mind which may be thus promoted, will be favourable to the mechanic’s character, and dispose his mind towards religion. We are willing to believe this.... Still it is their duty, if not to teach religious principles, to keep in view that there are such principles, and that they are all important.... Every mode of instruction, for whomsoever intended, which so teaches learning, science or art, as to make them seem all in all, and fails to connect them with the higher object of all education, the fitting of man for his ultimate destiny, we consider to be both incomplete and pernicious.***

"Quarterly Review, XXXII, 413 (Oct. 1825) ."

"London Journal of Arts and Sciences, IX, (1825), 369-70...."

"Quarterly Review, XXXII, 421-2."

Brougham is acknowledged to have been a friend of Owen’s. So, apparently, was Birkbeck. Birkbeck’s feelings about Owen’s work are evident from Birkbeck’s letter to Owen quoted by Thomas Kelly in his George Birkbeck, Pioneer of Adult Education, Liverpool, At the University Press: 1957, page 125:

"Sept. 23rd 1830

“My Dear Sir,

“I am exceedingly anxious for the success of your benevolent endeavours, and were it in my power, would most gladly co-operate with you. I am however engaged to the utmost of my leisure time, with measures which I believe to be of great importance; and remotely if not directly contributory to the success of your projects. I cannot therefore promise to be efficacious as a member of your projected Committee, and consequently had better not be placed upon it. I have indeed a great objection to be an idle name in any valuable undertaking.

“You will I hope feel assured, that altho’ I thus decline this nomination, I am deeply interested in the promotion of your views; which, the more they are developed by you (and they still admit of further development), the more they connect themselves with the best objects and the best hopes of the human species.

“With great regard,
I remain ever, my dear sir,
Very faithfy. yours
GEORGE BIRKBECK” **

"Holyoake House, Owen MSS., 287” **

The founding of the Edinburgh Review had been the idea of an English writer and Anglican priest, Sydney Smith (1771-1845) who lived in Edinburgh in 1798 and who studied moral philosophy there under Dugald Stewart at the University of Edinburgh. According to the article on Sydney Smith in the Encyclopedia Britannica (1963, Vol. 20, p. 834), Smith wished to start a periodical to publish material written by young people who wanted changes. Smith wrote in October, 1802, in the preface to a collection of his own articles in the Edinburgh Review::
“I was appointed editor and remained long enough in Edinburgh to edit the first number”.

There obviously were many good reasons for discontented young people in Great Britain at the time. The Edinburgh Review, the organ for the Whigs, was jointly founded in 1802 by Sydney Smith, Francis Jeffrey, and Henry Brougham (Encyclopedia Britannica, Vol. 17, “Periodicals,” page 513). It continued publication for over a hundred years, until 1929. Its competitor, the organ for the Tories, the Quarterly Review, began publication in 1809.

Sydney Smith continued to write for the Edinburgh Review for many years. One of the positions Smith took in his lifetime was in favor of Catholic emancipation, and he also wrote an unpublished text on misrule in Ireland. Yet he was afraid to publish it and his widow later destroyed it after she was urged to do so.

Note the parallel between what happened to Smith’s manuscript, some time after he died in 1845, and what happened to Lakanal’s manuscript after Lakanal’s death, which was, like Smith’s, also in 1845. As has been discussed in Part 3 of this history, Joseph Lakanal’s manuscript disappeared mysteriously, apparently on the very day of his death. Lakanal’s manuscript concerned the period of the French Revolution from about 1789 to 1799. For most of those years, Lakanal had been a prominent legislator. Smith’s manuscript was destroyed probably in the year of his death, 1845, or shortly after. Lakanal’s disappeared in 1845, so both disappearances took place in the same general time frame.

Lakanal’s manuscript had been completed for five years before his death, with only the title page in print, which fact is itself very strange. Others obviously knew of the existence of the manuscript, as well as the author of Lakanal’s short biography, quoted in Part 3, who had “often seen the manuscript volume.”

One such person who might have known of Lakanal’s book was Lord Brougham. As has been discussed in Part 3, the author of Lakanal’s short biography recorded:

“We assisted one day at a visit that Lord Brougham made to the ex-conventionnel. ‘Your Lord,’ said Lakanal to Lord Brougham, who answered him, ‘Dear Citizen.’”

Lakanal’s great work had been begun while Lakanal was in America, and was finished in Paris in 1840. The work was very possibly discussed and perhaps even shown to Brougham when he visited Lakanal after Lakanal returned to Paris carrying his unfinished history with him. Was there some material in Lakanal’s history so embarrassing to some persons in France, England, or America that they had his book stolen on the very day of his death? After all, it is an attested fact from that close friend of Lakanal, as previously quoted in Part 3, that:

“[Lakanal’s history] mysteriously disappeared at the moment of the death of Lakanal!”

Brougham’s own biographical writings suggest that Brougham preferred sanitized history, since he apparently omitted most of his enormous activities on education. It is a recorded fact that someone had Sydney Smith’s history suppressed, and it is probable that someone did the same for Lakanal’s history. Was Brougham, who had close contact with both Smith and Lakanal, perhaps involved in the suppression in 1845 or shortly after of both of these works?

Brougham had been, like Sydney Smith, a student of Dugald Stewart at Edinburgh University, and it was Brougham who wrote widely and long on education. Stewart was widely acknowledged as a very influential professor, so his ideas on education, and the possible effect of these ideas on Brougham, are important. A summary on Stewart’s ideas will be given later.
The biography of Henry Peter Brougham (1778-1868) is given in the Encyclopedia Britannica (1963, page 280-281, Vol. 4). Born of parents who were neither rich nor powerful, Brougham himself was active in British politics for over 30 years, and became lord chancellor of England from 1830 to 1834. He had entered Edinburgh University at 13 (not unusual at the time), and had studied under the famous Dugald Stewart, and then became a lawyer in Scotland in 1800. Brougham wrote many articles for the newly-established Edinburgh Review, and five scientific papers that he wrote before he was 20 were so highly regarded that they earned him membership in the Royal Society when he went to London in 1803. Brougham is credited with having eventually done important work in the abolition of slavery, in education, in legal reform, and in other areas. Brougham was a gifted speaker, a talent of great use for promoting his programs in the House of Commons. Brougham was one of the founders of the Society for the Diffusion of Useful Knowledge and of the non-denominational University of London.

However, there is a problem with the lengthy, admiring biography on Brougham in the Encyclopedia Britannica, which has far more detail than is mentioned above. The problem appears in almost any mainstream biographies written after about 1920. “Mainstream” in publishing since about 1920 has meant “liberal,” and such liberal sources tend to filter out data which might be considered negative in the eyes of conservatives. The result is that arch-liberals are usually unofficially canonized. Amos Bronson Alcott’s biography in the 1963 Encyclopedia Britannica is a case in point. Without doubting Alcott’s misplaced good intentions, the fact is that Alcott was weird and that his emotional brainwashing of children, as reported first-hand (and usually approvingly) by Elizabeth Peabody, was monstrous. Yet Alcott appears in the biography as a gentle reformer. Brougham was on the side of the angels concerning slavery, but was he therefore necessarily equally so concerning education? His co-founder of the Edinburgh Review had written at length in defense of Catholic rights. Yet for some reason Brougham’s writings were opposed by the English cardinal, John Henry Newman. According to the Catholic Encyclopedia, Vol. X, page 800:

“(Newman) wrote forcibly against the shallow enlightenment of Brougham....”

Something must have been gravely askew in Brougham’s positions in the eyes of such conservatives as Cardinal Newman.

Brougham was a member of the Royal Society, presumably a glittering achievement. Insight (October 1, 1990, page 62) has an article, “Exhibit Lifts the Veil of Obscurity,” on the English 18th century painter, Joseph Wright, a member of the Lunar Society, a similar group, which was described in the following excerpt. (Reprinted with permission of Insight. Copyright 1990, News World Communications, Inc. All rights reserved.)

“[The Lunar Society was] ‘a microcosm of that European movement of the 17th and 18th Enlightenment,’ (by) David Fraser, head of the Derby Art Gallery and Museum, in the exhibit catalog....

“Wright’s second great scientific painting, ‘The Air Pump,’ is rather more ominous.... in this case, the philosopher is demonstrating the concept of the vacuum by placing a dove in a glass container and pumping out the air, suffocating the bird. No wonder the two little girls in the audience look appalled.

“Actually, by Wright’s time it had become customary to use an artificial lung in the air pump for demonstration, a more humane solution, though one that would make for a less dramatic scene. Not that squeamishness was a hallmark of the early empirical scientists. Samuel Pepys, for instance, enthusiastically recorded a meeting of the Royal Society in London where the gathered gentlemen did experiments on a dog’s spine to everyone’s satisfaction except the dog’s.”
Gentlemen?! But from such men came the Unenlightenment, and the fact that Brougham was tried and not found wanting by such a group in the early nineteenth century may be no character endorsement, if the Royal Society still had the same kind of “gentlemen.” Two faults, such inhuman abuse of animals as that on the Royal Society dog, and obscenity, or indifference to these two faults, are curious themes which turn up in the biographies of some historically famous “intellectuals.” To be endorsed by such people is anything but a compliment.

Paul Johnson’s book, Intellectuals, documents grossly immoral behavior in the lives of some famous intellectuals. The characters of some of the most highly visible ones has also been grossly deficient. Rousseau, for instance, ludicrously considered education’s messiah, said himself that he had put his own children by his common-law wife in orphanages as soon as they were born. Yet the name of this deformed personality has unfortunately been permitted to deface the soaring ceiling of the lobby of the magnificent Library of Congress, because of the harmful nonsense Rousseau wrote about the education of children! Yet mainstream “histories” endorse such “intellectuals” by bowing respectfully before them (Paul Johnson excluded).

Brougham was intimately associated with the movement towards state control of education, though it was far longer in arriving in England in force than in America (to the credit of England). His involvement apparently dated at least from his joining an ex-classmate from Edinburgh University, George Birkbeck, in promoting what were called “institutes” for the education of lower-class adults.

According to Lawrence A. Cremin in American Education - The National Experience - 1783 - 1876 (Harper & Row, Publishers, New York: 1980, pages 314-315), the roots of the institutes lay in the Andersonian Institution, Glasgow, founded from a bequest from Professor John Anderson. Anderson wanted a system of popular education established which would be available to all classes and to both men and women. George Birkbeck, who at the time was a young professor at the Andersonian Institution, put out an announcement on a series of lectures in natural philosophy, meant for artisans and mechanics. He later moved to London, where he practiced medicine, and, with Birkbeck, worked to set up the London Institute for the Diffusion of Science, Literature and the Arts. Later, Birkbeck gave some lectures on natural and experimental philosophy to mechanics and artisans.

Cremin said that while Birkbeck was in London, he renewed his association with Henry Brougham, who had been his classmate at the University of Edinburgh. Both men worked for the reform of English education. Brougham gave an address, “Practical Observations Upon the Education of the People,” in 1824 which was published in 1825 and which had twenty editions in a year. Brougham said the question was not whether to educate but people how to do so. He pushed for the development of libraries, clubs, forums, and mechanics’ institutes like those in Glasgow and London.

Cremin stated that, in America, mechanics’ institutes and Brougham’s writings were reported generally, including in the American Journal of Education, of which William Russell was editor.

Cremin reported that when the American, Holbrook, proposed a Universal Lyceum some ten years later, meant for the whole world, he suggested Brougham as its president.

Some of Brougham’s writings were published in the Harper Family Library. The Family Library had 187 titles and was widely sold. Cremin recorded (pages 303-304) that the Harper publishing firm was founded in New York City in 1817 by James and John Harper, and by the late 1820’s was widely
considered to be the biggest book publisher in America. The Family Library included words by Bacon, Locke, Paley, Franklin, Brougham, George Combe, (the Scottish phrenologist), and the American, Richard, Henry Dana. As the publication of his works by the large Harper company makes clear, Brougham was very influential in both Great Britain and America by the 1820’s.

**Concerning the Influence of Dugald Stewart on Brougham, and the Possible Earlier Influences on Stewart**

Brougham and Birkbeck had studied under Dugald Stewart at the University of Edinburgh. According to Thomas Kelly in his George Birkbeck, Pioneer of Adult Education, Liverpool, At the University Press, 1957:

> “Everyone... went to hear Professor Dugald Stewart lecture on moral philosophy. According to Godard, Birkbeck took down his addresses in shorthand.... Cockburn has left us a magnificent portrait. Stewart, he says, ‘Breathed the love of virtue into whole generations of pupils. To many, his lectures were like the opening of the heavens....’” (page 15)

The quotation suggests Stewart was something like a charismatic prophet - or a demagogue. Yet his works, which I have looked over casually, are pleasant enough, but anything but “the opening of the heavens.” What is most noticeable about his philosophy/psychology texts are that they seem to have suggested the form for William James’ 1890 psychology text. There is another parallel: when James went to lecture at Columbia in 1908, according to the Encyclopedia Britannica (1963) he was received with wild enthusiasm. Yet his writings were not inspiring, either.

Something else must have been the cause of the wild enthusiasm in Edinburgh about 1800 and in New York about 1900. The record suggests it was the rejection of traditional religion, with all its inconvenient requirements. Bishop Fulton J. Sheen made a remark that went about like this: Some people who love humanity in the general, find it very difficult to love humanity in the particular. The ideas swelling the heads of the intellectuals about that time concerned loving humanity in the general, such as with the developing socialism. It was possible, therefore, for students to take a nice, self-congratulatory emotional trip without having to do anything concrete which interfered with their own comfort and convenience. After all, everything that was wrong in the world was “society’s” fault, not theirs.

Kelly continued, on page 26:

> “At the time of Garnett’s resignation from Anderson Institution, Birkbeck was a newly fledged graduate, contemplating, no doubt, a career in medicine.... He decided to apply, and secured the support of not only Garnett but of Dugald Stewart, Playfair, and others. On 18 November, 1799, he was appointed....”

So Birkbeck’s appointment at the Anderson Institution in Glasgow in 1799 was partly through the personal influence of Stewart, and Birkbook soon after began the work there that resulted in the famous mechanics institutes.

One wonders what kind of “moral philosophy” was absorbed by Brougham from Stewart, since Brougham was later considered so disreputable by many. Also, Birkbeck, who slavishly recorded Stewart’s lectures and so must have absorbed them, apparently did not find them in too much conflict with the ideas of the Scottish atheistic socialist, Robert Owen, since Birkbeck endorsed Owen so wholeheartedly (according to his letter to Owen previously quoted).
Birkbeck did not stay long at the Anderson Institution in Glasgow, but it may be noted that William Russell graduated from the University of Glasgow about 1817. Brougham, who had not been in Scotland in many years, was nevertheless elected rector of the University of Glasgow by its students in 1825. The students therefore thought as well of the radical Brougham in 1825 as the Columbia students thought of William James in 1908 when James’ lecture there was so enthusiastically received, as mentioned in the Encyclopedia Britannica (1963) account of James’ life, and as the University of Edinburgh students thought of Stewart about 1800.

Brougham and his close friend, Birkbeck, were clearly influenced in their thinking by their famous professor, Dugald Stewart. Did Stewart’s ideas on how knowledge is acquired - or not acquired - possibly have shaped Brougham’s and Birkbeck’s thoughts on education? If so, what had influenced the development of Dugald Stewart’s own ideas on education and on how the mind is shaped? In particular, what might have influenced Stewart’s ideas on the teaching of beginning reading? As Keagy’s statements demonstrate, Stewart certainly did have some kind of influence on the spreading movement to teach beginning reading by “meaning.”

An early influence on Stewart’s thinking about the act of reading could conceivably have been the writings of Isaac Watts. Early American Textbooks, 1775-1900, has an illustration on page 63 showing the cover of a book, Improvement of the Mind, by Isaac Watts, republished by A. S. Barnes & Co., New York, in 1866. Therefore, Watts obviously concerned himself, as did Stewart, with how the mind is “improved.” The cover showed that it was a “School Edition with Denman’s Questions,” and it also carried a quotation from Dr. Johnson, “Whoever has the care of instructing others, may be charged with deficiency in his duty, if this Book is not recommended.” Watts’ ideas on “improving” the mind must have been powerfully influential, to be endorsed by the famous dictionary author, Samuel Johnson, in mid-eighteenth century England, and then to be reprinted over a hundred years later for school children in America. The American edition is described on page 68 of Early American Textbooks, but with a date of 1850, presumably the copyright date, and the words, “A collection of essays counseling readers on how knowledge can be acquired and retained.” Isaac Watts wrote at the beginning of the eighteenth century. Conceivably, some of his advice to “readers on how knowledge can be acquired and retained” may have influenced Dugald Stewart in his ideas, but I have not seen Watts’ book to see if there is a resemblance.

Bishop Joseph Butler was a definite eighteenth-century influence on Stewart since Stewart specifically quoted him in one of his books. One of the many American editions of Dugald Stewart’s Elements of the Philosophy of the Human Mind was printed in Boston in 1821 by Wells and Lilly. Stewart (1753-1828) quoted on pages 242-243 a remark concerning reading without thinking, which had appeared in the preface to Dr. Butler’s Fifteen Sermons (1726). It was this remark of Butler’s, which was probably only casual, that may have been partially responsible along with de l’Epee’s influence for sparking the “reading for meaning” affliction that has beset us ever since. That is because Professor Stewart of the University of Edinburgh elaborated on Butler’s remark, and Stewart was an enormously influential man. The Bishop Butler referred to by Stewart is listed in the Encyclopedia Britannica (1963) (Vol. 4, page 482), as Joseph Butler (1692-1752), a moral philosopher and a Church-of-England bishop in Durham, whose works were well known in the eighteenth and nineteenth centuries.

The eighteenth-century works of Benjamin Franklin very probably also had some influence on Stewart’s thinking about the mind and about the act of reading. It is therefore pertinent to quote material concerning Franklin’s own educational background and Franklin’s resultant ideas on education as they showed up in Franklin’s written work. Franklin rejected the ancient Latin curriculum, and endorsed education in modern languages, which rejection very possibly reflected his own lack of Latin training. Presumably Franklin’s other views were also shaped, at least to some degree, by his own educational history.
In Benjamin Franklin on Education (Teachers College, Columbia University, New York: 1960’s?)
John Hardin Best quoted from The Autobiography of Benjamin Franklin, Max Farrand, Ed., 1949,
concerning Franklin’s own education:

“From my infancy, I was passionately fond of reading, and all the little money that came into
my hands was laid out in the purchasing of books. I was very fond of voyages. My first
acquisition was Bunyan’s works in separate little volumes. I afterwards sold them to enable me to
buy R. Burton’s historical collections; they were small chapmen’s books and cheap, forty or fifty
in all. My father’s little library consisted chiefly of books in polemic divinity, most of which I
read. I have since often regretted that at a time when I had such a thirst for knowledge, more
proper books had not fallen in my way, since it was now resolved I should not be bred to divinity.
There was among them Plutarch’s Lives, in which I read abundantly, and I still think the time
spent to great advantage. There was also a book of Defoe’s called an Essay on Projects and
another of Dr. Mather’s called Essays to do Good, which perhaps gave me a turn of thinking that
had an influence on some of the principal future events of my life.

“This bookish inclination at length determined my father to make me a printer, though he had
already one son (James) of that profession. In 1717 my brother, James, returned from England
with a press and letters to set up his business in Boston.... I stood out some time, but at last was
persuaded and signed the indenture, when I was yet but twelve years old. I was to serve as
apprentice till I was twenty-one years of age, only I was to be allowed journeyman’s wages
during the last year. In a little time I made a great progress in the business and became a useful
hand to my brother. I now had access to better books.”

The books that Franklin had read by the age of twelve are enormously impressive, but he was, of
course a genius. How was this genius educated - in classes for the “gifted and talented?”

Best stated on page 3 that Franklin’s father’s business was that of a tallow chandler and soap boiler.
Born in 1706, Franklin was put in Boston Grammar school at eight but stayed less than a year as his
father found it too expensive. Franklin then went with a writing and arithmetic master, George Brownell,
where he wrote well but failed arithmetic, leaving by the age of ten, after which he received no more
formal education! Best said:

“He found that with Cocker’s arithmetic book he could master figures on his own.”

Franklin, therefore, had very little contact with formal education, particularly with classical Latin, but
nevertheless published in 1751 his ideas on what a formal education should include. Best reproduced,
starting on page 165, Franklin’s Idea of the English School, Sketch’d out for the Consideration of the
Trustees of the Philadelphia Academy.

“It is expected that every Scholar to be admitted into this School be at least able to pronounce
and divide the Syllables in Reading, and to write a legible Hand.”

Franklin obviously endorsed learning to read by “sound” with the syllabary. Franklin clearly defined
what we today call “reading” as having learned “to pronounce and divide the Syllables,” and he expected
that to have been achieved BEFORE a child even began school! Yet, as will be seen later, Franklin
eventually introduced a very unsettling idea concerning advanced reading (or elocution), very possibly
based on Butler’s suggestion. That idea of Franklin’s may have unwittingly become one of the sources for
the switch from “sound” to “meaning” in beginning reading.

“...First or lowest Class.
“Let the first Class learn the English Grammar Rules, and at the same time let particular Care be taken to improve them in Orthography...

“Let the Pieces read by the Scholars in this Class be short, such as Croxall’s Fables, and little Stories. In giving the Lesson, let it be read to them, let the Meaning of the difficult Words in it be explained to them, and let them con it over by themselves before they are called to read to the Master, or Usher; who is to take particular Care that they do not read too fast, and that they duly observe the Stops and Pauses....”

The advice up to this point was probably standard enough, except for the lesson’s being read to the children first. Note that “to read” meant only to pronounce (after dividing) syllables. Note that the children were likely to “read too fast” if not stopped. Children were therefore not expected to have any difficulty with “decoding” in 1751 when the first step in “decoding” was to divide words into syllables. After words were broken up into their syllables, children could then simply pronounce already-memorized syllable sounds or work out any new syllable sounds.

“The Second Class to be taught

“Reading with Attention, and with proper Modulations of the Voice Some short Pieces, not exceeding the Length of a Spectator, to be given this Class as Lessons (and some of the easier Spectators would be very suitable for the Purpose). These Lessons might be given over Night as tasks, the Scholars to study them against the Morning. Let it then be required of them to give an Account, first of the Parts of Speech, and Construction of one or two Sentences, this will oblige them to recur frequently to their Grammar and fix its principal Rules in their Memory. Next of the Intention of the Writer, or the Scope of the Piece, the Meaning of each Sentence, and of every uncommon word. This would early acquaint them with the Meaning and Force of Words, and give them that most necessary Habit, of Reading with Attention.”

The advice up to the last line was not surprising, but in the last line Franklin touched the heart of the matter concerning “reading comprehension.” The attention necessary for reading comprehension to take place can be either voluntary or involuntary. When the reading process itself is a healthy automatic conditioned reflex like normal walking, attention to the content arising from that healthy act of reading is voluntary. It is not involuntary as with a disabled reader who must use his consciousness to guess at the print in order to read anything at all. The voluntary attention of a healthy reader can be encouraged but can never be forced as with a disabled reader. A healthy reader’s attention can only be made “habitual” in the sense that choosing to brush one’s teeth in the morning is “habitual”: It is a voluntary act that has become easier to repeat because of the framework of routine, yet still voluntary. Yet Franklin had raised the topic of reading for meaning, and he elaborated on it later.

Franklin’s next comment concerned “elocution,” but the practice he mentioned, unobjectionable in itself, was to be abused in the next century, by which time children were no longer expected to be able to decode anything for themselves without help.

“...the Master then to read the Piece with the proper Modulations of Voice, due Emphasis, and suitable Action, where Action is required, and put the Youth on imitating his Manner.

“It is requir’d that they should first study and understand the Lessons, before they are put upon reading them properly, to which End each Boy should have an English Dictionary to help him over Difficulties. When our Boys read English to us, we are apt to imagine they understand what they read because we do, and because ‘tis their Mother Tongue. But they often read as
Parrots speak, knowing little nor anything of the Meaning. And it is impossible a Reader should give the due Modulation to his Voice, and pronounce properly, unless his Understanding goes before his Tongue, and makes him Master of the Sentiment. Accustoming Boys to read aloud what they do not first understand, is the Cause of those even set Tones so common among Readers, which when they have once got a Habit of using, they find so difficult to correct: by which Means, among Fifty Readers we scarcely find a good One. For want of good Reading, Pieces publish’d with a View to influence the Minds of Men for their own or the public Benefit, lose Half their Force. Were there but one good Reader in a Neighbourhood, a publick Orator might be heard throughout a Nation with the same Advantages, and have the same Effect on his Audience, as if they stood within the Reach of his voice...."

The last paragraph is extraordinary. Boys (note the disregard of “girls”!) were presumed to read with “even set tones” because they did not understand the content. Good orators were presumed to be able to deliver a message because they did not speak with “even set tones.” Even though the audiences listening to orators would not have had access to dictionaries to check unknown words, the audiences were presumed to be able to understand them because of their superior delivery. Franklin therefore is making the EMOTIVE content of oral speech responsible for carrying its meaning!

Yet Franklin, himself, before he was twelve years old, brilliant as he was, certainly could not have thoroughly understood all the heavy reading material he covered. In the material just quoted, Franklin endorsed silent reading first as opposed to oral reading because with oral reading the boys might acquire the bad habit of reading without attention to “meaning.” It is startling, indeed, to find Benjamin Franklin to be the first on record to endorse silent reading for “meaning” (unless possibly Dr. Butler did so first in his 1726 book).

However, Franklin’s recommendations for the third, fourth and fifth classes were not startling, though undoubtedly novel in those days when Latin, not vernacular, schools were the norm.

Although Franklin had written very few articles, the “Family Library” published by the Harper firm in New York in the 1820’s included works by Franklin. As has been shown, one of the articles Franklin wrote concerned schools, and probably that article was influenced by Butler.

Franklin also wrote, of course, Poor Richard’s Almanack, published from 1732 to 1757, according to John Hardin Best, in Benjamin Franklin on Education (Teachers College, Columbia University, New York: 1960’s?). Best said:

“As an agent of mass education the Almanack was unparalleled. Its folk wisdom and enlightened perceptions were generally laced with an earthy Colonial humor....”

The huge success of the Almanack is just one more indication of the high literacy in America in those years.

Besides possibly being influenced by Butler’s and Franklin’s writings, Stewart’s ideas were almost certainly affected by Rousseau’s offensive nonsense, which was perceived as credible in the gullible eighteenth century.

The comments of Jean-Jacques Rousseau (1712-1778) concerning reading, in his book, Emile (1762), are quoted by Thwaite in from Primer to Pleasure (pages 65-66):

“Reading is the curse of childhood, yet it is almost the only occupation you can find for children. Emile at twelve years old will hardly know what a book is.” (p. 80, Book II) “The child
who reads ceases to think, he only reads.” “He is acquiring words, not knowledge.” (page 131, Book III)

The last two sentences must have intrigued Dugald Stewart since they only paraphrase his ultimate theme.

Butler, Franklin, Rousseau and Stewart objected to the use of language without thought, and yet the repeating of language without thought of its meaning is undoubtedly as old as mankind. It appears in Shakespeare’s Hamlet, Act III, Scene 2, Line 81. Hamlet’s guilty uncle finds it impossible to pray, saying:

“My words fly up, my thoughts remain below,
Words without thoughts never to heaven go.”

The phenomenon is explained by automaticity. The neurosurgeon, Dr. Wilder Penfield, said the brain’s automatic sensory motor mechanism can perform learned functions, such as reciting memorized prayers or reading, with or WITHOUT the presence of conscious attention. With a certain type of epilepsy, for instance, it was possible for an accomplished pianist to play selections with great accuracy, even when his “higher brain mechanism” through which his conscious mind operated was totally blacked out. This specific case was cited in Penfield’s The Mystery of the Mind, Princeton University Press, Princeton, New Jersey, 1975, page 39.

Dugald Stewart’s works were actually psychology texts. In casually looking over the three volumes of Elements of the Philosophy of the Human Mind,, their resemblance to William James’ psychology text is marked, in tone and content. It is true that the Scottish Commonsense philosophers, such as the younger Thomas Brown (1778-1820), reportedly all provided:

“...a systematic classification of the various powers of the mind”

That description was given by Bruce A. Ronda in Letters of Elizabeth Palmer Peabody (1984), page 67. But reading that three-volume work of Stewart’s is like reading a first draft of James’ Principles of Psychology. Even the quotations in the body of Stewart’s work and the anecdotal footnotes as on page 134 are highly reminiscent of James’ treatment.

It seems likely William James was well acquainted with Stewart’s works, even to the point of using an apparent paraphrase of one of his expressions. Stewart had made the following comment on page 135 of Volume III of his Elements of the Philosophy of the Human Mind, concerning religious enthusiasm:

“...the infectious tendency of religious enthusiasm; a tendency...very justly ascribe(d), in a great measure, to the violent bodily agitations which it is apt to produce and the rapidity with which such agitations are propagated among a crowd.... ...some other instances of the same kind which occurred in Scotland, at the time of Mr. Whitefield’s’s visit to this country, are stated, upon incomparable authority....”

“The reason of the belief is undoubtedly the bodily commotion which the exciting idea sets up. ‘Nothing which I can feel like that can be false.’ All our religious and supernatural beliefs are of this order.”
Note the resemblance in the discussion of religious feelings between Stewart’s “violent bodily agitations” and James “bodily commotion.” Stewart had claimed “bodily agitations” of “religious enthusiasm” were infectious; James claimed “bodily commotions” were the CAUSE of belief, making faith dependent on emotion instead of intellect. James’ ludicrous conclusion is in keeping with his philosophy of “pragmatism,” which itself is irrational.

Another striking similarity between the views of Stewart and James concerns the faulty definition both gave for the human will.

Stewart said he believed in the human will and rebuked Diderot for his opinion, which Stewart quoted (I believe from page 587 of the Carey edition listed below, but on this section my notes are not clear). Diderot had said:

“Examine the memory, and you will see that the word liberty is a word devoid of meaning, that there are not, and that there cannot be, free beings, that we are only what accords with the general order, with our organization, our education, and the chain of events. These dispose us inevitably. We can no more conceivably act without a motive (etc.) .... the motive is always exterior and foreign, fastened upon us by some cause distinct from ourselves.”

Thus spake Diderot, the famed encyclopedist of the “Enlightenment,” which ended in the blood-soaked French Revolution for “liberte, equalite, et fraternite.” The personal convenience of Diderot’s denial of free will should not be overlooked, however, as it probably helped to cushion any uneasiness this ex-student for the Roman Catholic priesthood might have felt about his own spiritual health. The “freedom” Diderot was denying was described very clearly by Francis Canavan, S. J., Professor Emeritus of Political Science at Fordham University, in the January 20, 1992 issue of the Catholic Eye:

“So far is the Catholic Church from denying our freedom that it insists on it. Cardinal Ratzinger, for instance, has spoken of ‘God’s unconditional respect for the freedom of His creature.’ Pope John Paul II has said: ‘All of God’s action in human history respects the free will of the human “I”.’ In Catholic teaching, only God can save us, but not without our free consent.”

Yet Stewart claimed that he, himself, believed in free will but, when he defined free will as being identical to “attention,” instead of being the human ability to make choices between alternatives, he cancelled out any meaning to his belief. Stewart said in Volume 3, page 341 and following of the Carey Philadelphia edition mentioned below:

“I have been accused of overlooking, in the preceding chapter, a very important distinction between voluntary and involuntary attention. In some cases (it is said) attention attaches itself spontaneously to its object. In others it requires a painful effort to keep at study - nay, when we will to fix it on one subject, we find it perpetually wandering to another. The fact on which the criticism is founded must unquestionably be admitted, but the conclusion drawn from it is nevertheless erroneous.... when I am anxious to attend to a particular subject, I am apt to say that I will to attend to it, and when I forget my purpose, that my attention is involuntary; whereas the fact is, that the unintended distraction... was the effect of a particular volition of the mind, exerted in consequence of a momentary forgetfulness of my general purpose. Indeed, to those who are at all accustomed to precision in the use of language, the phrase involuntary attention must appear a manifest contradiction in terms.”

402
The same error, wrongly equating attention with will, appeared on page 291 of James’ Principles of Psychology written in 1890. Possibly James acquired the error from Stewart. As will be discussed, it had an exceedingly baleful effect on the teaching of reading:

“...when we see (as in the chapter on the will we shall see) that volition is nothing but attention; .....we must admit that the question whether attention involves such a principle of spiritual activity or not is metaphysical as well as psychological, and is well worthy of all the pains we can bestow on its solution. It is in fact the pivotal question of metaphysics, the very hinge on which our picture of the world shall swing from materialism, fatalism, monism, towards spiritualism, freedom, pluralism, - or else the other way....”

Stewart also clearly connected “attention” with “reading,” as did James’ followers, as will be shown. Chapter II of Stewart’s first volume of March 13, 1792, text was entitled, “Of Attention.” It was in this chapter that Stewart said the following, implicitly denying what today is called automatic behavior in reading:

“When we read a book (especially in a language which is not perfectly familiar to us), we must perceive successively every different letter, and must afterwards combine these letters into syllables and words, before we comprehend the meaning of a sentence. This process, however, passes through the mind, without leaving any trace in the memory.”

Stewart’s opinions on reading were obviously well known in the English-speaking intellectual world for a long time afterwards. In Volume II of Proceedings of the Royal Irish Academy, 1844, on pages 217 and following, a summary appears of a paper by Rev. J. Wills, read by Dr. Anster. The elaborate discussion below primarily outlines Wills’ views, only mentioning Stewart’s in contrast. Stewart is mentioned by name, but most of the references to “he” are to the author, Dr. Wills.

“...upon Mr. Stewart’s attempt to explain certain processes of the Human Understanding, on the supposition that it acquires, by habit, an acceleration of the succession of ideas, so great as to escape the consciousness. After having observed that Mr. Stewart’s error consisted, not in his reasoning, but in having failed to observe that his facts are themselves complex results which demand a minute analysis... the author proceeded to a detailed investigation of the several examples....

“The author next entered on a detailed view of Mr. Stewart’s example of a person reading, and showed that the same reasoning is applicable. He noticed the complication of trains of thought, which, according to Mr. Stewart’s theory, must be simultaneously proceeding; and also observed, that his theory could not stop short at any point of these, and that wherever he might attempt to stop, an explanation should be given, which ought to supersede his whole theory. He then pursued the inquiry as in the previous example, by investigating the mind’s progress in learning to read, and deduced similar conclusions. These he also confirmed, by noticing the various errors which occur in reading and printing; of these he showed, that they illustrate the effect of the combinations or complex conceptions previously formed to supply even the want of many of the component parts; so that the letter is inferred from the general form of the syllable, and the syllable from that of the word, rather than the contrary process. From this example he concluded, that the mind, by repeated acts of attention, acquires a stock of syllabic and vocal associations, of which the act of reading is a combined result; that by a further extension, written sentences may become combined with a process of thought, and that every reader possesses some range of thought thus symbolized by habit; and finally, that the general inference to be drawn from this and other similar examples is, that by means of habit, groups of signs, of movements,
facts, thoughts, sensations or phenomena, may acquire varied relations to each other; and that
these being acquired, the combination alone becomes the object of notice....

“After several observations on the comparative difficulties of Mr. Stewart’s method and his
own, the author noticed the distinction between the previous cases, in which there is an apparent
character of combination, and others in which a difficulty must seem to arise from continuity. He
then went at considerable length to apply the same reasoning to the case of the orator, as adduced
by Mr. Stewart, and more fully described by Lord Brougham....

“...he observed, in conclusion, that Mr. Stewart had set out with a notion adapted to lead him
astray....”

In the author’s complicated exposition, he had endorsed sound, not meaning, for beginning reading:

“...the mind, by repeated acts of attention, acquires a stock of syllabic and vocal associations,
of which the act of reading is a combined result.... by means of habit, groups of signs... acquire
varied relations to each other; ...being acquired, the combination alone becomes the object of
notice.”

That author wrote his refutation half a century after Stewart’s conclusions, by which time teaching for
“meaning” had replaced teaching for “sound” in Great Britain and America. The author also mentioned
Lord Brougham, seemingly of like mind to Stewart, and Brougham was one of the moving forces for
government schools in England. Not surprisingly, therefore, opposition to phonics became apparent in
England, too, in the same time-frame. In A History of Children’s Reading and Literature by Alec Ellis
(Pergamon Press, Oxford, England, and elsewhere), he stated on page 18:

“Kay-Shuttleworth compiled The First Phonic Reading Book (1843) which was approved by
the Committee of Council on Education, but was subjected to scathing criticism in The Quarterly
Review.”

The point for this history is that Dugald Stewart and his views, which would have included his views
on reading, were very influential, reaching not only his students Brougham and Birkbeck in his own time,
but reaching the psychologist James in the next century. Yet information on Dugald Stewart and on his
influence on psychology and education have all but disappeared.

The preface to Stewart’s third philosophy/psychology volume, Elements of the Philosophy of the
Human Mind, is dated November 24, 1826, and it was published in 1827. An edition was published in
America by Carey, Lee & Carey in Philadelphia. The senior Mathew Carey was the refugee Irishman who
had received a loan from Lafayette in Paris, while working as a printer for Benjamin Franklin in Paris, to
come to America and who was the first to print Parson Weems’ fable of George Washington and the
cherry tree. He was the same Carey, by then a rich man according to Elizabeth Peabody (as quoted
elsewhere in this text), who greeted Lafayette on his return to America in 1824. The Carey concern had a
very prestigious trade, printing the Philadelphia Journal of the Medical and Physical Sciences, the
American Quarterly Review and English Common Law Reports. The Carey company agents’ page for
these journals showed how very many they dealt with, and confirmed that communication by printed
matter all though the United States was very efficient in those early days. In Boston alone the company
listed three agents: Munroe and Francis; Hilliard, Gray and Company; and Richardson and Lord. The
company even listed agents in Canada and Mexico!

The illusion that communication was difficult before the appearance of the telephone, radio and
television should be contested. It is true that the telephone, radio and television have brought the gift of
immediacy but they have generally taken away the far more important quality of carefully crafted and researched thought. We have largely traded in the use of carefully written journals and books, as the medium of communication between separated areas, for conversations which are often empty of meaningful content. By doing so, Hegelian cultural “progress” has taken a giant step backwards. It is probable that the contrasting of any paragraph, chosen at random, from any journal sold in America in the early nineteenth century, with any paragraph, taken at random, from the TV evening news in 1991 would make that clear. It would also make clear that the language, itself, has deteriorated.

People did communicate with great precision by printed matter over vast distances in earlier days, as the background given for Dugald Stewart makes clear. Stewart is shown as a member of the Imperial Academy of St. Petersburg, of the Royal Academy of Berlin and of Naples, of the Philosophical Society of Cambridge and of the American Philosophical Society of Philadelphia and of Boston. Furthermore, in Stewart’s 1826 Volume 3, in his remarks concerning Indian sign language, he referred to the Transactions, page 116, of the American Philosophical Society (Philadelphia, 1819), and to a later work of 1823 reporting on an expedition ordered by the U. S. Government to the Rocky Mountains in 1819 and 1820. Two-way communication between the United States and Scotland was obviously in fine working order before 1826! Stewart said (Volume 3 of 1826, page 20):

“...we are given to understand that there actually exists a system of visible signs, intelligible wherever Indians are to be found, over the whole American continent....”

How long Stewart had been a member of the American Philosophical Society of Philadelphia is not known, though he referred to a copy of their Transactions from 1819. As a member, however, he would have been interested in their back issues, one of which concerned teaching language to deaf-mutes, and “phonics.” The following appears in R. C. Alston’s A Bibliography of the English Language from the Invention of Printing to the Year 1800, Volume VI, Rhetoric, Style, Elocution, Prosody, Rhyme, Pronunciation, Spelling Reform, “Printed for the Author by Ernest Cummins, Bradford, England, 1969.” (The title has been capitalized below, which was not done by Alston.) Alston’s comments are quoted exactly.

This is another possible indication that Stewart was well versed on methods for teaching the deaf, which is discussed further below.

Stewart also wrote Philosophical Essays in 1810 and The Philosophy of the Active and Moral Powers in 1828, and presumably other similar materials. However, his three-volume Elements of the Philosophy of the Human Mind was his most important work, the first volume appearing in 1792, the second in 1814, and the last, written in 1826, in 1827. The Encyclopedia Britannica (1963) noted in its short article concerning Stewart, as a member of the Scottish school, that his views were largely those of his predecessor, Reid. Yet Keagy quoted Stewart, not Reid, concerning reading, and so did the speaker from Ireland mentioned elsewhere in this history. In his 1826 volume, Stewart demonstrated his familiarity with the problems of language for deaf-mutes and with the Indian sign language. It is also apparent Stewart concerned himself with reading, probably building on Reid’s earlier comments concerning language.

In Volume 3, page 341 (1826), Stewart quoted Thomas Reid (1710-1796) on language:
“From what cause does it happen, that a good speaker no sooner conceives what he would express, than the letters, syllables and words arrange themselves according to innumerable rules of speech, while he never thinks of these rules.... Yet all this may be done by habit.

Yet Stewart made it clear in the “Advertisement” to his second volume, dated November 22, 1813, and published in 1814, that his own consideration of language did not wait until the preparation of his third volume which was completed only in 1826 and published in 1827. In 1813, Stewart referred to:

“The third volume (of which the chief materials are already prepared....)”

Stewart stated in 1813 that one of the principal subjects in the anticipated third volume was language, which belonged:

“...in strict propriety to the second part of my work, but the size of the volume has prevented me from entering on the consideration... at present.... Much, indeed, still remains to be done in maturing, digesting, and arranging many of the doctrines which I was accustomed to introduce into my lectures....”

Stewart was specifically interested in the skill of writing, since he referred on page 91 of his Philosophical Essays of 1810 to Warburton’s history of writing.

The inference is that the material on “language” had been covered in his lectures, which were enormously popular with students, two of whom were Lord Brougham and Brougham’s close friend, George Birkbeck. The philosopher/psychologist James Mill (1773-1836) said, in his article “Association of Ideas,” (from History of Psychology, by William Sahakian, F. E. Peacock Publishers, Inc., Itaska, Illinois, 1981: page 58):

“The idea of Professor Dugald Stewart delivering a lecture, recalls the idea of the delight with which I heard him; that, the idea of the studies in which it engaged me; that, the trains of thought which succeeded; and each epoch of my mental history, the succeeding one, till the present moment....”

In his third volume, Stewart showed a remarkable knowledge of methods for teaching the deaf, and, it can be presumed from his earlier comments, the knowledge was not new to him. He may very well have referred to it in his other works or in articles. On page 19 of the 1826 Volume 3, he referred to the work of Braidwood in teaching speech to deaf-mutes and revealed he personally knew Braidwood. In various places from pages 281 to 285, Stewart referred to the Abbe de l’Epee and to his follower, Sicard, who used manual language to teach the deaf, the same method used by Gallaudet.

But it was in his earlier volumes that the objection to reading without concentrating attention on meaning appears, to which Keagy must have been referring in 1832.

Stewart discussed the question of attention in Volume 1, (page 400 and 408), of an 1808 Brattleboro, Vermont, edition printed by William Fessenden:

“In general, whenever habits of inattention, and an incapacity of observation are very remarkable, they will be found to be arisen from some defect of early education. I already remarked that, when nature is allowed free scope, the curiosity, during early youth, is alive to every external object, and to every external occurrence, while the powers of the imagination and reflection do not display themselves till a much later period: the former till about the age of
puberty, and the latter till we approach manhood. It sometimes, however, happens, that, in consequence of a peculiar disposition of mind, or of an infirm bodily constitution, a child is led to seek amusement from books, and to lose a relish for those recreations which are suited to his age. In such an instance, the ordinary progress of the intellectual powers is prematurely quickened, but that best of all education is lost, which nature has prepared both for the philosopher and the man of the world, amidst the active sports and the hazardous activities of childhood. It is from these alone, that we can acquire, not only that force of character which is suited to the more arduous (sets) of life, but that complete and prompt command of attention to things external, without which the highest endowments of understanding, however they may fit a man for the solitary speculations of the closet, are but of little use in the practice of affairs, or for enabling him to profit by personal experience.... Where, however, such habits of inattention have unfortunately been contracted, we ought not to despair of them as perfectly incurable....”

Stewart also made the following comments concerning attention, some from Volume II, which I believe I copied from Chapter VI of the 1821 edition by Wells and Lilly of Boston:

“Attention is a voluntary act; it requires an active exertion to begin and continue it; and it may be continued (as long as) we will, but consciousness is involuntary, and of no continuance, changing with every (thought)....” (page 60, Volume II)

“The distinction between attention and consciousness is pointed out by Dr. Reid in his Essays on the Intellectual Powers of Man....” (page 70, Volume II)

“....that the plan of reading which is commonly followed is very different from that which I have been recommending will not be disputed. Most people read merely to pass an idle hour... and a considerable number... to the display which they are afterwards to make of their literary acquisitions....” (page 242, volume II)

“In general, I believe, it may be laid down as a rule that those who carry about with them a great degree of acquired information, which they have always at command, or who have rendered their own discoveries so familiar to them, as always to be in a condition to explain them without recollection, are very seldom possessed of much invention or even of much quickness of apprehension.” (page 408, Volume I, 1808 Vermont edition)

“Nothing, in truth, has such tendency to weaken not only the powers of invention, but the intellectual powers in general, as a habit of extensive and various reading, without reflection. The activity and force of the mind are gradually impaired, in consequence of disuse, and not infrequently, all our principles and opinions come to be lost in the infinite multiplicity and discordance of our acquired ideas. By confining our ambition to pursuing the truth with modesty and candour, and learning to value our acquisitions only as far as they contribute to making us wiser and happier, we may perhaps be obliged to sacrifice the temporary admiration of the common dispensers of literary fame. We may rest assured, that it is in this way only we can hope to make real progress in knowledge, and to enrich the world with useful inventions.” (page 243, Volume II)

When stripped of its reasonable tone, this excerpt shows that Stewart was recommending that people read less, because of the “infinite multiplicity and discordance of... acquired ideas” caused by wide reading. In his own way, therefore, Stewart was “drowning the books” just like the Viking invaders of Ireland a thousand years before.
Robert Owen wanted to subject little two-year-olds to his institutional training so that he could shape their adult minds. The idea of the importance of very early training was, of course, not new with Owen. Dugald Stewart referred to it (page 344, Volume II) and quoted John Locke on the importance of early training:

“Hence it would appear, that he who has the power of modeling the habitual conceptions of an infant mind, is, in great measure, the arbiter of its future happiness or misery. By guarding against the spectres conjured up by his superstitious weakness, and presenting to it only images of what is good, lovely, and happy, he may secure through life a perpetual sunshine to the soul, and may perhaps make some provision against the physical evils to which humanity is exposed....”

To Owen, of course, religion was “superstition” against which the child should be “guarded,” and Owen believed that “he who has the power of modeling the... infant mind...” should NOT be the infant’s parents. It was after Owen founded the infant schools and infant schools became widespread that the shaping of infant minds began to be taken away from their parents.

Besides commenting on the long-term effects of “educating” toddlers, which became Brougham’s concern in his work on infant schools, Stewart revealed his great familiarity with the problems of teaching the deaf, on pages 281 to 295 of Volume II, and elsewhere. He referred to the Abbe de l’Epee and his successor, Sicard, and to articles concerning this work “in some of the continental journals.” Stewart had, himself, offered to work with a particular unfortunate deaf-blind child in Scotland (who did show some improvement in sight as the years progressed despite very inept surgery). Stewart also referred to Sicard’s use of manual sign language for the deaf. As mentioned, Stewart even said he personally knew Braidwood and referred to Braidwood’s “dumb pupils, from whatever part of the country they came” (on page 19, I believe).

Stewart therefore discussed at length the deaf and dumb, Braidwood, the Abbe de l’Epee, Sicard, deaf-mute sign-language, Indian sign-language, “words,” and, apart from the problems of the deaf, the presumed overpowering necessity for all people to read only for “meaning” so that their brains did not, in effect, atrophy.

Yet nowhere could I find that Stewart connected the two ideas: the teaching of sight-words, as given to the deaf, to hearing children, to assure “reading for meaning.” Stewart may have done so in articles I did not see, or the jump to that unfortunate conclusion may have been made by Stewart’s followers, such as Keagy. Nevertheless, Stewart’s general ideas provided a firm foundation for the promotion of the “meaning” method to teach beginning reading.

Stewart appears to have been very much a man of his era. By inference, he endorsed Brougham’s Society for the Diffusion of Useful knowledge, and, although he stated he opposed the atheism of the French Revolution, he clearly was not one with the religious conservatives. Both of these views are found in his comments from The Philosophy of the Active or Moral Powers of Man, in his preface signed “Kinneil House, April 16, 1828:”

“The large and perhaps disproportionate space which I have allowed in these volumes to the Doctrines of Natural Religions...... the substance of lectures given in the University of Edinburgh in the year 1792-3 and for almost 20 years afterward... (Ed.: He stated he intended this to be in opposition to the atheists of the French Revolution.) - my attention was thus imperatively called to this part of my course in a greater degree than to any other by the aspect of the times when, entered upon the duties of my office as Professor of Moral Philosophy I published for the use of my students, in November 1793, a small Manual under the title of Outlines of Moral Philosophy, which I afterward used as a textbook as well, to go with my lectures at the University. The second
part of this Manual contains some Principles expressed in nearly the same words and it gives me heartfelt satisfaction to believe that, in consequence of the more general diffusion of knowledge among all ranks of people, such discussions are now become much less necessary than they seemed to me to be at that period....In this belief I am confirmed by the eagerness with which the “Library of Useful Knowledge” has been (received) by that class of readers for whom it is more peculiarly intended....

“I cannot conclude this Preface without expressing the satisfaction I have felt on observing among the more liberal writers in France a reviving taste for the Philosophy of the Human Mind. To this no one has contributed more than Victor Cousin, so well known, and so honorably distinguished, as the object of Jesuitical persecution; a persecution which appears to have followed him beyond the limits of his own country.”

Blumenfeld in Is Public Education Necessary? (page 140 and following) gave the following background on Cousin. To what degree Stewart endorsed Cousin’s particular ideas on the following would be of interest:

“Both the American Journal of Education and its successor, the Annals of Education, ran numerous articles on Prussian education. But it wasn’t until Victor Cousin, a French professor of philosophy who was highly regarded by the Harvard liberals, had published his report on the Prussian public school system in 1833, that American educators began to think seriously of using the Prussian system as the model for the national public school system they hoped to establish in America. It had everything the reformers wanted: full state financial support via taxation, compulsory attendance, truant officers, punishments for recalcitrant parents, graded classrooms, uniform curriculum, and teachers trained by the state...

“That Victor Cousin should have been the one to write the report was both fitting and appropriate. Cousin had gained considerable notoriety as a great admirer and interpreter of the German transcendentalist philosophers - Fichte, Schelling, and Hegel - and he became the chief channel through which their pantheism and subjective idealism were introduced to French and New England intellectuals....”

That Cousin was himself a pantheist, whose ideas should have been resisted by Christians and Jews, is evident from this comment of his, quoted on page 144 of Is Public Education Necessary?:)

“The God of consciousness is not an abstract God, a solitary king... He is... infinite and finite both together: a trinity, in fine, being at once God, nature, and humanity.”

Blumenfeld stated further (pages 149-153), concerning Cousin’s appointment immediately after the shift in power in France in 1830, which had made the movers in the French Revolution (and their ideas!) acceptable again:

“...in 1830, Cousin was sent to Prussia by the French minister of education to find out why the Prussian system was so much better developed than the French.... his report...completed in June of 1831... was translated into English by Sarah Austin, a noted liberal Englishwoman, whose husband had been studying law in Germany.... Mrs. Austin’s translation first appeared in the Edinburgh Review in 1833 before it came out in book form in 1834. In December 1833, the American Annals of Education reprinted large extracts of the report as printed in the Edinburgh Review. It commented: ‘Such is the account of a system of schools acknowledged to be the best in the world, given by a distinguished philosopher....’”
“...The publication of Cousin’s Report in 1833 in the Edinburgh Review was enough to activate the liberals into greater effort in behalf of public education. Holbrook’s Lyceum movement was in full swing, teacher’s conventions were being organized in many towns, the American Institute of Instruction was preparing for its fourth annual meeting, the School Agents’ Society was sending its operatives across the country to awaken slumbering educators in remote districts, and the Cousin report gave the New England intellectuals the perfect snobbish appeal which added immeasurably to the public school movement’s prestige: philosophy’s seal of approval as given by the ‘first philosopher of the age.’"

By 1828, the year of Stewart’s death, Stewart had kind words to say about the pantheist and statist Cousin who was a clear enemy of Christianity and Judaism, as well as an enemy of the political ideals of such figures as George Washington and Thomas Jefferson. They opposed state tyranny, and that is what was being proposed by Cousin in the field of education.

Stewart had sparked a major conflict in Edinburgh University shortly after 1800 (recorded in a series of papers pro and con) over ministers appointing professors. Whatever the merits of that particular case, it suggests the possibility of Stewart’s aversion to traditional religion.

Stewart also appears to have been an uncritical supporter of the work of Brougham’s group in “diffusing useful knowledge” and founding mechanics’ libraries. On the surface, of course, these aims were exemplary. Yet an English writer recognized the hidden poison of the movement: it was separating the body politic into opposing groups: the “working” class versus the “privileged” class and such separation invited civil war. Karl Marx spelled out that artificial separation more clearly, and with it succeeded in making the twentieth century overwhelmingly the bloodiest in human history.

In summary, Stewart appears to have been in agreement with the “improved” intellectual climate of the late 1820’s, which included not only his ex-students Brougham and Birkbeck, but men such as Cousins. Yet most people do not adopt new philosophies after middle age, and Stewart was old at that time. The probability is that those “new” philosophies were only Stewart’s old ones in a new packaging, fundamentally the same as those he had taught at the University of Edinburgh to Birkbeck, Brougham and so many others. It may well have been Stewart who inspired both Birkbeck and Brougham with the desire to do the actual work involved in converting education and society to such philosophies.

One of those philosophies concerned teaching reading for “meaning” instead of “sound,” and Stewart’s writings were certainly used to justify that change. The ultimate conversion of education to that particular philosophy was successful beyond belief.
Chapter 18
The Evidence Suggests Deliberate Cooperation Among Movers-and-Shakers to Bring About Their Braver, Newer World

Orestes Brownson (1803-1876) was involved in 1829 and 1830 with the son of Robert Owen, the famous Scottish socialist, and with other activists associated with the famous, early, attempted socialist utopia in New Harmony, Indiana. Blumenfeld’s book (pages 95, 96, and 113) quoted from Brownson’s autobiography, The Convert, concerning the agendas of the people with whom Brownson was involved at that time:

“The great object was to get rid of Christianity, and to convert our churches into halls of science. The plan was not to make open attacks on religion... but to establish a system of state, - we said national - schools, from which all religion was to be excluded, in which nothing was to be taught but such knowledge as is verifiable by the senses, and to which all parents were to be compelled by law to send their children.... The first thing to be done was to get this system of schools established. For this purpose, a secret society was formed, and the whole country was to be organized somewhat on the plan of the carbonari of Italy, or as were the revolutionists throughout Europe by Bazard preparatory to the revolutions of 1820 and 1830. This organization was commenced in 1829, in the city of New York, and to my own knowledge was effected throughout a considerable part of New York State. How far it was extended in other states, or whether it is still kept up I know not, for I abandoned it in the latter part of the year 1830.... It would be worth inquiring, if there were any means of ascertaining how large a share of this secret infidel society, with its members all through the country unsuspected by the public, and unknown to each other, yet all known to a central committee, and moved by it, have had in giving the extraordinary impulse to godless education which all must have remarked since 1830....

“How far the secret organization extended, I do not know: but I do know that a considerable portion of the State of New York was organized, for I was myself one of the agents organizing it.”

Brownson went on to become a well-known lecturer, and was influential in shaping the early education of Father Isaac Hecker, before Hecker became a Catholic convert and founded the Paulist Fathers (discussed in a biography of Father Hecker by Boniface Hanley, O.F.M., in The Anthonian, Vol. 57, 4th Quarter, 1983). Brownson was an associate of people like Ralph Waldo Emerson, Nathaniel Hawthorne, Elizabeth Peabody, and the Transcendentalists, before Brownson himself became a Catholic convert.

The point is that, although Brownson was a colorful man, he does not appear to have been an unreliable man, so his testimony may be taken at face value: He testified that “movers and shakers” in 1829 and 1830 were consciously trying to shape American education secretly, and to establish government schools and mandatory attendance laws in order to remove religion from American society. There were obviously many members of this secret society, but his is the only known testimony to its existence. It would therefore appear that such activist groups leave little trace in the records. Brownson’s personal knowledge of such a secret group, which clearly emanated from the Owenites, dated from 1829. That group may well have had an older parent group in the Owenite circle. The record suggests that the sudden switch in America from the “syllable” (“sound”) method, which had been the norm in 1825, to the “word” (“meaning”) method, which had become the norm by about 1830, was very likely one of the achievements of such a group, as was the eventual establishment of government schools in America and
Great Britain. After all, the “word” method for English has always been the siamese twin to the movement for government schools: Wherever government schools arrived in America and Great Britain, the “meaning” method for learning to read has always arrived attached to them.

According to the Encyclopedia Britannica (1963) in its article on secret societies (Vol. 20, p. 264), the purpose of secrecy is either to strengthen relationships among members or to exert power over outsiders. The public may have no objection to the former purpose but has great objection to the latter. The public rightfully objects to anyone’s trying to place hidden “controls” on its freedom.

In the 1820’s, secret societies were rampant in Europe, including such groups as the revolutionary Carbonari in Italy. The memory of the ill-famed Illuminati in Europe was still fresh, of which Pestalozzi had been a member (which group only surfaced in the 1790’s because of the accidental death of a courier who was carrying incriminating papers). That Pestalozzi was a member of the Illuminati, of course, only confirms that it is unfortunately not impossible for well-known educational reformers to be associated with the most lunatic and extreme of secret societies! It may be appropriate to call the Illuminati the intellectuals’ Ku Klux Klan. The opposition to such secret societies was intense in the early nineteenth century.

Two influential meaning-method primers published by two different companies in two different years, 1828 and 1844, were clearly related to each other in content. They shared another similarity which suggests that they had a possible connection with the secret societies of the change-agents of the period. Both of these meaning-method primers used the rather rarely seen printers’ asterism, a mark consisting of three asterisks in the form of a triangle, and they used it in a fashion which was abnormal, particularly in view of the mania for secret societies and for subterfuge which was so popular at that time.

Various definitions were given for the word “asterism” in the Britannica World Language Dictionary, Edition of Funk & Wagnall’s Standard (1965) but only one concerned three asterisks forming the shape of a triangle. The dictionary used three separate categories to define the word, “asterism.” Definition 1 concerned printing, and 1a was for a set of asterisks. Definition 1b was for three asterisks in the shape of a triangle, placed in front of a selection so as to draw attention to it. Definition 2 had two sections, both under the category, astronomy. Definition 2a meant a group of stars, and 2b meant a constellation. Definition 3 concerned the ability of some mineral crystals to produce a star shape when light is reflected from or sent through them.

It is obvious that only definition 1b, using an asterism to draw attention to a printed item, concerned the use of the asterism on the 1826 Franklin Primer, in an 1828 edition, and its use on the 1844 book described below. On the back cover of the 1828 edition of the Franklin Primer, the name of its publishers, “A. Phelps and A. Clark,” was preceded by an asterism with its point facing down. The placement of an asterism in that position is very curious. Why would publishers wish to call attention to their own name? Was the use of the asterism before that name possibly meant to announce that the publishers were members of some select group and therefore worthy of assistance from any other members of the same group who happened to see the symbol?

The triangular asterism with its point facing down is also found indented and preceding the first words, “The plan of this primer,” in the final paragraph in the preface (called “Advertisement”) to William Russell’s 1844 Primer of First Steps in Spelling and Reading, published by another publisher than that of the Franklin Primer. Since, according to the Britannica definition 1b, the asterism in the form of a triangle is used to call attention to something, attention was obviously being called to “The plan of this primer.” Russell’s primer with the triangular asterism used the same sight-word meaning-method “plan” as Reverend Willard’s ground-breaking, “meaning”-method 1826 Franklin Primer which had the triangular asterism immediately before the publishers’ name on an 1828 edition.
The argument could very reasonably be made that the use of the asterism in these two cases may have been meaningless. However, its use on materials by known activists (by the publishers of the critically important Franklin Primer, and by the Scot, William Russell, whose change-agent history is given later) does raise doubts. Furthermore, since I found the triangular asterism on only about ten of the hundreds of nineteenth century reading texts I examined, the rarity of its use should be considered along with the doubts. (One later reader on which it appeared was a copy of Swinton’s Second Reader, copyright 1882, published by Ivison, Blakeman, Taylor and Company, New York and Chicago. On the back of the title page, all Swinton’s Readers were listed, followed by an asterism and this note in italics: “All the above books are handsomely bound in cloth, similar to this book, and in all respects of mechanical execution and illustration are of the highest order of excellence.”)

The words immediately following the triangular asterism on the 1844 text are “The plan of this primer” and the “plan” of Russell’s 1844 primer is almost identical with the sight-word meaning-method plan of the 1828 copy of the 1826 Franklin primer which also carried the triangular asterism, except for far greater vocabulary control in the 1844 copy. Why would a printer “decorate” the beginning of the final paragraph on a page with a triangular asterism unless the words immediately following the asterism were of considerable importance? Those words were, of course, “The plan of this primer....” and the “plan” was the teaching of beginning reading purely by meaning, and not by sound.

Since the early nineteenth century was a period overrun with secret societies, is it possible that the triangular asterism was to indicate to those who would recognize it that “The plan of this primer,” the meaning-method, was officially endorsed by some group? Is it possible that the triangular asterism preceding “A. Phelps and A. Clark,” the publishers of the 1828 copy of the 1826 The Franklin Primer and its sequel, the Improved Reader, meant that their meaning-method series was to receive all possible assistance from that “in” crowd? If so, this might explain the extraordinary fact that the Franklin Primer and the three books which eventually followed it were, as later announced on the cover of A. Phelps’ printing of Mrs. Barbauld’s Easy Lessons (1843):

“...reviewed and noticed with approbation in the ‘Revue Encyclopedique,’ (published in the city of Paris) one of the most distinguished Scientific Journals published in Europe.”

Why should a leading scientific journal in Paris, published in French, pay any attention at all to reading books for five-year-old children published in English in far-off western Massachusetts? Why did that flimsy, little, rural Franklin Primer written in English receive attention in Paris worthy of the pompous and philosophical 1822 French text written by the Belgian university professor Jacotot? Jacotot’s Universal Instruction (mentioned elsewhere) had, it should be remarked, promoted a very different kind of “word” method because it actually endorsed “sound,” even though it was a grossly incompetent approach.

It is interesting that the 1828 copy of the 1826 The Franklin Primer with the intriguing triangular asterism carried immediately under its title a long endorsement from The American Journal of Education, whose editor was the same William Russell who wrote the 1844 comparable primer, carrying the triangular asterism immediately before the words, “The plan of this primer,” which plan was the teaching of beginning reading by “meaning” instead of “sound.”

The biography of William Russell, who wrote the endorsement quoted on the 1828 copy and who wrote the 1844 primer, is very interesting. According to the Dictionary of American Biography, Charles Scribner’s Sons, New York, 1934 - 1962, William Russell was born in Glasgow, Scotland, in 1798 and died in the United States in 1873. However, the details in this biographical account of a man who was essentially unknown by 1934 when the material was published strongly indicate that the 1934 account had
to have been lifted almost wholesale from a highly complimentary account written about 1873 or so, at which time William Russell would still have been well known. That account, very probably, was from Russell’s obituary in some circa 1873 periodical. According to the biographical account in the Dictionary of American Biography, Russell had entered the University of Glasgow in 1811. The account stated, however, that:

“He did not receive a degree upon completing his studies, because he could not afford the journey to Oxford or Cambridge, which alone had the privilege of granting degrees at that time. He had decided to devote his life to teaching, but before he was able to establish himself in his native city, a pulmonary ailment made it necessary for him to seek a warmer climate. Accordingly, he sailed for Georgia early in 1817. He seems to have improved here sufficiently to take employment as a tutor in the home of Judge John McPherson Berrien of Savannah. Later in the year he revisited Glasgow, and was convinced that the Scottish climate was too severe for his health.

“Returning to Savannah in 1818, he conducted a private school for about two years.....”

The account then said that Russell married Ursula Wood, one of the teachers, and the daughter of Reverend Luke Wood of Somers, Connecticut, which probably influenced Russell’s move in 1822 to New Haven, Connecticut, where he and his wife conducted a school. He then became headmaster of the Hopkins Grammar School, and also gave elocution and oratory lessons to Yale students. The biographical account continued:

“Suffering a recurrence of his ailment, he resigned and moved to Boston, where, for five years, he gave instruction in elocution in several schools and to students attending Harvard College. In 1826 he became first editor of the American Journal of Education, carrying on his editorial work at night. During this period he gave many lectures on educational topics before teachers’ institutes, reading circles, and lyceums, and took an active part in the discussions of the Transcendentalists in Boston and neighboring towns. Late in 1830 he removed to Philadelphia with Amos Bronson Alcott, and the following year established a school for girls in connection with the academy at Germantown. He organized the first teachers’ association in Philadelphia (1831) and founded a Journal of Education there a year later. In 1833 he withdrew from the Germantown academy and established a school for girls in Philadelphia, where he remained until 1838. Returning then to Boston, he again taught elocution and later, in partnership with James E. Murdoch, opened a school of speech. From 1842 to 1844, he resided in Andover, teaching elocution and oratory at Phillips Academy, the theological seminary, and Abbot Academy... Although he removed to Medford, Mass., in 1846... he lectured periodically [at many schools such as] Brown University, Union Theological Seminary, and Princeton.

“In 1849, he founded the Merrimack Normal Institute, at Merrimack, N. H., a private normal school which he conducted successfully until 1852. The year following he taught in the normal school at Providence, R. I. In response to an invitation from the town of Lancaster, Mass., he opened the New England Normal Institute there on May 11, 1853, but because of failing health, closed it in 1855. During the two years of its existence, it became an important center of Pestalozzianism in the United States. He resided in Lancaster until his death, devoting his later years to lecturing and writing for various teachers’ journals. He was one of the organizers of the American Institute of Instruction, and did much to further its important work.... “

The inconsistencies in this biographical account, which probably originated about 1873, are glaring and badly need criticism. William Russell lacked the money to go from Glasgow in Scotland to Oxford or Cambridge in England to receive his degree “because he could not afford the journey.” Yet, “before he
was able to establish himself in his native city,” and within a year or so of the time he lacked the money to travel from Scotland to England, “he sailed for Georgia” all the way across the Atlantic Ocean! If he really had failing health, he could hardly have gone as a working sailor. After he came to America, presumably near penniless, his only source for money appeared to have been from tutoring in a private home of a very influential man. Yet with that puny income, THE VERY SAME YEAR, he sailed across the Atlantic and went back to Scotland! Russell came back to Savannah in America by 1818, having made three one-way trips all the way across the Atlantic in one year, after he had been unable to pay for transportation only shortly before merely to go from Scotland down to England! Not too long before, immigrants from Great Britain to America had signed “indentures” promising many years of service to whoever paid for their ONE-WAY tickets across the ocean. Yet the penniless Russell somehow paid for THREE passages across the Atlantic in less than two years!

The biography refers to Russell’s great successes with his schools. What is glaring, instead, is the obvious fact that he never “established himself” as a teacher anywhere! Instead, he was a confirmed job-hopper. He spent only four years in Savannah, Georgia, three years in New Haven, Connecticut, five years in Boston, three years in Germantown, Pennsylvania, five years in Philadelphia, four years in Boston again, two years in Andover, Massachusetts, presumably two years in East Windsor, Connecticut, (or else the two years from 1844 to 1846 are unaccounted for), three years in Medford, Massachusetts, two years in Merrimack, New Hampshire, one year in Providence, Rhode Island, and two years in Lancaster, Massachusetts, teaching in his normal school.

Russell then closed his normal school “because of failing health” in 1855. Yet he remained in Lancaster “lecturing and writing” (which obviously also means traveling) the rest of his life, his “failing health” not finishing him off until eighteen years later, in 1873, at the ripe old age of 75! Back in 1817 at the age of not quite nineteen, he had left Scotland because “a pulmonary ailment made him seek a warmer climate.” Yet when his pulmonary ailment recurred in Connecticut in 1825, the warmer climate he chose to seek at that time was BOSTON! He had ailments, presumably, for 56 years: from the age of not quite 19 to age 75. Such ailments sound suspiciously like robust health.

It is evident, however, that Russell did “establish himself” but it was as a traveling activist, not as a teacher. It is in this frame of reference that Russell’s Scottish connections become of interest. It seems altogether probable that William Russell was sponsored and subsidized financially originally by someone he may have known from Scotland, who had an intense interest in education, and whose views he shared. The money for those three one-way tickets across the Atlantic had to come from somewhere. The biographies on Brougham and Birkbeck raise the possibility that Russell’s sponsor may have been someone like Lord Brougham, or someone associated with Brougham, or associated with George Birkbeck who had taught at the Anderson Institution in Glasgow from which city Russell came. Possibly Russell’s financial sponsor was someone associated with Brougham’s Edinburgh Review or with activists in the University of Glasgow from which Russell had recently graduated. It is of interest that Brougham was elected rector of the University of Glasgow by its students about 1825, even though Brougham had not been in Scotland for many years. Clearly, like minds to Brougham’s in the University of Glasgow student body were involved in Brougham’s election or he never could have been elected. Russell had been a member of that student body only about eight years earlier, just before coming to America in 1817, and secret societies in universities were reportedly a fact of life about that time.

On page 309, Cremin recorded that the Society for the Diffusion of Useful Knowledge was founded by Henry Brougham and his associates in London in 1826.

That was a critical year, indeed: the 50th anniversary of the Declaration of Independence and the year that war was declared in America on the age-old “sound” method of teaching beginning reading, by the publication of three widely promoted “meaning” texts. It was the year that Holbrook started his
“institutes” which became the lever to promote government schools. It was noteworthy for something else, as Blumenfeld stated (page 118):

“The year 1826 also saw the creation of the American Journal of Education, the first national journal in the country devoted exclusively to the subject of education. The editor’s prospectus in the first issue left no doubt that the Journal would become a mouthpiece for the cause of public education. Its editor, William Russell, was a Scotsman who had come to Boston in the 1820’s and, as a teacher of elocution, had quickly become part of the Channing circle. The prospectus in the January 1826 issue read in part:

‘The conductors of the Journal will make it their constant endeavor to aid in diffusing enlarged and liberal views of education. Nothing, it seems to us, has had more influence in retarding the progress of improvement in the science of instruction, than narrow and partial views of what education should be expected to produce.’

Russell then wrote:

‘There is a deep and strong tide of opinion already undermining all that is useless and cumbrous in instruction. The current of improvement is already flowing; and all that any individual can claim, is the merit of assisting in giving it the most advantageous direction. Our office is not to rouse a dormant attention. Already there is everywhere a stirring of the public mind, and a fervency of public effort, which make it too late for any candidate to hope for the honor of being ranked as a reformer. All that can now be reasonably expected, is the satisfaction of contributing a proportion of service to so good a cause.’

The statement, “Already there is everywhere a stirring of the public mind, and a fervency of public effort,” was just so much pump-priming propaganda. Sales of printed materials were enormous in America at the time, as shown by the Harper brothers’ success. Yet, only seven years before, in 1819, after only about a year’s life, the previous and sole educational journal ever published in America, The Academician, the effort of Albert Picket, President of the Incorporated Society of Teachers, had gone out of business presumably because of lack of interest! As mentioned, it had carried a series of articles on the Lancastrian and Pestalozzian methods, among other things, before it was abandoned, so presumably there was no ground-swell of interest in the public even for these most current educational enthusiasms of the change-agents.

It was not the public seeking educational change. Those seeking change were a small group of “reformers” in Scotland, England, and America, but they possessed superb abilities for organization and publicity, and they knew how to prime the public pump to produce the current for change that they wanted. Brougham had already begun with his 1825 book on education which went through 20 editions in 12 months, but then, of course, his greatest talent was known to be as a publicist.

Blumenfeld continued:

“In one of the back pages of the first issue there appeared this little notice about New Harmony:

‘Mr. Owen, whose plans for the melioration of society, have of late excited considerable interest in this country, has instituted, at his settlement of New-Harmony, (Indiana), a school similar to that which attracted so much attention at his establishment
in New-Lanark (Scotland). An account of this school will be given in an early number of our work.’

“That account was never forthcoming. The June 1826 issue published a short extract from a letter from New Harmony, which told very little, and in the March 1827 issue another extract from a letter was published. Among other things, the letter said: ‘The schools here are independent of all Mr. Owen’s religious, political or moral opinions - as much so as those in Boston.’

“After that the Journal of Education was conspicuously silent on Owen, Maclure, the school at New Harmony, the lectures of Frances Wright and Robert Dale Owen, the program of the Working Men’s Party, or anything else connected with the radicals in New Harmony and New York.

“What did the Journal of Education write about? In that first year, eight of the issues carried major articles on the Infant Schools, which had become very popular in England and were about to be launched in America. And three issues published large extracts from James G. Carter’s books on public education.

“In none of the articles was Robert Owen ever to be given credit as the originator of the infant school idea with his school for the formation of character at New Lanark. Owen had particularly focused on the two- to six-year-old group as the crucial period for molding character.”

The Journal of Education obviously dropped its reporting on the Owen group because the Owen group was becoming notorious. For instance, Frances Wright eventually advocated “free love,” and that would hardly have been acceptable to the conservative America of the day!

Some of Russell’s activities in Boston can be determined through the biography of Elizabeth Palmer Peabody, the sister-in-law of Horace Mann and Nathaniel Hawthorne, and a well-meaning but fuzzy-minded teacher/reformer who was famous in Massachusetts for decades.

Elizabeth Palmer Peabody had little, if any, contact with teaching beginning reading in her schools. When she began teaching at sixteen years of age:

“Her formal assignment was the teaching of history, both ancient and American....” (From Letters of Elizabeth Palmer Peabody, Edited by Bruce A. Ronda, Wesleyan University Press, Middletown, Connecticut, 1984, page 49).

Elizabeth Peabody’s mother had kept a school in Salem, Massachusetts, from 1809 to 1818, which Elizabeth attended. Ronda said (page 49):

“The curriculum was rigorous. ‘The aim was History and Literature.... The qualification for entrance was to ‘read English intelligibly;’ and her youngest scholars were eight and ten years of age.”

Ronda attributed the quotation to the “Letter from Miss E. P. Peabody,” American Journal of Education (Barnard) 32 (May 1882): 739.

As late as April, 1833, when writing to Sarah Hale, sister of Edward Everett who gave the two-hour address preceding Lincoln’s Gettysburg address, Peabody said (from page 106 of Ronda’s text) that she
had given up on her price, and had decided to take children under ten years old for fifteen dollars, but that they must be able to read, and children over ten years old for twenty dollars.

Peabody obviously had never heard of reading at the “second grade level,” the “sixth grade level,” or any “level,” since these levels can apply only to those taught to “read” sight words for “meaning.” With “sound,” there is only ONE level: knowing “how to read,” orally, the Bible or anything else. (Whether it is understood or not depends on the reader’s mental and language levels, and his stock of general information.)

However, the eight-year-old children that Peabody took into her school in 1833 had first begun reading in 1829 or 1830 after change had begun to spread in 1826. That she questioned whether some of these eight-year-olds could read or not suggests that some time before 1833 she had met some eight year olds who could not read, even though such a thing had been almost unheard of before 1826.

Peabody did not teach beginning reading, but she had a great interest in teaching the “meaning” of words. Ever since the late eighteenth century, and through the first half of the nineteenth century, students in Great Britain and America had been given the ridiculous chore of memorizing words and definitions from dictionaries after they had finished the spellers. The practice arose with the advent of English dictionaries, and probably had begun sometime during the seventeenth century. Authors of dictionaries sometimes also wrote spellers. Such authors’ dictionaries were therefore seen as a kind of Book Two to be used after their spellers. This memorization of dictionary meanings is one of the probable roots of the “meaning” nonsense that has plagued English-language education ever since. As late as about 1845, Noah Webster’s son produced a short-form dictionary to reduce the memory load on students. Yet this memory load should never have existed, since language cannot be learned properly from dictionaries when used apart from meaningful contexts.

However, in part, Elizabeth’s concern with “words,” and in a far more elaborate form than the mere memorization of definitions, was probably the result of being exposed very early to all the educational winds blowing across from Scotland, England and Ireland. That exposure came in from the fact that her mother read aloud to her pupils stylish and witty portions from the Edinburgh Review as examples, as well as portions from the Spectator, the Quarterly Review and Rambler (Ronda, page 49).

On her first teaching job at age 16 in 1820 (from Ronda, pages 49-50):

“...Peabody suggested to her pupils that they seek to establish connections between words as indications of external reality and of the inner reality they point to.”

Unlike William James who considered language to be incapable of adequately expressing thought, Peabody thought words were signs of great power, capable of expressing the tiniest differences in thoughts and feelings.

Peabody was deeper into this sort of thing by the time she was teaching in Brookline, Massachusetts, in 1825, with her sister Mary (later Horace Mann’s wife). Ronda said (page 50):

“Peabody did not teach, as other teachers did, by requiring memorization of rules, but by identification of the function of words in relation to other words. A skeptical father who witnessed this exercise in her school in Brookline later recalled selecting a passage for the students to analyze.... At the end of the hour, the father was convinced.

The utility of the exercise was exceedingly doubtful, but its purpose was sufficiently fuzzy-minded so that it might satisfy even today’s “experts.”
But Elizabeth Peabody had a close relationship with two men who did teach reading: William Russell and Bronson Alcott. Strangely, both these men also had what was probably a long-standing relationship with each other, and both betrayed her and both behaved contemptibly towards her.

Ronda said that Elizabeth and Mary Peabody left Brookline and opened a school on Beacon Hill in Boston, on Collonade Row, and that the children of prominent Bostonians were enrolled. Then, after two years, the whole Peabody family moved to Colonnade Row, where they had rented a house.

About 1827, Elizabeth Peabody acted as a volunteer secretary for William Ellery Channing, a Boston Unitarian minister connected with the movement for public education (concerning which see Samuel Blumenfeld: Is Public Education Necessary?). Channing was obviously in sympathy with other activists for the “brave new world.” Blumenfeld recorded (page 208):

“A wealthy Unitarian of Genesco, New York, James Wadsworth, wrote in his diary on June 24, 1839: ‘This morning Dr. Channing asked me whether I thought something like Owen’s ideas might not be realized on a modified scale, and with a more highly improved population? He could not conceive that the present state of toil and feverish pursuit of wealth, carrying suffering to so large a portion of the people, was to be eternal, and he did not see any obstacle in human nature that was insurmountable to their adopting a co-operative system for supplying their physical wants, and seeking their chief pleasures in moral and intellectual intercourse. I told him that these were precisely my views. I had opposed Owenism on account of the choice of the worst brains to fulfill the highest moral functions.’”

What the drive for government education had in common with Owen’s socialism was the replacing of individual choice by centralized control, but this destruction of individual freedom apparently caused these “intellectuals” no uneasiness.

It is possibly through Channing that Elizabeth Peabody met William Russell, who became a partner in the Collonade Row school in 1827. Peabody described Russell’s work at the school during the year he was there (Ronda, page 80). Russell took charge of reading and composition, and the spelling and defining of words, spending one hour a day with each class on those topics. The “defining words” portion sounds a little strange to our ears today, but the dictionary was actually “studied” by older students after the spelling book, and Abner Kneeland’s 1802 spelling book had brought such definitions down to the lower level of the spelling book. The probability is that the activist Russell would have thought highly of the activist Kneeland’s book, which was reprinted in 1826.

So Russell’s work in Elizabeth Peabody’s school in 1827-1828 specifically concerned the teaching of reading. Since 1826, Russell had also been the editor of the American Journal of Education published in Boston, and had endorsed the Franklin Primer and Worcester primer of 1826 in this journal. Their new approach to reading must certainly have been available in Elizabeth Peabody’s school - at least for the year that Russell was there.

Russell had expressed himself clearly on the subject of beginning reading in the Journal in October, 1826, when reviewing Cobb’s speller which he considered a good speller. However, Russell’s qualified approval of Cobb’s speller should be remembered when Cobb’s books are discussed, because it suggests that Cobb was receiving the approval of the movers and shakers, while the honorable and once-revered Noah Webster very definitely was not:

“For our own part, however, we confess we have no great partiality to spelling books, and think very favorably of the more recent plan of using only a primer and then an easy reading book

So Russell’s work in Elizabeth Peabody’s school in 1827-1828 specifically concerned the teaching of reading. Since 1826, Russell had also been the editor of the American Journal of Education published in Boston, and had endorsed the Franklin Primer and Worcester primer of 1826 in this journal. Their new approach to reading must certainly have been available in Elizabeth Peabody’s school - at least for the year that Russell was there.

Russell had expressed himself clearly on the subject of beginning reading in the Journal in October, 1826, when reviewing Cobb’s speller which he considered a good speller. However, Russell’s qualified approval of Cobb’s speller should be remembered when Cobb’s books are discussed, because it suggests that Cobb was receiving the approval of the movers and shakers, while the honorable and once-revered Noah Webster very definitely was not:

“For our own part, however, we confess we have no great partiality to spelling books, and think very favorably of the more recent plan of using only a primer and then an easy reading book
of simple and intelligible character; the little scholar making his own spelling book, by spelling every lesson he reads; and taking his pronouncing lessons from the dictionary. Under the management of a careful teacher, this will be found a much more efficacious course, than endless drilling on the dull, unmeaning columns of a spelling book.”

Ronda said that Peabody had remarked that she felt sympathy for someone she had only identified as Mrs. R, but Ronda then explained in a footnote on page 149:

“‘Mrs. R’ is probably a reference to Mrs. William Russell, wife of the educator who had similarly abandoned his family, departing Boston in 1828 and leaving the Peabody sisters with a considerable number of unpaid bills from their joint private-school venture.”

Elizabeth’s school had finally failed in 1830. The Russell/Peabody incident is also referred to in the book, Nathaniel Hawthorne in His Times, by James R. Mellow, Houghton Mifflin Company, Boston: 1980, pages 135-138. (The third Peabody sister, Sophia, had married Nathaniel Hawthorne in 1842, while Mary Peabody married Horace Mann in 1843.) Concerning the school that two of the Peabody sisters opened in Boston in 1828, Mellow commented that they had taken in:

“...as a partner, William Russell, a highly touted educator and teacher of elocution.”

“Lizzie had been deeply disappointed when her school for girls had failed in 1830; Russell, who had a taste for regal living, had mismanaged the finances and then left for a new teaching position in Germantown, a rich suburb of Philadelphia. (No books had been kept, however, and Lizzie had no legal recourse.) Now she was full of enthusiasm and new plans for opening a school for boys....”

Yet, Ronda had said that Russell left Boston in 1828. However, the Dictionary of American Biography said he was accompanied by Amos Bronson Alcott, and the date as 1830, not 1828. Then, after having been cheated by Russell, Elizabeth Peabody later managed to get cheated also by Russell’s friend, Amos Bronson Alcott. Mellow recorded that she dropped her own later plans for a school:

“But in the fall of 1834, Amos Bronson Alcott, the pedlar-turned-educator, began his radical experiment, the Temple School, with classes held in the huge, drafty basement hall of the Masonic Temple on Tremont Street. Lizzie gave up her own risky venture and took a seemingly more secure position as Alcott’s assistant, teaching half a day for whatever Mr. Alcott could afford to pay.... It was in order to promote Alcott’s educational methods that, in 1835, Lizzie published her Record of a School: Exemplifying the General Principles of Spiritual Culture.... it was hardly the financial success she had hoped for. Nor did Alcott manage to pay her her salary. Under the circumstances, it was advisable for her to move in with the Alcotts in exchange for bed and board....

“Lizzie soon found that living with Alcott and his wife, Abigail, was not the congenial experience she had expected. The philosopher-educator turned out to be narrow and intolerant in his views and rigorously critical of anyone who held opinions different from his own...”

Mellow commented that Alcott carried on:

“...tirades against other educators and writers.”

Mellow said that Elizabeth Peabody began to have grave reservations about the plans for publishing Alcott’s conversations with the children in the school, which conversations she had been recording, since
Alcott had begun to discuss the subject of human birth. At that point, she refused to record the material. Furthermore, since living with the Alcotts had become very trying, she had said so in a letter she was writing to her sister Mary. In that letter, she also reported acidly that Alcott was not paying her. The bad situation became considerably worse when Mrs. Alcott had come into Elizabeth’s room, found the letter she was writing to her sister, Mary, and showed the letter to Alcott. Alcott then raged at Elizabeth about what she had written to Mary, without actually admitting he had read her letter. As a result of that explosion, Elizabeth wrote a formal letter to Alcott, saying that any arrangements between them were finished.

The following August, Elizabeth wrote Alcott another letter reporting her dissatisfaction with the soon-to-be-published book on which she had worked with Alcott, entitled Conversations with Children on the Gospels. Elizabeth wanted the parts she considered to be questionable to be omitted, or, at the very least, in no way associated with her name.

Elizabeth Peabody was quite correct to be alarmed, because, when the work came out in 1836 and 1837 in two volumes, the Boston newspaper, the Courier, called it an “indecent and obscene book.” Alcott then wrote a complaining letter to his friend, Emerson, saying that as a result of the reaction to the book he had only ten students in the term following its publication.

In addition to Mellow’s illuminating remarks about Elizabeth Peabody, Russell, and Alcott, from his biography on Hawthorne, is a comment in Nathaniel Hawthorne, The American Years, by Robert Cantwell (Octagon Books, New York, 1971, page 300), concerning Sophia Peabody’s rendezvous with Hawthorne in a Boston Gallery, apparently in May, 1839:

“She again braved the morning air and reached the gallery at eight o’clock. The day was cloudy. The gallery was empty, except for William Russell. Russell was a teacher and writer, the founder of the American Journal of Education.... He was living with the Alcotts at 6 Beach Street, where Alcott had started another school.”

Cantwell gave, as a reference, Pedlar’s Progress, the Life of Bronson Alcott, by Odell Shepard. Russell was close enough to the Alcotts in 1839 to be living with them. Russell’s and Alcott’s relationship had lasted from their joint trip to Philadelphia in 1830 until at least May, 1839. They must have had a great deal in common, besides their cheating of Elizabeth Peabody. One of the things was their interest in teaching reading.

Without the knowledge that Russell had endorsed the “meaning” method enthusiastically in the American Journal of Education in his reviews of the Franklin and Worcester primers and the Cobb speller, and that Russell himself had written a “meaning” beginning primer, his comments in Barnard’s American Journal of 1857 might be misinterpreted. Russell was a teacher of elocution, and elocution required that students eventually be drilled in making proper vowel and consonant sounds. That was the upper-grade “phonics” taught after children had learned to read by “meaning” after 1826, and it was that kind of upper-grade phonics that Russell meant in his remarks of 1857 in his article, “Cultivation of the Reflective Faculties,” in Barnard’s American Journal, when he deplored the fact that by 1857 children were learning to read “perhaps without ever acquiring a knowledge of the power, or actual sound, of any one of the whole group” (of letters). Of course, this is positive confirmation, from a contemporary in 1857, that American children were NOT learning to read by phonics at that time! Russell went on:

“But (the child) is not allowed the satisfaction of recognizing the fact, that these troublesome and perplexing marks before his eye, are little graphic characters to suggest, phonetically to eye and ear, the very words which he is constantly uttering....”
By Russell’s own testimony, phonics was dead in most American schools by 1857, except for elocution.

Russell’s close associate, from at least 1828 until 1830 when he lived with the Alcott family, was his fellow teacher, A. Bronson Alcott. Elizabeth Peabody discussed Alcott’s teaching methods in her letter to her sister, Mary, dated Sept. 20 - Oct. 6, 1834 (Ronda’s page 134). Elizabeth Peabody said that at the opening of the school day the children arranged their chairs in a large semicircle before Alcott. (That recalls the circling of chairs or sitting on the floor in a circle) that was practiced in the Open Classroom movement of the 1970’s.) Mary Peabody said that Alcott then talked and read to the children, and heard them read, and had them spell and define words, until the recess period. After that, Mary Peabody gave the children lessons in Latin, geography and arithmetic. She said that meant that she did not have to be at the school until eleven a.m. That also meant, of course, that most of the time she was not observing Alcott’s actual performance!

Elizabeth Peabody in her own way was as up-to-date on the fashionable philosophies as Russell and Alcott. Ronda remarked on page 67 that Elizabeth wrote to Maria Chase on January 23, 1824, saying that she had been reading nothing but the philosopher Brown, gushing over his work. Ronda’s footnote on the same page noted that Thomas Brown was a member of the Scottish Commonsense school, and his book, Philosophy of the Human Mind, systematically classified the mind’s powers. Ronda said that the work was very popular with the Unitarians and those at Harvard at that time.

McGuffey was not the only one reading Brown, a successor to Dugald Stewart and others in the “Commonsense” school. However, Elizabeth later found his “common sense” too restrictive for her as she floated away on increasing waves of Transcendentalism.

As Blumenfeld pointed out, Elizabeth’s Boston associates were intimately concerned with the educational movement (page 125):

“In the spring of 1829, Boston formed its Lyceum under the name of the Boston Society for the Diffusion of Useful Knowledge. Its statement of purpose was signed by William E. Channing and twenty-nine other members of the Boston elite.... The first article in the Society’s constitution stated its purpose quite succinctly: ‘Its object shall be to promote and direct popular education by lectures and other means.’”

In his book, The National Experience, 1783-1876, Lawrence A. Cremin also gave some background on the formation of the American Lyceum (page 312). He identified its founder in 1826 as the prosperous Connecticut farmer/amateur scientist, Josiah Holbrook, a Yale student some years before. Holbrook had run a private school in Derby, and then carried out experiments with schools combining manual training, agricultural training, and formal academics. He had become known by the early 1820’s as a proponent of the new sciences and of reform in education. His proposal for the founding of the Lyceums was made in a letter he sent anonymously to the American Journal of Education, of which William Russell was editor. Holbrook’s anonymous letter was published in 1826 on page 594 of what became ultimately the 1826 volume of the American Journal of Education:

“Sir, I take the liberty to submit for your consideration, a few articles as regulations for associations for mutual instruction in the sciences, and in useful knowledge generally.... It seems to me that if associations... could once be started in our villages, and upon a general plan, they would increase with great rapidity, and do more for the general diffusion of knowledge, and for raising the moral and intellectual taste of our countrymen, than any other expedient which can possibly be devised.”
Cremin commented that Holbrook outlined in his letter how the associations might best be set up, with a hierarchy of county and state “boards of mutual education” and a “general board” for the whole country. Cremin said that, by 1829, only three years later, lyceums existed in every part of the country. Such a rapid development is, to put it mildly, astonishing. Holbrook’s influence must have been enormous.

Blumenfeld stated (page 137-138):

“In 1834, however, Holbrook decided to leave Boston and move his base of operations to Pennsylvania where the ‘friends of education’ were preparing to push a new public education law through the state legislature. William Russell, former editor of the American Journal of Education, was also now living in Philadelphia. Opposition to the new law in Pennsylvania was fierce, and 30,000 signatures were gathered by the opponents to stop it. The opponents were, for the most part, Lutherans who maintained their own private system of parochial schools. Nevertheless, the law was passed, and attempts to repeal it in 1835 failed.

“One of the chief activists for public education in Pennsylvania was a New Englander by the name of Walter R. Johnson. Johnson had been a classmate of James G. Carter at both Groton and Harvard, from which he was graduated in 1819. In 1821, he had moved to Germantown, Pennsylvania, to become principal of an academy. While there he published a series of essays on popular education in the Journal of the Franklin Institute and became a founder of the Pennsylvania Society for the Promotion of Public Schools. His interest in the natural sciences led to his appointment in 1826 as director of the Philadelphia High School established under the Franklin Institute. It was at the Franklin Institute, incidentally, that Robert Owen addressed a Philadelphia audience on June 7, 1827. Johnson became active in the Lyceum movement soon after it was started and lectured at the American Institute of Instruction conferences. It is said that the Pennsylvania school law of 1834 was largely due to his efforts. Undoubtedly, he and Holbrook worked hard to overcome the opposition. .... With the new Pennsylvania school law passed in 1834, Holbrook spent the following year organizing the teachers of that state into Lyceums and countering attempts to repeal the law.”

The siamese twin to the move for government schools was the move to replace “sound” spellers with “meaning” primers, and the same people whose names turned up in support of government schools or the organizations working for government schools were also supporting the switch in reading methods.

A primer written in Harrisburg, Pennsylvania, in 1831 is an example of that siamese-twin effect. The Monitorial Primer was written by J. A. Prest, “Late of the City of London, in Great Britain, Principal of the Lancasterian School, Harrisburg,” and was printed in Harrisburg by F. Wyeth, “Printer,” in 1831. Little doubt can exist on Prest’s associations, as the following appears inside the title page of his book: “To the American Institute of Instruction (Established at Boston), This Effort To Be Useful Is Respectfully Inscribed, By One Of Their Members, THE AUTHOR.” Although this appalling primer pretends to teach vowel sounds in a peculiar fashion from whole sight words (presumably meant for drill in elocution), in the teaching of reading it is almost a straight Code I book, geared to “meaning.” Yet it is exactly what might have been expected from a devoted supporter of The American Institute of Instruction in Harrisburg, Pennsylvania, in March, 1831, which was the date when Prest wrote his “Preface.”

Was Principal Prest’s Lancasterian school in Harrisburg the same one that was founded in 1826 by Keagy? It certainly appears possible.
Chapter 19
Contemporary Testimony on the New “Correct” Reading Methods from the “Experts” Themselves

The two Alcott cousins, A. Bronson Alcott and William Andrus Alcott, left written records of their support for the “meaning” method in place of the “sound” method in teaching beginning reading.

The New York Public Library has a volume, * c.p.v. 1265, Observations on the Principles and Methods of Infant Instruction, “by A. B. Alcott, Teacher of an Elementary School, Boston. Boston, published by Carter & Hendee, 1830.” This would have been written just about the time that Bronson Alcott was reported to have left Boston for Pennsylvania with William Russell. Where Alcott accompanied Russell, it presumably was partly to join in the battle for government schools there. The following quotations show that Bronson Alcott was touching most of the bases of the activists in this book published in 1830 (from pages 4 through 25):

“Institutions of Infant Schools, now so generally established among us, are full of much promise and hope. Their present and increasing popularity, the amount of misery and vice which they relieve and prevent; the happiness and virtue which they create and encourage; their reception of children from all classes of society, at an age when every impression so much determines their future habits, motives, principles, and whole character, places them among the highest and happiest agents of christian beneficence.

“...on the influence of sensation upon the mind in early life, Dugald Stewart makes the following remarks. ‘...the attention of young persons may be seduced, by well selected works of fiction, from the present objects of the senses, and the thoughts accustomed to dwell on the past, the distant, and the future;.... (that) which it has contributed to fix...will remain...to the latest hour.’”

Alcott also recommended natural history, pictures, stories, specimens, cubes, slates, and wooden blocks, all of them, of course, very good in themselves, but chosen because of Locke’s materialistic idea that the mind can contain nothing that is not totally derived from sense impressions. Alcott’s wholehearted endorsement of this error belittling the mind is seen in the following. Also evident is his rejection of the fact that the brain usually needs practice to learn (to acquire conditioned reflexes). Note his recommending that “mechanical recitations... are wholly to be avoided”:

“...Mechanical recitations, wordy lessons, dissociated from the intellect, are wholly to be avoided. That only is worthy of the infant mind, which it can understand and feel. Nature has associated interest, pleasure and progress with perception alone; and from mystery and error, the infant mind, of all others, should be kept scrupulously free.

“...Enunciation, spelling the simplest names of familiar objects, actions, and qualities, defining their thoughts, writing the elements of morality, and natural history, may constitute the chief portion of the children’s lessons. During the intervals of more direct influence from the teacher, they may delineate their lessons on the slate and blackboard.”

Note the entrance of William Russell’s “elocution” with “enunciation,” and the exit of Webster’s “phonics.” Children had previously learned Webster’s key and then “enunciated” printed words for themselves. Now Russell and his followers like Alcott would “enunciate” first for the children to imitate,
pronouncing the words in the spelling book for the children so that the words would always after be perceived as meaning-bearing whole words, and the children would have no practice themselves in sounding out unknown words. Teacher “enunciation” of all words for beginning readers was the death-blow to real phonics in reading, in Great Britain as well as America.

Bronson Alcott’s cousin, William Andrus Alcott (1798-1859), eventually became a medical doctor, but he was a teacher until the 1830’s (and an activist). He wrote a kind of autobiography in 1839, Confessions of a School Master, published at Andover, Massachusetts, by Gould, Newman and (?Saxton), and also in New York, at the “Corner of Fulton and Nassau Streets.” (Concerning possible associations, Samuel R. Hall had founded his seminary for teachers at Andover in 1830, and William Russell was later connected with the Phillips Academy there, as noted elsewhere. Gould, Newman with offices in Andover and New York in 1839, as noted from Alcott’s book, also published Sanders’ speller in 1838 and Sanders’ vastly used Code 1 readers in 1840).

William Andrus Alcott’s 1839 autobiography showed, unwittingly, the ease with which children had learned to read when William Andrus Alcott was a boy starting school in 1802, and it showed, equally unwittingly, the pompous confusions that had replaced such simple, effective instruction by 1839. It is also a contemporary account of the changes that occurred in the use of various reading and spelling books over the years from about 1802 to about 1832. What is most curious, however, about the 1839 anecdotes of William Andrus Alcott is that no where does he relate them to specific dates. From another souce (a New York public library microfilm reel on Annals of Education), I know the year of his birth, and can therefore estimate the dates for his entries. Why should he have omitted dates so consistently?

“Preface. The following work is a faithful though painful observation of facts as they occurred during ten or twelve years of the life of a school master.... (page 13) My preparation for schoolkeeping consisted, principally, in attending the district school near my native home from three to four months every winter, from the age of four to thirteen, (Ed.: 1802-1811) and a few months every summer, from that of four to eight (Ed.: 1802-1806). It was indeed customary in my native region for boys to attend school in summer till they were about ten or twelve; but my father becoming dissatisfied with the female teacher to whom I was sent in my eighth year, took me out of school, and finding my assistance on the farm valuable, as he had no other boys, I was not permitted to attend any more in the summer season. Between the ages of 13 and 17 (Ed.: 1811-1815), I was permitted, however, to go to school to the parish minister, who kept a kind of high school every winter, in all about six months. (page 15) Two summers and one winter had made me a “speller,” as it was then called, and a tolerable reader of easy lessons (Ed.: at the age of 5, in 1803).”

The following is from page 22, which concerned William Andrus Alcott’s examination by the Board of School Visitors when he was 18, about 1816, for a teaching job. The Board asked him how many sounds has B and C:

“I could have repeated the ‘Introduction to the Spelling Book,’ as it is called, in which they were then examining me, from beginning to end, without a failure. I could not only spell all the common words of the spelling book.... I do not remember the time when there were more than half a dozen words in common use which I spelt wrong, even in writing.”

The following is from page 25, in which he equated reading with acting ability, and not accuracy in pronouncing the printed page. Yet, by doing so, he unconsciously revealed that he, himself, read accurately and swiftly, and he had learned to read with a speller - probably Webster’s - by the time he was five years old:
“...My deficiency in regard to reading was most obvious. I read too loud, and too fast; as well as in a tone of voice altogether different from that of common conversation. This habit I had acquired, during my first years at school, in reading in books whose language I did not understand; and to the meaning of which none of my teachers ever furnished me with a clue. Besides, I did not articulate well.

“This branch (Ed.: articulation was elocution), however, strange as it may appear to some - the committee did not deem an important part of the examination. They had embraced the opinion - very common in the world - as I have since found - that a teacher who cannot read well himself can teach others to read well. They seemed wholly to overlook the force of example in this matter, and the fact that children learn to read chiefly by imitating others. I do not say that to learn (to) pronounce the words when they see them in a book (Ed.: portion is missing here) in this way; but I do not regard that as worthy of the name of reading.”

Obviously, William Andrus Alcott was denying here that oral accuracy is reading, but stated instead that “reading” is elocution. Yet the Scot William Russell was the only “elocution” teacher in America whose name I have turned up before 1826, although upper-grade American books concerned elocution. I have lost the source, but believe Pierpont’s 1823 book in its preface denied that much time was spent on elocution in America, even though the subject was covered in textbooks. However, in Letters Addressed to the Parochial Schoolmasters of Scotland.... By A Schoolmaster, Edinburgh: 1829, the Schoolmaster compared a country schoolmaster to those:

“...in great cities, where every branch is taught by a separate master; for though the teacher of elocution, who devotes his whole attention to the modulation of the voice, may produce more elegant readers than the country schoolmaster....”(etc.)

The Schoolmaster said elsewhere that he took great pains in his own small school to train voices in reading. Therefore, obviously, “elocution” was important in Scotland in the 1820’s, in the cities and in the countryside. The reason for the importance of elocution in Scotland was probably the same thing that had produced the great interest in Sheridan’s lectures in Scotland on elocution some sixty years earlier: a heavy Scot accent was a barrier to advancement in the British culture dominated by England. However, the only references I have found in America to actual teaching of elocution before Russell’s arrival is in textbooks for older students, and the reference below by Alcott. Yet, the teaching of elocution became very prominent in Boston schools after 1826. This was obviously an innovation: although upper level text books had stressed elocution since the late eighteenth century, the actual interest in American schools before 1826 was obviously not high enough to make “elocution” a great concern.

Despite W. A. Alcott’s unfortunate biases, it is self-evident that he was a highly literate man. Yet he had spent very few years at school, and he had become so literate through the use of the much maligned spelling book!

“(From page 94:) For some time past, the only books which had been used in the school where I now was (as) reading books, were the New Testament, the Columbian Orator, the English Reader, the reading lessons in Webster’s Spelling Book, and Webster’s Elements of Useful Knowledge. These had been read over and over; and everyone at all acquainted with them knows, that except the Testament and spelling book, they are very poorly calculated to interest children, or instruct them in the arts of reading, (unless) special pains are taken at explanations and illustrations.
“I felt, most sensibly, the want of some new reading book for my school, this winter, especially for the older classes.... I decided on the ‘Introduction to the American Orator’“... (Ed.: which he found to be not suitable).

(From page 130, concerning his fifth year teaching, or 1821:) “The reading books in use as we have already seen were the Sequel to the English Reader, the American Preceptor, the Columbian Orator, the New Testament and the spelling book. The Testament was usually read by all the classes, in the morning, each reading, at a time, two verses. In other books, each read either a whole paragraph at a time, or to the first period.” (He said he then carried on discussion about the meaning of what they read. He then read to them for them to imitate: “elocution.”)

(From page 131:) “In spelling, it was my custom to commence at the beginning of the book, with the words of one syllable, and to proceed through the volume, omitting usually none of the tables, from beginning to end. In a few instances, the larger classes went twice through in a season, but generally only once. A certain page, or number of pages or columns, was assigned each class, which they were required to commit entirely to memory. A few were found in the first class, usually to do this, but in general they fell far short of it. All the older classes were required to commit to memory several explanatory pages of the spelling book, embracing an analysis of the sounds of the letters, both vowels and consonants, with much other valuable information and also a table of abbreviations at the end of the volume, and an account of the pauses used in writing....” (He said abbreviations were learned without understanding.)

(From page 135? My notes are not clear on this section:) “Nor did my first class ever obtain many practical valuable ideas in regard to the sounds of the letters. Thus, though they knew that g is said to be always hard before a o and u, it is quite doubtful whether they could have applied the rule to the pronunciation of a word with which they were before unacquainted - this, it is true, was not so much their fault, as mine.”

Alcott gave no suggestion that his pupils could not read fluently, and large numbers of words use “g” before a, o, and u. Many of these words his pupils would never before have heard pronounced aloud, particularly since the materials the children were being given to read had extraordinarily high readability levels. Therefore, Alcott’s “objection” that his pupils probably could not successfully apply the rule to pronounce unfamiliar words is unconvincing.

By the time he was 24, which would be about 1822, he said he had taught school for terms of 3 and 4 months each winter. Alcott said, “Few districts employed male teachers, except in winter.” He then got a position for 11 of 12 months, at 24 years of age, in a district school with 40 to 60 pupils. The practices he described about 1822, therefore, are prior to the critical date of 1826. He wrote:

“Among my pupils were 15 little girls who were ...‘in the alphabet...’ eleven of whom scarcely knew a single letter, and some were but little more than three years of age.”

W. A. Alcott made the following comment concerning his work after almost ten years teaching, so this should have been about 1825:

“An attempt was also made to introduce better school books, especially as reading books. Many of the schools had been confined to the New Testament, the American Preceptor, the English Reader, the Columbian Orator or Webster’s Elements of Useful Knowledge for a long series of years.”
On page 118(?), he discussed introducing as a new book the story of Jack Halyard. That story can be found at the end of John Franklin Jones’ Analytical Spelling Book, copyrighted in 1822, an 1824 edition of which was published by E. Bliss and E. White of New York and Albany. Conceivably the Jack Halyard story - or stories - also might have been published separately.

On page 204, he referred to the Journal of Education as having been published for two years, so the following comment must have concerned 1828, and it is notable that spelling was now being taught “meaningfully.” He wrote:

“In regard to spelling, I was careful to assign my pupils short lessons, and see that they understood their meaning. This... was quite an innovation.... a few older pupils had a very inferior sort of dictionary.”

Alcott referred to learning about new methods from Hall’s Lectures on School Keeping. Samuel R. Hall’s Lectures on School Keeping was obviously a very important book of that period. It is not surprising that it contained “new methods,” and presumably they concerned, among other things, the new methods of teaching spelling and reading. Since Hall endorsed G. and C. Merriam’s 1833 The Easy Primer, as shown on a copy, and since that was a Code 1 beginning book, it is easy to see what Hall’s preferences were. According to Samuel Blumenfeld in his book, Is Public Education Necessary? on page 133, Hall was a teacher as well as conservative minister, and had worked with Holbrook in the founding of the American School Agents Society, the purpose of which was to organize teachers everywhere in the country through the use of paid agents. In September, 1830, Hall was hired as the director of a new seminary for teachers at Phillips Academy, Andover. William Russell also briefly had a connection with Phillips Academy, as noted elsewhere.

W. A. Alcott said he suffered from poor health for three years and left the school room to do other work. The curious theme of poor health constantly recurs to explain changes in occupation of many of these activists, such as Russell and Gallaudet. However, W. A. Alcott declared, “I was born for the purpose of improving the condition of my fellow men.” Such men never ask if their fellow men want to be “improved.” On page 214, Alcott made comments about his poor health, and said:

“I was... appointed one of the board of school visitors, whose office, in that State, was not only to visit schools but to examine candidates and grant licenses.” (From page 221:) “We were required by the laws of the state ... to visit each school at least twice... one of which visits was to be near to commencement, and the other near to closing.”

(On page 224, concerning improving teachers:) “...but I was unable to furnish them with the Journal of Education - the best work of which I then knew, ......nor even with Hall’s excellent Lectures on School Keeping. To one or two of them, I loaned Miss Edgeworth’s Practical Education; but their minds were as yet too immature....”

(On page 226) “During the first winter after I became a member of the Board of School Supervisors, I made a strong effort to do something to promote the improvement of teachers. They were mostly young men of my acquaintance, and seemed willing to unite in my plan which promised to add to their usefulness.”

(From page 237:) “After spending three years in my profession, and recovering my health, I began to think of abandoning it, and returned once more to schoolkeeping.”

The dates of the excerpts when compared to the known date of his birth (which is not given in his text but which shows up on the New York Public Library microfilm reel on the Annals of Education) suggest
that Alcott started school at the age of four in 1802, and last attended any kind of school in 1815 at the age of 17 (although since he became a doctor after writing this account, he presumably returned to school in middle-age). From 1816 to 1822, W. A. Alcott taught in a common school but only part of the year. From 1822 to 1825 he taught in an eleven-months’ school, and from 1825 to 1828 he was a member of the Board of School Supervisors, probably in Connecticut. From 1828 to 1829, 1830 or 1831, he again taught school. However, it is very strange that in his biographical account in 1839 Alcott should give only obscure references instead of real dates.

Curiously, from a biography he wrote of Gallaudet, W. A. Alcott revealed he became involved with Gallaudet and the move for government schools about 1825, and remained Gallaudet’s lifelong friend. Did Alcott get his appointment to the “Board of School Supervisors” through Gallaudet? W. A. Alcott’s anecdotes concerning Gallaudet occur in a book presently in the New York Public Library, call # AB 1856, Tall Oaks from Little Acorns, or Sketches of Distinguished Persons of Humble Origin - “By William A. Alcott, M. D., New York - published by Carlton & Phillips, Sunday School Union.” (The deterioration in Sunday school texts after 1824 is referred to elsewhere in this history. The publication of Tall Oaks... therefore establishes - although as late as 1856 - a connection between one of the activists, W. A. Alcott, and the “Sunday School Union.”) Since Alcott’s book was published in 1856, and Alcott said he first met Gallaudet thirty years before, that would place their meeting date in 1825 or 1826 (assuming Alcott may have been writing the 1856 book the year before it was published). On page 257, he began his biography of Thomas H. Gallaudet, which included the following comments:

“Thirty years ago, I called at the American Asylum for the Deaf and Dumb, at Hartford, in Connecticut. The man at the door of the institution directed me to the principal, whose office was only a few rods distant. I rang the bell at his office door, and a small, thin, but active man met me, and in the most kindly manner invited me in, and gave me a seat. On learning my object, he promptly granted me permission to visit the institute, and a letter of introduction to some of the principal teachers.

“This was the beginning of an acquaintance with the Rev. Thomas H. Gallaudet, a brief account of whom I am about to give you.... I was familiarly acquainted with him from the date of the foregoing incident to the time of his death. He was, moreover, a much valued friend....” (Alcott stated Gallaudet was born in Philadelphia December 10, 1787:) “His father, Peter W. Gallaudet, was descended from the Huguenots of France... mother, the daughter of Thomas Hopkins of Conn.”

It should be noted that the Hopkins school associated with Yale at which Russell briefly taught was presumably named after Gallaudet’s mother’s family. Alcott said in 1800 Gallaudet’s family moved to Hartford where Gallaudet attended Hartford Grammar School and entered as a sophomore at Yale when almost 15, graduating before 18, but with a weak constitution. Soon after leaving college, which would have been about 1805, Gallaudet studied law in the office of the Hon. Chauncey Goodrich of Hartford. At the end of the first year, his health broke and he left. In 1808, he was appointed tutor at Yale, then being 20 years old. In 1810 or 1811, he had:

“...(a) business agency in the Western States particularly Ohio and Kentucky.... On his return, he became a clerk in a counting room in New York, intending to pursue a mercantile life. But he did not continue long in that situation.... In the autumn of 1811... (he) commenced (the study of theology) at Andover, Mass. His progress here was slow, owing to bad health. He was licensed, however, to preach in 1814.... Being at home one day on a visit, a little deaf mute, the daughter of an eminent citizen of Hartford, by the name of Alice Cogswell, was at play with the rest of the children, in her father's garden. Mr. Gallaudet, having succeeded in gaining her attention by signs, proceeded to give her a lesson in written language, by teaching her that the word hat
represented the thing hat, which he held up in his hand. Following up this first step as well as he was able, he succeeded in importing to her a number of many simple words and sentences. His ingenuity was also greatly assisted by a publication of the Abbe Sicard of France, which Mr. Cogswell, the father of the girl, had received from Paris, as well as by the efforts and cooperation of other individuals residing with her in the family, among whom was Lydia Huntley, afterwards Lydia H. Sigourney, the poetess. His success greatly encouraged Dr. Cogswell and the whole family. Until now, they had intended to send little Alice to London or Edinburgh for instruction; but the inquiry began to intrude itself upon their minds, why may we not have a deaf and dumb school in Hartford?

“(Cogswell) had already ascertained that there were in the State of Connecticut no less than 80 deaf mutes, most of whom were young enough to attend school... One of his first steps was to call a meeting, at his own house, of the principal citizens of Hartford and lay open his plan....”

Alcott told of the plan for an American school for the deaf and of Gallaudet’s being sent to Europe to learn methods for teaching the deaf. He mentioned that because of a “delay” in London Gallaudet went to France. Yet Alcott made no mention of the diametrically opposed methods of Braidwood in Great Britain and Sicard in France, Braidwood teaching by “sound” so that the deaf could learn to speak, and Sicard by “meaning” with sight-words and sign language. Gallaudet arrived back in August, 1816, and then visited New York, Philadelphia, Albany, Salem, Burlington, and New Haven to raise money for the institute. Alcott wrote:

“After two long years of effort... and in appeals through the public press of the country... (the asylum) opened with a class of seven pupils April 15, 1817.”

Note the reference to “appeals through the public press of the country” before 1817. This may have been one of the routes through which Dr. Keagy learned of deaf-mute methods. Furthermore, demonstrating the widespread publicity on deaf-mute methods, Alcott said that between 1818 and 1831 Gallaudet visited a number of the legislatures of the “several northern and Middle States.” Alcott wrote:

“I remember a meeting of this kind, about the spring of 1826, in the Methodist Church of New-Haven, Conn., to which the legislature was invited.”

In reading the following, it should be remembered that Alcott said that Gallaudet resigned as principal of the deaf-mute asylum in 1830, because of poor health. Alcott wrote:

“Labors in the Cause of Education... (page 276) Between the years 1825 and 1835, he probably did as much as any other individual, both by his writings, and by personal labors and sacrifices, to effect a reform.... When in the year 1830, the American Annals of Education began to be published in Boston, under the editorial care of Rev. William C. Woodbridge, and subsequently of myself, Mr. Gallaudet consented to furnish contributions to those columns from time to time; which engagement was faithfully fulfilled and he continued a regular contributor for eight years... The Connecticut Common School Journal especially... during the years 1838, 1839, and 1840, felt the weight of his influence. Several articles of an editorial kind from his prolific pen found their way into the Mother’s Magazine, published in New York, as well as into the columns of other publications. Nor must we forget to mention in this connection, that he prepared and published, or caused to be published, several excellent school books, among which were a spelling book and dictionary. Finally, he edited an American edition of Dunn’s Principles of Teaching, a British work, which had done much good in that country, under the name of the Schoolmaster’s Manual.
“I ought ere now to have said, that when a ‘Society for the Improvement of Common Schools’ was established in Connecticut in 1827, he became at once an active and efficient member, and his labors in conjunction with the writer of this manual and others, had much influence all over New England.

“The list of his labors in the cause of education might be greatly extended. I might speak of his connection with the American Lyceum, which held some of its meetings in Hartford; and of his labors in behalf of the Goodrich Association, as it was then deemed, and a course of popular lectures which it established. I might tell you of a journey he made to the Western States in 1835 to aid the cause of education. I might speak, finally, of his efforts to sustain Mr. Barnard, of Connecticut, and others, between the years 1838 and 1850 in establishing a normal school, then new, in Britain, near Hartford.” (Alcott said Gallaudet went every day to a mental asylum to visit the inmates at the end of his life, though I believe he had some paid position there.)

Alcott’s anecdotes confirm that in 1827 (and probably from 1825) he was working with Gallaudet on the drive for government schools. Alcott’s endorsing ‘meaning’ in reading and opposing ‘sound’ probably came from his association with Gallaudet, more than from Samuel R. Hall’s book on teaching methods, Lectures on School Keeping, to which he had referred to approvingly in two earlier excerpts. It should be noted that Gallaudet’s acquaintance with de l’Epee’s and his disciple Sicard’s deaf-mute method dates back at least to the time Gallaudet read the work Dr. Cogswell got from Paris, probably in 1814 or 1815.

Further information on Gallaudet is given in the Cyclopedia of Education (1911-1913), in a short biographical entry by “W. S. M.,” presumably W. S. Monroe:

“During 1832 and 1833 Gallaudet was Professor of the Philosophy of Education in New York University. This was the first professorship of education in the United States. He was also active in the movement which established the first normal schools in America. Beside his writings on the education of the deaf, he published a number of essays on the philosophy of education and several textbooks, including the popular Mothers’ Primer and the Child’s Picture Defining and Reading Book. His Plan of a Seminary for the Education of Instructors of Youth (Boston, 1825) gave rise to the normal school education in America. He died in Hartford the 9th of September, 1851.”

Presumably the Mothers’ Primer of 1836 received its name through some association with the Mothers’ Magazine in New York to which Gallaudet contributed. As late as 1911, W. S. Monroe, knowledgeable enough to write an article for the Cyclopedia of Education, referred to the Mothers’ Primer as having been “popular!” Yet, by the time Samuel Blumenfeld dredged up the facts concerning that text in his book, The New Illiterates, the Mothers’ Primer had dropped into oblivion and had disappeared from almost all libraries. All of this establishes, however, that Gallaudet was a central and dominant figure in the move to government schools including normal schools, and to their siamese twin as well: the use of “meaning” instead of sound in the teaching of beginning reading.

William A. Alcott wrote another book in 1832, which strongly suggests that by then he was again involved in something like professional school visits. He could not have been a teacher at that point as he would not have had the time to make such visits. (It was in 1837-1838 that he was the editor of American Annals of Education.)

The book, Historical Description of the First Public School in Hartford, by W. A. Alcott, was published in Hartford, Connecticut, on January 24, 1832. It was addressed “To Teachers, School Visitors,
The “School Visitors” to whom he was referring were state-employed inspectors, which job he had once held.

(Page 2:) “Most of you are supposed to have read with attention the interesting Lectures of Mr. Hall on School Keeping. . ..The writer considers it his duty to lay before you an account of the first common or public school in Hartford, Conn., now under the superintendence of Mr. J. Olney, author of a system of Practical Geography....”

Being an activist had a positive side for those involved: they endorsed each other’s books. By the sheerest coincidence, of course, Hall’s Lectures and Olney’s geography were famous books which were used in government schools for years. The books must have produced comforting dollar profits for their authors.

+(Alcott mentioned that a school convention) “assembled in this city in November, 1830; Mr. S. R. Hall, author of the Lectures on School Keeping, Mr. Josiah Holbrook... and many other distinguished individuals, whose names might be mentioned, have also honored (the school) with their visits and approved of many of its methods and principles. Mr. Holbrook even pronounced it the best public school which he had seen.”

Alcott said he himself spent days and even weeks visiting it over two years. That suggests, of course, that Alcott had left teaching by 1830.

Alcott gave a description of the school in section II of the book. The school had a “cabinet of minerals,” and, as Blumenfeld pointed out, a preoccupation with geology was characteristic of these activists and of Maclure, Owen’s partner. Geology was very “scientific” and could wrongly be interpreted at that time as anti-Biblical. Interest in geology suggested a possible tie with geology-conscious Maclure.

Section III covered methods of instruction and referred to the early history of the school, starting in 1810. It has used the Lancasterian system for some three or four years before abandoning it. At present, the youngest children were in the Third Department. This was in the basement, in two rooms, one for boys and one for girls, with four teachers and 200 children, a real sardine can.

Alcott would have been describing practices in the school in 1831, in this book published in January, 1832. Only a few of the primary- graders were using Edward (not Jasper) Hazen’s Symbolical Primer (Code l), the rest still using Webster’s (Code l0). But they were also using the New Testament and Leavitt’s Easy Lessons. Alcott said, “In addition to these, it is customary in both rooms to allow the pupils to read in any proper book which the teacher can procure; one pupil reading at a time, and the rest giving their attention....” The emphasis for these beginners was obviously on “reading for meaning” and not “spelling for sound.” Even when Webster’s was being used, Alcott’s comments show that the school’s practice did not match that excellent textbook. No longer were children to work out the sounds of words themselves from the key: the teacher was to read the words to them first. No longer did the children have long lessons on which to practice their phonic skills; the spelling lessons were greatly abbreviated. A spelling method originating with Gallaudet was being used in some classes; it had the interesting addition by this “progressive” school of leaving out syllabication on words. Webster’s key was also being discarded for pupils because they presumably did not understand it; instead the teacher was to give children oral drill on the sounds of the letters (i.e., elocution). In any event, it was recommended that children be given better textbooks, which they could “understand.” It must not have been very long before Edward (not Jasper) Hazen’s unbelievably bad Code l book or one like it pushed Webster’s Code 10 book completely out of the Third Department.
In reading instruction, considered apart from spelling, children had formerly read long, long selections, with the happy product of automaticity from such long practice. Now the lessons were being enormously shortened, so that the students could concentrate instead on “meaning.” A class might spend a whole lesson on only one paragraph, where previously they had read - independently, and by themselves first - whole pages.

Spelling was endorsed as very important, but it should be remembered that learning to spell sight words (see-aye-tee, cat) has nothing whatever to do with learning to decode print by sound. If it did, parents of little children would not resort to using oral spelling with each other as a way to hide what they are saying from their children (such as, “Where is the C-A-N-D-Y?”)

All these changes were touted, of course, as great “improvements” which delighted the children. That same kind of promotion was being used about that time to sell snake oil.

“METHODS OF INSTRUCTION - THE ALPHABET The Alphabet is taught only in the Third Department of this school, and is confined to the two subdivisions of it, which embrace the youngest pupils. It is not very peculiar in the methods adopted. The teachers endeavor to render the exercise as agreeable to the pupils as possible.... A young teacher (is) at the head of forty or fifty, sometimes sixty pupils, most of whom are from 3 to 5 years of age.

“SPELLING The most common method of teaching this branch here, is that which generally prevails in our schools, and which it is unnecessary to describe in this place. A few improvements have been adopted, among which are the following:

1. Reading aloud the words of the lesson before it is studied, sometimes merely Pronouncing the Word with distinctness and propriety; the others, repeating with the same distinctness every letter and syllable....

2. Shorter lessons. I have often known classes spell several pages of words at a single lesson.

4. During the exercises, many of the teachers chose carefully to give explanations and definitions...

5. In some of the departments of this school, particularly the first, in both of its branches, one spelling lesson a day is selected from a reading book.... (“First” was the oldest grade.)

6. Great pains are taken to make the pupils acquainted with the powers of the various letters, and with the nature of accent. Many teachers think they have accomplished a great work, when they have succeeded in making their scholars repeat by rote the Introduction of Webster’s American Spelling Book. But a child may recite the whole of it a thousand times, without being any wiser than when he commenced.”

The “powers of the letters” were undoubtedly being practiced in oral drill, to produce pear-shaped tones. This has nothing to do with decoding print.

“The following improved method of teaching spelling has been recently introduced into this school. It serves to interest the pupils, and keep them constantly employed.... The plan is said to have been used by Mr. Gallaudet, in the instruction of the deaf and dumb, and it has also been lately mentioned by a writer in the Annals of Education.
“Suppose the word to be spelled is table. The first pupil says t; the second a; the third pronounces the syllable ta; - the next then says b; the fifth says l; the sixth e; the seventh says ble; the rest then pronounce the whole word table. By close attention on the part of both the teacher and pupils, they are able to spell in this manner with considerable rapidity. For a casual exercise, at least, it is certainly valuable. The plan has been modified in this school in one respect. The pupils go through with all the letters of the word, without stopping to pronounce the separate syllables; and only pronounce the whole word, when they come to the end of it.”

(Books used: Webster’s spelling book, the New Testament, Leavitt’s Easy Lessons) “...and in some of the smaller classes of boys Hazen’s Symbolical Primer. In addition to these, it is customary in both rooms to allow the pupils to read in any proper book which the teacher can procure; one pupil reading at a time, and the rest giving their attention.... Each of these divisions is again sub-divided. The eldest and most advanced pupils, to the extent of rather more than half the whole number, occupies one end of each room, under the care of the most experienced teacher, while the rest, under the care of the younger teacher, occupy the other.” (He said there were four women teachers).

“Order of the Exercises This does not differ materially from that of common schools in general. Among those who are able, reading occupies a considerable part of the first hour and a half of each half day; spelling, defining, exercises on the blackboard, slates & c. is the other. The oldest pupils generally read first, and the youngest last.” (Alcott said they varied the routine.)

“But there are a great many ways of teaching spelling which might be mentioned. All have their.... excellencies, and probably many of them have defects. But a new plan which is defective may be useful, for it has at least the charm of novelty, to recommend it, and no wise teacher will disregard the fondness of children for that which is new but on the contrary will endeavor to make it a means of their improvements. This consideration alone should silence the common objection to new plans in school, viz., that they are experiments, for they produce in general no evil, if they fail, and they interest the pupils while they are going on. Anything is better at sea, than a dead calm.

“In some schools, spelling is neglected for the sake of the higher branches. It is true, teachers often push their pupils forward into those studies which have high-sounding names ... teachers should, however, remember that good spelling is one of the pillars of a correct education; and that without this, the edifice cannot be erected.---or, if erected, cannot stand firmly. Even if we admit the principle, of late so fashionable, that children ought to spell no words whose meaning they do not fully comprehend, yet this is by no means an encouragement to neglect this branch....

“During almost every exercise, the teachers frequently stop to give or require definitions and explanations. None of them have done more in introducing this practice into the school, than the principal teacher of the girls’ division of the Third Department. This explanatory system, as some writer has denominated it, is destined to accomplish a revolution in our primary schools generally, as it has already done in some parts of that which I am describing....

“READING. Reading is another branch which common schools are apt to neglect. By this is not meant that they do not devote hours enough to this exercise; nor read a sufficient number of pages; nor that the subjects of the lessons are not well chosen. There is time enough spent; and there are pages enough read. But until within a few years, and even now in many places, the popular methods of teaching are calculated to produce almost any other results, than make good readers. The first public school in Hartford has, at every period of its history, fallen more or less into the error. But in order to exhibit clearly, the character and value of the improvements which
have been introduced into it, within a few years, for several improvements have been made - it may be useful to give a few specimens of the former methods of instruction in this branch, as they existed in this vicinity and elsewhere.

“A class in a town adjoining this, consisting of two pupils about five years of age, read one day, in my presence, a lesson containing sixty-six different words, of which more than forty were nouns, pronouns, verbs and adjectives. Now, of these forty words, I suppose these pupils had not the remotest conception of the meaning of more than six or eight. It would be difficult to describe the various positions of the limbs, and contortions of the muscles, especially those of the face, which were observable during the ten minutes in which they were thus obliged to do penance.”

This is very interesting testimony from a contemporary witness who observed this some time before 1832. As only one day’s lesson, two five-year-olds had the reading of a list of sixty-six relatively low frequency words (and they must have been low-frequency words since Alcott claimed the children did not know the meaning of most of them). Alcott’s comments implied the children were able to pronounce the list, and he also implied that their being able to do so was the norm at that time. Alcott also implied that the day’s lesson for the five-year-olds was only one of a sequence of similar lessons meant for them. The children were obviously reading their way successfully through the word lists in a speller like Webster’s at the young age of five, as Alcott said elsewhere that he, himself, had done at the age of about five, as already discussed. Compare that independence in pronouncing print to the sight-word beginning vocabulary of William Scott Gray’s “Dick and Jane” series. The entire vocabulary of Gray’s 1930 material covered in the first six months or so of first grade would equal only one day’s lesson for five-year-olds a century earlier. Even so, every one of the “Dick and Jane” basic vocabulary sight-words had to be pronounced by the teacher first because children taught with “Dick and Jane” could not read the words first by themselves!

Alcott continued:

“In an adjoining county, I once heard a little girl only nine years of age, read nearly the whole of two difficult pages in the American Preceptor at a single lesson. She had no class-mate, and was accustomed to read lessons as long, or nearly as long as this....

“A first class in a large school one day read a lesson from Murray’s English Reader, containing two thousand and two hundred words; of which more than half were words of importance, such as they ought to have understood, and been able to define. That they did not, was evident from the want of interest which they all manifested while the others were reading; for the subject had interest enough in itself. The teacher was almost constantly calling out, ‘Look on your books.’ ...On the other hand, I know of one instructor, who used to spend half an hour, with a large class, on eight or ten lines. Yet every pupil was kept constantly employed; and was pleased and profited. Several others do not extend a single reading lesson beyond half a page.....

“...You will ask; ‘What shall be done?’ I answer; do what the Hartford school has attempted, and not without some success - keep the pupils constantly employed. Do this, but do much more. Like this school, go on from day to day in attempting improvements.

“The first point to be gained is to provide reading books which the pupils can understand. When this cannot be effected, we must try to make them understand easy paragraphs in such books as they already possess; or else invent, or teach them to invent lessons for themselves upon their slates.
“Something has been done in this school in both respects. One or two improved reading books have been introduced. But results more striking have been effected by attempting to interest the pupils, and make them understand what they read.

“For this purpose the lessons are very short. Then instead of reading round the class in the order in which they sit, one reads a paragraph, and another, who thinks he can read it better, raises his hand; he is then allowed to read the same. Sometimes half a dozen pupils read the paragraph; and the teacher among the rest.

“This method has been introduced, to a greater or less extent; into several of the classes, in the various departments. It originated, as I was informed, by the Principal, with Miss Reeve, the principal teacher in the girls’ division of the third... but this plan of teaching reading has been carried farther in the Third Department (Ed.: the youngest group), especially in that division where it originated, than in any other. After one pupil has read a sentence or paragraph, all who can, are permitted to make corrections. As they are fond of the exercise, it serves to keep them constantly employed. Those who wish to make corrections raise a hand. The teacher then addresses one of them and says ‘What error did you observe?’ They then mention errors in regard to pauses, pronunciation, emphasis, cadence, tones, inflections and the addition or omission of words or letters. The one who makes the correction is next required to read the passage, as in the First Department. There is no lost time where this process is fully in operation, and the progress of the pupils is beyond any example which I have witnessed. The plan, already extending, will, it is hoped and believed, soon become common in every class of the institution...

“Throughout the school great pains are taken to have the pupils read in a pitch of voice that is perfectly natural, like the tones of common conversation. In general these efforts have been attended with success. There are at present very few who speak either too loud, or too low. They generally read distinctly and slowly. The great rule, ‘read as you talk,’ seems to be properly appreciated by many of the pupils; though it must be confessed a few of them disregard it, and read in the old fashioned monotonous manner. The teachers should read more with their pupils than some of them do. Example has a powerful effect in this respect, as well as in everything else.

“The explanatory method of teaching reading is not forgotten, even in the Bible lessons. The principal took great pains to explain such words as centurion, leper, &c.; and not only to define them himself, but to ascertain whether the pupils comprehended his meaning, and could define them in their turn.

“But there is another method still, which is practiced in the First Department, and which I believe originated there. A pupil reads till he comes to a pause of some sort, if it be but a comma - then stops, and the next reads; and so on, through the whole lesson. As some will read only a single word at a time, and no one but a few, they are obliged to pay the closest attention to the exercise. So far as this goes, then, the difficulty of keeping scholars constantly employed is overcome.

“The principal teacher of the Second Department has been accustomed to allow his scholars to read for places, as follows. A certain position of honor is appointed – say the teacher’s chair. A paragraph is then selected, and he who can read it best, takes the chair. If any one can read still better, he is allowed to take his place. In this way, they sometimes read a considerable time, on a sin(gle paragraph)....”

The children were systematically being denied, at all levels from the Third Department (primary) to the First Department, that practice in spelling and reading on which accuracy and automaticity are built.
“Sound” was being systematically displaced, in multiple ways, by “meaning.” It should be carefully noted that the change-agents’ names showed up in connection with this school which was moving in 1831 from “sound” to “meaning”: Josiah Holbrook, Thomas Hopkins Gallaudet, William Andrus Alcott, S. R. Hall and others.

The principal of that school, J. Olney, who had written a widely used geography, shortly after wrote what is probably a series of reading books. The only copy I have seen is The Easy Reader, or Introduction to the National Preceptor, but the title confirms there was a sequence in these two books. The cover of The Easy Reader shows that Olney also wrote the Child’s Manual, which may have been meant as the first book.

J. Olney’s views on teaching reading were given at length in the “Preface” to The Easy Reader, excerpts of which are quoted below. Olney argued that the formerly long and difficult spelling and reading assignments for children should be replaced with extremely short and very simple reading selections. In effect, he wanted “sound” in beginning reading replaced by “meaning.”

The case Olney presented seems very reasonable. The problem, however, is that his assumptions have little base in reality. Furthermore, in all the ages of Western literacy, from the completion of the sound-based alphabet in Greece about 800 B.C. until the early nineteenth century in America and Great Britain, no one - anywhere - had ever openly taught hearing children to read alphabetic print by consciously concentrating on “meaning” instead of “sound,” in a fuzzy-minded conviction that doing so would improve their understanding. Yet most of Western Civilization’s great geniuses since the days of ancient Greece had lived before 1826 and if they were literate (as most were), they had all learned to read by “sound.”

Yet giving children heavy practice in learning to pronounce words in the spelling book and even teaching children to read connected text like the Psalms was seen by Olney as mindless reading; therefore, such practice had to go, to be replaced with endless discussion and dissection of only a few simple sentences. After 1826, bringing children to the level of automaticity in reading had gone out of style.

Keagy had justified his endorsement of the deaf-mute method to teach beginning reading by citing Stewart. Olney did not actually cite Stewart, but, as can be seen by comparing his comments below to Stewart’s given elsewhere, Olney’s arguments were probably derived from Stewart’s ideas. Olney was in contact with William Andrus Alcott and so many other activists in his school. Olney’s wholehearted endorsement of “meaning” is only one more indication that the activists shared the same aims. Those aims included replacing freedom in education with controlled government schools, and replacing “sound” in reading with “meaning.”

“As the great end of elementary education is to develope and bring into exercise the various faculties of the youthful mind, it is of the first importance that such methods of instruction should be employed as will most successfully accomplish these desirable objects. It should ever be borne in mind by those who are interested in the education of the young, that childhood is the progressive state of both mind and body, and that if either is neglected at this stage, it will never attain that height in excellence to which it is capable of ascending. ... Much more depends on the early education of children than is generally supposed. The mind at this age is susceptible of any
impression, and can be trained to any habits, and it is at this period that a solid foundation must be laid for all subsequent attainments in the arts and sciences. .... Whatever may be the method of instruction habits will be formed, and these will be good or bad in proportion as the methods employed are judicious or otherwise. How important then, that the education of children should be properly commenced, and conducted, - that the mind at its first setting out in quest of knowledge, should be guided to wisdom’s paths which ‘lead to the fields of knowledge and the founts of science.’

“It is supposed by many that no study is calculated to exercise the mental faculties of children except arithmetic. But this is a great mistake. No study is better calculated to effect this than reading; and as this is the fundamental branch of instruction in our schools, particular attention should be paid to make this in all cases a mental exercise. When this is done, the pupil will make rapid progress, and in the outset acquire the habits of reading for ideas. The powers of his mind will thus be awakened and brought into exercise, and he will be prepared to engage in other branches of study and pursue them understandingly. But let a pupil, six or seven years of age, be permitted to read two or three years, in a careless, unthinking manner, - hurrying over sentences without understanding them - attaching no meaning to the words that he reads, and he will contract habits of thoughtlessness, indifference, and inattention, that will disqualify him for pursuing any other branch of education either with pleasure or profit. The reason is obvious. Such a course of instruction does not lead him to think. The powers of his mind are not developed and his judgment is in no case exercised. Nothing can be a greater obstacle to the acquisition of vigorous habits of investigation and of sound and useful knowledge than the habit of reading without thinking, and of resting contented with a very confused or superficial notion of what is read.

“That much time is uselessly spent in teaching children to read - and that bad habits, as regards pronunciation, emphasis, tones, attention, &c., are often contracted for want of suitable books there can be little doubt. In most cases those who have prepared reading books for children, have consulted their own taste instead of that of the class for whom they were laboring. Lessons designed for children should be interesting, suited to the capacities, and adapted to the natural progress of their minds. Books prepared in this manner are read with interest, and always effect the object intended.... Impressed with the truth of the above sentiments, the compiler has prepared the following work, with a firm belief that its use will have a direct tendency to obviate the evils complained of.... Great care has been taken to arrange the lessons so as to lead the pupil by regular gradation from easy to difficult reading, and to an acquaintance with a few new words in each succeeding lesson....

“In using the following work, it is intended that the learner should spell, pronounce, and define the principal words of each lesson before he reads it. This will enable him to enter into the sense of what he reads, - will call into exercise the various powers of his mind - and daily advance him in acquiring a knowledge of language. That orthography, pronunciation, definition and reading can be taught more successfully in connection than separately, there can be no doubt. For studied in this manner, each assists in the acquisition of the other...

“In teaching a child to read, the motto of the teacher should be ‘a little and well.’ In the reading of each sentence his attention must be directed to pronunciation, emphasis, cadence, inflections, tones, and the addition or omission of words or letters. Now it must be evident to any one that the lesson must be short, or many of these subjects must be passed unnoticed. But, one sentence read in which attention is paid to each of these, is more beneficial than pages or even volumes read in a hasty, careless, or unthinking manner. The former method tends to cultivate and discipline the mind, while the latter tends as directly to disqualify or unfit it for all mental
exertion. The grand rule, ‘Read as you converse’ ought to be deeply impressed on the mind of the learner, and if this rule is observed, his reading will resemble graceful and animated conversation....

J. OLNEY”
“Hartford, July 20th, 1833”

Note Olney’s 1833 comment: about “an acquaintance with a few new words in each succeeding lesson....” Nila Banton Smith wrongly claimed that McGuffey was the first to introduce vocabulary control. Yet Olney was one of those before McGuffey who controlled vocabulary.

Olney and William Andrus Alcott obviously shared the same aim in beginning reading instruction. That aim was the substitution of “meaning” for “sound.” As Olney put it in the above, “But, one sentence read in which attention is paid to each of these, is more beneficial than pages or even volumes read in a hasty, careless, or unthinking manner.”

Olney also said in the above, “Nothing can be a greater obstacle to the acquisition of vigorous habits of investigation and of sound and useful knowledge than the habit of reading without thinking.” That was essentially Stewart’s thesis. Alcott had specifically referred to one of Stewart’s statements when writing of infant schools. Olney was apparently reading Stewart, as well.
A book which was apparently published originally in 1836, and which had a second edition in 1837, corroborates the massive influence of trans-Atlantic change-agents in the installation of the beginning-reading “meaning” method in the schools. As the presumably 1836 text clearly demonstrated, where government schools had been slow in taking root, the change-agents had operated through charity or church schools. The book was entitled:

“POPULAR EDUCATION: OR, THE NORMAL SCHOOL MANUAL; CONTAINING PRACTICAL SUGGESTIONS FOR DAILY AND SUNDAY-SCHOOL TEACHERS.

In a Series of Letters. By Henry Dunn, Secretary to the British and Foreign Schools Society, Second Edition, London: Published by the Sunday-School Union, 1837.”

Dunn signed the Preface to this second edition, “Borough Road, December, 1837,” and on page 46 spoke of “the Central School in the Borough Road.” That practice school/normal school was apparently the headquarters for the British and Foreign Schools Society, which was the successor to Lancaster’s monitorial school society. Dunn referred to the “rapid sale of the first edition.” His table of contents showed the subjects discussed under each chapter, and the names and the topics he listed, some given below, demonstrate the trans-Atlantic ties:

Dunn’s second edition was published by the Sunday-School Union in Great Britain in 1837. A book referred to earlier was published by “Carlton & Phillips, Sunday School Union” in New York in 1856, containing the short biography on Gallaudet, entitled Tall Oaks from Little Acorns, or Sketches of Distinguished Persons of Humble Origin “By William A. Alcott, M. D.” Since both Dunn’s and Alcott’s books were published by Sunday School Unions, that fact shows that the change-agents such as Dunn and Alcott were operating through the private Sunday school groups in both America and Great Britain as well as through groups promoting government schools.

The Sunday school groups gave the activists a wide organizational net through which to exert their baneful influence, which was paid for, of course, by other people who thought they were supporting charitable works, and not change-agent works. As mentioned elsewhere, Sunday school beginning reading texts had been among the very first to show the shift from “sound” to “meaning,” and that was the apparent result of early “expert” influence.

Dunn’s “letters” began:

“Letter I. To a Friend. Object of the work. I. Various motives, my dear friend, have influenced me in determining, without further delay, to attempt the preparation of a small volume for the use of teachers. It is just seven years today [Ed.: Jan. 1, 1836, was the date of the first letter] since I entered upon my present engagements, and became exclusively devoted to the furtherance of popular education in connexion with the British and Foreign Schools Society....”
That places Dunn in operation in London by January 1, 1829, at almost the exact same time that the anonymous Scottish Schoolmaster was writing the first of his withering comments on monitorial schools, the same kind of schools that Dunn began officially promoting in 1829.

Dunn wrote (pages 2 to 5):

“That a manual of this description is wanted, I have long been convinced. Gathered, as elementary teachers generally are, from the humbler walks of society... without books, and unable to purchase them; it is not to be expected that they should possess any acquaintance whatever with education as a science, unless the substance of what has been written on the subject by practical men, can be placed before them at a cheap rate, and in a small compass. Of the four hundred and sixty young persons, who, during the period to which I have already referred, have left our own institution to assume the responsible office of instructors, I know very few to whom a volume of this character, however imperfectly executed, would not have been, at their first setting out, a treasure....

“...Under each head will be found, I may venture to say many practical remarks of great value, the suggestions of experienced teachers either in this country, in Germany, or in the United States of America.... One source, however, from which I have drawn unsparingly must be specially mentioned. I refer to the “American Annals of Education and Instruction,” edited by the Rev. W. C. Woodbridge, of Boston, U. S., a journal of which it is impossible for me to speak too highly; I scarcely know the extent of my obligations to this educational treasury....

“...How far the main object of the undertaking, the preparation of a suitable text-book for young teachers, has been attained, remains to be seen....to facilitate examination on its contents, either orally or by means of written compositions, a series of questions adapted to bring out the most important points has been added, and each paragraph numbered....”

Lower-class prospective teachers for whom this “official” book was written would be anxious to get the paying monitorial schools jobs being offered by their “betters” like Dunn. Such poor young teachers would be very careful to answer an official textbook’s questions “correctly.” In his book, Dunn promoted the “meaning” method for beginning reading. Therefore, such prospective teachers being given his book would say that the “meaning-method” was the only “correct” way to teach beginning reading. Dunn’s change-agent control would then have become nicely operative. Note that in the seven years that Dunn’s London normal school had been in existence, it had already prepared 460 such “official” (which means, “incompetent”) teachers!

Dunn said in a footnote on page 30:

“Vide Hall’s Lectures to Schoolmasters, Boston, 1833 [sic]; a work of considerable value, and which has met with a large circulation in the United States. - See also Salzmann, Abbott, &c.”

Therefore, Dunn knew Hall’s American book had a large circulation. Also, as shown below, Gallaudet in America knew Dunn’s work “had done much good in England,” and so obviously must have had a large circulation in England. Information on the sale of change-agent books on “education” was apparently traveling very freely across the Atlantic Ocean.
W. A. Alcott was a cousin and close friend of Amos Bronson Alcott, who made a kind of triumphal visit as an “educator” to England about 1840, and W. A. Alcott was also a close friend of Rev. Thomas Hopkins Gallaudet who edited the Schoolmaster’s Manual. W. A. Alcott said of that work:

“(Gallaudet) edited an American edition of Dunn’s Principles of Teaching, a British work, which had done much good in that country, under the name of the Schoolmaster’s Manual.”

The quotation is from W. A. Alcott’s Tall Oaks from Little Acorns, 1856, and it gave no date for Gallaudet’s edition of the British text, which was most probably Dunn’s 1836 Popular Education, or The Normal School Manual or its possible later revision, and not a book called Principles of Teaching, on which I have found no record. Presumably W. A. Alcott’s close friend, Gallaudet, was his source for the comment that Dunn’s book “had done much good in that country,” meaning England. Yet how could Gallaudet have known Dunn’s book “had done much good in that country” unless there were a trans-Atlantic clique of “improvers” who were able to communicate effectively through publications, personal letters, or visits?

Dunn quoted directly from “Pillans’ [sic] Three Lectures, 1836”:

“...much intellectual and even moral training is accomplished by means of monitors; and these schools, we may confidently anticipate, will serve as models in the preparation of any great legislative measure for the education of the English people.”

Pillans was plowing the ground to sow government schools. The monitorial schools being pushed by Brougham, et al, were the entering wedge for government control (and through the government, change-agent control) over the education of the public’s children.

After this, Dunn went on at length on the training of pupil monitors. Failure was to be laid at the foot of the teacher who had not properly prepared the monitors! With such numbers of monitors and students, the “planning” and supervision was clearly as impossible as the method itself, but Dunn’s wordy advice sounded so learned. It was the standard education activists’ approach so evident in any education “reform:” in actual practice, abuse the teachers as well as the children.

Gallaudet went to the trouble to publish an edited edition of Dunn’s work in America, and most probably it was this work. Yet no intelligent and right-thinking person could have promoted such worthless material, any more than the Scottish Schoolmaster would have done! As Dr. Alcott and other sources made very clear, Gallaudet was a very energetic government-school activist, both during and after he left his work with the deaf. Gallaudet’s promotion of Dunn’s work suggests Gallaudet was no different from the rest of the activists.

In Letter IV, The Monitorial System, Dunn said (page 46 and following):

“The most obvious advantage which the monitorial plan possesses over all others, is, without doubt, the greater facility which it affords for the maintenance of order and good government, by securing at all times the regular and constant employment of every pupil. It is equally evident that the amount of knowledge imparted in a school where the pupils are constantly occupied, will be very much greater than it can be in one where every thing having to be managed by the teacher, aided perhaps only by a single individual, a large proportion of the children must, during many hours of the day, be comparatively idle....”

“Constantly occupied” was a theme which was promoted over and over as a presumed virtue of the monitorial schools.
“But this is by no means the extent of benefit which may fairly be claimed on its behalf. Monitors are in some respects better teachers than adults; they sympathise more readily with the difficulties of the pupil; they are more patient in imparting knowledge, and more fertile in expedients for explaining and illustrating it: they communicate with more facility, and, learning while they teach, they willingly undertake an amount of labour, [which] would be to an adult intolerable drudgery. As subordinate instructors they are far superior to adults....”

In a footnote on pages 46 and 47, Dunn said:

“Father Girard, the benevolent founder of the system of mutual instruction in Switzerland, told Mr. Woodbridge, when examining his school, that when he met with difficulty in explaining any word or subject to a child, he had often called in a boy more advanced, to aid him, and had usually found him succeed entirely, even when all his own efforts had failed.”

Dunn then gave a similar anecdote from Wood’s monitorial school in Edinburgh concerning a mathematical example and said Professor Pillans “bears similar testimony.” Dunn finished by saying:

“The experience of the Central School in the Borough Road is precisely of the same character.”

Dunn said on page 58 that his material was not intended:

“...to occupy the place of any existing manual for the regulation of monitorial schools. Otherwise much would have to be added on other subjects, besides the selection and training of monitors.... But for these and various other matters of detail, highly important as they are in themselves, and intimately connected as they must be, with the general efficiency of a school, it is sufficient to refer you to the authorized publications of the two societies.”

The “two societies” were Lancaster’s unsectarian Royal Lancastrian Association of 1810 that had been renamed the British and Foreign Schools Society, and Andrew Bell’s 1811 The National Society for Promoting the Education of the Poor in the Principles of the Established Church Throughout England and Wales.

Yet the noisy din in the monitorial schools could not be denied. Dunn turned the noise into a seeming virtue, by indicating that it demonstrated that the children were “constantly occupied.” He said (page 59 and following):

“One objection, however, which is continually made against monitorial schools, deserves a passing notice. It is a matter of frequent complaint, that they are so often scenes of noise and of tumult. That this is a very serious evil cannot be denied, tranquility and quietness would certainly be far preferable, if they could be attained without too great a sacrifice of time and improvement. But the truth is, noise is inseparable from the united employment of numbers, and there is no remedy for it, but dispersion or listless indolence. A quick eye and ear will soon distinguish between the activity of business, and the irregular action of idle conversation....”

Dunn made a bow to Dugald Stewart and his ideas. (As previously shown, Dugald Stewart, along with Brougham, had been cited as a supporter of Wood’s Edinburgh monitorial school.) On pages 61 and 62, Dunn used the phrase, in quotation marks, “to cultivate his original faculties,” and after the quotation put this footnote:
‘The business of education.’ - Dugald Stewart.”

This, of course, can refer to “teaching” comprehension, which is an oxymoron. In a footnote on page 63, Dunn said:

“Probably it is no exaggeration to say that the appetite for knowledge is as great as any bodily appetite. To know is one of the strongest desires of childhood; to obtain a new word is pleasant, and to gain a new idea is pleasanter still; but to be crammed with words without ideas is very painful.”

Without explicitly condemning the old “sound” spellers which contained thousands of words, Dunn had done so in principle, following a vague quotation of Stewart’s about “cultivating” faculties.

Dunn quoted directly from “Mr. Crossley, the able superintendent of the Central School,” whose remarks on training monitors for teaching reading over-emphasized the “meaning” of words in context and their precise definitions.

On page 66 through page 84, Dunn discussed the alphabet, spelling and reading. His comments were a total endorsement of all of the change-agent ideas which had replaced “sound” in learning to read with “meaning.” In the section, he referred approvingly to Wood, Pillans, Jacotot, Parkhurst, Thayer, and to the Manual of the System of Primary Instruction, “pursued in the model-schools of the British and Foreign Schools Society.”

The Schoolmaster in two volumes was published by Knight, Ludgate Hill (England), before 1836, and was mentioned on pages 70 and 71 of Dunn’s book. He said it contained American lectures, one by Thayer at the formation of the American Institute of Instruction in 1830. Dunn said Thayer, like Parkhurst in his book, The Teacher’s Guide, said that words:

“...to be spelled should first be embodied in reading lessons, and afterwards arranged in columns; and both insist that the evidence of their being possessed by the pupil should in all cases be rendered in writing.”

The new “written” spelling like the new teaching of whole words only in story contexts for hearing children did away with the age-old spoken drill on sound and syllables. (That was also the kind of “reading” and “spelling” taught by Gallaudet to deaf-mutes). Dunn quoted Thayer’s promotion of such written spelling, presumably in 1830, at the formation, under Holbrook’s guidance, of the American Institute of Instruction:

“It may be said, the eye remembers. It is more attentive than the ear. Its objects are not confused. It takes in a single and perfect image of what is placed before it, and transfers the picture to the mind.”

All the authorities that Dunn quoted in 1836, like Thayer and Parkhurst, were consistently pro-“meaning,” and anti-“sound” in the teaching of beginning reading.

Dunn said further:

“See also, on this subject, Wood’s Account of the Edinburgh Sessional School. To Mr. Wood the cause of education is deeply indebted. He was certainly the first to call public attention to the importance of giving a more intellectual character to popular education; and by his unwearied exertions in the Sessional school he demonstrated the practicability of it.”
The “intellectual” character in Wood’s school was the harping on word “meanings” to the exclusion of “sound.” No mention was made, of course, of the negative evaluation of Wood’s Sessional School by men like the Scottish Schoolmaster. He had personally visited Wood’s school twice and was supremely qualified to comment on its relative achievement after his own 30 years experience teaching elementary school children.

Dunn described on pages 71, 72 and 73 the content of the Manual of the British and Foreign Schools Society:

“The plan pursued at the model-school in the Borough Road, which plan is fully explained in the Manual of the society, is perhaps the best that can be devised.

“The spelling lessons, which are printed in both roman and italic type, to exercise the children in reading various characters, exhibit a two-fold arrangement. The names of things are arranged under various heads, such as trades, measures, vegetables, quadrupeds, clothing, fruit, medicine, flowers, birds, &c.; and columns of other words are placed alphabetically.”

Note that the “category” arrangement had been followed by the first Franklin primer of 1802, by the Columbian spelling book of 1819, and by the 1826 Franklin primer. Although it had been very rare in beginning reading materials, that same “meaning” method in beginning reading then turned up in the society founded by Lancaster in England as the replacement for Lancaster’s own very different “sound” approach Lancaster’s “sound” approach may have been dropped not long after Lancaster, himself, was dropped. The use of the category approach had probably been justified as a Pestalozzian concentration on sense objects. Yet Pestalozzi himself had taught the syllable “sound” approach, even using a ridiculous over-emphasis!

Dunn continued:

“The last fifteen lessons of the set consist of a selection of words, approximating in sound, but differing in spelling and signification.”

The first arrangement had emphasized meaning (categories) and the second had emphasized meaning (alphabetical order). So did the last also emphasize “meaning” by its implicit message to DISREGARD sound, since words making a similar sound were spelled in different ways, for which no rationale was apparently given. Dunn continued, concerning the last list:

“They embrace the principal orthographical irregularities of the language.”

Dunn then summarized that spelling book:

“The whole set consists of sixty folio lessons, containing, besides four alphabets, nearly six thousand words, selected primarily for the purpose of communicating a complete knowledge of English orthography, and revised with the design of including a very extensive range of useful knowledge, and inducing habits of observation and inquiry.”

Note the buzz-word, “useful knowledge.” “Six thousand words” suggests the “meaning” speller was probably a little over a hundred pages long, which was more or less the norm for the “sound” spellers that this “meaning” speller was attempting to replace. Dunn continued:
“The plan of teaching is invariable throughout the series; the pupils are expected to spell, read, and explain every word. Suppose, for instance, the word to be “he.” The first boy would say, h,e - he; and the second boy would, without giving a regular definition, express his sense of its meaning. He may be supposed to say, “him,” or “not me;” or, putting it in a sentence, say, “he is here.” Any answer which indicates a knowledge of the word should be accepted, however homely either in language or illustration. The same remark applies to all the definitions they give: if the idea be correctly received, repeated demands for explanation will soon lead to more suitable language and more correct definitions. The two principal points to be attained by the pupil are, the comprehension of the meaning of the term, and the power of expressing that meaning in suitable language.”

Constantly asking a five- or six-year-old child with normal intelligence and hearing to define words like “he” is not only ludicrous. As discussed elsewhere, it might interfere with automaticity in the use of already acquired language.

“The meanings of the words in the alphabetical columns, which are generally derivative, the pupils learn by being exercised in separating the prefixes and affixes, and then tracing the root through other combinations. For instance, the word, ‘retrospective,’ the monitor would say, ‘Separate it;’ and the boys would reply retro, behind, spect, look, and tion, act or action.”

I could not now do this, even as an adult. It is reminiscent of the “vocabulary” work weighing down our “readers” which are turning out illiterates today. Children waste - quite literally - the time which should be engaged in necessary learning (which is - also quite literally - the acquiring of conditioned reflexes). It sounds highfaluting, however, and this fakery was and is used to crowd real learning out of the schools - both then and now. Teaching poverty-stricken children this esoteric material in the Borough School, without teaching them to read independently, was as monstrous then as “whole language” is today. The excerpt continued:

“He would then say, ‘What is the meaning of the word retrospection’ and he would ask for other instances in which the root occurs. In-spect, pro-spect, spect-acle, circum-spect, re-spect, and other words would be given.”

After citing this monstrous excerpt, Dunn continued:

“The advantages of this system of interrogation are numerous and weighty. It teaches even the youngest child to apply every word as it is brought before him, from his earliest acquaintance with a written or printed language. It leads the mind direct from the words to the legitimate use of them, the communication of ideas. By inducing the child to draw on the resources of its own mind, it teaches him to compare, to discriminate, to judge; a process by which he is rendered capable of far greater mental exertion. It necessarily insures a habit of observation and scrutinizing inquiry; it occasions close application; and it constantly calls upon the master rather to restrain than to excite.”

Thus did the propaganda run.

However, the acts of comparing, discriminating, and judging are done in the higher brain mechanism, and the higher brain mechanism cannot be conditioned, or taught. Such interrogations were therefore not “teaching” anything, any more than the endless “reading comprehension” exercises of today teach anything.
It is true that it is probably possible to strengthen the generalized power of the higher brain mechanism through use, just as muscles and other parts of the body are strengthened through use or atrophied through disuse. This appears to be confirmed by recent experiments with rats in enriched environments. Yet such dreary and boring “meaning” exercises would disgust children rather than stimulate them to make prolonged use of the reasoning powers of the higher brain mechanism, as the enriched environments apparently do for the rats.

However, a clear distinction should always be made between that purely physical organ, the brain, and the non-physical mind which operates through that brain. A mountain of nonsense has been written over the past hundred and forty years or so, and is still pouring from the presses from “distinguished” scientists, which tries to equate the mind with the brain. None of the attempts has ever been even remotely successful. The brain is, after all, just another physical organ of the body like the stomach or the spleen, but with a different function.

Dunn’s dismal 1836 book establishes that, some time before it was written, the Lancaster “sound” beginning reading approach had been replaced by the “meaning” beginning reading approach in the schools that Lancaster had founded. Yet even the French monitorial schools when they were founded in 1815 had used a partial adaptation of Lancaster’s “sound” tables: words learned solely by letter length, after a “sound” introduction. Did Lancaster run afoul of the “experts” after about 1815 because he refused to throw out “sound” for “meaning” in beginning reading? Is that really why Lancaster was dumped? Andrew Bell who had founded the National monitorial schools made an almost direct and enigmatic about-face on the teaching of beginning reading, from “sound” toward “meaning,” sometime between 1808 and 1823, and the record shows that Bell was emphatically not dumped. It does make one wonder.

Dunn stated the following on page 75, under paragraph 81, again endorsing “meaning” and openly dumping “sound” for beginners:

“(1.) Take care that the pupil thoroughly understands that which he is directed to read. This is absolutely essential to his success. If he do not fully comprehend the thought, how can he be expected adequately to express the language in which it may be clothed? Attention to this point is just as important in the lowest as in the highest class. Indeed it is there (in the lowest class) that the habit of fully comprehending in the mind that which is presented to the eye, must be formed. The great evil of putting before children unmeaning combinations of letters, such as “bla, ble, bli, blo, blu,” and all the rest of this ridiculous tribe, is that in reading them, a habit is formed of separating the sight and sound of words from sense, a habit which frequently cleaves to the mind long after the days of childhood have passed away. If, therefore, you would have a sentence well read, read so as to be understood and felt by the hearer, take care that the reader himself both understands and feels it. The progress of your pupils, too, will by this means be greatly facilitated. ‘He who is taught the habit of carrying the sense along with the sound, is armed with two forces instead of one, to grapple with the difficulties he encounters; the one, his knowledge of the letters and syllables, and the other, his knowledge of the story.’"

Note that the child had been given a “story” to read, and not what was once read: his prayers and the Bible! Dunn’s footnote showed that the quotation was from Pillans.

On page 77, under 84. (4), Dunn said:

“Do not permit too much to be read at one time. A good teacher can profitably occupy twenty or thirty minutes over a page, without at all wearying his children. He will often have to say, ‘I perceive you do not quite understand that passage; read it again.’ Then he will require definitions of the leading words, their synonyms and their opposites; then perhaps he will have the sentence
analysed or paraphrased; and after this, he will thoroughly explain every incidental allusion, whether geographical, historical, or biographical, which may be involved in the passage. All this, it may be, must be done before that which is read can be thoroughly understood; ...until it is understood it can never be properly read.”

On the fake “meaning” basis again, Dunn was throwing out the lengthy practice that was necessary for children to establish automaticity in their reading skills. The long practice selections used previously were being replaced by endless classroom “meaning” drill on reading selections as short as a page. The enormous shortening of reading practice which Dunn recommended in England in 1836 had also been recommended a few years previously in America, as described elsewhere.

Dunn stated on page 77 and following:

“Intimately connected with the point which I have been urging, is the practice of interrogation; the object of which, when rightly conducted, is two-fold; first, it ascertains satisfactorily that ideas, in distinction from mere words, are received by the pupil; and, secondly, to afford opportunities for the communication of incidental instruction.”

Dunn referred to “Miss Hamilton’s” telling of a man who, in childhood, mistook patriarchs for partridges “and to the latest day of his life, he could not get rid of the association.” Dunn said:

“Now there are two methods in which this tendency to misconceive the meaning of words may be met; and both must, as far as possible, be brought to bear upon the evil.

“The first is, - VISIBLE ILLUSTRATIONS. Wherever the subject will admit of it, there is nothing equal to this kind of explanation. You will recollect an observation made some paragraphs back, ‘the eye remembers.’ It might also be said (although of course comparatively and subject to exception,) the eye makes no mistakes....

“Among the subjects which admit most easily of being explained by objects of sight, might be mentioned the various branches of natural history, and the physical sciences generally. In some of these the object itself can be called in, and in others detached portions of it. In the absence of the object itself, or any part of it, a model, a graphic representation, an outline, or a diagram, will suffice; but something of the kind must, if possible, be presented. Hence the importance of schools being provided with specimens of as many different things as possible, and of children being taught to cultivate habits of observation and inquiry. It is in many respects of the highest importance to teach children to discern the most minute differences and resemblances in objects which they can examine; the eye, the ear, the touch, the taste, the smell, should all be educated, by exercise on a great variety of objects. If the perceptive faculties be not carefully cultivated, it is impossible that....” [Etc.]

Dunn was promoting not just object lessons but “natural history,” just as had been done by others in America with questionable (probably anti-religious) motives, despite the obvious high value of the content. Yet Dunn presumed to limit sensibly the teaching of “meaning” in science, since he said on page 83:

“...it is a great mistake to involve him in the intricacies of the solar system, to talk to him of orbit and gravity, parallax and disturbing forces, or even of ecliptic, equator, and meridian, at an age when his mind cannot possibly go beyond the figure on the map or board, and when the planetarium itself, if there happen to be one, is to him nothing more than a plaything. To set children a chattering about oxygen, hydrogen, caloric, and all the mysteries (as they must be to
them) of modern chemistry, is education run mad; and, in truth, no less to be deprecated than the opposite extreme of the no-meaning system.”

At this point he showed a footnote, “Letters to Kennedy” which were written by Professor Pillans, presumably because of the phrase, the “no-meaning system.” Dunn went on:

“And even if understood, such knowledge is little worth. The mere accumulation of facts in the memory is of trifling value, if unaccompanied by the development and training of the faculties. A mind filled with the results of other men’s research, and unacquainted with the steps and processes of the proof, may, as Beattie remarks, fitly enough to be compared to a well-filled granary, but bears no resemblance to the fruitful field, which multiplies that which is cast into its lap a thousand fold.”

All of this sounds so well-meaning, and certainly little children should not be burdened with material which they are incapable of understanding. Yet Dunn’s over-all view in the last paragraph above concerning the acquiring of general knowledge is only a paraphrase of Stewart’s earlier appeal for the drowning of the books. An empty head, devoid of any knowledge except that which concerned the learner intimately, was quite literally considered by Stewart to be better than a head filled with massive and intricate knowledge of history, geography, world events, and everything else appropriate for an educated person. When Stewart’s and Dunn’s proposals are stripped of their philosophical packaging, they can be seen for what they are: astonishingly destructive.

Dunn continued on page 84:

“Having thus, briefly laid down the general plan on which you should proceed, in your endeavour to make that which is read fully understood, both by interrogation and illustration, I cannot do better than recommend you to study, as an exemplification of the principles I have endeavoured to enforce, a specimen of this kind of teaching, as it is actually carried on in the Borough Road School. You will find it in the Appendix. It is an extract from the Educational Magazine, and was drawn up for the work by the editor under the title of “A Day at the Borough Road School.” This specimen, relating, as it chiefly does, to the impartation of scriptural instruction, will not be unacceptable to Sunday-school teachers. They will see how diversified instruction may be, without at all losing its religious character; and they will feel, I trust, more than ever, that in order to do children good, it is necessary to interest them.”

Note John Dewey’s “interest” theme in 1836! By the time this was written, by 1836, with a second edition of 1837, the failure of children to be able to read independently in Great Britain, as in America, must have become very apparent from Bell’s work from at least the early 1820’s, from Wood’s work from probably before 1826 and certainly from before 1828, and from Dunn’s imitating Wood probably at least from January, 1829. Yet the glowing claims continued: “meaning” was a more effective approach to teaching beginning reading than “sound.”

Another book corroborating the influence of the trans-Atlantic change-agents was published a year before Dunn’s 1836 English work. It was by the American, Theodore Dwight, Jr, who had been cited in Dunn’s 1836 book as an American “authority.” (Dwight was possibly the son of Reverend Theodore Dwight who had been president of Yale in 1798, and, as such, would have been in an influential position.)

In Dwight’s text on school practices, he promoted the “meaning” approach in beginning reading. Dwight was also a member in good standing of the change-agent “mafia,” as will become apparent. The title of Dwight’s book was The School-Master’s Friend, With the Committee Man’s Guide, New York: Roe, Lockwood, 1835. With the reference to the “Committee Man,” Dwight made it evident that he had
aimed his comments at the government school group in America, while Dunn had aimed his at the Sunday schools and the religiously-sponsored schools in Great Britain, which fell increasingly under government control.

Dwight’s publisher, Roe, Lockwood, had apparently been a publisher of “meaning” approach materials in reading instruction for some years before 1835. They had a ninth edition in 1831 of Introduction to American Popular Lessons “By the author of American Popular Lessons” which higher book they presumably also published. They also sold The First Book of Primary Lessons by the same author, who is shown elsewhere as Eliza Robbins. From the title of this lowest book of Robbins, her reading series was presumably “meaning” oriented since the title does not suggest it was a speller. With the third title, American Popular Lessons, Eliza Robbins had obviously written a three-level reading series published before 1831 for the same publisher who put out Dwight’s work in 1835.

Dwight himself wrote the New Picture Primer and Table Book, or, The Child’s First Book in Spelling, Reading and Rules of Arithmetic, For Primary Schools and Families. It was a mere 35 pages long and was probably really meant only as a “toy” book for sale to families. It contained some spelling by analogy, but was far too sparse on “sound.” His primer rates only a Code 3. On page 21, Dwight had a child say, “I must know what the words mean. Then I can know how to sound them.” That comment plus the over-emphasis on pictures showed Dwight’s philosophy. A copy of his primer which was published in 1841 at New London survives at Harvard, but his New Picture Primer was very possibly originally published some years before 1841.

According to Blumenfeld, Dwight had been on the committee for the original American Lyceum organized by the arch-activist, Josiah Holbrook, in May, 1831.

Samuel Seton had been another member of that original activist committee, and had written a guide for infant school teachers in 1830, The Abecedarian, which was unbelievably bad. Seton recommended methods for learning the alphabet which would probably have resulted in some children being permanently unable to distinguish one letter from another. Like Dwight, Seton also endorsed the “meaning” approach, saying, “When learning the letters, the child may be taught to pronounce syllables and words at sight. * This exercise will be found very useful when connected with pictures of the object named.”

*“ Hazen’s Symbolical Primer is well adapted to this purpose.”

Edward Hazen’s primer which had been finished only the year before in 1829 was a straight Code 1 book, and the first purely picture-word primer in America and very possibly the world. Jonathan Lamb’s picture primer of 1828, The Child’s Primer or First Book for Primary Schools, had been far from that extreme. The sudden emphasis on “pictures” in beginning reading books published by 1828 and 1829 confirms, of course, that an intentional move had been made from “sound” to “meaning” in beginning reading before 1828, at whatever date the writing of such “picture dictionaries” first began to be considered.

In Henry Dunn’s book, he had referred to “Dr. Dwight,” but whether Dwight eventually became a physician, as Alcott had done, is unknown. Purely academic doctorates were reportedly not granted in America at the time, and ministers with advanced degrees were apparently referred to as “Reverend,” not “Doctor.” A parallel appears between Dwight and Alcott: both had been schoolmasters, and both apparently later became physicians.

Pertinent sections from Dwight’s book, particularly concerning “correct” reading methods, follow:
“Preface ... The schoolmaster also feels many discouragements, arising from the indifference with which education is regarded by the people, the want of respect towards his profession, the inadequate pay generally afforded, the inability of advisers, and the ignorance of those who are to pronounce on his qualifications and success.”

This statement of Dwight’s and other statements he made confirmed there was no swell of public interest for government schools in 1835, outside the change-agents’ clique. When reading his alarmist comments, the demonstrated high literacy in America up until that time should be kept in mind. The American public was already highly literate before the “push” began for public schools in 1826, and they remained generally indifferent to the change-agents’ promotion of government schools to replace existing private schools. Dwight confirmed this indifference further on page 8:

“...so long as our people remain so generally ignorant and indifferent concerning common education, they will offer teachers little encouragement to improve.... Incompetent teachers and an ignorant and indifferent public might go on to any extent degrading each other.

“It has been proposed to form seminaries for the education of teachers for common schools, and a few exist in different parts of the country. But their influence is likely to be feeble for some time to come; and they are not conducted with any uniform views concerning any fixed system of education appropriate to our circumstances. The author, having labored for the establishment of a central seminary for teachers in the City of New-York, and having seen something of the obstacles which may delay the formation of such an institution in this country, even after the necessity of it has been admitted, has determined to present to teachers, and others interested in common education the following little volume. He has endeavored to embrace in it, small as it is, such plans, facts, hints and examples as he deems particularly important to be generally known, with the hope that they may prove useful, by being immediately applied to practice by those who are this year engaged in directing or conducting common schools in the United States.

“Teachers of private schools may also find this work not uninteresting to them.... The author has been a school-master, and felt the need of friendly advice....”

Dwight then made a comment that suggests he had also been in some kind of supervisory position over schools in New York, just as Alcott had been in Connecticut, again suggesting Dwight’s access to influence. Teachers normally have no opportunity to observe other teachers working, because they are all isolated in their own classrooms. Only supervisors normally have the opportunity to observe teachers at work. Dwight said on pages 10 and 11:

“He has often observed young teachers, and seen them assiduously endeavoring to make good schools. He has conversed with them and heard them inquire for better methods than their own. He has heard them lament the apathy of parents, and others around them.......”

“The author has also witnessed some of the difficulties which lie in the way of those who have the general oversight of schools, as well as of the friends of knowledge at large, and the great majority of parents....

“The French Minister of Instruction officially stated, in 1832, that ‘very few primary teachers, who came from the new normal schools, had learned the secret of good methods and the principles of a national education;’ and that therefore, ‘most of them need direction in their studies and efforts. Without it, their zeal diminishes, and a sad routine becomes their last resort, and thus ignorance is maintained and propagated by the very persons who are appointed to combat with it.
“Citizens are called to the oversight of schools, who have had no special studies to prepare them for the duty. It is a great sacrifice on their part to take time from their own concerns and business to devote to such an object: it is therefore the duty of the government to furnish them precise instructions, that the oversight of schools may be more easy for them, and of real benefit to education.”

Dwight was unhappy that America did not yet have government normal schools in 1835, where teachers could be taught all the “correct” ways to think about things by change-agents, who themselves, of course, always thought “correctly.” Our first government normal school was founded in 1839, after which such schools rapidly multiplied. Yet England had already progressed to that elevated “normal school” condition since Dunn’s school, although not officially a government school, had turned out almost 500 “correctly” educated teachers by 1836. France, however, except briefly during the Revolution, had stumbled along throughout history pretty much deprived of such “correct” government guidance of primary teachers’ thoughts. This was despite the fact that the Revolution had produced a functioning government normal school during the Revolution, all university degrees were granted under government control, and all primary education had technically been under government control since the Revolution. Now, however, France was finally setting things right, since the government was once again promoting normal schools and finally acknowledging its “duty” to “furnish... precise instructions” to those charged with supervising the primary schools and the primary teachers in them. Yet Prussia had long since acknowledged that “duty” and for a long time had been turning out instructors who thought “correctly” according to the government “experts’” definition of correctly, as later comments by Dwight demonstrate. The change in France was undoubtedly at least partly due to the change in power in 1830, after which those who had been active in the French Revolution were once more in good favor.

However, there are other ways to train teachers to think “correctly” than by attendance at normal schools, which is not financially possible for many people. In America, the teacher’s institutes, which were held during released time or during the summer, became the pipeline for transmitting “correct” thinking to teachers. They were often followed by examinations to “certify” teachers to see if the “correct” thinking had sunk in. Teachers’ later employment often depended on passing such tests. France, however, found another way besides its normal schools and its overseers to transmit thinking which was “correct” according to the government and its in-house “experts.” Dwight described it as follows on page 11:

“The king of the French approves the views of the minister, and authorized the publication of a monthly magazine on Primary Education. This work has afforded the author information on many points touched upon in this volume.”

The government newsletter was a fine medium to transmit “correct” thinking. Dwight said he had read the newsletter and other works, and had:

“...consulted various other works, including the most approved school-books of our own and other countries, as well as publications of other kinds, relating to education. He has at the same time resorted to other means, for ascertaining the opinions and practices of individuals engaged in directing and conducting instruction at home and abroad, and endeavored to introduce into this little book what is most likely to prove useful to practical persons.... The author’s intention has been to give the reader an interesting and plain view of common education, in its present state in this country, and the means by which it may be most readily and permanently improved....”

Dwight said on page 13:
“School-masters are highly valued in Prussia, Holland, Switzerland and France, and in other countries of Europe are held in esteem in proportion to the regard in which common education is respected. In Prussia, where late improvements in schools first began, the teachers, sixty years ago, were poor, despised, and half paid. Many of them were men who had failed in other kinds of business, through ignorance or bad conduct, and could not obtain employment in anything else.... Some sensible and benevolent men, seeing the evils of having the young bred up in ignorance, under the influence of vicious examples, took measures to encourage the most intelligent and virtuous to remain in the profession, and to render them still more competent for it. A school was soon established by funds contributed for the purpose, to give them instruction; and although the progress of these improvements was retarded by prolonged and bloody wars, such institutions have been very numerous, and now furnish about three quarters of the teachers who are wanted for vacant schools. The benefits have been far greater than any one probably anticipated. The Prussian schools are so good as to be regarded in a great measure as models for other countries of Europe; in several of which schools for teachers have been in successful operation for some years, with similar success.”

Note the private group activity, not initially official government activity, which was the original cause of the official Prussian government normal schools: “Some sensible and benevolent men... took measures...” Along with the normal school of the French Revolution, these “sensible and benevolent men” were the root of all government normal schools, which are now ubiquitous in the Western World, (Presumably those privately organized men were like the “sensible and benevolent” privately organized men in the Carnegie foundation today who are working so hard, without any mandate whatsoever given to them from the American public, to change American education for what they - but not some others - consider to be the better.)

Dwight said further on page 14:

“The government of France, having seen the importance of elevating school-masters in the respect of the people, and in self-respect, have made them public officers, so far that they cannot be appointed or removed without the approbation and signature of the Minister of Public Instruction. Schools have been established for their education, a monthly magazine and a weekly paper are published for the benefit of them and of local committee-men, arrangements are made for occasional public meetings in small and large districts of the kingdom, money is paid for libraries, essays and books, calculated to promote education.”

All these actions, no matter how good they may have been individually, were also “calculated to promote,” not just “education,” but centralized government control over education. Those men that the government chose to run such “education” programs (or who volunteered to run such programs for the government!) would be in positions to shape much of the nation’s future thinking, and therefore eventually to shape the future nation itself.

On page 16, Dwight continued his sales job for government control of education, but dropped some familiar American names into the discussion, while doing so. The appearance of familiar names resulted from the fact that the influential group which was promoting government education at that time, in America as well as in Europe, was really very small:

“An attempt is made to show briefly the value of good schools to every class of individuals in every society in the country; to persuade persons of every class to do something for this truly common cause.... Books on Education Recommended. The American Annals of Education, a Monthly Magazine Edited by W. C. Woodbridge, Boston; The Journal of Education, do. C. Wines, Princeton, N. J. (Soon to appear); Grimke’s Orations, &c. on the study of the Scriptures;
The District School. By J. O. Taylor, New-York; Hall’s Lectures to School-master’s. [sic] Do to Female Teachers; The House I Live In.” by Dr. [W. A.] Alcott, Boston.”

The names of Woodbridge, Hall and W. A. Alcott occur again and again at critical points as being insiders who were associated in various ways with Holbrook and Gallaudet, while Taylor appears to have been well known but less of an insider. (I have no information on Grimke and Wines.)

Yet Dwight showed that the schools before 1835 when government control was minimal or non-existent might seem very pleasant to many today. He told of the routine daily exercise for the whole school - from near beginners to older children - of reading orally from the Bible. In schools today, many would be unable correctly to read orally from the Bible, and in government schools it would be considered illegal to ask them to read the Bible in the first place!

Dwight showed the following on pages 18 and 19:

“In School. Opening School. The teacher gently rings the bell precisely at the hour. - ‘You will all please to take your seats,’ or, ‘School is open....’ Reading the Bible. ‘Prepare to read the Bible,’ or ‘Take your Testaments. ...Where is the place? What did we read about last? Repeat one of the verses. Have you thought of that passage since? Have you tried to do any thing it teaches? Begin.’ The scholars may read one or more verses each. You may sometimes call on one to read out of order, to keep all attentive. The teacher may read in his turn. ‘Put up your books.’“

The previous quotation is from a section which is actually a summary and which directs the reader to specific chapters. On page 20 appeared the summary of the material on reading:

“Reading class. p. 47. Old plan of teaching to read. p. 47. Learning to read without spelling. p. 51 Do second method p. 55.”

The actual material on reading was in Chapter IV, which began on page 47, with the following sub-headings:

“Reading - Its importance - Difficulties of teaching it - The old method - Other methods - Learning to read without spelling - lst French method adapted to our language - 2d. Another method: learning to read at once - Learning to spell alone - Simultaneous reading.’

Dwight said in this chapter on reading (pages 47 and following):

“There are various plans, founded on different principles. 1st. The common, or old fashioned way, of showing one letter in the alphabet, making the child pronounce it, then the rest in order [and] going though a class one at a time in this manner. This is founded on some good and some bad principles. We remember what we have heard or seen a great many times over; and after seeing a letter and hearing and calling its name over many times, we connect them in our memory. Thus we by degrees may learn the whole alphabet. But this is very seldom liked by children, and it is generally a slow task. The reason is, that each scholar receives but little instruction. If there are four in a class and an hour is employed in this branch, each is taught but fifteen minutes. In a class of ten, each gets only six minutes in an hour. If they are made to attend the whole time, watching over and correcting each other, each may get an hour’s instruction. (And this is a principle that holds ... in all branches, and should never be forgotten... it also helps to keep the children out of mischief.)”
Dwight had made the proper bow to children’s being “constantly occupied,” the theme which was used to justify the tumultuous monitorial schools.

“Books for reading are formed on different plans and have qualities of different kinds. A well qualified teacher may use any of them with great advantage; and make up for their defects by applying... principles in his own way.

“Reading well is a much more simple thing than many pupils suppose. They should be taught to read very much as they should speak, with a natural manner in all respects. By the natural manner they should be made to understand such variants of tones as are proper in conversing, such force of loudness as is necessary for the audience and no more, sufficient slowness or moderation to render what is read distinct and impressive according to [its] importance. At the same time they should be armed and guarded against the errors in pronunciation, tone, &c., which particularly prevail around them, be taught that there is a common standard, and have a clear conception of what it is.”

Dwight carefully avoided the most obvious need the students had. They needed to be taught how to figure out the words by themselves. Yet the fact that most beginning children could no longer read independently by 1835 was hidden because of all the previously stated “important” facets of reading. The instructors by 1835 were reading everything out loud first so that the children would know the right tones, etc. The children were therefore being taught pure “sight words.”

Dwight went on confusing simple reading with elocution, just as today simple reading is wrongly equated with “comprehension”:

“Now, on all the points just mentioned, there are very erroneous ideas. Children are rarely preserved from them without difficulty. Some of them can speak very well, who drawl, or scream, or fall into an intolerably monotonous style as soon as they begin to read. Indeed a great part of the difficulty [in] making good readers generally is the correction of faults already acquired, or false notions which are usually derived from the example of others...

“The child must be at his ease, in body and mind, or he cannot read with advantage. The exercise is partly intellectual, partly physical and it might be added, partly moral....

“Familiar lessons should first be used in reading and the more familiar the better. Even sentences composed by the scholars themselves, corrected if they need it by the master, may well serve for [early] lessons. Children should first be made to read [what] they understand, and something that relates to their own circumstances, and interests their feelings. They will then have the same advantages in reading which they have in conversation.”

Obviously, Dwight was giving the children little independent practice in decoding. The following shows very clearly that the “reading” lessons of which he was speaking were not lessons in decoding print, but in elocution.

“It is a very good practice to introduce exercises in reading, with reading slowly, distinctly, and [all] together a few words or lines.... It may be made a rule for the class always to begin with reading simultaneously the first two lines on the page... or the first two or three of the lessons. The teacher may wish a little more information on this subject. The way of reading in this simultaneous manner is very slow, a pause being made after every word. All speak as nearly together as possible, on one tone.... The teacher may train their organs still more, by requiring them occasionally, by signals to vary their voices, now to the high pitch, now to the low pitch, or
even a whisper. The exercise is not agreeable to the hearer.... It should not be practiced too often or too long, for fear of leading to the habit of too loud or monotonous reading...."

Compare this 1835 advice on teaching reading to Dr. Alcott’s reports of reading lessons he had observed about 1830, described in Chapter 19. Dr. Alcott deplored the fact that little American five-year-olds read many long lists of words independently every day, and that a girl of about nine years was accustomed to read two whole pages or so of difficult material independently and alone each day. He admitted - and deplored - the fact that most children about 1830 covered large amounts of reading material all by themselves, with little or no time spent on elocution or “meaning.” The “new” way was to drill whole classes, over and over, on sections as short as a paragraph or even a sentence to promote elocutionary tones and “meaning.” A la William Scott Gray in the 20th century Scott, Foresman series, the “new” method was to question the children endlessly on these little snippets of reading matter that they repeated over and over and over.

To my knowledge, no public attention has ever been drawn to this enormous fakery in place by 1835 of replacing real reading instruction and practice with wheel-spinning and useless activity. The change from meaningful reading practice (“sound”) to elaborate fakery (“meaning”) was promoted by change-agents on both sides of the Atlantic. The change appears to have started in the early nineteenth century, to have been institutionalized in America in 1826, and to have been in full and rank flower by the 1830’s on both sides of the Atlantic. Along with other “experts” in what appears to have been a consciously cooperating group of change-agents, Dwight and W. A. Alcott (and Alcott’s cousin, Bronson Alcott) in the 1830’s were throwing out the lengthy “sound” reading practice on which automaticity in reading is built. They did it on the fake grounds that they were promoting “meaning.” In its place they recommended what amounted to a lot of gargling exercises to “train” children’s “organs” (“elocution”) and hosts of pointless questions on the “meaning” of simple, self-evident material.

Dwight referred in 1835 to the fact that teaching reading by “meaning” had also been recommended recently in France. He wrote on page 51 and following:

“Learning to read without spelling.

“The University of France and the Deaf and Dumb Institution of Paris have adopted a system for teaching to read without spelling. This has been approved by some very good judges in that country. Teachers and parents in the United States may wish to understand it. I have therefore adapted it to our own language.

“‘Two methods of spelling have been practiced;’ says a French book published in 1834: ‘the old way, in which the common names of the letters are first spoken and then the word pronounced: as es, te i double ef...’

Dwight was obviously spelling, “stiff,” but at this point his pronunciation of letter names and the words they were supposed to spell became completely garbled. He was trying to spell by letter names the three-syllable word, humorous, but either he or his printer, or the both of them, did not read his page proofs. Dwight then tried to show the “new” French way with the same two English words, stiff and humorous:

“The new way is to give the sounds which form the word as [nearly] as possible; and then pronounce the word... as ste, ef - stiff...”

The method he showed was followed in the Code 3 “phonic” books in English for years: a consonant cluster, followed by a phonogram: phony phonics. Dwight then showed how to spell humorous with his
wildly garbled letters. What came through, however, with his spelling by “sound” was that he was also dropping the spelling of each syllable separately, merely reciting the supposed letter sounds all at once. Note also that in his sound “spelling” of stiff the consonant blend, “st” was given as a unit. The move was clearly away from parts and towards wholes. He continued to quote the French writer:

“‘The latter method,’ says the writer, ‘is undoubtedly preferable, but, being convinced that [in] reading, the true elements of words are syllables, [we] have rejected all sorts of spelling: that is, the division of syllables, as a thing calculated only to fatigue the memory of pupils unnecessarily, and consequently to give them a weariness and [disgust] which greatly retard their progress. The only objection against the omission of spelling is, that [it] prevents children from learning spelling and reading together. In answer to this it is stated, that the most distinguished teachers in Paris agree, that [the] spelling exercises without the sight of the words do no good, but greatly retards [sic] improvement. It is argued also, that ‘orthography is much [better] learnt by the eyes than the ears; and that children better receive the image of a word which they [have] often seen, than the composition of one whose letters they have often named.’”

Dwight was apparently quoting his French source inaccurately, but he was correct in the fact that “spelling” had sometimes been dropped in French methods, as has been discussed in the chapter on French history. His comments are of interest, however, concerning the University of France and the Deaf and Dumb Institution of Paris which “have adopted a system for teaching to read without spelling.” The so-called “University of France” was actually the government’s department of education, and the “meaning” method for deaf-mutes was used in the Paris school. French texts which dropped spelling usually did give drill on the sounds of the letters in the alphabet first and then on whole syllables. Their approach was therefore not truly a “meaning” approach, despite the dropping of spelling, but it was a move in that direction. Therefore, by 1834, “experts” in America, Great Britain, and France were all to some extent at least pushing “meaning” approaches in reading over “sound” approaches.

Dwight then gave his version of the French method, “adapted” to English. He began by teaching an incomplete vowel table, and then a consonant table, to be taught by sounds and not letter names. Next came a mixed-up and incomplete syllabary, not to be spelled but only pronounced. He said on page 55:

“After proceeding thus far, the common spelling-books may be used in further experiments with this plan, but without spelling.”

Obviously, his “adapted” approach was a pronounced move to “meaning.” He then compared the first method to his second method (pages 55 and 56):

“To teach reading without spelling. - 2d Method.

“The recommendations of the French plan above given are, lst, that it presents no contradiction to the mind of the scholar. When we say ‘a, be-o, bo, el-i-es-aytch - abolish,” we say what a child cannot easily understand. It is a principle of philosophy that the whole is equal to all its parts. But here there is no equality, and no resemblance between the whole and its parts. When however we say “a-bo-lish,” we say what is intelligible, and apparently reasonable and useful. 2d. The method gives frequent repetitions to the eye and the ear, and constant exercise to the mind. But there is an objection to it, in the want of interest. Children cannot find ready use for what they learn in the first lessons.

“The 2d method is to begin with easy sentences, such as are found in most spelling-books, and go over them much as before: for instance - Having this or some other line written or printed:

-
“The dog sees his master.

“Point at the first word and say The - make the pupils repeat it. Then all the other words one at a time. Then say the dog, &c., and make them point at each word as you speak it, correcting each other when mistakes are made, and always making the missing scholar say it right. Then point at the words out of order, and then speak them out [of] order.

“Afterwards, or at a second lesson, write under [this] line another: - The dog sees his food. After succeeding with this in a similar manner, other [lines] may be used, each with a new variation: - as

“The dog sees a man.
A dog sees the man.
The man sees his dog.
The man calls his dog.
The man sees a wolf and calls his dog.
The men saw the tracks of the wolf.
They called Putnam.
Putnam did not call his dog, but took his gun.”

I have found a curious consistency in many of such tiny primer sight-word “stories” written for impressionable little beginners by such “experts” as Dwight. Although the stupid little selections are so very short, someone is often attempting to kill or to hurt some creature, as “Putnam” who went gunning for the wolf.

“The sooner a story can be begun to be [followed] day after day in such exercises, the better. [It will] interest the children, and they will learn much [faster.]

“The teacher may add writing, and occasionally spelling, to this method of teaching to read.”

What Dwight had outlined with his second method, of course, was Code 1 reading. It should be noted that when Dwight gave his own preference on beginning reading, he opted for his Plan 2, the “meaning” approach.

Like W. A. Alcott, Dwight referred to having learned to read from Webster’s Code 10 speller, and, like Alcott, and Samuel R. Hall who will be quoted later, Dwight found great fault with its use. All three who belittled Webster’s “sound”-method spelling book, W. A. Alcott, Hall, and Dwight, are easily identifiable as major activists who were simultaneously promoting government schools and the “meaning”-method in reading. Webster’s “sound”-method spelling book was also obliquely belittled by Samuel G. Goodrich, without actually naming it, in his child’s “meaning”-method school reader, Parley’s Little Reader of 1836 Goodrich had been the second publisher of the American Journal of Education while William Russell was still its editor, presumably about 1827 or 1828, so, on that ground alone, Goodrich can be identified as an activist in good standing. As quoted elsewhere, in Parley’s Little Reader of 1836, Goodrich clearly belittled Webster’s speller without naming it, with the negative comment about “an old spelling book, on brown paper, with a blue cover and frightful pictures.”

However, Dwight committed an extreme case of over-kill with his fault-finding about Webster’s spelling book, because what he said simply did not square with what his fellow activist, Dr. Alcott, had said about having learned to read from Webster’s speller and about having taught Webster’s speller himself over so many years. In contrast to Alcott’s far more objective (even though negative) comments,
Dwight’s comments are clearly identifiable as emotionally loaded propaganda, which raises an interesting question. Why WERE all these promoters of “meaning” in beginning reading from 1818 into the 1830’s so deadly afraid of Webster’s old Code 10 “sound”-method spelling book of 1783?

Dwight’s diatribe against Webster’s speller and his childhood teacher who had used it began in the middle of page 177 and continued to the top of page 180:

“I well remember a time, many years past, when I sat on a bench in a woman’s school, in the room of a private house, where some hundreds of my towns-people received some of their early impressions against learning; and the thoughts which passed through my mind. I was sitting on a bench with a row of other children, and had Webster’s Spelling-book in my hands, open at one of the pages which I think I should know if I should see one of that edition again. Not a spot or dot on that page did I understand. I understood that it had some thing or other to do with reading, but how I could not conjecture. My teacher once or twice a day would say, ‘b-a, ba, k-e-r, ker, baker:, c-i, ci, d-e-r, der, cider,’ &c. in my hearing, and some of the children would say it again. But of what use that was, or what was to be the end of it, I could not conceive. There was probably something which she knew about it that I did not. O that she would tell me! When might I get out of it? I had been, I know not how long, getting over a leaf or two, and my companions were travelling slowly on the same road - some had got another and another leaf beyond: but those I looked upon as veterans: ‘older soldiers abler than myself’ - I might perhaps have said what I really thought: ‘older soldiers, not better - did I say better?’ If I did I cared not, however, except so far as the whole business related to myself.

“I had got into a job which was to have no pleasure, and no end. I turned over my book. The same aspect, leaf after leaf, leaf after leaf, and I must go over it all! I did not believe that I could go on, I saw no object to be gained, I anticipated nothing but trouble and pain. My back ached, my legs ached, I began to stir. ‘Sit still!’ exclaimed the teacher. Then I found punishment threatened. I felt as a Spanish mountaineer may have done when first clutched by the Inquisition.... There on that bench, I made a solemn resolution for a child of my age: ‘If I am ever a school-mistress, or a school-ma’am, I mean school-master, I will be kinder to the children than she is to us!’

“...This resolution signified much. I determined to rectify an evil if I could, which I felt was not only great and almost intolerable, but extensively prevailing. My school-mates were suffering with me, and we had no advocate as well as no deliverer. I saw that our situation and feelings were not understood. We were thought to be idle when we were disposed to be industrious. I was willing to sit and weave backwards and forwards and mumble over any sounds that might be put into my mouth. We were called naughty and disobedient, sometimes, when we had brought fruit to the mistress, and really wished to love her. We were told we would not learn, when we knew we could not - we did not know how, we knew not what we were expected to do - we had nothing put in our hands as tools or materials that we could find out how to use; and now and then one and another of our sweet little circle was whipped or put to scream in the dark, for doing what we had done, or were disposed to do, or were then innocently meditating; and when filled with terrors unspeakable lest we should be taken next, the teacher would command us all to study, or call us to recite.”

Dwight then left the topic of Webster’s speller and concentrated on the topic of cruel and insensitive teachers. But his emotional baggage had been neatly inserted: it was Webster’s “sound”-method spelling book that was also cruel and insensitive, just like his (probably largely imaginary) teacher. Insincerity sticks out all over Dwight’s anecdote.
The renowned Samuel R. Hall also aimed his blows at poor old Noah Webster’s “sound”-method spelling book. In his Lectures on School-Keeping, 1829, page 20, Hall said:

“Many of the school-books in common use in the country, have been, and still are, entirely unfit for use. To mention one: a Spelling-Book, of very different orthography and pronunciation from the dictionary in common use, is now found in many, and till lately, has been found in almost all the country schools. * Many of the books are not adapted to the capacity of children, or do not present a satisfactory view of the subjects on which they treat.

“But this difficulty is in a degree obviated, by improvement in the character of some of the books designed for common schools. Could all the best books extant, be introduced extensively, great improvement should ensue. It is a subject of congratulation, that much effort is using for this purpose.”

“*As a substitute for this, The National Spelling-Book, by Mr. Emerson, recently published at Boston, may be strongly recommended for adoption.”

Emerson’s spelling book received a full page of endorsements in the advertising section at the back of Hall’s book. Hall’s book had been published by Richardson, Lord and Holbrook of Boston in 1830 but Hall had completed it in Boston in August of 1829. (The Holbrook in the company name was not Josiah Holbrook.) The dictionary that Hall said was “in common use” in 1829 was Walker’s, not Webster’s. Yet Noah Webster has been quoted elsewhere in this history to the effect that he found Walker’s dictionary to be the very worst English dictionary in existence! Nevertheless, as late as the 1870’s, the “experts” in Boston were still rejecting Webster’s dictionary spellings!

On page 21, in Hall’s “Lecture II,” appeared the following footnote:

“Teachers and School Committees would do well to examine the articles of apparatus prepared by Mr. Josiah Holbrook of Boston, and for sale by most of the booksellers in that place. They are ingenious, simple, and not expensive. With the aid of them, every teacher might be qualified to give his pupils interesting lectures, upon the most useful principles in Geometry, Mechanics, Astronomy, &c. They are furnished at so cheap a rate as to be within the means of almost every school district.”

Hall was endorsing Holbrook’s and Emerson’s materials, just as every change-agent seemed to endorse every other change-agents’ products. Josiah Holbrook later had an apparatus company which survived for many years.

The publishers of Hall’s book, Richardson, Lord & Holbrook of Boston, were selling many other change-agent books besides Hall’s. Advertised in the back of Hall’s book were other publications of Richardson, Lord & Holbrook, including Boston Reading Lessons for Primary Schools, 5th Ed., a terrible “meaning” text which had already been adopted by Vermont, as well as B. D. Emerson’s The National Spelling-Book with a great number of recommendations. The company also sold Emerson’s An Introduction to the National Spelling-Book, “Just Published” “calculated for Primary Schools,” and Pierpont’s The National Reader. Also just published was an introduction to Pierpont’s National Reader. The company also sold Goodrich’s Outlines of Geography (not Samuel G. Goodrich), Rensselaer Bentley’s American Instructor and Word Book for Use After the Spelling Book with many New York state recommendations, and Pierpont’s The American First Class Book. (See Appendix B for entries on Bentley’s and Pierpont’s books.)
As these final three change-agent texts demonstrate - Dunn’s in England and Dwight’s and Hall’s in America - by the mid-1830’s, the “sound” approach in beginning reading had been replaced officially by the “meaning” approach. The “meaning” approach was not to be seriously challenged again until the early twentieth century, despite abortive efforts in both countries to do so in the mid-nineteenth century.
Chapter 21
New Textbooks to Match New Methods and Their Results

Textbooks published after 1826 show that the “experts” of that period had increasingly replaced the “sound-bearing” phonic syllable spelling books (what Keagy had called syllabic spelling) as the beginning books with “meaning-bearing” whole-word primers and readers, which became progressively less phonic with each passing year. The beginning books became critically less phonic after Horace Mann enthusiastically promoted the Reverend Gallaudet’s Mother’s Primer, written in 1835.

Gallaudet drew no attention to a fact which is obvious when word counts in his primer are analyzed. That is Gallaudet’s use of a concept which had probably been used by de l’Epee in teaching deaf-mutes, the existence of a “frustration” level for the introduction of new sight words. When the Mother’s Primer is analyzed, it can be seen that most of its selections only used about ten per cent or less of new words, which were embedded in a context of about ninety per cent of previously taught words. Not going below the ninety per cent level of “known” words assures that most readers will not be frustrated in guessing the meaning of “new” words from the meaning of the context as a whole. Example: “Mary had a little lamb, its ____ was white as ___.” This deaf-mute context technique is currently used in our schools with hearing children and is pompously called the “cloze” approach, with no credit given, of course, to the deaf-mute approach.

Reverend Thomas H. Gallaudet wrote his primer for hearing children using his deaf-mute school’s methods. The record suggests he did so to protect “meaning,” possibly being familiar with Dugald Stewart’s ideas as well as de l’Epee’s and Sicard’s. Of course, Gallaudet may at a very early date have read de l’Epee’s book, as well, and de l’Epee himself in his book printed in English in 1801 concluded that the deaf-mute method produced concentration on “meaning.”

Meaning, of course, was Keagy’s primary concern. The reason for Mann’s enthusiasm was the same as for Keagy’s and for today’s “experts”: Mann felt the children would improve what is now called their “reading comprehension” if they learned with this method which concentrated on “meaning” instead of “sound.” What the “meaning” beginning reading method was actually doing was interfering with the formation of proper conditioned reflexes. The activists were forcing children to focus permanent conscious attention on the actual act of reading, which should instead become a totally automatic conditioned reflex. If the act of reading is totally automatic, that automatic act then automatically generates language, the “meaning” of which the conscious mind can either reflect on or ignore.

To confirm the fact that the use of spelling books for beginners was dying out by 1832, Noah Webster himself published in 1832 one of the new primers to precede his own exceedingly widely used spelling book. (His 1783 original version had been revised in 1829, but both were apparently still in print.) Noah Webster’s primer was entitled, The Elementary Primer, or First Lessons... Being an Introduction to the Elementary Spelling Book. If his exceedingly widely used spelling book, which still had vast sales in 1832, was still being bought for beginners as well as for older students, it seems highly unlikely that Webster would have written a primer to displace the sales of his own book.

Gallaudet’s introduction to his 1835 primer also confirmed that spellers were out of use before 1835 for beginning reading, saying:

“The author cannot but hope, that this book will enable many a mother...to go through... the whole art and mystery of carrying a little child from the alphabet, and simple spelling and reading
lessons, to the second book which usually follows the primer. Such a second book, founded on
the same principles with this, the author hopes to prepare....”

The spelling, of course, was now of meaning-bearing whole words, not sound-bearing syllables. The
children were no longer memorizing sound; they were memorizing meaning. However, if Gallaudet ever
produced that second book, no record exists of it (which does not rule out his having done so).

The American Antiquarian Society has an 1832 copy of Webster’s rare The Elementary Primer, three
years older than the New York Public Library’s 1835 copy. The Webster primer is an appalling little
book, and attempts ineptly to teach by sound, trying to mix the new heavy “story” approach with
too-abbreviated phonics lessons. As a beginning book, it is a pathetic substitute for Webster’s spellers,
either in the 1783 or 1829 version. (It is interesting, however, that for the first time Webster used
diacritical marks on his connected texts, which was not true in his spellers where he used coded numbers
to indicate vowel sounds.) Webster wrote the primer, obviously, to protect his market position. With the
antagonism to spellers as beginning books, and with a publication like the Boston School Primer of 1829
as respected competition, Webster went along with the trend and published a reading “primer” by 1832
(and possibly earlier).

By 1847, after his death, Webster’s speller was being published by Geo. F. Cooleage and Brother,
New York, who had previously published materials like The Christmas School Primer Designed for
Schools and Families Containing More Than One Hundred Engravings. The Christmas School Primer
was a mixed-up picture-book mess. On the scale running from meaning at Code 1 to sound at Code 10, it
would rate only perhaps a 3. The Cooleage company also published similar picture-book primers which
are discussed elsewhere in this history. That the use of Webster’s speller as a beginning book was
stone-dead by 1847 is demonstrated by Cooleage’s advertisements in his 1847 The Illustrated Primer, or
Child’s First Book Designed for the Earliest Instruction in Schools and Families. It praised the wonders
of Webster’s speller and its huge sales (about a million a year at that time, if its current publisher, Cooleage,
could be believed) but then also advertised the Cooleage company’s beginning primers to be used FIRST.

By 1847, Geo. F. Cooleage and Brother were also the publishers of John Pierpont’s readers, which
had been an extremely wide-used and widely-known series. The first book of Pierpont’s series, The
American First Class Book; or Exercises in Reading and Recitation, was apparently first published in
1823. (As an interesting kind of footnote, John Pierpont was the grandfather of the famed financier, J.
Pierpont Morgan [1837-1913]. Talent obviously ran in that family).

Pierpont’s readers which had been so highly successful, his “American” readers, had been considered
to be in opposition to the previously widely-used Murray’s English readers. Yet Murray’s English readers
had been preceded by Murray’s speller, a beginning book, and Pierpont’s readers lacked such a beginning
book for many years. As discussed elsewhere, Pierpont’s readers were meant originally to be used only
after a child had learned to read in a speller.

As “change” affected beginning reading after 1826, it finally began to show up on Pierpont’s readers.
In Boston, by 1830, Pierpont had prepared a new and lowest volume, The Young Reader, “To go with the
spelling book.” More time passed, the “meaning” method for primary reading instruction became even
more entrenched, and John Pierpont finally fell completely in line with the “expert” wisdom and finally
dispensed with a speller as a beginning book. That Pierpont did so is shown by the fact that in 1839,
Pierpont published The Little Learner, or Rudiments of Reading, meant to be a beginning book, and it
was only a typical sight-word primer. It taught beginning reading by “meaning” instead of by the “sound”
approach of the old spelling books.
George F. Cooledge had taken over Webster’s speller some time before 1847, probably shortly after Webster’s 1843 death, but Cooledge had kicked it up to the upper grades by selling only the various Cooledge picture primers as the first books for children. Then, Cooledge added to his triumph of taking over the Webster speller by taking over, sometime before 1847, the famous (but by now somewhat outdated) Pierpont readers, which had been turned into a straight sight-word series by the addition of that 1839 Pierpont primer.

Obviously, the Cooledge company was of immense importance in the history of American textbooks. Yet the obvious importance of the Cooledge company in the school book market is mentioned no where, while we hear ad nauseum about the McGuffey publishers.

In 1839, George F. Cooledge, Publishers, of New York, had put out The United States School Primer, Designed for Schools and Families, copyrighted by William W. Allen in 1839. As mentioned elsewhere, that 1839 edition showed that George F. Cooledge was located in the second story of M. Day & Co.’s Book Store, 374 Pearl Street, presumably the same Mahlon Day listed as a distributor of The Franklin Primer on an 1840 copy and of Mrs. Barbauld’s Easy Lessons, published, like The Franklin Primer, by A. Phelps of Greenfield, Massachusetts.

However, as mentioned elsewhere, the cover of Day’s Infant School Primer of 1837 showed that Day sold an exceedingly large variety of school books.

Although many “sound” spellers meant for beginners as well as older students had been published before 1826, almost all spellers published after 1826 were not meant for beginners but only for older students. In addition to the sight-word primers being added to reading series after 1826, many “primers” for beginners appeared on the market after 1826 relied heavily on “meaning” but which were not part of any reading series. These isolated primers were obviously not the catechism/prayer book primers of earlier times that had been used as the second reading book, but used sight-word approaches of varying degrees. Most used pictures heavily for identification of words and were meant to be used as the beginning book for children.

An extraordinary record of spellers in English before 1801 is provided by R. C. Alston’s Spelling Books, Volume 4 of A Bibliography of the English Language from the Invention of Printing to the Year 1800. Yet no such list has been available after that date. Heartman’s 1935 list of non-New-England primers only accidentally included some spellers which had been misnamed primers.

However, an incomplete (but irreplaceable) list has now turned up in the library of the American Antiquarian Society in Worcester, Massachusetts. In the introduction to an 1846 speller entitled in one place The English Spelling Book and in another place in the same book The New English Spelling Book, I found a reference to a “Report on the Subject of Spelling Books” which had been published by the American Society for the Diffusion of Useful Knowledge. It was described as including a list of spellers published in America since 1804. The English Spelling Book had been published by the American Society for the Diffusion of Useful Knowledge in 1847 and by Leavitt & Company, New York, in 1849, who described that speller in 1849 as part of the “American School Series” which included a first, second and third reader. Neither the Library of Congress nor the New York Public Library has any publication from the American Society for the Diffusion of Useful Knowledge entitled, “Report on the Subject of Spelling Books,” but the American Antiquarian Society does have that 32-page pamphlet. It includes that extraordinary list of spellers published in America between 1804 and 1842. The pamphlet with the list had been published in January, 1843, by The American Society for the Diffusion of Useful Knowledge.

The name of the society, founded in New York in October, 1836, apparently was just an opportunistic variation on the name of Brougham’s famous British group. Its unstated purpose was apparently solely to
push “approved” books into schools which could then produce royalties for the society’s founder and secretary, Rev. Gorham D. Abbot, and his few close associates such as William Cutter, “Esq.,” a clerk in the Bank of Commerce. They had managed to arouse interest by including on their letterhead some well known names as members of their organization, sometimes with and sometimes without the approval of those concerned. That disreputable background is very convincingly given in The American Society for the Diffusion of Useful Knowledge, an eight-page pamphlet signed “Justice,” which can be dated from its content to the spring or summer of 1844. This pamphlet is also available at the American Antiquarian Society in Worcester, Massachusetts. However, it is the 1843 32-page pamphlet, Report of the Committee on Spelling Books, which is pertinent to this history.

While its purpose was to establish the “need” for “standard” textbooks, obviously in order to promote its projected sales of such textbooks, the report backed its argument with a long list of spellers published in the United States since 1804. Some of the spellers had obviously inaccurate titles, but the report produced the interesting statistic that there were in 1843 one hundred and twenty different spelling books on sale in America, and that the American Society for the Diffusion of Useful Knowledge had collected three-fourths of them.

They referred to curious documents of 1804 and 1832, titled Catalogues of American School Books. That of 1804 was very probably prepared from The Catalog of All the Books Printed in the United States, With Prices and Places Where Published Annexed, published by the booksellers of Boston in January, 1804. That catalog is listed at the beginning of the 1928 United States Catalog.

Their report included columns for 1804 and 1832 to indicate which of the books they listed were also listed in these earlier catalogues.

The 32-page report stated on page 31:

“One of the greatest evils in our present systems of education, is the multiplicity of School Books.

“In 1804, there was a catalogue published, professing to contain all the School Books, then used in the country. There were above ninety. In 1832, there was another similar catalogue published. There were, then, about four hundred. Now, there are between eight hundred and one thousand, in all the various branches, and the number is daily increasing.

“...This is a subject of almost universal complaint, among parents, teachers, and friends of education.

“...The late Secretary of State, and Superintendent of Common Schools in New York, in his Annual Report, 1840, says,

‘This is an evil of the greatest magnitude; yet it is feared from past experience, that our fellow citizens would be unwilling to submit to the prescription by law, or under its authority, of any school books to be used by their children.’

‘Past experience’ suggests that public outrage had been the result of previous attempts to control children’s textbooks, such as the 1828 Vermont attempt referred to elsewhere.

Both the 1804 list and the 1832 list omit numerous titles which are presently in the Harvard textbook collection and elsewhere which should have been included, and so does the 1842 list. Despite such obvious drawbacks, the report is still an extraordinary document as it is the only such listing, and a
contemporary one at that, available for the period after 1800. However, presumably a more complete list might be compiled for 1800 to 1820, with much effort, by referring to American Bibliography, A Chronological Dictionary of all Books, Pamphlets and Periodical Publications Printed in the United States of America from the Genesis of Printing in 1639 Down to and Including the Year 1820, by Charles Evans, published by Peter Smith, New York: 1941.

A section of the 1843 report concerned spellers reported to be in use in certain states, and for New York State showed the use over a period of years. The figures on New York State confirm that Webster’s speller had been massively used there but that competition sharply increased after 1827. However, Webster’s was still in wide use in Michigan. Yet, at that date, it was far less used in Massachusetts. “Change” was therefore obviously spreading out from the Massachusetts intellectual center, reaching New York State first and Michigan later, and more distant states even later.

Textbook data from Virginia and Arkansas for the years 1844 and 1846 is reported by Edgar W. Knight and Clifton L. Hall in Readings in American Educational History, Appleton-Century-Crofts, Inc., New York: 1951, Greenwood Press, Publishers, New York, 1970. After 1826, in these two more distant states, records show that the speller had often been pushed up to upper grades, being replaced at the first grade with “meaning” primers. Therefore, reports from any states on the sale of Webster’s speller apart from the sales of such primers reveal nothing about first grade methods.

The dominant primers which were reported as being sold in Virginia and Arkansas for the years concerned, 1844 and 1846, were the American and the United States Primer. The American primer referred to most probably was that of George F. Cooledge, New York, (which concern some time before 1847 became George F. Cooledge and Brother.) Cooledge also published the American Pictorial Primer or the First Book for Children, Designed for Home or Parental Instruction in 1843(?), and the United States School Primer in 1839. Chauncey Goodrich (a distant and not too influential relative of the publisher, Samuel “Peter Parley” Goodrich and not the Chauncey Goodrich under whom the young Gallaudet had worked) had published an American Primer in 1829. Of course, neither primer name was very original. Since the Arkansas report specifically identifies the United States Primer as a Cooledge text and since Cooledge was publishing Webster’s speller in the 1840’s, the probability is that both the texts referred to in the Virginia report were the Cooledge texts. Cooledge’s American Pictorial Primer and United States School Primer were both predominantly “meaning” emphasis primers with a huge reliance on pictures.

Another Cooledge primer, The Illustrated Primer, or Child’s First Book, apparently a revision of the American Pictorial Primer because it carried the heading, “The Pictorial Primer” on each of its inside pages, was specifically advertised by George F. Cooledge and Brother in 1847 as “Designed for the Earliest Instruction in Schools and Families.” Advertised in this book also was one of their other primers, The National Primer, or the Child’s First Book. Obviously, the Cooledge company meant their primers to be the child’s “first book.”

George F. Cooledge also published The Christmas School Primer, another of the many beginning books at that time which made a massive use of pictures. Nila Banton Smith’s comments concerning it in her “history” are typically misleading:

“A number of miscellaneous primers appeared under such names as these: The Child’s Guide, Union Primer, The Child’s Instructor, Gallaudet’s The Child’s Picture Defining and Reading Book, The Child’s Instructor and Moral Primer, and The Christmas School Primer. Each of these had some distinctive feature, yet there was a dreary sameness about them all.

“Perhaps the most entertaining of these readers is The Christmas School Primer. No author is named on this interesting little book, which was published in 1839.”
This is a magnificently misleading section, glossing over sight-word texts such as Oliver Angell’s 1830 sight-word Union series which was very long-lived and widely used. As shown by Early American Textbooks, U. S. Department of Education (1985), Angell’s texts were still being published in a new edition by E. H. Butler & Co. in Philadelphia in 1850. Also glossed over is the startling fact that Gallaudet’s 1830 book had originally been specifically written for deaf-mute children past the beginning stage of reading, and Gallaudet then recommended the same book for hearing children who were past the beginning stage of reading. That “distinctive feature” should have erased any “dreary sameness.” The phrase, “dreary sameness,” was probably deliberately lifted from the earlier reading history prepared by an instructor at Columbia Teacher’s college, Rudolph R. Reeder. He wrote The Historical Development of School Readers and of Method in Teaching Reading, 1900, and on page 51 applied the unusual phrase to texts published from 1850 to 1860. Yet the Longley Pitman-print readers were popular in some cities during that period, and they hardly possessed a “dreary sameness.”

In the body of her text, Smith did not attempt to name the publisher of The Christmas School Primer but only described two of its stories which are also in the American Antiquarian Society’s undated copy of The Christmas School Primer. That copy clearly indicated it was published by George F. Cooledge at 323 Pearl Street, New York. The two little stories, including the picture that Smith reproduced, are also in Cooledge’s earlier United States School Primer, which was published in 1839. But, judging from the address on the American Antiquarian Society’s copy of The Christmas School Primer, that copy had to be 1840 or later, as in 1839, when Cooledge published The United States School Primer, his location had been shown as “Second Story of M. Day & Co.’s Book Store, 374 Pearl Street.” That was obviously Cooledge’s location before he moved to 323 Pearl Street after 1839. (Cooledge showed elsewhere that his later address at 323 Pearl Street was on Franklin Square). On the back cover of Mahlon Day’s 1837 Infant School Primer, Mahlon Day showed his address as “Mahlon Day, at his long established stand, No. 374 Pearl st., a few doors above Franklin Square.” On his checklist of non-New England primers, Heartman showed (page 77) Mahlon Day at 376, not 374, Pearl Street from 1825 to 1832

Pearl Street is also where the successful publisher, Samuel Wood had been located: at 360 Pearl in 1806, at 357 Pearl in 1811, and at 261 Pearl in 1823 and 1829. In 1823 and 1830, G. C. Morgan published editions of the English text, The Primer by M. Pelham (pseudonym for Dorothy Kilner) referred to elsewhere, and G. C. Morgan’s address was also Pearl Street, which he showed simply as Pearl Street, Franklin Square. Even as late as 1860, Harper & Brothers showed their address on Marcius Willson’s The First Reader of the School and Family Series as 327 to 331 Pearl Street, New York, and on their 1860 copy of Reading Without Tears showed their address simply as Franklin Square. Therefore, Cooledge at 323 Pearl Street and Harper at 327 to 331 were both directly on Franklin Square, and Mahlon Day at 374 Pearl Street, and Samuel Wood in 1806 at 360 Pearl and 1811 at 357 Pearl, were just “a few doors above” Franklin Square. (As shown in Appendix B, an 1816 copy of Oran’s American Primer was published by George Long who was at a lower numbered Pearl Street address, No. 71 Pearl-Street in 1816, but his 1820 and 1829 editions show his address as161 Broadway.) The evidence indicates that Pearl Street, and most particularly in the area of Franklin Square, where Cooledge was located, was New York’s publishing center in the early nineteenth century.

Yet the fact that Pearl Street (at or near) Franklin Square should have been New York’s publishing center as late as 1840 when Cooledge was still located there, and particularly as late as 1860 when Harper was still located there, seems very curious. On page C24 of The New York Times for July 12, 1991, appeared a description of a place recommended for week-end visiting, “Archeological Site, Pearl Street and Park Row.” The article said that a group of archeologists had been digging at that location, called Five Points, at the edge of Chinatown, for several months. In the nineteenth century (although the article did not specify what years), the area had been one of the most degenerate slums in New York, and it had a very bad reputation. The oldest buildings still remaining today were built in the 1830’s. An article a few
weeks earlier in the Times gave a map of the area and more information. Both articles implied that the
slum area did date to the early years of the nineteenth century. Those early nineteenth century New
York publishers appear to have been located adjacent to, or possibly even inside, a very strange region, indeed!

Smith showed as item 32 in her bibliography, on page 428, “The Christmas School Primer. New
York: William W. Allen, 1839.” The United States School Primer published in 1839, with so much of the
same content, shows that it was copyrighted by William W. Allen but published by Coolegedge. One would
assume the 1839 copy Nila Banton Smith saw had the same notations. If so, why did she omit the name of
the real publisher and imply instead in her bibliography that the primer was published by the man who
took out its copyright? After all, William W. Allen may very well have been the author.

On the back cover of The Infant School Primer, which Mahlon Day published in 1837, Mahlon Day
listed “School Books” which he sold in twenty-one categories. The first was “SPELLING BOOKS, by
Webster, Marshall, Burham, Bentley, Bolles, Cardell, Cobb, Cummings, Emerson, Hazen, Jones, Peter
Parley, Picket, Sears, Worcester, Wood.” Next came “READING BOOKS - all the varieties...” M. Day
could not afford to be less than open minded about all the authors and publishers of the day or he would
have interfered with his book store sales. However, as a publisher only, Coolegedge did not have that need,
and could concentrate on selling only his own books.

In 1840, three years later than the date of Mahlon Day’s Infant School Primer, and after Coolegedge had
moved out of Mahlon Day’s building, Coolegedge published his own version of The Infant School Primer,
“Compiled by the Publisher for Small Children, and Approved by Samuel W. Seton.” (Samuel W. Seton,
discussed below, was involved in the lyceum movement, and the primer that he originally wrote in 1830
for infant schools, also described below, was a “meaning” monstrousy.) About three years after Coolegedge
published his own version of The Infant School Primer, Coolegedge published his 1843(?) The American
Pictorial Primer which carried on its inside pages the same heading as his 1840 book, “Infant School
Primer.” Therefore, Coolegedge’s 1843(?) book, The American Pictorial Primer, presumably was only an
up-dated version of Coolegedge’s 1840 book with the title, The Infant School Primer, but it made a heavy
use of pictures.

The Coolegedge company which Nila Banton Smith never mentioned was an enormously important
publisher by the 1840’s as it became the publisher of the Webster speller! Noah Webster, who had been
born in 1758, died in 1843. As mentioned, his speller had provided income for his family for years. Its
copyright was an important financial resource. Coolegedge advertised the Webster speller on his 1847 book,
The Illustrated Primer, citing sales of over a million copies a year. Sometime before 1847, probably in
1843 after Webster’s death, Geo. F. Coolegedge & Bro. became the “Proprietors of the Copyright of
Webster’s Elementary Spelling Book,” as shown by the title page and the page opposite it from a Webster
speller of 1848. Both of these pages are reproduced on page 117 in Early American Textbooks -
1775-1900, Office of Educational Research and Improvement, U. S. Department of Education,
Washington: 1985. Wrongly identified as from their item 2592, page 123, it is obvious the reproduced
pages are instead from their item 2595, page 123, “New York: G. F. Coolegedge & Bro., 1848.” It appears
probable that the Webster family sold the copyright for the Webster speller to the Coolegedge company on
Webster’s death in 1843, or shortly after.

As the reproduction showed, by 1848 Coolegedge claimed that 30,000,000 copies of Webster’s speller
had been sold, and that 1,000,000 were still being sold annually. (From the Webster figures quoted earlier
of 3,000,000 copies sold between 1783 and 1809, that would mean 27,000,000 had been sold between
1809 and 1848.) Early American Textooks - 1775-1900, also shows by its entries on page 123 that D.
Appleton & Co. of New York had become the publishers of the Webster speller by 1857. Yet, as
confirmed elsewhere in this history, the actual date of the change was1855, not 1857. Nevertheless,
another source referred to later indicates G. and C. Merriam copyrighted a revised Webster speller in
1857, also copyrighted by Webster’s children, which is puzzling. American Book Company, formed in 1890 by the merger of Appleton and other companies, became the publishers in 1890. Early American Textbooks shows an incorrect 1880 date for a Webster speller published by American Book Company, yet that company was not even in existence until 1890. At what date Cooledge went out of business or was absorbed by another publisher is not known, but Early American Textbooks of the U. S. Department of Education shows that G. F. Cooledge and Brother published, along with Thomas, Cowperthwait & Co. of Philadelphia, The National Speaker by Henry B. Maglathlin in 1851. Therefore, the Cooledge company may still have been in existence in 1851, if the report is correct, and possibly went out of business in 1855 when Appleton’s acquired the Webster speller.

Figures on copies of books sold in any area are meaningless unless annual sales can be compared to the area’s population figures. Webster’s speller is known to have been enormously popular between 1783 and 1809, a period of 26 years, but annual sales are unknown. Between 1809 and 1848, a period of 39 years, a great increase was shown in gross sales. Yet it is necessary to compare annual sales figures to annual American population figures to get a real picture of Webster’s market share. The fact that Webster’s maintained sales in excess of 1,000,000 copies a year in the 1880’s is less impressive when that fact is compared to the population of 1890, as opposed to the population for 1850, when sales of 1,000,000 were also claimed. For purposes of comparison, these are the American population figures cited in the Encyclopedia Britannica (1963), Volume 22, page 814:

These figures should also be kept in mind when comparing the reported figures for the McGuffey Readers to those for Webster’s speller. Webster’s speller was most influential before 1840; McGuffey’s was most influential after 1840. Comparing gross figures for those two periods reveals nothing about their relative percentages of the market during those two vastly different periods. (The ultimate sales of the Webster speller, and of the McGuffey Readers, are discussed at length in later chapters.)

However, the record shows that the Cooledge company, to which Smith made no reference, went from an upstairs and apparently relatively unimportant company in 1839 to a company which was able to buy out the Webster speller copyright some time between 1843 and 1847, when Cooledge is known to have been advertising the Webster speller, as mentioned later. However, Cooledge probably acquired the rights to the Webster speller shortly after 1843 when Webster died. The Cooledge company was able to do so, presumably, because of its success with its largely sight-word pictorial primers for rank beginners. The picture primers were meant to be used before the spelling book which had been the beginning book.
until 1826. Such a commercial success as that of the George F. Cooledge company should not continue to remain unnoticed and unexplained.

Nila Banton Smith covered up the huge use of pictures to identify words by implying that pictures were but little used at that time. By lumping textbook names together and claiming that the texts possessed a “dreary sameness,” Smith of Columbia Teachers College in 1932 deflected attention away not only from Gallaudet and the heavy use of pictures to identify words. She also deflected attention away from Angell who had published a sight-word series in 1830, and from the Cooledge company, which was pushing Webster’s speller into the upper grades and away from beginners.

No one should have known better what book was used first for children than the Cooledge company which published Webster’s speller. They advertised on The Illustrated Primer of 1847 that Webster’s speller was:

“The cheapest and most popular Spelling Book published in the United States.... This Spelling Book...is in almost universal use throughout the United States, the sale of it being about One Million Copies per Annum.”

Yet their description of their primers such as The Illustrated Primer made it clear that only their illustrated primers, and NOT Webster’s speller, were meant to be the first book for children.

The Cooledge company, the 1840’s publisher of Webster’s, is tied to the earlier activists through its publication of The American Pictorial Primer (1843?). As mentioned, on the top of that text’s inside pages, it read, Infant School Primer, and Cooledge had published a different version, The Infant School Primer, in 1840. The 1840 copy carried the notation that it was “Approved by Samuel W. Seton,” who was one of the activists of the period. In 1830, Seton had published an appalling and totally misleading book, the Abecedarian, for use in teaching reading in infant schools. Seton had dedicated it to “the Infant School Teachers of New York.” In it, he proposed a harmful way of teaching the alphabet, and endorsed the spelling (naming of letters) in sight-words. Seton had said on page 48 in his 1830 book:

“When learning the letters, the child may be taught to pronounce syllables and words at sight. * This exercise will be found very usefull when connected with pictures of the object named. **“Hazens Symbolical Primer is well adapted to this purpose.”

Edward Hazen’s Symbolical Primer, copyrighted in the spring of 1829, was straight Code I, pure “meaning,” with pictures next to each word to provide the word’s “meaning” totally apart from its “sound.” Edward Hazen said in the Preface to his 1829 text:

“In teaching children to read and spell, it will not be necessary to pay much attention to the alphabet or elementary sounds. The better way would be to begin with the words under the cuts and let them learn the letters as they occur in their several combinations. By pursuing this plan, weeks, and sometimes months, may be saved from total waste...”

Edward Hazen’s “plan” would make the learning of the alphabet save “sometimes months.” But, as for reading itself, Hazen said in his later 1845 text, The Grammatic Reader, No. I:

“Much of the first and second years of the scholastic course is wasted in learning to read and spell.”

Yet this comment had appeared for beginning readers in so many spellers which were teaching by “sound” before 1826:
“In a few weeks you will read well,”

The pre-1826 comment had been replaced in 1845 by the comment by an author of “meaning” texts that it took TWO YEARS! Yet even that was far, far too rosy an estimate. With the “meaning” method, it takes far longer, when it works at all.

By the time E. A. Sheldon wrote his phony-phonics “meaning” readers in 1875, he said children did not really learn to read until fourth grade, though I have lost my reference for his comment. However, the source that Nila Banton Smith quoted from the 1880’s or 1890’s (either Pollard or Ward, which she does not make clear) stated that children at fourth grade could read only with the greatest difficulty and with stumbling over words. E. A. Sheldon was apparently wearing rose-colored glasses by stating children had learned to read (by the “meaning” method) by fourth grade, and Edward Hazen was certainly wearing rose-colored glasses with his two-years estimate.

The full title of Edward Hazen’s book was The Symbolical Primer, or Class Book No. 1, with 492 cuts, Part The First, “by E. Hazen, Published by M’Elrath & Bangs, New York, D. F. Robinson & Co., Hartford, Connecticut; Denny & Walker and David Clark, Philadelphia; and Armstrong & Plaskitt and Cushing & Sons, Baltimore.” The second book was The Symbolical Primer, Part the Second. The third book was The Speller and Definer, or Class Book, No. 2. The following comment was made on back of the cover of Part The First:

“The Symbolical Primer has been published in sheets, to be pasted on cards or boards, for the use of Infant and Monitorial Schools. It is also published on smaller pages, and in less type, for the use of common schools.... The time usually devoted to a Spelling Book will be sufficient to become well acquainted with “THE SYMBOLICAL PRIMER” and “THE SPELLER AND DEFINER,” so that, by using them, the time usually spent in committing to memory a Dictionary or an Expositor, is saved.”

Primer No. 1 had been copyrighted on May 5, 1830, in the Southern District of New York. The Preface dated January, 1829, stated:

“The author of this Primer published two Class Books; the one, entitled “THE SYMBOLICAL PRIMER, OR CLASS BOOK, NO. 1,” the other, “THE SPELLER AND DEFINER, OR CLASS BOOK, NO. 2.” The two together were designed not only to supersede the necessity of using a Spelling Book, but a Dictionary, so far as it is used to be committed to memory. They have been introduced into a great number of schools, and a sufficient trial of them has been made to prove, that they answer the purposes for which they were intended.

“Many persons, however, object to the Primer, on the ground that it contains too many cuts, and no columns for spelling lessons. They take for granted the correctness of the old plan of teaching, and, of course, every other, in their estimation, must be wrong. If, however, they would lay aside their prejudices, so far as to consider the subject, they would see, that the orthography and pronunciation of words, presented in columns without explanations of any kind, cannot be recollected without considerable difficulty, inasmuch as there is nothing with which they can be associated to assist the memory.

“Besides, mere spelling lessons are so uninteresting and absolutely unmeaning, that it is almost impossible to induce a pupil of sense to pay much attention to them.
“An Attempt has been made in ‘THE SYMBOLICAL PRIMER,’ to render the task of learning to spell and read easy and agreeable. To this end, a great number of cuts have been introduced, which explain the meaning of the words, and assist the pupil in pronouncing and recollecting them. While learning to spell and read by the aid of the cuts, he is, by the same means, acquiring at least a partial knowledge of sensible objects... Although children can learn to spell and read much more rapidly in ‘THE SYMBOLICAL PRIMER’ than in a Spelling Book, yet the Author wishes it to be distinctly understood, that it was principally designed to assist in communicating information adapted to the young mind....

“In teaching children to read and spell, it will not be necessary to pay much attention to the alphabet or elementary sounds. The better way would be, to begin with the words under the cuts, and let them learn the letters as they occur in their several combinations. By pursuing this plan, weeks, and sometimes months, may be saved from total waste...

“‘THE SYMBOLICAL PRIMER’ in large type, as in the following pages, was prepared for infant and monitorial schools, to be used on cards, and to be found in a book for those who might prefer it to the Smaller Primer, which corresponds with it in every thing, except in size and price.”

He gave the alphabet and open syllables (ba, be, bi, bo, bu, etc.) at the beginning, but no closed syllables (ab, eb, ib, ob, ub, etc.) which means none of the short vowels which reportedly occur in some 60 per cent of English syllables. This was followed with pictures with words under them: ant, ape, etc.

After Edward Hazen’s 1829 pictorial book (as well as the two 1828 pictorial texts described elsewhere, Jonathan Lamb’s The Child’s Primer, or First Book for Primary Schools, and E. and G. Merriam’s The American Primer Designed as the First Book for Children), picture primers multiplied, and many so-called “toy books” imitated the picture primers, though they could not seriously have been meant for instruction as they were so small and incomplete.

One producer of toy books who was apparently very successful was Wm. Raine of Baltimore. On the back cover of The New Juvenile Primer and Child’s Own Progressive Guide to Learning, which claimed to be “Carefully arranged, on a new, simple and interesting principle,” the statement was made that he “has entered extensively into the publication of juvenile books. His facilities for manufacturing Works of this class, enable him to furnish them at lower prices than any other establishment in the United States.”

Yet his 1840 “primer” was a picture parody of the old spellers, with pictures on top of most pages and words and stories under pictures. No pretense had been made on a method, despite the claim. New colored books were advertised on the back cover, obviously story books, including the delightful The Butterfly’s Ball and Grasshopper’s Feast originally published over thirty years before in England. The quality of much of Wm. Raine’s art work was atrocious, and the proofreading even worse. Despite the surface resemblance to Cooledge’s picture primers, Raine’s primer was only accidentally in the line of development of school texts. Raine and those like him parodied the work of more competent publishers of picture primers. Yet Raine did add to the flood of toy books for children in the 1840’s, many of which were of dreadful quality.

Samuel Seton had approved Cooledge’s primer in 1840. According to Blumenfeld, Seton had been on the committee for the original American Lyceum organized by Josiah Holbrook in May, 1831. Seton wrote the harmful original infant school primer, which is discussed elsewhere. Another member of that original committee was Theodore Dwight, Jr., who published the New Picture Primer in 1841 at New London (and possibly earlier), and who wrote the teacher’s manual discussed at length in the previous chapter. Primers obviously interested some of the 1830 founders of the Lyceum. Since Seton was one of the activists, this suggests Cooledge’s enormous and apparently rapid success after 1839 may have
resulted from some outside help from such government school activists as Seton. Cooledge first appeared on the scene on the second floor of Mahlon Day’s facility in 1839. Yet, by 1847, eight years later, Cooledge had not only long since moved into new and presumably more spacious quarters but had already taken over the famous Webster speller and the almost equally famous Pierpont readers. Those texts had been in use all over the United States for decades. Furthermore, Cooledge’s own picture primers were highly successful and were in use as far away as Arkansas. That was a great deal to achieve in less than eight years.

It appears probable from the following statistics that Cooledge’s heavily illustrated American and United States primers were being used in place of spellers as beginning books in at least a part of Virginia and almost all of Arkansas as early as 1844 and 1846. Edgar W. Knight and Clifton L. Hall in Readings in American Educational History, Appleton-Century-Crofts, Inc., New York: 1951, Greenwood Press, Publishers, New York, 1970, showed the following on page 491:

*Journal of the House of Delegates, 1845-1846, Doc. 4, pp. 43-44.”

Virginia appeared more resistant to change coming in from the activists in 1844 than Arkansas was in 1846, not just at the beginning reading level, but at the advanced level. Not only did spellers such as Webster’s remain dominant in many counties at the beginning level, as is probable from the fact that Virginia ordered overwhelmingly more spellers than primers, but another table on reading books showed
that Virginia was still reporting heavy use of the English Reader, presumably Murray's, for upper levels. Furthermore, this other table on reading books showed that 103 counties were still using the Bible and Testament in reading instruction! In all, the table reported twenty-eight different texts in use for reading instruction. Obviously each county might have listed more than one text. McGuffey’s was one of the 28 texts, but only one county reported using it in 1844, another indication that McGuffey’s which had begun publication in 1836 had not taken over the market for reading books by 1844. Furthermore, these 1844 statistics prove that Virginia was resisting purchasing the Southern Primer, which book was a blatant appeal to sectionalism, and which also had increased “meaning” emphasis, though not so extreme as some.

Knight and Hall reported on page 499 concerning Arkansas in 1846. Unlike the Virginia statistics for 1844, the Arkansas statistics for 1846 demonstrate that the primer had displaced the spelling book at the beginning level. It is also obvious that the Cooledge company was working hard to increase its market share of textbooks by introducing a sequel to the speller. It is also apparent that Samuel “Peter Parley” Goodrich was supplying the market for readers in Arkansas in 1846, while McGuffey’s was not even listed.

“Textbooks Purchased for the Schools of Arkansas, 1846. *

“A statement of the kinds of books purchased by the auditor for the use of common schools, under ‘An act to appropriate the whole of the common-school fund to the purchase of books for common schools,’ approved January 7, 1845, to which is added a sequel to Webster’s Spelling Book, 300 copies of which George T. Cooledge, New York City, furnished without charge; also a statement of the price at which the boards of school commissioners are to dispose of the books as provided by law, being an advance of 10 per cent on the cost and transportation.

**“Auditor’s Report, 1846. Given in Stephen B. Weeks, History of Public School Education in Arkansas, p. 35.”**

Note the curious effect of centralized, “thorough and efficient” standardization in Arkansas in contrast to decentralized Virginia. In Arkansas the sight-word primer had become standard, but the Bible and Testament had disappeared!

One of the reasons for the continued popularity of Webster’s speller was that it was cheap. Also, in contrast to some other picture primers of the period, Cooledge’s primers were obviously flimsier, though no where nearly so much so as Raine’s, and probably also cheaper. Both Cooledge’s Webster spellers and Cooledge’s primers were therefore probably cheaper than such series as Sanders’, Cobb’s and Angell’s. Undoubtedly, Cooledge’s materials were so widespread partly because of their prices.

A similar remarkable publishing success to that of Cooledge’s was associated with the Merriam company and the Webster dictionary. In 1828, E. and G. Merriam of Brookfield published The American Primer, Designed as the First Book for Children. They also published The American Reader, with material by Mrs. Hemans, Lydia Sigourney and others. In The American Primer, they advertised The American Reader by saying:

“This highly popular little work has gone through three editions within fourteen months from its publication.”

Despite the inference that The American Reader was fairly recent, the New York Public Library catalog shows its publishing date as 1821, and referred to Merriam’s American Readers series. Therefore the Merriam company had been in business probably since at least 1821, and had a reading series by 1828.

The American Primer was a Code 3 book, with words identified by pictures, and whole sentences next to them, before the complete syllabary was given. It then had little phonics, only by analogy, and
most too late to do much good. As might have been expected from probable activists of the period, just enough religion had been inserted to deflect criticism, but even that was unsuitable at the beginning.

G. and C. Merriam of Springfield, Massachusetts, the presumed successors to E. and G. Merriam of Brookfield, copyrighted in 1830 and published in 1833 The Child’s Guide, which was not a beginning book. Yet it carried in its preface the comment that too great pains cannot be taken to prevent the formation of a “habit of reading without thinking,” quoting “Babington” as the authority for this Stewartian conclusion. On this 1833 copy, G. and C. Merriam advertised their text, The Easy Primer Containing Children’s First Lessons in Reading and Spelling. An 1836 copy of that book, with a copyright date of 1833, rates only a Code I. The 1836 copy carried an advertisement for The American Reader which had been published by E. and G. Merriam, which would seem to confirm that G. and C. Merriam were their successor company. The back of The Easy Primer copy of 1836 contained an endorsement from S. R. Hall, who wrote Lectures on School-Keeping, a highly popular book with the change-agents. The Easy Primer was an arrogant book, not even referring to its dismissal of all sound or even discussing how to teach its sight-word content. Yet the Merriam company obviously prospered by dumping “sound” in favor of “meaning” for beginners, because they became the publishers of Webster’s dictionary, with later revisions carrying that familiar title, the Merriam-Webster dictionary.

According to the card catalog in the New York Public Library, Charles Merriam was born in 1806 and died in 1887. George Merriam was born in 1803 and died in 1880. “E. Merriam,” one of the first partners, was not shown, but undoubtedly was a relative. The card catalog showed:

“The Village Readers designed for the use of schools, by the compilers of the Easy Primer, Merriam, George and C. Merriam, Springfield”

I believe these were shown under the date 1841. Also shown was:

Besides these entries, the card showed:

E. and G. Merriam at Brookfield therefore published The American Primer (1828), and The American Reader (in 1821). G. and C. Merriam of Springfield, the successors to E. and G. Merriam, continued to publish The American Reader and probably The American Primer and any other books which may have been in the series, Merriam’s American Readers. They also published The Child’s Guide (1830) and The Easy Primer (1833), heavily slanted towards the “meaning” approach. By 1841 they were publishing The Village Readers, about which no information is available but on the title page of which they were still advertising The Easy Primer of 1833, to judge from the New York Library card catalog. Also, they were apparently still publishing The Child’s Guide in 1843 and presumably were still publishing some of the others. Certainly they must have become a highly successful firm, or they would never have become the publisher of Webster’s dictionary. They were a firm, however, which had joined the “meaning” group in reading by 1828 or earlier. It seems strangely unsuitable that a company which had rejected Webster’s synthetic phonics for beginning reading should have become the company publishing Webster’s dictionary which was the culmination of his life’s work.
The historical evidence clearly establishes that sight-word “meaning” primers like Cooledge’s, Merriam’s, Sanders, Gallaudet’s and so many others which were in almost universal use for beginning reading in America by the 1840’s not only had NOT been the beginning reading books in America before 1826, but SUCH PRIMERS DID NOT EVEN EXIST BEFORE 1826! Until 1826, spelling books - predominantly Webster’s - had been the standard beginning books. They had been overwhelmingly syllabic and phonic and had taught children to read by “sound,” not “meaning.”

Concerning the many new American reading series for older students which began to be published after the early 1820’s, the first important addition to the early reading series of Webster, Bingham, Murray and Wood was made by John Pierpont (1785-1866). (Merriam’s American Readers, including the American Reader of 1821, the American Primer of 1828, and probably others, although they were obviously successful, may not have been too widespread as so little information is available on them.) Pierpont wrote the first of his highly successful readers in 1823, and took many years to complete his reading series. But, unlike those earlier series which had been completed before 1826, the Pierpont series straddled the 1826 change-agent date. By 1830, therefore, Pierpont added a book to go “with” the speller, obviously reflecting the change in school practice that had started before 1830. By 1839, it is apparent that most schools had abandoned the spelling book as the first book for beginners. As previously mentioned, it was in 1839 that Pierpont finally wrote a straight sight-word primer, to go BEFORE a speller. It was sometime before 1847 that the Cooledge company became the publishers of the famous Pierpont series.

Jessey Torrey, Jun., had published a Code 8 “sound” spelling book in Philadelphia in 1824, Familiar Spelling Book. He also came out with the first of his readers in 1824, but its advertising material showed a clear tie to change-agents pushing “meaning”. His book, A Pleasing Companion, referred to the fact that The Committee of the Philadelphia Academy of Teachers endorsed his book on November 6, 1824, “to improve understanding.” By 1836, Torrey had added Torrey’s Primer, or First Book for Children, which seemed to indicate that by 1836 Torrey endorsed replacing the “sound” speller for beginners with a “meaning” primer. Yet, as mentioned elsewhere, his publishers, Grigg and Elliot of Philadelphia, produced a new series in 1844 which endorsed the use of the speller before the first reader, so the effect he may have intended was apparently not endorsed by his publishers.

Pierpont - and Torrey - were reacting to change that had started in 1826, with the publication of the first readers of the Franklin series and the Worcester series, both of which threw out the speller for beginners. Pierpont and Torrey were also responding to the flood of independent sight-word “primers” which had reached the market after 1826, meant as beginning books for children.

Three other series in the post-1826 period endorsed “meaning” but did not originally include primers. Merriam’s American Readers, presumably a series of more than the two books on which information is available, have already been mentioned. Samuel Putnam’s series began to come out in 1825 and apparently never had a primer. B. D. Emerson’s is of uncertain date but probably began about 1830. By 1835, however, B. D. Emerson, “late Principal of the Adams Grammar School Boston,” had published his Progressive Primer, a Code I sight-word book meant to precede his speller. The Merriams, Putnam and Emerson were among the change-agents or had clear ties to the change-agents who were pushing “meaning” to replace “sound” in beginning reading.

In the “Preface” to Samuel Putnam’s 1825 Lessons in Simultaneous Reading, Spelling and Defining, published by T. H. Miller, Portsmouth, New Hampshire, Putnam said, “The monotonous sing-song mode of reading too often noticed in common schools... is acquired through reading what they do not understand.” In the 1826 copyrighted copy (published in 1827) of Samuel Putnam’s Analytical Reader Containing Lessons in Simultaneous Reading & Defining, With Spelling From The Same, published by Samuel C. Stevens at Dover, New Hampshire, the cover spoke of Putnam’s aim, “to lead children to
search for the meaning of what they read... not words only.... Upon this plan, I am satisfied the pupils must think as well as read.” The cover of Putnam’s 1826 book also carried this comment, “I had rather speak five words with my understanding that I might teach others also, than ten thousand words in an unknown tongue,” a variation of the motto on the cover of the 1827 Franklin Sequel by A Friend of Youth. These people were apparently all change agents, but Putnam was curiously right with his numbers: Children in 1826 were trading in their ability to read ten thousand words by sound for the ability to read only five words by meaning.

Emerson’s widely used Code 8 speller appeared in 1828 but was obviously not a beginning book. Neither did Emerson’s readers originally have a beginning book, but the publishers of his speller, Jenks & Palmer of Boston, were simultaneously publishing the sight-word Worcester series. Emerson therefore had a tie to the change-agents through his publisher. However, by 1835, his publisher was Carter, Hendee & Co., of Boston.

After the critical Franklin and Worcester series, which were sight-word “meaning” series from their inception, the two most important new series which also included books which served as sight-word primers were Oliver Angell’s pure sight-word series of 1830 and Lyman Cobb’s sight-word series of 1830. (I have not seen Cobb’s 1830 material, but only his 1840’s revision.)

Oliver Angell’s 1830 Series

Oliver Angell’s important series of sight-word readers appeared in 1830. Angell was from Providence, Rhode Island where eleven years before, in 1819, the Columbian Spelling Book and Children’s Friend, by A Friend to Youth, had been published by Miller and Hutchins, which text for beginners rated only a Code 5. That was only the third “meaning”-oriented text which I found to have been published before 1822.

Angell’s Union Series of Common School Classics began with The Union No. 1, or Child’s First Book, dispensing totally with a speller for beginners although spellers had been in universal use for beginners until 1826, only four years earlier. Marshall, Clark & Co., School Book Publishers (Pennsylvania School Book Depository, No. 4, North Fifth Street, Philadelphia), produced a brochure for the Angell readers in 1833, with attached letters of recommendation, a copy of which is in the Harvard library. The action and support of school activists is marked on the letters of recommendation.

Angell’s “Preliminary Remarks” on his 1830 edition (curiously not repeated on later editions) are illuminating. Note also that in 1830 it was common knowledge that American shops were full of “books for children.” Children’s books were obviously selling very well in America in 1830. American children in 1830 must have been able to read very well and so had no need either for the government schools that the activists were pushing for frantically in 1830 (as Blumenfeld recounted) or for the “meaning” method which Angell was promoting for beginning reading in his 1830 series. Angell wrote in his 1830 “Preliminary Remarks”:

“What, another new school book! - A catch-penny I dare say. Pray, what need have we of more books for children, when the shops are already full of them? - And what have we here? a long preface or oration or some fine story about such a little book as this! Surely the man who made it must be deranged!”

“But have patience a moment, friend, and if you are not too much engaged, have the goodness just to run over my oration or preface or whatever you please to call it...
“Twenty years ago we had excellent machinery in our factories, but you find very little machinery now like that in use twenty years ago; and the consequence is, that a great deal more yarn is now spun with the same labor, and much better cloth is made of it...

“The author of this little book and the volumes which follow it, has for more than twenty years, been engaged in instructing youth, and has had an opportunity of testing most of the popular school books now in use. He has not yet met with any connected, system, calculated to lead the young mind by regular and progressive steps through the various stages of common school education....

“...The plan of the work he claims as original with him, although a similar plan may have been pursued by others which has not fallen under his notice. It is proper, however, to state, that after the present work was commenced, and a considerable portion of each number was prepared, a little book entitled “The Franklin Primer,” * was handed the author by one of the teachers of the public schools, while he was exhibiting to him the manuscripts. This was the first notice he had of the existence of that excellent little book. The arrangement of the spelling lessons is similar to that which had already been adopted and pursued in this work. There are, however, some points in which the two books materially differ. This statement is made, to show that there has been no designed encroachment on the invention or labors of others.

“The notion, too long prevalent, that a child must spend two, three or four years in learning to spell, before he can be permitted to put his words together or to commence reading is certainly unnatural if not absurd. It will be seen that in this book, the child, instead of being dragged through a long course of spelling lessons, commences reading at once, or as soon as he has obtained some idea of the shape and sound of the letters. It is an obvious fact, that children will much sooner become familiar with their letters by being taught their use, than by the mere abstract exercise of conning over their alphabet; especially if they are required to select certain letters from every line, column, or lesson. - In this way a child or class may be kept constantly occupied, by the aid only, of a little monitor already acquainted with the letters: and instead of spending nine tenths of their time as children in the alphabet usually do at school, in idleness and mischief, they may be kept pleasingly and usefully engaged....

“The particulars in which these books differ from others which have as yet come to the notice of the author, are the following:

“1st. The spelling lessons are all selected from the reading lessons to which they belong....
“4th. Every lesson, except a few in this first book, is accompanied by a set of questions to ascertain whether the pupil understands what he has read, or by some useful table to be committed to memory; frequently both. The utility of this will be acknowledged by all who are sensible that children cannot read well, what they do not understand....
“5th. The reading lessons are intended to be adapted to the capacity of the reader; but little therefore which is above the understanding of children has been admitted....
“7th. It may be mentioned as another peculiarity of these books, that the reading lessons, in general, are such as will seize and interest the minds of youth; and simple, interesting stories, anecdotes, &c. are made the means of conveying to their minds the purest moral principles..........

“Published in Greenfield, Mass.”

It stretches credibility that “the plan of the work” was conceived of independently from the author of The Franklin Primer by Angell sometime between 1826 and 1830. It is shown elsewhere that the phrase, “The plan of this primer” appeared in 1844 under peculiar circumstances on William Russell’s primer,
which book also followed the 1826 Franklin Primer “plan.” The purpose of that “plan” so obviously was
to stop teaching beginners to read by the “sounds” of syllables and instead to teach them to read only by
the “meanings” of memorized whole words.

As discussed in Part 3, the “meaning” method for reading alphabetic print which the activists were
promoting in America after 1826 as a “plan” had originated in France in the eighteenth century. The
activist use of that word, “plan,” which has the same meaning in French, had also occurred heavily in
France in the eighteenth century, but in a different connection than with beginning reading. “Plan” had
been a constantly recurring buzz word, in combination with “national”, in the activist period in France
from 1762 until some years after the French Revolution in 1789, during which period government
(“national”) schools were being promoted so as to wipe out church and home education.

Nor had children EVER spent “several years” in the spelling book before beginning to read, as the
previously quoted comments of Lindley Murray, William Andrus Alcott, the anonymous Scottish
Schoolmaster and others of the period prove. Furthermore, the spelling books, themselves, carried
numerous “reading” selections, increasing in size and number as children worked their way through the
books. Many pre-1826 spelling books actually carried the statement near their beginnings that in a few
weeks the child would read well. William Andrus Alcott, who is quoted elsewhere, and who was himself
a pro-“meaning” activist, nevertheless admitted he was reading by the time he was five years old, after
having used a speller, and seemed to consider that anything but unusual. The speller that Alcott had used
as a child was almost certainly Webster’s phonic Code 10 speller, and Webster began to introduce
practice reading selections not too far into his book, as did Murray and other spelling book authors. The
reading selections became increasingly longer and more complicated later in the book. They were
certainly not “spelling books” in the sense that the term is used today.

The meant-to-be-negative comments of the activist, William Russell, in his (and John Goldsbury’s)
1845 book, American Common-School Reader and Speaker, about Memorus Wordswell, the little reading
machine, are cited by Nila Banton Smith and are reproduced in Part 7 of this history. Yet Russell
implicitly admitted in 1845 that the classmates of the (possibly imaginary) defective five-year-old child’s
classmates had already gone all through Webster’s demanding spelling book, which included many,
many, reading selections, when they were only seven years old!

Lyman Cobb’s Spelling Books and Reading Books

Lyman Cobb’s readers first appeared in 1830, the same year that the Angell reading series appeared.
Cobb’s 1825 spelling book (a revision of his 1821 spelling book) had openly attacked Noah Webster’s
spelling book, and the pronunciation key it used. Yet Webster’s speller was brilliant, in many ways that
are not immediately apparent. Webster not only gave a “key” listing all the vowel sounds in English, but
gave all the ways to spell every vowel sound in English! Children memorized Webster’s key, and, by
doing so, had the ability to decode anything in English independently.

An 1807 copy of Webster’s the American Spelling Book had on page 13 “An Easy Standard of
Pronunciation. Key to the following Work.” At the bottom of the key and extending to the next page was
“Explanation of the Key.” Children in those early days learned this entire section of Webster’s speller and
eventually could recite it by heart. The emphasis in Webster’s key was on the spelling of sounds, not
words, since in his “Explanation of the Key” Webster used some different words to illustrate sounds than
the words he had used to illustrate those same sounds in the key directly above that section (“father”
instead of “part,” “hall” instead of “tall” and “bald,” and so on). His key also clearly showed his
Down-East accent: “bush” and “root” were marked to rhyme; and “Short aw” included “what” and “not.”
It seems strange today that Webster did not show short “o” at all in his scheme. This is because Webster
obviously rhymed short “o” words like “not” with “naught,” as well as with his Down-East pronunciation
for “what,” and called them all “short aw.” However, what Webster was showing was manifestly NOT whole words, but only the variant spellings for the sounds in English as he had learned them as a boy in Connecticut in the eighteenth century.

Webster broke his vowel key down into 12 vowel categories, and under these categories showed 17 different vowel sounds in English. What is most critical concerning teaching children how to decode English spellings is that Webster listed FORTY DIFFERENT WAYS USED IN ENGLISH TO SPELL THESE SEVENTEEN DIFFERENT VOWEL SOUNDS! It is no wonder that children learning to read with the Webster speller learned to read so quickly and so independently with these forty different keys, as well as the keys he gave them to consonant sounds! They were learning to read with a kind of pronouncing print!

Yet it was Walker’s, not Webster’s, dictionary which was cited the change-agents as the “standard” dictionary. It is therefore shocking, indeed, to find how inadequate Walker’s dictionary pronunciation key was as a tool for beginners to use to unlock the sound of print. Walker’s also showed seventeen different vowel sounds, but, instead of showing forty different ways to spell them, showed ONLY SEVENTEEN! With spelling books like Lyman Cobb’s which used Walker’s pronunciation key, students had to refer to one of the seventeen whole words carrying the same number as that at the top of the column they were pronouncing. Then, with two-step analytic phonics, they had to transport that sound into the word in front of them which often was using a different spelling for that sound, for which different spelling no explanation was given to the student.

Webster’s speller also showed such “key” notations over columns of words: all words marked “1” were long, “2” were short, and so on. But he also showed notations such as “9,” which was also a long sound, the long “a” spelled by “e” as in “there” and “vein.” (Any vowel not marked by Webster was to be considered silent, as the “i” in vein.)

Walker’s pronouncing dictionary was usually cited by the authors of pronouncing spelling books in competition with Webster after about 1818, like Lyman Cobb, and they modeled their pronunciation keys largely on Walker’s dictionary. Elihu Marshall’s 1819 speller used Walker’s key, for instance, and the McGuffey speller of 1838 used it with only one change. Because of the inadequate key in his dictionary, Walker could not mark words phonetically exactly as they were spelled in order to make them pronounceable but instead had to be respell them to match his abbreviated key. The result of the spelling key modeled on Walker’s was the replacing of one-step synthetic phonics, or the blending together of sequential letter sounds, with two-step analytic phonics, in which one whole word has to be compared to another whole word in order to figure out its sound. We have two-step analytic phonics today in our dictionary keys and are acutely aware that such decoding keys can only be used haltingly.

The key in Cobb’s 1825 speller was modeled on Walker’s and could, of course, be used for “elocution,” or the production of pear-shaped sounds. Elocution was to masquerade as “phonics” in reading for the next fifty years. Many different spellings for the same sound in those spellers using the “elocution” approach were lumped together in one keyed column. No hint was given to the learner that the different spellings for the same sound were anything but irrational and random. The learner was therefore forced to learn these words only as “wholes,” by two-step analytic phonics, comparing an unknown whole word to a whole word in the key. (By contrast, the original Webster spellers had children memorize the various ways to spell all the sounds in English words, and, with this information memorized, the children used synthetic one-step phonics to work out unknown words.) The same faulty key modeled on Walker’s inadequate approach and the lumping together of words of different spellings appeared in the McGuffey speller of 1838. Whether Lyman Cobb used a faulty key in his first speller of 1821 is unknown, but other spellers from about 1821, if they used pronouncing keys, usually did not use complete ones. (The Columbian Spelling book and Children’s Friend, by “A Friend to Youth,”
Providence, April 19, 1819, which has been discussed elsewhere, used no key at all, nor did the appalling book even use much analytic phonics like Dilworth’s, which is the grouping together of words of similar spellings. However, it did have a syllabary.) As will be shown, Lyman Cobb actually made a public attack by 1825 against Webster’s key which had made true synthetic phonics possible in the beginning reading of many seemingly irrationally-spelled English words.

As mentioned earlier, Lyman Cobb’s speller of 1825 had received a qualified endorsement from William Russell in his journal, which suggests Cobb had the support of the movers and shakers, even though his speller, despite its faulty key, was heavily phonic over-all, rating perhaps a Code 7. Yet Lyman Cobb’s reading series written later, the first book of which was published in 1830, was in practice a sight-word series, perhaps Code 3, though at first glance its 1842 revision appears phonic. (I have not seen any of the 1830 texts, but only the 1842 revision.) The books in 1842 had totally controlled vocabulary of high-frequency words, and the “phonics” consisted of dictionary-type respellings of these words, to be learned as “wholes.” This approach does not develop readers who can handle new material, but only readers who have a memorized stock of “whole words.” Cobbs’ 1830 books, which I have not seen, were also controlled by syllable-length, so they appear to have been sight-word books, but, in 1830, he apparently expected his Code 7 phonic speller to precede the use of his readers.

Lyman Cobb (1800-1864) was from Massachusetts, but according to John A. Nietz in Old Textbooks, page 23, “most of his educational career was spent in New York State.” One wonders if he was one of those involved in the New York state activist organization around 1829 referred to by Orestes Brownson, mentioned elsewhere. Nietz said Cobb had written a poor speller in 1821. Yet by 1825, Cobb had written a Spelling Book which rates perhaps a Code 7. Cobb had also meddled with Webster’s word tables, producing instead his own revised tables which emphasized high-frequency use. Nietz commented that Cobb had few reading selections included in his spelling book and that Cobb said, “The Author is highly pleased that our schools are furnished with reading books adapted to the capacities of scholars of every age.”

In 1842, when Cobb revised his first reading textbook series, it is interesting that Nietz commented concerning New Juvenile Reader, No. II (page 69), “...the reading content was greatly reduced, but each reading lesson was preceded with a list of its key words together with their meaning and pronunciation.” The reduction in content was an implicit admission that throwing out “sound” for “meaning” had resulted in reading problems by 1842. Cobb’s 1842 (and presumably his 1830) books had totally controlled vocabulary, which was a supposed “improvement” over some other readers, but it was in reality another clear admission that his children could not read independently.

In his preface signed, New York, April, 1842, to New Juvenile Reader No. II, Cobb said:

“In these Reading-Books, all the new words contained in each Reading Lesson, are placed at the head of the Lesson, divided, pronounced, accented, and defined, with the part of speech designated. Thus, all the words in Reading Lesson I, are formed into a Spelling Lesson, and placed at the head of the Lesson. Then, all the words in Reading Lesson II, not in Reading Lesson I, are formed into a Spelling Lesson, and placed at the head of Reading Lesson II, and so throughout the five reading books.... The scholar will thus have an opportunity to become acquainted with the spelling, pronunciation, and definition of all the words in each Reading Lesson before he reads them, or, if already acquainted with their orthography and pronunciation, he can go over these as a kind of review, while learning the definitions of the words.”

Webster, Bingham, Murray, and Pierpont before 1826 had no need for such lists of “new” words in their readers, even though their readers contained real literature and, except for Murray’s lower materials, uncontrolled vocabulary. (Murray had a controlled vocabulary for new words at the beginning level,
introducing words only if all their phonic elements had already been taught.) Yet, by 1842, Cobb needed to list all the “new” words in his “controlled vocabulary” readers, indicating a drop in reading ability and a dependence on memorized sight-words. Cobb’s readers were massively used in New York State, Pennsylvania, and elsewhere for many years.

Lyman Cobb’s definition of the purpose of a spelling book seemed traditional enough in his preface to Cobb’s New Spelling Book, in Six Parts in 1842:

“The great and prominent object of a spelling book should be to aid the pupil in learning to spell, pronounce and read with ease, accuracy and precision...”

Cobb said on page 16, in his note “To Teachers,” that children should not be asked to read before learning spelling and the spelling book. However, by 1842, children were being taught “spelling” (see-aye-tee, CAT) in the sight word primers before they ever saw the phonic spelling books. Cobb may have been endorsing that harmful practice which turned children into sight-word readers for life since by 1842 Cobb had produced a primer himself to precede his speller, but whether it emphasized “sound” or “meaning” is unknown. However, Cobb said that his speller was meant to precede his readers (but obviously not his primer) initially, and only afterwards were his Juvenile Readers 1, 2, and 3 to accompany the spelling book. Therefore, when he first wrote his 1830 readers, before he had a primer, he apparently endorsed the use of the spelling book as the first step, although by 1842 he no longer did so.

In Cobb’s defense, it is only fair to mention what is discussed elsewhere: even Noah Webster wrote a primer to precede his speller by 1832, in response to market forces, but Webster’s primer was, of course, heavily phonic. Webster’s primer was also apparently almost totally unsuccessful. The only place I have ever seen it is in the New York Public Library and the American Antiquarian Society who each have a copy of this rare book. Yet I have never seen any reference to Webster’s primer in print, other than in the catalogs of these two libraries. Webster dropped the number codes for vowels in his 1832 primer, and instead used vowel symbols very much like those in use today.

Cobb’s primer, meant to precede his Juvenile Readers, appeared apparently in 1842. In 1830, Juvenile Reader No. 1 had been the first book in his series, but in the new series it was the second, being preceded by Cobb’s New First Book. I have not seen a copy of this book, Cobb’s New First Book. The publishers advertized it as the “Introduction to the Spelling Book” on the back cover of Cobb’s New Juvenile Reader No. 2 of 1842, published in 1845 by Caleb Bartlett of New York. Therefore, by 1842, the speller was no longer the foundation book in Cobb’s series, which included New Juvenile Readers Nos. 1, 2, and 3, and Sequel, or New North American Reader, to form the five-book 1842 Cobb series. As discussed elsewhere, by 1842 the speller was no longer the beginning book almost anywhere in America.

The New York Public Library Rare Books Room has an interesting old publication by Lyman Cobb. It is a collection of letters he wrote to the newspaper, the Albany Argus, in 1827 and 1828, and includes a response from Noah Webster, whose speller Cobb was attacking in the columns of the newspaper, claiming that his own was far superior. Cobb specifically found fault with Webster’s phonic key. Cobb was horrified that Webster should equate “e” with “a” with sample spellings like “there” and “vein” and “purified” his own key by omitting them.

The replacing in spellers of Webster’s synthetic phonics key (“sound”) with keys modeled on Walker’s two-step whole-word analytic phonics (“meaning”) was a very important and critically damaging step in the teaching of beginning reading. Cobb later followed through with it in his reading series, crippling children’s decoding ability. It is small wonder that Cobb met the approval of Russell and that he prospered in the highly activist-organized schools of New York State.
Cobb obviously preferred the dictionary-respelling approach because all new words in his 1842 readers had dictionary-type phonetic respellings. Yet, even in his 1828 dictionary, Webster used no such phonetic respellings. Instead, Webster’s markings which were also used in his speller were, in effect, a kind of pronouncing print. His unsung “pronouncing print” is perhaps the most striking of Webster’s brilliant achievements. Cobb’s use of respellings for all new words was a lethal defect since it killed many children’s ability to decode unfamiliar words independently. Yet Cobb, who gave definitions for all words in his readers, most naturally, received the support of the movers-and-shakers, as he was shifting toward “meaning” in beginning reading with his “improvements.”

Many of Cobb’s comments in his articles finding fault with Webster’s speller also appeared in the preface to Cobb’s 1825 speller dated July, 1825. Cobb had obviously been warring with Webster for three years by 1828, but it was a very successful war. In July, 1842, when he wrote his New Spelling Book in Six Parts, he said that in the previous twenty years seven million copies of his spelling book had been sold!

In Cobb’s articles, he referred to “several of the spelling books now most generally in use.” Of these spelling books mentioned by Cobb and of which he approved in the following extract, I have photocopies on portions of all but Hawes’. About Hawes, I have no information. All the others rate a Code 7 or above, but all except Perry’s appear to have been chipping away at the Webster model of what an ideal speller should be. Perry’s, first published in Scotland in 1776, was republished in America by Isaiah Thomas in 1785 and later. It was, however, heavily phonic, as was Webster’s. Yet, it was the Webster 1783 speller of which America had approved so resoundingly for so many years.

The first dates of publication of those spellers on which I have some photocopies are:

- Perry - 1776
- Marshall - 1819
- Cummings - 1819
- Cobb - a defective edition in 1821 per Nietz, but revised in 1825 on which later edition I have some photocopies.
- Sears - 1826
- Bolles - 1825
- Hall J. Kelley - 1827 revised seventh edition

According to Superintendent Philbrick’s “Report” in the Annual School Report for Boston of 1874, pages 374-375, Kelley’s spelling book was used in the Boston primary schools when they were opened in 1818. An 1827 copy of Kelley’s speller was weaker on “sound” than Webster’s speller, but an earlier edition of Kelley’s, which may or may not have been as weak, dates from at least 1818 according to Philbrick.

The fact that Webster’s speller was NOT used in the Boston primary schools in 1818 when they opened should be noted. It shows that opposition to Webster’s speller as early as 1818 was present in the area of the Webster speller’s greatest use, New England, and that the opposition was coming from the change-agents who were promoting the Boston primary schools. (Samuel Blumenfeld’s statistical analysis of historical sources in his book, Is Public Education Necessary? shows that the Boston public primary schools were totally unnecessary, not only because of existing private educational facilities but because literacy was virtually universal in the Boston area for native-born Americans in those days when Webster’s easily used Code 10 “sound” speller had been the norm in Boston.)

Note also that all of the spellers listed by Cobb except for Perry’s apparently date from 1818 or after, the date when “change” first surfaced. Perry’s was the excellent Code 10 1776 Scottish speller, which was
apparently inspired by Thomas Sheridan’s lectures on elocution in Scotland. Perry’s speller was written before Webster’s 1783 American speller but it had been published in America ever since 1785 by the famous publisher Isaiah Thomas of Worcester, Massachusetts. Although Webster had campaigned for copyright laws for decades because of the many spellers which had pirated and imitated his speller, Cobb listed none of those earlier Webster challengers except for Perry’s famous Scottish speller.

The American publisher of Perry’s Scottish speller, which was not protected by copyright in America and which was not very successful in Great Britain, was Isaiah Thomas (1749-1831). Thomas was rich and powerful so perhaps it was not expedient for Cobb to incur Thomas’s displeasure by failing to approve of the Perry speller published by the extremely successful and obviously powerful Isaiah Thomas company.

According to the Encyclopedia Britannica, (1963), Thomas had been born in Boston and was apprenticed to the printer, Zachariah Fowle, at the age of six. By modern standards, that was an appalling thing to do, to put a six-year-old to work for a printer, even if it did involve the child’s learning a trade! It could not have been too happy an association, either, because at the age of sixteen Thomas ran away to Nova Scotia and worked as a printer in Nova Scotia and New Hampshire.

Yet Thomas and Fowle eventually were reconciled, because Fowle consented to Isaiah Thomas’s next move to Charleston, South Carolina. Then, in 1770, when Thomas would have been twenty or twenty-one, he and Fowle published the Massachusetts Spy as partners. The periodical became a weekly owned solely by Thomas and it backed the Revolutionary cause. Thomas took part in the Battle of Concord on April 16, 1775, but three days earlier he had moved his printing operation out of Boston to Worcester. As an indication of Thomas’s stature, after having very successfully gone into the printing business for himself by 1775, he eventually had book stores and printing plants all around the country.

Isaiah Thomas founded the enormously important American Antiquarian Society in 1812 with its historical library in his own town of Worcester, Massachusetts. In 1810, he had written History of Printing in America, and according to the Encyclopedia Britannica account had given over the Worcester business to his son in 1802. Whether Thomas relinquished his other business is unknown.

Cobb most probably did not wish to battle with Thomas over the moderately successful Perry speller. However, as Cobb’s remarks show, it was Cobb’s obvious intent to battle in the public press with Webster over the far more successful Webster speller, and Webster’s answers to Cobb’s charges are quoted in that publication.

While Cobb admitted that Webster’s 1783 speller was a great improvement on Dilworth’s 1740 text, he gave no hint that Webster’s was different in kind from Dilworth’s. Yet nothing in Dilworth’s is remotely comparable to Webster’s essay on phonic pronunciation, which older American children until about 1820 often committed to memory. Webster’s essay was a variation on Thomas Sheridan’s essays and speeches on phonics dating from the late 1750’s, and Sheridan’s work did not appear until almost twenty years after Dilworth’s speller was first published in 1740. Sheridan’s writings were enlargements of the brilliant and highly original (but almost totally ignored) work of the anonymous author of the 1740 Irish Spelling Book, who may very possibly have been Sheridan’s schoolmaster father. It is evident the author of the Irish Spelling Book was a schoolmaster. As discussed elsewhere, it is possible to trace the phonic ideas in the Irish Spelling Book of 1740 back to their probable source, Blaise Pascal in France in 1655.

The following are excerpts from Cobb’s articles in 1827 and 1828 opposing Webster’s speller, portions of which articles had appeared previously in the preface to Cobb’s 1825 speller:
“Critical Review of Noah Webster’s Spelling Book, First Published in a Series of Numbers in the Albany Argus in 1827 and 1828. By Examinator. Printed in 1828. (Written by Lyman Cobb according to the New York Public Library)

“Advertisement - This critical review of Mr. Webster’s Spelling-Book is submitted to the candid perusal... with a request that you will compare it carefully with the other Spelling-Books now in use among us, with Perry’s, Marshall’s, Sears’, Hawes’, Kelly’s, (sic) Cumming’s, Bolles’, &c but more particularly with Cobb’s in which, it is believed, the defects contained in Mr. Webster’s Spelling-Book are remedied...

“... the subject of rudimental or common school Education has recently excited much attention...."

At this point, Cobb indulged in much flowery rhetoric on government schools as necessary for America’s salvation, even though the United States had existed for over fifty successful years with very few government schools. Government schools in New York and Massachusetts began to increase after about 1818. (Northern New York had been heavily settled by Massachusetts people who went west, and they had carried the common school idea with them, although the concept was gradually dying out by 1818 except with activists.) Cobb said suggestions for improvement in education concerned instructors and:

“... it is necessary to examine elementary books. Among the suggestions which have been recently made for the improvement of our common school system, the importance is urged of making some publck provision for the qualifying of competent instructors. Towards the accomplishment of this object it will be found essential, that correct systems of instruction be adopted. Hence the importance of considering, with closer scrutiny than hitherto, the character of elementary books; and of introducing none but such as are plain and judicious in their plans, and correct in their principle and execution. These works form the basis of the teacher’s knowledge, and prescribe the means and method by which he imparts instruction to his pupils; or should he be competent to detect the errors of a system, it would be impossible for him to counteract its mischievous effects, since the book itself must form the scholar’s standard, or all confidence will be destroyed in the utility of their studies.

“In this view of the subject, the simple manual, the SPELLING-BOOK, is not the least in importance. It is the first elementary work placed in the hands of the scholar. From this he derives his earliest impressions of the nature and utility of the language in which he is to speak and write. From this book he acquires his habits of thought and expression; the tone and modulation of voice which distinguish him generally through life; from this he is to acquire the practice of spelling and pronouncing correctly, qualifications which give great force and effect to what is spoken or written. With respect to the character, and the proper study of this elementary book, there has hitherto been a great neglect. Its importance does not seem to be appreciated; and hence the great variety of works of this class, differing widely in their principles and practices, which have appeared, and made their way into the schools, without due scrutiny on the part of those who should guard our sanctuaries of knowledge against the entrance of imperfection and error. From this great and apparent evils have resulted. There is a general ignorance of the elementary principles of our language, and no system of orthography seems to be known and followed.... in orthoepy.... we are equally defective and devoid of system. The variableness and consequent want of correctness in the pronunciation of many of our most eminent scholars and publck speakers, are apparent and painful to ... observers....
“As an evidence that this long neglected branch of instruction is beginning to be properly appreciated, and that correct elementary books may hereafter be deemed a desideratum, a premium was for some months offered, through the medium of your paper, for the best Essay, or Criticism, upon the various spelling-books in use in this country. It is indeed to be regretted, that no one has embraced the opportunity to render an important service to the publick. The task, truly, was not an easy one of accomplishment and perhaps few persons have devoted sufficient time to the investigation of the subject, to render them competent for... the comparative examination and description, of so numerous a class of books of such various instruction and character....”

Cobb had established that no member of the public had produced an essay, which indicated the subject of the relative value of different spelling books was of no interest to almost anyone in the Albany area except that editor and Cobb about the end of 1826, when the editor apparently announced his contest. The editor’s motives in making the offer can only be surmised. Perhaps he was aware of the chipping away at the Webster perfections in the new flood of spellers and was horrified. Perhaps it was the opposite, and he was one of the change-agents himself, interested in displacing Webster’s “sound” speller with “meaning” primers. In the early 1820's, the Webster speller had a hold on ordinary Americans second only to the Bible. To destroy Webster’s high reputation with such a public could only be done indirectly and one step at a time, and certainly could not be done by a frontal attack on Webster’s speller or the results would boomerang.

Cobb went on, in his lofty and superior tone, to state what was necessary in a spelling book. He said that only common words should be used, the book should be simple, “the classification of words should be judicious and distinct and the system adopted be strictly and correctly adhered to,” and “in orthography and orthoepy it should correspond with the standard dictionary of the country.” The “standard dictionary” he presumed was not Webster’s early dictionaries, but Walker’s.

Cobb admitted Webster’s historical success and called Webster’s speller the oldest, “Mr. Dilworth having become almost obsolete....” Cobb said, on page 5:

“Webster’s Spelling Book was founded upon and succeeded Dilworth. It was so superior to its predecessor in many respects, as to acquire an immediate and unparalleled popularity, which it has sustained with little interruption for more than forty years. So magical indeed has been the charm of popularity woven around it, that all desire for, or efforts to improvement, seem to have been paralyzed; and it is not until within a few years, that any successful attempts have been made to improve upon this popular system. The merits of Mr. Webster’s books have been duly considered by me....”

Cobb said Webster had 6,950 words to spell and said (I believe) 220 were repeated. A twentieth-century response to this kind of fault-finding is, “So what?” (Webster had good reasons for the inclusion of words in his tables. Cobb quoted Webster as having said, “My tables are so constructed, and so nearly complete, that they cannot be improved.”) Cobb also found fault with the omission of very long multisyllable words accented on the final syllable. Yet how many of such words could meet Cobb’s criterion that spelling words should be common?

Most significantly, Cobb found fault with Webster’s use of a phonically marked “e” which beginners could use by themselves to work out the pronunciation of words with irregular “e” spellings for the long “a” sound like “their.” Here, of course, is the heart of the matter: Webster provided beginners with a “key” which mimicked actual English spellings so that children could use it later themselves to pronounce anything in English. In Cobb’s readers, he was taking away the beginners’ ability to pronounce unknown words for themselves by denying them the key to the actual letters in front of their eyes as those letters
appeared in unknown words. Instead, children had only the dictionary’s respelled key to guide them to the pronunciation of unfamiliar words. (It should be remembered that Webster’s 1828 dictionary, like his speller, did not need to alter almost any spellings to make them pronounceable as Walker’s did. Webster only marked the words so that they could be pronounced exactly as they were written. This was Webster’s most astonishing - and ignored - achievement.)

Cobb referred to Webster’s appeal “To the Public” published in New Haven in March, 1826, and said on page 30:

“Having pointed out... what I considered defective and contradictory in Mr. Webster’s spelling book, I shall now conclude my remarks... by taking notice of some declarations made by Mr. Webster relative to his spelling book, in his appeal ‘To the Public’ published at New Haven, March, 1826....From a review of his appeal... I was fully convinced that Mr. Webster was not aware of the defects and contradictions contained in his spelling book and school dictionaries and I have therefore been more particular in giving proof of what I have said.... Again, he says, in speaking of the attempts to rival his book: ‘In order to accomplish their object, it has been expedient to depreciate my work and to charge me with innovation and with introducing a system of orthography and pronunciation in many respects vague and pedantic ... Surely if this is true, if my book is really a bad one, I have been very much deceived; and I have done not only an injury but great and extensive injury to my country.’“

Some people WERE in the very act of doing “great and extensive injury” to Webster’s country and to ours in 1826, but it was certainly NOT Noah Webster!

Cobb said:

“...to my remarks on his spelling book, Mr. Webster attempted an answer in your paper of the 12th December....”

In Webster’s answer, he said he had supported his family on the small profits from his spelling book. (If ever a laborer was worthy of his hire, it certainly was old Noah Webster!) Concerning the argument on “correct” spelling and “correct” pronunciation, Webster said when he completed his book in 1782, there were no authorities on spelling or pronunciation. Of those who had written dictionaries up to that time, he said something good could be said of almost all of them - except for Walker, whom he considered the most incorrect, but it was Walker’s “authority” which Webster’s opponents were citing as “correct.” Webster’s letter to the Albany Argus was signed, “New Haven, December, 1827.”

So the opposition to Webster, including Cobb with all his arguments, fitted very nicely into the movers’-and-shakers’ apparent timetable for educational change, which included government schools, teacher “training,” and textbook control. Webster had felt it necessary by March, 1826, to write an appeal “To the Public” in defense of his spelling book against attacks. By December, 1827, he publicly answered Cobb’s attacks against his speller.

Cobb was apparently a very handy “public relations” tool for the activists who were opposed to Webster’s phonic speller. “Public relations” is usually considered to be a twentieth-century activity. Yet the history makes it clear that the movers-and-shakers after 1818 had already worked out public relations as a science. The kind of public relations in which they dealt, however, sounds a good deal like conspiracy.

It was in 1843 that William D. Swan, Principal of the Mayhew Grammar School in Boston, came out with a book for teaching “reading” in primary schools. All that Swan was attempting to do was to teach
children the proper pronunciation of their sight words, though his book would look “phonic” to the
unwary. Swan clearly stated its purpose, though. It was not to teach children to hear the printed page, but
to make the right sounds with their mouths: “The subject of articulation must be taught in our Primary
Schools, as it forms the basis of good reading.” Of course, by teaching beginners how to make
pear-shaped sounds when pronouncing their sight-words out loud, the schools were accidentally teaching
children something about how to decode unknown words, but that was not the intent. In fact, by 1843, the
idea of teaching children to sound out words for themselves apparently never occurred to teachers. By
that time, “new vocabulary” was supposed to be taught the way Cobb did it, with the words respelled in
parentheses for the teacher to read aloud to the children, so that the children would not stumble over the
new words when reading their sight-word texts. It was no accident that Joseph Rice got the remark from a
New York City primary school principal which he did about 1892 which went about like this: “How can
children know what a word is if they never saw it before?”

Reading Series After 1830

After Angell’s and Cobb’s highly successful series which started in 1830, joining the highly
successful but pivotal Franklin and Worcester series of 1826 and later which have been discussed, reading
series came out in great numbers. Almost all, commonly in newer editions, continued to be published
simultaneously over decades, generating textbook wars. These textbook wars are described by Vail in his
history of the McGuffey readers, and are humorously discussed in the excerpt from The School Bulletin
in Appendix A. Also, these series were commonly rewritten in later years by a collaborator and the
original author. The original author’s name, it is suspected, may have appeared largely for its advertising
value. In addition, before 1870, publishing houses which had handled a once-popular series often
completely replaced it with a new series by new authors, who tended to have impressive “literary”
credentials, such as George Hillard. Hillard’s publishers obviously used Hillard’s new series to replace
the Worcester series they had previously been publishing.

Merriam’s American Readers have been discussed earlier, including in 1821 The American Reader,
Containing Extracts Suited to Exciting a Love of Science and Literature, to Refine the Taste and to
Improve the Moral Character. Designed for the Use of Schools. In 1828, the Merriam company published
The American Primer. That American Primer was obviously added by 1828 to Merriam’s American
Readers series, which presumably had other books in the series besides the 1821 reader. Their Easy
Primer came out in 1833, and the New York Public Library card catalog shows that in 1841 the Merriam
company published The Village Readers, Designed for the Use of Schools, by the Compilers of the Easy
Primer. An 1846 and an 1849 copy of The Village Reader is listed in Early American Textbooks, but no
other information is available on the Village series, or other books in that series, published by the
company that became the publishers of Webster’s monumental dictionary.

Jesse Torrey’s series of readers have been discussed, as have those of Olney, and both Torrey’s and
Olney’s reading series may have been completed by the early 1830’s. Torrey’s had been started with the
1824 publication of the reader that became the third book in his series. Torrey’s books were published as
late as 1836 by Grigg and Elliot of Philadelphia, but in 1844 Grigg and Elliot produced its New Series of
Common School Readers of three books. Curiously, its “No. 1” reader stated, “This little volume is
intended to be used as a First Reading Book after the Spelling Book.” This was a strange holdover from
pre-1826 practices, and perhaps had also applied to Torrey’s materials. The Grigg and Elliot 1844
materials were still in print when the 1876 American Catalogue was published, but were out of print by
the time the 1912 United States Catalog was published.
James Kay, Jr. & Brother, 122 Chestnut Street, Philadelphia, and C. H. Kay & Co., Pittsburgh, published in 1840 Kay’s Infant and Primary School Reader & Speller, No. 1, in Words of Two and Three Letters, which had been copyrighted by the Philadelphia company in 1839. No author’s name appeared, but, in its “Preface,” the words appeared, “...the author speaks from experience...” concerning the quieting effect on a class when children were permitted to draw on their slates. Presumably, therefore, its author was a teacher. The author said he based his book on “Mr. Ballantine’s Infant School Reader, which consisted of Reading, Spelling and Defining lessons, all confined to Monosyllables...” which book was apparently originally published in Great Britain some time (perhaps considerably) before 1832.

Yet the author of the 1839 work completely changed the original material. First, he had made a list of all the words he could find in English composed of only two or three letters, which he said numbered 500, and used all these words in book No. 1, all but 24 introduced in the first half, all in whole sentences. The author also recommended that the alphabet be learned only through exposure to these whole words. The author said that throughout the book, “New words are gradually and systematically introduced,” and he used a controlled high-frequency vocabulary of 200 two- and three-letter words before he began to introduce capitals. He said he also often used pictures for word identification.

All but 24 of the list of 500 words were introduced before the “Second Part” that “consists of Spelling Lessons.” In the “Second Part,” “all the words in the reading lessons are arranged in classes according to their similarity of sound.” Since the children had already learned 476 of the 500 words as meaning-bearing wholes, this sound analysis became two-step phony phonics.

The book was a straight Code 1 book until the spelling section, when it changed to Code 3. The cover of the book which I saw was badly blurred, and held two drawn portraits which were indistinguishable. Under them, however, could be seen a quotation for each man. For the second, the words could be made out,”but let it be useful knowledge. William...” “Useful knowledge” was, of course, a buzz-word of the activists, of which “William...” was possibly one, and this book certainly had activist earmarks. Its back cover advertised the whole series:

“Kay’s Infant and Primary School Series in Three Volumes:

“Infant and Primary School Reader and Speller, No. 1, in words of Two and Three Letters.

“Infant and Primary School Reader and Definer, No. 2, in Words of One Syllable.

“Infant and Primary School Reader and Definer, No. 3. In Words of One and Two Syllables.”

No other reference to this Pennsylvania series of 1839 which was so in line with activist thinking has turned up in any other material which I have seen, although it was still in print when the 1876 American Catalogue was published. It was most decidedly “au courant.” It might be described as ammunition that was being set off considerably after the 1826 “sound” vs. “meaning” war was over, except for the fact that the use of the speller as the first book was lingering in the Philadelphia area, such as in Grigg and Elliot’s materials. The Kay materials were a direct challenge to those materials.

Another set of books produced in Philadelphia began with one published in 1830, The Clinton Primer for Common Schools, by Montgomery Robert Bartlett, “Author of the Common School Manual,” which was the second book in his series, published by Carey and Lea of Philadelphia. The Library of Congress has an 1830 copy, which rates Code 4. It describes itself as a “series of first lessons with cuts for little children designed to prepare them for entering upon the study of the first part of the Common School Manual. It will also be found well adapted to the purposes of instruction in infant schools and private families.” An 1832 copy held by the New York Public Library shows that Bartlett changed the name of
his upper level material from the Common School Manual to the National School Manual, stating, “This work of which the Clinton Primer is the incipient branch will include nearly 1400 pages and embrace a comprehensive and practical system of English education, the cost of which will be about three dollars. The parts of the work will be retailed at the following prices: primer, 48 pages, 6 1/4 cents; 1st part, 108 pages, 18 3/4 cents; 2nd part, 302 pages, 62 l/2 cents; 3rd part, 380 pages, 75 cents; 4th part, 550 pages, $1.00; Atlas, 75 cents. Primer with the first, second and third parts are completed and now (?) offered for sale by ALL booksellers.” Bartlett’s materials certainly sound like a reading series, or like a series meant to replace existing reading series, but no other information has surfaced concerning any part of it except The Clinton Primer. The 1832 copy was published by Carey & Lea at Chestnut Street, Philadelphia and stereotyped by James Connor.

Roe, Lockwood Company of New York, New York, mentioned earlier as the publishers of Dwight’s Schoolmaster’s Friend and Committee Man’s Guide in 1836, had published a series of readers apparently some time before 1831. On the 9th edition of Introduction to American Popular Lessons carrying the date of 1831, the Roe, Lockwood Company advertised the book preceding it, The First Book or Primary Lessons, which they said was “By the Author of American Popular Lessons,” who obviously had written a three-book series probably before 1831: The First Book..., the Introduction..., and American Popular Lessons. Eliza Robbins, a teacher, was credited as having been the author of the American Popular Lessons on an 1838 book, The School Friend, published by “Robinson and Franklin, Successors to Leavitt, Lord & Company” of New York. The School Friend was not a beginning book, but apparently was Eliza Robbins’ latest enthusiasm, since it was modeled after the 128th edition of a German book from Saxe-Weimar. It was a terrible book in which she quoted Cousin, so Eliza Robbins and her reading books were, apparently, very much in agreement with the “best” thinking of the time.

Edward Hazen’s first material, discussed previously, had appeared in 1829, but he had written an additional reading series by 1845. Harvard Library has a copy of Hazen’s 1845 The Grammatic Reader, No. I, published by J. S. Redfield, New York. It is a Code 3 book which flatly admitted in its Preface that teaching to read had become difficult: “Much of the first and second years of the scholastic course is wasted in learning to read and spell....” The back cover of this 1845 book advertised Grammatic Readers Nos. I, II, III published by J. S. Redfield, N. Y., so Hazen’s Code 3 Grammatic Readers were in print by 1845.

On page 101, Early American Textbooks indicates another reading series was published in 1849 on which I have no other information: The Second Reader (252 pages), Oliver Beale Peirce, Published by Gates, Stedman & Co., New York. Early American Textbooks also shows on page 54 that Peirce wrote The Grammar of The English Language, Impr. ed., Watertown, N. Y.: Knowlton & Rice, 1843, 192 pages. No further information is available on Peirce’s books or on the apparent reading series published by Gates, Stedman & Co. of New York before or in 1849.

The 1876 American Catalogue lists reading books published around the 1850’s by “Claxton,” apparently Claxton, Remsen & Haffelfinger of Philadelphia, and additional previously unknown texts by J. B. Lippincott of Philadelphia. These titles, known only from the 1876 American Catalogue, are listed in the appendix, but no further information is available on them.

A great many series came out between 1830 and 1860, in addition to those series already mentioned, and are described more fully in Appendix B. The series of A. Picket came out in the 1830’s, as did that of S. G. (Peter Parley) Goodrich (1793-1860). Gallaudet produced his deaf-mute-method The Mother’s Primer in 1835, possibly named after the Mother’s Magazine to which he contributed. Gallaudet indicated that he meant to follow his primer with a higher level book (which he apparently never wrote). J. E. Lovell’s first series began in 1836, copies of which I have not seen. Lovell’s second series, which surprisingly was truly phonic and rated a Code 7, began in 1855.
Horace Mann’s second publisher, William Bentley Fowle, wrote a reading series starting in 1837 when he copyrighted The Primary Reader. (Fowle wrote many other books, besides the spellers discussed elsewhere in this history, including The Teacher’s Institute, mentioned as late as 1878 in the October Primary Teacher, page 57.) Josiah Freeman Bumstead’s (b. 1797) series was started by 1838. An 1851 copy of Bumstead’s My First School Book showed it was adopted by the Boston Primary Schools on June 5, 1839. Bumstead’s terrible sight-word series is discussed in Appendix B. Rensselaer Bentley’s series was started in 1839. (Note the possibly meaningful same family name as William Bentley Fowle.) The series of Charles W. Sanders (1805-1889) began with his Primer in 1840, although his speller came out in 1838.

The elocutionary series of David B. Tower, Principal of the Eliot Grammar School, Boston, was started in 1841. The elocutionary series of William D. Swan, Principal of the Mayhew Grammar School, Boston, was started by 1843. The series by the elocutionist/activist/editor, William Russell and the series by the author Lydia Sigourney (a toy book approach) were started by 1844.

Also started in 1844 was the series by Salem Town (1779-1864). Town had written Town’s Speller and Definer in 1836 which had a one hundredth edition by 1843, in which year it was revised and enlarged. An 1838 copy carried the notation, “Designed to impart distinct ideas while learning every new word,” and showed that it was published in a long list of New York state locations, plus in Boston and Philadelphia. As mentioned elsewhere, Noah Webster considered Town’s one-word definitions to be objectionable because they were often wrong. Later, Salem Town wrote The Progressive Series with Nelson M. Holbrook which was being published by 1855.

Joshua Leavitt’s Leavitt’s Reading Series came out in 1847. As previously mentioned, Leavitt & Company, New York, published a speller in 1849 which they said was part of their “American School Series” which included a first, second and third reader which have not turned up, and which were apparently unconnected with Joshua Leavitt’s Reading Series. Henry Mandeville’s series came out in 1849, and J. S. Denman’s The Student’s Series by 1850 (discussed later) based on 1846 articles in The Student, a monthly. Elias Longley’s Pitman-print series came out by 1850. Farmer, Brace & Company’s Young American’s Series, Lucius Osgood’s Progressive Series, and the first book of the first series of G. S. Hillard (1808-1879) came out starting in 1855. (Hillard wrote two later series with Loomis J. Campbell in 1864 and 1871-1873.) The first series of Epes Sargent (1813-1880) came out by 1854 and an available copy of his Standard School Primer is dated 1856. (He also published The New American Series with Amasa May in 1871.)

J. Russell Webb’s first series of books, the Normal readers, came out between 1846 and 1855. Webb also published The Analytical Series of readers with Richard Edwards between 1866 and 1871. According to the 1876 American Catalogue, he also published the Model Readers between 1873 and 1876. The 1885-1890 American Catalogue showed that “Webb” with no initials wrote the New Model First Reader in 1888. The 1876 American Catalogue had also shown that a W. H. Webb, who was possibly a relative, wrote the Word Method Primer, a surviving copy of which is dated 1857 but which carried no author’s name.

This does not pretend to be a complete list of all the American series, or revisions of American series, between 1830 and 1860, and, in addition, there were many, many, reading materials published which
were more transient than the complete series of books. Amidst all of this material, McGuffey’s which came out starting in 1836 was only one of many.

The dates that were given in the above for authors’ births and deaths were taken from Nietz’ text, except Bumstead’s birth year, from the New York Public Library index card for their 1857 copy of Bumstead’s Spelling and Thinking Combined, or The Spelling Book Made a Medium of Thought, in the Gansevoort-Lansing Collection. However, for most authors, no such dates are known.

I have not seen a copy of Eliza Robbins’ The First Book or Primary Lessons, but presume, from its title, it was a “meaning” approach, particularly since its author was “au courant.” The probability is that the Leavitt and Company series was also a “meaning” approach. If so, then every single one of the reading materials listed previously which were published between about 1830 and 1860, except Elias Longley’s, Grigg & Elliot’s, and Lovell’s 1855 series (but probably not his earlier series), taught children to read primarily by sight-words. The emphasis was primarily on “meaning” and not “sound,” even in the elocutionary series of Tower’s and Swan’s. (The beginning books of Town and Holbrook’s Progressive Series were written by Tower but were not phonic.)

Mentioned as exceptions were the materials published by Grigg & Elliot. They had published Torrey’s series and in 1844 the Grigg & Elliot New Series of Common School Readers. Common School Reader No. 1 stated, “This little volume is intended to be used as a First Reading Book after the Spelling Book.” Grigg & Elliott were located in Philadelphia where a weakened revision of Comly’s speller was published in 1842, and both Comly’s speller and Grigg & Elliot’s readers were still in print when Leypoldt’s 1876 American Catalogue was published.

Therefore, the use of a speller as a beginning reading book appears to have lingered in Pennsylvania and also for a while in very poor rural areas where books and the money to buy them were scarce. Yet even Grigg & Elliot of Philadelphia were agents in 1843 for Salem Town’s ridiculous Town’s Speller and Definer, so they were fairly up to date. (Town’s first version for which Grigg & Elliot were agents rated a Code 7, but Town’s revision that same year, 1843, being published by Sanborn and Carter of Portland in 1848, rated only a Code 4.)

Despite the pattern of the Grigg & Elliott series in Pennsylvania which began with a speller, it is evident from the remark by James Pyle Wickersham, Principal of the normal school at Millersville, Pennsylvania, in his 1865 book, Methods of Instruction, that spellers had generally died out by 1865 as the beginning step even in Pennsylvania. In his book, Wickersham was reviewing various methods to teach beginning reading. When he discussed “The Phonic Method,” he said on page 183:

“The word-tables composed of such monosyllables as ba, ma, le, he, si, no, tu,... ble, bad, mad, &c., as found in our old-fashioned spelling-books, could be made very useful as exercises in phonic synthesis.”

Wickersham obviously did not consider it customary in Pennsylvania by 1865 to have such spelling books as the very beginning step. The 1839 Kay Code 1 - Code 3 series published in Philadelphia which has already been described remained in print until at least 1876, according to the American Catalogue. It was in obvious competition with Grigg & Elliot’s materials which began with a speller. The existence of the Kay series in Philadelphia over all those years until at least 1876 is further confirmation that the “meaning” approach was strong in the Pennsylvania area after 1839, despite the apparently popular Grigg & Eliott series which began with a speller and which also remained in print, along with Comly’s speller until at least 1876.
A series of readers meant for children past the beginning level was published by 1839 by John Hall, "Late Principal of the Ellington School," Connecticut. It consisted of "The Reader's Guide, which was published two or three years since... designed for scholars of an advanced standing... The Reader's Manual, (the present work)... designed for scholars less advanced... (and) The Primary Reader... intended for a still younger class of learners, who are already able to read sentences with some degree of readiness..." (from page x of The Reader's Manual, dated May, 1839). On page 13 of The Reader's Manual, "Designed for the Use of Common Schools in the United States," Hall confirmed that reading disabilities existed by 1839. No such comments had appeared on pre-1826 texts:

"REQUISITES FOR READING WELL.

"The very first thing to be acquired in reading is to be able to call every word right, just as soon as it meets the eye. A mere glance of the eye at any word should be sufficient to enable the reader to tell what it is, without stopping to spell it out. Nothing appears so bad, so awkward, and so vulgar, in a scholar who is old enough to read with fluency, as to be continually boggling on words of more than one syllable, and hesitating what to call them, or calling them wrong. The first rule, therefore, should be this:

CALL EVERY WORD RIGHT; AND CALL IT RIGHT AS SOON AS YOU SEE IT, WITHOUT STOPPING TO SPELL IT.

"Many readers make nonsense by leaving out words which are in the book, or by inserting words which are not found in it. This fault is a very great one, though it is very common.... The second rule then is:

"NEVER LEAVE OUT ANY WORDS WHEN YOU READ, AND NEVER INSERT ANY WHICH THE BOOK DOES NOT CONTAIN."

The "late principal of the Ellington School" in Connecticut in 1839 therefore added his testimony to that quoted by Horace Mann in 1839, referred to later, confirming that the schools by then were turning out some very poor readers. They were obviously very inferior to the vast majority of seven-year-olds that the Scottish Schoolmaster had described in 1828 who could read anything fluently by the time they were seven years old.

Besides the "meaning" materials being printed for school use, ample "meaning" materials were being published for home use, and by respected publishers such as the Ticknor company of Boston. Harvard library has an 1852 copy of Indestructible Reading Book Chiefly in Words of One Syllable (in coated cloth) published by Ticknor, Reed and Fields, Boston. That company published the Indestructible Alphabet, the Indestructible Primer, the Indestructible Spelling Book, and the Indestructible Reading Book. They were combined in the Indestructible Lesson Book: The Four Parts Bound in One Volume. The Indestructible Reading Book carried this note:

"To the teacher: In describing the pictures, many words are used that are too difficult for young beginners. The teacher, in such cases, is requested to help the child by pointing to the object named, or by repeating the word two or three times."

That is obviously a pure "meaning" approach. The material was evidently English, with references to May Day, to a cottage with an "old dame," to a "barrow" and "water pot." It also used the term, "hay cock" instead of hay stack. Ticknor, Reed and Fields were apparently printing for home use in 1852 an English Code I series, also intended for home use. Pity the poor children who were "taught" with it!
The McGuffey readers, which are discussed at length later, also first appeared in the 1830-1860 period. Dugald Stewart’s ideas on reading may have influenced McGuffey before he wrote his readers since McGuffey had been a professor of philosophy. In A History of the McGuffey Readers, The Burrows Brothers Co.: Cleveland, 1911, Henry H. Vail referred to McGuffey’s work as a professor at Miami University, Ohio.

“In 1832, he was transferred to the chair of Mental Philosophy.... He had become well read in philosophy, especially of the Scottish school, Brown being his favorite author.”

If McGuffey knew about Brown “of the Scottish school” of Mental Philosophy in 1832, it appears probable he also knew about Dugald Stewart of that school, and this bears directly on McGuffey’s possible philosophy concerning the teaching of beginning reading when he first compiled his readers. Perhaps McGuffey’s clear evasion of any method of teaching children to read at that time, beyond repeating “whole words,” in his 1830’s readers came from such a contact, since Stewart, as quoted by Keagy, disapproved of reading without “meaning.”

McGuffey’s 1836-1838 sight-word readers prospered in America’s spreading government schools because they fitted the prevailing educational theory. That theory was that children should learn to read by “meaning.” However, William H. McGuffey (or possibly his publisher) must very soon have had a change in attitude concerning beginning reading, because McGuffey’s brother, Alexander H. McGuffey, almost immediately afterwards, in 1838, wrote the spelling book of the series, which clearly recommended in a lesson near the end of the speller that children should learn to spell BEFORE beginning the First Reader. (Presumably, he meant their thin 1836 Eclectic Primer teaching the alphabet was to be used jointly with the beginning pages of their speller.) This was a clear endorsement of sound, and not meaning, for beginners.

If the speller had been used first as recommended, it turned the whole McGuffey series into a “sound” approach to reading, the content of which is superior even today. However, and unfortunately, Alexander H. McGuffey followed the lead of those spellers competing with Webster’s after about 1815, and used an analytic phonics key at the top of each page derived from Walker’s approach for children to use in sounding out words. This awkward key required two comparison steps for its use. By contrast, Webster’s original synthetic phonics key, the spellings of which children memorized, required no comparison. It was the spelling of the word itself which provided its sound, and no comparison to other words was necessary. As a result of this defective key, and because of some other weaknesses, Alexander McGuffey’s speller rates only a Code 7, and not a Code 10. (The entire original McGuffey 1836-1838 series can be obtained from Mott Media, Milford, Michigan, in a very high-quality reproduction. However, the reproduction dropped the hyphen to show words broken up into syllables that had been present in parts of the lower level selections.)

By 1840, the normal schools and education meetings were recommending the use of “meaning” and the dropping of spellers at the beginning level. Spelling books as a beginning step had passed out of general use before 1836, so it is unlikely that much use was made of the 1838 McGuffey speller as the introduction to reading. Like the Sanders spellers and all the rest, the McGuffey speller would have been used at upper grade levels.

The 1826 Switch From “Sound” to “Meaning” Was Essentially Completed Before 1840

The publishing record demonstrates that the cut-off date for the switch from “sound” to “meaning” had, indeed, been 1826. Except for Elias Longley’s Pitman print, Grigg & Elliot’s Pennsylvania materials, the apparently largely unknown Lovell 1855 material, and the lingering use of the spelling book for
beginners in isolated areas, the use of “meaning” to teach beginning reading in America remained almost completely unchallenged until after 1860. The same change from “sound” to “meaning” had occurred about the same time in Great Britain. Therefore, it is obvious from looking at beginning reading materials after 1826 that “sound” for beginning readers in the English language was almost dead not long after 1830.

Furthermore, the record shows clearly that the demise of “sound” in the teaching of beginning reading was the result of hard work by activists. Change-agents had produced large numbers of “meaning”-approach textbooks for beginners starting in 1826, but first those new textbooks had to be helped in finding their way into the schools and had to be helped in driving out materials like Webster’s “sound” speller from the beginning reading level. Cited earlier was the “approved” list of textbooks in Arkansas in 1846, which is one indication of such “help.” The approved list included large copies of the United States Primer. That was almost certainly Cooledge’s sight-word material, discussed earlier. Cooledge intended the United States Primer to be used by beginners as the first book, and Cooledge was publishing that sight-word book for beginners at the same time that Cooledge was the official publisher of the Webster speller!

The activist drive to install government education and to switch from “sound” to “meaning” in reading had begun with the founding of the American Journal of Education in 1826 in Boston. As early as 1828, only two years later, a pamphlet published in Vermont demonstrated the massive influence of change-agents on the choice of new textbooks for schools. A copy of that pamphlet is now in the U. S. Department of Education Library in Washington, D. C. The pamphlet demonstrated that Webster’s formerly best-selling “sound-method” speller for beginners was being massively replaced at that early date by the “meaning-method” Franklin Primer only two years after the Franklin Primer had been published, by the “meaning-method” Worcester Primer less than two years after it had been published, and by the “meaning-method” The Child’s Primer or First Book for Primary Schools by Jonathan Lamb, called the Lamb Primer in the pamphlet. Lamb’s book had just been published at the time the pamphlet was printed on October 28, 1828 and Lamb’s primer was being added to the list of textbooks that had been approved for the state of Vermont the previous June. (The Lamb text actually carries a copyright date of November 4, 1828, so the copyrights at that time apparently followed publication.) The Vermont pamphlet demonstrated that even at upper grades Webster’s speller was being forced out because other spellers were named on the approved list but Webster’s enormously famous speller was omitted.

The pamphlet also showed that new change-agent “meaning-method” reading materials for very young children just past the beginning stage were being installed in the schools in 1828. Previously, children had moved from the reading selections in Webster’s widely used “sound-method” speller right into parts of the Bible. Now the book to be used immediately after the new “meaning-method” primers” was to be something like Leavitt’s Easy Lessons written by Joshua Leavitt in 1823, or the Boston Reading Lessons, copyrighted on March 22, 1828. Boston Reading Lessons had been copyrighted only a few months before the Vermont meeting in June which selected the approved textbooks, including the latter two books. Boston Reading Lessons for Primary Schools, the full title, consisted of stories with morals, and some sections were horrid and upsetting. This has often been true of change-agent materials for little children. Yet an 1830 edition published by Richardson and Lord of Boston, who also were publishing Pierpont’s widely used readers, said that before that date the Boston Reading Lessons had been adopted by the Boston Primary School Committee and “many other schools in various parts of the country.” Therefore, Vermont was obviously not alone in adopting the objectionable text almost immediately after its publication in 1828, which certainly suggests a widespread net of change-agent influence.

The Vermont pamphlet proves that the state-wide promotion of change-agent textbooks was made legally possible (and was undoubtedly financed) by the same Vermont legislation that formally
established Vermont’s “government schools.” As elsewhere, the “meaning-method” to teach beginning reading had arrived in Vermont piggy-back on the brand-new “government schools.”

“In obedience to the regulations of the act, entitled, ‘An Act, to Provide for the Support of Common Schools,’ passed November 9, 1827, the Commissioners of Common Schools respectively report, that a meeting of the board was held at Montpelier, in June last, to take into consideration the several subjects which came within its scope, and powers and duties. At that time, the Commissioners, after as full an examination as circumstances would allow, of a considerable number of books received from different parts of the country, were induced to propose to the superintending committees in the several towns, and other people generally, the following list of books as suitable and proper, in their opinion, to be used in the common schools in this state - to wit: For Young Pupils - Franklin Primer, Worcester’s Primer: - Spelling Books - Marshall’s Spelling Book, Hazen’s do. Emerson’s National do: - Reading Books - Leavitt’s Easy Lessons, Boston Reading Lessons, Pierpont’s National Reader, Murray’s English Reader, New Testament, without note or comment: Geography - Goodrich’s Outlines of Modern Geography, Woodbridge’s Geography: - English Grammar - Murray’s Grammar, Nutmeg’s Grammar, Greenleaf’s Grammar Simplified: History - Goodrich’s History of the United States, Hale’s do., Whelpy’s Compend, Tyler’s Elements of History, Worcester’s do. - Arithmetic - Smith’s Practical and Mental Arithmetic, Adams’ New Arithmetic, Thompson’s New Arithmetic.

“The above list was published in all, or most, of the newspapers in the state. The Commissioners have since deemed it proper to add to the same (For Young Pupils) Lamb’s Primer which is now published.

“The duty of the commissioners in this respect is merely advisory. They are directed ‘to propose a list of school books from which they shall advise the superintending committees to select the books to be used in the common schools of their respective towns.’ In making the selection above stated, they were governed principally by two considerations - that most of the said books [were] already in extensive use, and might be easily obtained in the different sections of the state, and that they were well adapted, in design and execution, to the purposes of common school education.... It is scarcely necessary to remark, that many of the school-books which are more or less used, but which are not included in the above list, possess no inconsiderable degree of merit. But it was necessary to make selection, and, moreover, the superintending committees are at full liberty to exercise their own judgement in recommending books to their progressive towns.... “

It went on to say that the commissioners advised the reprinting of the fourth section of the school act which authorized superintending committees in each town to choose the books for the schools. This local “authorization” which was firmly based on state power also was monumental, since obviously no such “official” state power had existed previously. The first reference I have ever seen to any such “official” textbook lists in America had been, not surprisingly, in connection with the establishment of the city of Boston’s “government” primary schools in 1818, ten years previously. The city of Boston’s “government” primary schools, which Blumenfeld’s work demonstrated were totally unnecessary because of pre-existing private facilities, were the fruit of change-agent activity.

The pamphlet confirmed widespread opposition to such state control, saying on page 6:
“But so generally diffused through the great mass of the community is the sense of personal, as well as political, independence, and so [great] is the jealousy of arbitrary power, which is almost instinctive in the popular mind, that the attempt, however well intended, to dictate and prescribe the books to be used in our common schools, is regarded by many as an invasion of the right of private judgment, and, consequently, as incompatible with the genius of our free institutions.... the school act, passed at the last session, was, in its most important provisions, an experiment...."

The Vermont pamphlet also showed that, even as early as 1828, the change-agents were controlling the use of geography texts, as well as of reading texts, and probably of books in other subjects. Other geographies than those authorized in the pamphlet had been available before that date and had been in use over a wide area. Yet by that date, as the above entries suggest, the earlier works had been replaced. The geography by “Woodbridge” above is apparently by the same William Channing Woodbridge whose geographies are listed in Early American Textbooks. William Channing Woodbridge was an ex-associate of Gallaudet in his school for the deaf and was one of the editors of the American Journal of Education, called American Annals of Education under his editorship. The geography by Goodrich listed in this Vermont publication was not written by the publisher, Samuel Goodrich, but by Rev. C. A. Goodrich. Although not on this list, an 1828 geography was written by Jessie Olney, who is discussed elsewhere and who is shown elsewhere as associated in some degree with that most active of change agents, Holbrook. Olney’s geography was in wide use for many years, so it also most probably was included on the next “official” Vermont list.

Therefore, in this brief 1828 widely influential document, appear references to the following established “meaning-reading-method” texts or change-agent personalities: the Franklin Primer, the Worcester Primer, Lamb’s primer, Leavitt’s Easy Lessons, the Boston Reading Lessons, and the ex-teacher of the deaf in Gallaudet’s school, former college classmate of Holbrook, and later editor of the change-agent American Annals of Instruction (formerly the American Journal of Education), William Channing Woodbridge. Yet, notably absent from the list was the “sound-reading-method” and once-ubiquitous Webster’s speller! The change-agents were obviously in control at high levels in the state of Vermont. They were also obviously among the enemies of Webster’s “sound-method” speller, such as Lyman Cobb in New York whose public attacks on the Webster speller have been discussed previously. Yet the Vermont change-agents were wary of potential public resentment concerning their attempts at controlling textbooks and their dumping of Webster’s once unchallenged and enormously respected speller. This is the apparent reason the change-agents pretended an open-mindedness and reasonableness that the evidence suggests was just so much fakery.

Gallaudet’s Mother’s Primer of 1835 was apparently in relatively wide use almost immediately after its publication, since it had a seventh edition by 1840, as shown by a copy held by the American Antiquarian Society in Worcester, Massachusetts. Even as late as the 1911-1913 Cyclopedia of Education in his article on Gallaudet, W. S. Monroe referred to the Mother’s Primer as having been “popular.”

As Samuel Blumenfeld pointed out in The New Illiterates, William Scott Gray apparently had Gallaudet’s deaf-mute method on which to draw to use as a model for Gray’s 1930 “Dick and Jane” readers, and so must Arthur I. Gates have had Gallaudet’s method to use as a model for his 1930 silent reading workbooks. Yet, largely because of the McGuffey Myth, it is still generally unknown today that American reading instruction history has been influenced profoundly ever since Gallaudet’s time by the deaf-mute method of mental comparison of previously memorized sight words to new words, in order to record the new words to memory. From about 1830 until the early twentieth century, and then again after 1930, most American beginning books for hearing children taught whole sight words. They then often
compared new words to previously learned words with similar spellings, which usually but not necessarily also had a similar sound.

In 1966, Mitford Mathews resurrected the fact that there had been a reading instruction “war” in Boston by the late 1830’s over the use of sight-words. Dr. Mathews’ 1966 book, Teaching to Read, Historically Considered, University of Chicago Press, made it evident that the reading “history” as normally given is very awry, because until he wrote that book almost no one living knew anything about the real facts on American reading instruction history. Mathews has some very illuminating comments in his remarkable book concerning some real opposition that the change-agents received in the Boston area because of their use of pure sight words. Yet Mathews discounted Gallaudet’s influence, since he mistakenly believed that, because Gallaudet eventually taught children the alphabet, his method could not be a true sight-word method, which it very definitely was.

However, Samuel Blumenfeld was the first to identify the reading method of Gallaudet as a pure deaf-mute method, and the true source of our current reading problems, which Blumenfeld discussed at length in his book, The New Illiterates (1973, 1988: The Paradigm Company, Boise, Idaho). Blumenfeld’s critically important research on Gallaudet and his period is also briefly covered in Appendix E of Teaching Reading by Charles C. Walcutt, Joan Lamport, and Glenn McCracken (Macmillan Publishing Co., Inc., New York: 1974). Blumenfeld also found and reproduced in his book an illuminating 1844 essay, “Modes of Teaching Children to Read,” by Samuel Stillman Greene (1810-1883), Principal of the Phillips Grammar School in Boston. It is a priceless addition to the history of the sight-word controversy in Boston.

Mathews was a firm supporter of “sound” in beginning reading instruction, and had what he called “sidewalk seminars,” which were informal talks with Dr. William Scott Gray while they were standing on the sidewalks at the University of Chicago where they both taught. However, Mathews simply did not have the resources available to sort out the whole ugly story, but he knew there was, indeed, “something rotten” in academia’s “Denmark” concerning the history of reading instruction. Mathews should receive the credit as the first “revisionist historian” of reading instruction. It was he who focused attention on the fact that there had been a major conflict in Boston concerning teaching by sight-words and “meaning,” although he did not realize that what was being promoted was simply an inferior method for teaching deaf-mutes.

Mathews wrote, on pages 67-68:

“Of much more influence, probably, [than Worcester and Gallaudet’s primers] were the lectures on reading delivered by locally prominent people before groups of teachers and school administrators. One of these, worthy of much more space than we can afford it here, was the so-called Prize Essay delivered by Thomas H. Palmer before the American Institute of Instruction in August, 1837. The title of this lecture was “On the Evils of the Present System of Primary Education.”

“Palmer was apparently not a teacher, but he had served on a committee that examined teachers in his home town of Pittsford, Vermont. In the discharge of his duties he had visited many district schools and had been impressed by the inferior quality of the reading.” [Ed.: It was only what Palmer claimed was inferior!]

“‘In the course of these visits I was much struck with the heavy, dull, vacant countenances of the pupils, the cause of which quickly appeared. For, when the reading classes took their places, it was easy to perceive, that the mind was no farther engaged in the exercise than attention to the pronunciation of the words required. As to comprehension of the meaning, the language might
almost as well have been Greek, Arabic, or Chinese, as English. An inveterate habit of mechanical reading is formed, (if reading, indeed, that can be called, which is nothing but a mere utterance of sounds) which not one in fifty can ever overcome. Here lies the grand impediment to the attainment of knowledge, the impassable barrier to self-education....

""The pupils commenced with the spelling-book, from which they learned the alphabet. Next came their a, b, ab, e, b, eb, & c. followed by spelling lessons of words of one syllable, in columns, without any connexion. Spelling words of two syllables came next in order. All this, you will perceive, is a mere affair of memory, in which the reason and judgment of the child are never called into action. For months, nay, in many instances, for years, he is occupied by barren sounds alone. He is taught to connect them, it is true with certain characters; but of their use, viz, to convey the ideas of others to his mind, he as yet knows nothing...."

Note that Palmer had just implicitly confirmed that the great majority of children beginning with the old-fashioned spelling books had been able to pass from such pure “sound” instruction to reading independently only a few months after beginning school, which is just about what the Scottish Schoolmaster implied. Therefore, Palmer in 1837 had also confirmed the truth of that sentence quoted previously that had been contained in many beginning readers such as Lindlay Murray’s before 1826: within months, not years, after beginning instruction, children being taught to read by “sound” were expected to be able to read well.

The probability is, however, that Palmer’s 1837 prize essay was only used as a mopping-up operation by the change-agents who had been promoting the switch to “meaning” in beginning reading for at least eleven years. Palmer certainly was not saying anything new or startling! Long before 1837, the change-agents had been saying the same things in so many publications, and long before 1837 the change-agents had succeeded in promoting that switch from “sound” to “meaning” in many, and perhaps most, schools. It seems probable that the “experts” in the American Institute of Instruction who awarded the “prize” to Palmer were such change-agents, particularly considering the fact that the American Institute of Instruction was founded by Josiah Holbrook only seven years earlier. It seems obvious that by awarding their “prize” to Palmer’s essay, Holbrook’s American Institute of Instruction was only confirming that the speech’s content was American Institute of Instruction official policy.

Blumenfeld referred (page 125) to the founding of the American Institute of Instruction:

"Holbrook had also called a teachers’ convention in conjunction with the Lyceum meeting [in 1830 in Boston]. Nearly three hundred teachers and other friends of popular education converged on Boston. At that convention a vote was passed ‘recommending that a general association of persons, engaged and interested in the business of instruction, be formed.’ The result was the American Institute of Instruction, the first academic organization of its kind in America.... The American Institute of Instruction was also the first organized manifestation of a national academic establishment, and of course it was dominated by the Harvard-Unitarian proponents of public education.”

Holbrook’s American Institute of Instruction was therefore promoting the establishment of government schools, so it might have been anticipated that it would also promote the siamese twin of the government schools’ movement: the switch from “sound” to “meaning” in beginning reading instruction. That the Institute awarded their official “prize” to Palmer for his essay is hardly remarkable.

To continue with Mathew’s excerpts (pages 68-73) from Palmer’s essay (but omitting many portions quoted by Mathews):
“What was called reading was now introduced, which is in no respect different from what preceded, save that there was some attempt at meaning in the arrangement of the words, but as the chief object of the compiler seemed to be the collection of words easy to be pronounced, with reference to the capacity of the pupil, his efforts were as mechanical as ever. Indeed, the manner of reciting these lessons would have rendered nugatory all attempts of the compiler to carry sense as well as sound to the mind of the child.... Truly, a dependence on the spelling-book or dictionary, “is trusting to a broken reed, on which if a man lean, it will go into his hand and pierce him.” (Kings 18:21).

“The chief distinctions between the old mode of teaching reading and the one I recommend, consist, 1st, in commencing with words and phrases, instead of the names of syllables....’

“Another lecture that must have had considerable influence was that of the Reverend Cyrus Peirce given on April 15, 1843, before the same organization [American Institute of Instruction]. He had been the Principal of the Normal School at Lexington and had taught advanced grades. He was asked to address the gathering without having had time to prepare a paper, so he spoke at considerable length.

“Peirce had apparently never had any experience teaching first graders, for what he said has the tone of one who ‘would do’ thus and so.....

“In teaching the child to read, he advised that the beginning be made with words, not letters, printed on the blackboard. These should be such as, combined, would form an easy sentence. He singled out for special praise the book prepared by Miss Peabody, in which ‘you will find full illustration of the whole method with words and sentences.’...

“Peirce was in error in claiming Mr. Wood of the Sessional School in Edinburgh as a practitioner of the word method, although the work of John Wood was certainly well known among schoolmen at that time. Wood himself had in 1828 written a book on what he was doing then. This book was favorably reviewed in Blackwood’s Magazine early in 1829, (footnote: Blackwood’s Magazine XXV (January-June, 1829, 106-34), and re-issued in Boston in 1830, where more favorable reviews of it appeared. It had been advertised among the books teachers should by all means have in the Connecticut Common School Journal (footnote: See Connecticut Common School Journal II (1839-40) 251-53. for an excellent review. In the Journal (III, 48), there is an advertisement of the book.)”

Mathews quoted from Wood’s chapter on the alphabet in Wood’s 1828 book, in which Wood said he taught children the alphabet first. However, Mathews, like so many others, had lost the real significance of what Wood was doing. Although Wood still taught the alphabet, as had been done for millenia with the syllable “sound” method, Wood’s emphasis was totally on word “meaning” and not on syllable “sound.” Mathews had never taught primary reading and so obviously did not understand that Wood’s method had introduced a catastrophic shift, moving totally from “sound” to “meaning.” Therefore, Mathews gave his apparent blessing to any subsequent “word” methods like Wood’s which taught the alphabet, and only rejected pure “word” methods, of which there were very few. Incredibly, Mathews even thought Gallaudet’s materials were all right, since Gallaudet eventually taught the alphabet, after beginning with whole sight-words.

The footnote Mathews gave for Wood’s book was Account of the Edinburgh Sessional School (5th Edinbugh ed., 1840) p. 181. Mathews also referred to Peirce’s mention of the Borough School in London, and gave this interesting information in a footnote on page 73:
“For information about the Borough School, see Paul Monroe, Cyclopedia of Education (New York, 1911-13), I, 416. Alexander D. Bache visited the school; see his Report, pp. 174-75. References to the school are in the Connecticut Common School Journal, I, 100 ff, 268 ff. It was the model school and training establishment of the British and Foreign School Society.”

Mathews’ book, despite its omissions and unconscious blind spots, remains an invaluable historical source.

The Price that Was Paid for the 1826 Switch to “Meaning”

It is almost unknown today that an enormous degree of reading failure as a result of Gallaudet’s non-phonetic approach existed through much of the nineteenth century. One proof of the rampant disabilities is the appalling spelling of school board officials of the period. Virtually all would have attended common schools, and spelling failure is the best indicator of reading failure.

The handwritten board of education minutes which were written by different men for Lyndhurst, New Jersey, from 1873 until before 1905 are one such source. (Its name was then Union Township.) The minutes contain such misspellings as “puting, oweing, pleasant, wheather, exceding, proagrames, pianno, enroled, their (for there), voteing, exausted” and “comeing.” My favorite is an entry by Mr. X whose reputation for competence in areas other than spelling was high. I know that Mr. X was a very respected man because, much later on in the 1930’s, my father was a member of the board and always spoke very well of Mr. X, who was a very old man by that time. There is actually a kind of splendor to intelligent Mr. X’s 1893 misspellings (although I omit his name out of consideration to his possible descendants!):

“This being know outher business Meeting Adjorned.”

This particular book of board minutes had never been filled up before another one was started. A thrifty principal in Lincoln School therefore had her “bad boys,” who did such things as playing marbles in school or getting on the trolley car at recess, write letters of apology to her on its empty pages. She obviously did not prompt them on spellings, as of the six boys who wrote letters of apology on November 2, 1905, for having played truant the day before, five spelled truant “creatively.” Yet, taken as a whole, the “bad boys” writing the letters of apology in her book, most of whom would have been eight to fourteen, spelled considerably more accurately than the school board clerks for the previous thirty years. Furthermore, many of them were from families in which Italian, not English, was spoken at home. An emphasis on phonetic spelling had returned to the schools after the late 1880’s, and the children’s entries showed that effect.

Another good source for letters of school board officials of that period which show spectacularly bad spelling is The School Bulletin, published in Syracuse, New York from 1874 until December, 1920. The School Bulletin was a particularly fine publication which received a prize at the 1893 Chicago World’s Fair and should not to be confused with the activists’ The School Journal. Its publisher, C. W. Bardeen, prepared bound copies for libraries, so it is disturbing that no complete set is still in existence. Bardeen published in Syracuse from 1874 to 1920. Yet the Syracuse Public Library has no copies of The School Bulletin at all. Syracuse University was given unbound copies that were found in the cellar of Bardeen’s former building in Syracuse only about thirty years ago. The university therefore now has a large proportion of the issues, but what is the story concerning the issues that the university and the Syracuse city library might be expected to have had since 1920? Bardeen said in his last issue of December, 1920:

“To the historian, (The School Bulletin’s) greatest service will seem its minute recording of educational happenings in this great state for nearly half a century. They have been careful,
detailed, comprehensive.... Libraries that wish to have this history complete may still obtain complete files for the entire forty-six years or for any period.”

It would be surprising, indeed, if Bardeen had not offered complete sets to the library and university in his own city in 1920! Yet neither had copies when the unbound ones turned up in Bardeen’s old cellar some forty years later. Did the city library and the university once have copies, and were they discarded? If so, why were such unique, historical materials discarded when so much else was kept? The fate of The School Bulletin in all our libraries in the United States, NONE of which have complete sets, is one more indication that “education history” is really just a black hole.

As can be seen from the copies of The School Bulletin which survived, letters from school board administrators before 1900 contained appalling spelling. The cause for the bad spelling of the school board administrators appearing in The School Bulletin was the dropping of “sound” from reading instruction beginning in 1826. By 1840, true phonics had disappeared from primers. Primers had become simple sight-word books, on which the children were to recite the letters of the new sight words as they were recording them to memory (see, aye, tee, CAT). Obviously, the mere naming of the letters gives no clue to the sound of the word.

This oral exercise of pronouncing the letters in front of the students’ eyes was called “spelling on the book.” Beginners were not usually required to memorize these spellings, but only the sight words. However, when beginners were occasionally required to memorize certain spellings in their reading books, it was called “spelling off the book.” This meant they were to recite the letters in a given word orally, not to write them. We are still familiar today with such oral spelling from “spelling bees.” However, written spelling tests, as we know them, were not the usual practice. The “see-aye-tee - CAT” method was called the ABC method instead of the former ABC syllable method. Phonics by 1840 was almost dead in the primary grades. After 1870, even the reciting of letter names in sight words was dropped. The method was then simply called the “word” method, which is, of course, what it had really been ever since 1826.

By 1839, the damage which had started in 1826 had become evident. Children had ceased learning the sounds of syllables by “spelling” syllables, and were instead learning the meaning of whole words, not their sounds, by “spelling” whole words. According to the Britannica Dictionary, a human generation is usually considered to be 30 years, so a half-generation would be 15 years. The following comments from 1839 refer to school children from a half-generation before, or from about 1825, which was just before the 1826 switch. It is meaningful that the comments came from Horace Mann, himself, in his Second Annual Report of the Board of Education. The following quotation is from the last page of The Common School Journal, Boston, Vol. 1, No. 20, 1839:

“...with scarcely a single exception in the whole State, the scholars are kept in spelling classes, or they spell daily from their reading lessons, from the time of their earliest combination of letters, up to the time of leaving school; and yet, if testimony, derived from a thousand sources, and absolutely uniform, can be relied on, there is a Babel-like diversity in the spelling of our language.

“It is impossible to ascertain with any considerable degree of precision the per centage of words in ordinary use, which the children are unable to spell; but it seems to be the general opinion of the most competent observers, that the schools have retrograded within the last generation or half generation, in regard to orthography. Nor is the condition of the schools better in regard to reading, as will be hereafter shown.”
A half generation before 1839 (15 years) would bring the beginning of the decline in spelling and reading to 1825, only a year before the definitive change in methods in 1826. However, as has been discussed, the "meaning" philosophy in opposition to "sound" had been brewing and gathering support since about 1817, showing up in some spellers and some reading books not meant for beginners.

In the next issue of November 1, 1839, No. 21, Mann’s report was continued from the last number. He said:

“In this State, where the schools are open to all, an inability to spell the commonly used words in our language, justly stamps the deficient mind with the stigma of illiteracy. Notwithstanding the intrinsic difficulty of mastering our orthography, there must be some defect in the manner of teaching it; - otherwise, this daily attention of the children to the subject, from the commencement to the end of their school-going life, would make them adepts in the mystery of spelling, except in cases of mental incapacity.”

Mann recognized a severe spelling problem by 1839. It had developed because children had been taught to spell meaning-bearing sight-words instead of sound-bearing syllables. To this day, to witness the difference in spelling achievement of phonically-trained spellers compared to sight-word trained spellers is an astonishing experience. The highly reliable Ayres’ spelling scale of 1915 obtained on a phonically-trained school population compared to the highly reliable Iowa spelling scales of the 1950’s obtained on a sight-word-trained school population demonstrates statistically the absolutely ENORMOUS difference in achievement between the two groups. (To repeat, the deaf-mute-method readers did not arrive until 1930.)

As will be shown, Mann curiously kept hammering on the evils of the “syllable” method for beginning readers. Yet the syllable method had been almost banished by 1839 by pushing the spelling book with its syllabary into the upper grades. If a syllabary were present at all in the primers which had replaced the spelling book for beginners, it was usually so mangled as to be almost meaningless.

Mann’s later publisher of The Common School Journal, William B. Fowle, made the following comment in the May, 1842, Boston “Preface” to his book, The Common School Speller, meant for upper graders. In it, he said that the spelling book by 1842 should no longer be used to teach reading, but only spelling. However, also notice his phrase, “...as society advances.” These Pied Pipers leading civilization over the brink refer to their march as “society advancing,” which, in a wry way, is technically true:

“...the almost infinite variety of reading books adapted to the capacities of children, and more appropriate than the lessons of any spelling book can pretend to be, authorizes us, as society advances, to separate these branches of study. Elocution is more intimately connected with reading than reading is with orthography; but the advanced state of instruction in this community has already said that reading books must not be encumbered with rhetorical rules. The author is aware that there may be a difference of opinion in regard to the omission of judicious reading lessons, (if there be any of this description,) in spelling books for the use of children just beginning to read; but he thinks there can be no doubt as to the propriety of omitting them in spelling books designed for classes which have already learned to read, and nine tenths of the classes that use spelling books in our common schools are of this description.”

Fowle implied that children were not learning to read in spellers but in readers by 1842. He confirmed that the vast sales of spelling books like Webster’s which was then reportedly selling about a million copies a year were meant overwhelmingly for upper graders, since he said “...nine tenths of the classes that use spelling books in our common schools are of this description.”
Fowle was an expert in good standing: “Late Principal of the Female Monitorial School in Boston, and Author of the Common School Grammar, Primary Reader, Bible Reader, and Other School Books, in French and English.” Before he was a principal of a monitorial school, Fowle had been an instructor in a monitorial school. Monitorial schools largely dispensed with the need for teachers. The instructor would give a lesson to a group of children, who in turn gave the same lesson to other children, who themselves could instruct further children. Theoretically, vast numbers of children could be educated at little cost. Both Joseph Lancaster and Andrew Bell of England are credited with inventing the monitorial school idea, but it actually dates back at least as far as the eighteenth century, and by its very nature must have been used since ancient times. How efficient Fowle’s school was is not known, but the method asks too much of little children, so his comments on what reading methods worked in his school cannot have much value. Fowle said in his preface:

“...any system for noting the pronunciation of words in a spelling book, if made in the expectation of its being used by children, is made in vain, and the capacity of the child is over-rated....An intimate acquaintance with the schools of Boston, from the primary to the highest, as a pupil, teacher, and overseer; the opinion of every disinterested instructor with whom he is acquainted; a careful study of every spelling book, from that of Dr. Watts to those of our times; and the actual use of the most popular in his own school, where the alphabet, as well as the higher branches, was always taught; - these circumstances have satisfied him that no very young children, and very few children of any age, can understand or make use of any system for marking the pronunciation.”

This is blustering nonsense. The kind of synthetic phonic pronunciation markings Webster used so successfully was “reinvented” in different forms by Dr. Edwin Leigh in 1864 and Rebecca Pollard about 1887. Both of these programs then were spectacularly successful in teaching thousands upon thousands of little first graders how to read new words independently by noting pronunciation markings. (Yet both the Leigh and Pollard “sound” programs were hounded out of the government schools by “experts” pushing “meaning,” as will be discussed.) What is amusing about Fowle’s 1842 comments are that they contradicted his very own 1824 comments! Fowle had said, in the preface to his 1824 book, The Rational Guide to Reading and Orthography, in which he taught sounds by analogy, which is a system for “noting the pronunciation of words” (from an 1828 edition):

“Some easier reading lessons have been added, at the request of the Committee of Primary Schools. In dividing the words into syllables the author endeavoured to make such a division as would lead children, (who usually study the spelling lessons before they have heard the words pronounced,) to a right pronunciation....”

That was a clear admission that in 1824 primary grade children in Boston were expected to and did sound out printed words for themselves before they heard them pronounced, by using phonics and syllabication. In Fowle’s 1824 book, after the complete open-and-closed-syllable syllabary, and after demonstrating all the vowel sounds by samples, Fowle said:

“As these sounds are the key of our language, they cannot be too thoroughly known; and, in the following lessons, if the child is at a loss, he must be referred back to these. Great care should be taken not to help the child until he has tried to help himself.”

It was a small step from teaching vowel sounds by analogy to teaching them by markings. Fowle conveniently forgot the fact that children in 1824 could sound out words by themselves, if they truly had been taught how to do so, and that he, himself, had acknowledged that fact in print! However, the 1842 spelling book that he wrote downgrading “sound” for beginning readers, saying in effect that little children were incapable of sounding out words, was, not surprisingly, approved by Horace Mann.
Mann continued his remarks on page 20 of the Common School Journal:

“...But what is there in the alphabet or in monosyllables, to stimulate this curiosity or to gratify it? The senseless combinations of letters into ba, be, bi, bo, bu, deaden this curiosity. And after it has been pretty effectually extinguished, so that, by the further aid of the spelling book, the child can perform the feat of speaking without thinking - as circus horses are taught to trot without advancing, - then let him be carried into reading lessons, where there are but few words he has ever seen or heard before, and where the subject is wholly beyond the reach of his previous attainments, and if by this process, the very faculty of thought be not subjugated, it must be because the child is incorrigibly strong-minded. These are the most efficient means of stultification, and if they do not succeed, the experiment must be given up....

“First and chiefest, in reading, let the lesson be understood; its words, its phrases, its connections; its object, if it have any object; if not, it is not proper for a reading lesson. Every word and sentence to which no meaning is attached is an enemy, lying in ambush.”

Mann was anything but logical. While promoting “reading for meaning,” he nevertheless, on pages 26 and 27, praised and quoted from an 1839 book which contradicted his position. The book was written by the Rev. Emerson Davis, of Westfield, Massachusetts, entitled, The Teacher Taught, or The Principles and Modes of Teaching.

“The time has been, when very particular attention was paid to the sounds of the vowels, diphthongs, triphthongs, and consonants. I have heard scholars twelve years old analyze words of two or more syllables selected promiscuously from a reading lesson, giving to each letter its sound according to the common pronunciation and correctly fixing the accent...

“More attention should be given to orthography, to the simple and combined sounds of letters. In very many schools, and I fear in most of them, this subject is entirely neglected. I have made inquiries of many young people in regard to this matter, and have not been so fortunate as to find one who ever received any such instruction....

“Our spelling books ought to give more prominence to this subject; they ought to arrange the sounds of the vowels and consonants in tables printed in as large type as the spelling lessons, and illustrated by plain examples. There are some spelling books in which the different sounds of the letters are not even mentioned; in some the information is huddled into the preface, that part of the book which is seldom read, either by teachers or scholars. I know of no book, in which it holds that prominent place that it must before it will receive the attention that its importance demands.

“Some may be ready to say that this subject is too refined and intricate to be taught in common schools with any success. It will be of no use to dispute with an objector. The question can be brought to the test of experiment. I was taught the sounds of letters in the common school and understood them. I have taught the same to many children in the common school, and I believe they understood them, and were interested in the study.”

Recognition of the drop in spelling caused by abandoning the syllable “sound” method spellers appeared in an 1863 speller with a “meaning” emphasis. Published over thirty years after the switch in methods, it nevertheless acknowledged that there had, indeed, been a change (which acknowledgment was very, very unusual at that time). The comments appeared in the preface to Willson’s Primary Speller,
a sight-word “meaning” speller by Marcius Willson, published by Harper & Brother in New York in 1863:

“...There is no doubt that pupils, by a great amount of drill exercise in oral spelling, may learn to spell, by mere repetition, almost any quantity of words of whose meaning they are totally ignorant. This was the old system of teaching spelling; and, with the prominence given to it in the exercises of the schoolroom, it did make good spellers; and, where it has been wholly abandoned - where spelling has been taught only in connection with reading, or definitions, or dictation exercises - good spelling in our schools has diminished in an alarming degree. It has been our aim, in the present work, not only to retain the advantages of the old system, but also to remedy, as far as possible, its great defect, as exhibited in what have been very appropriately called the “nonsense columns” of the old books. To this end we have adopted, in a majority of the spelling lessons, such a natural grouping of the words in columns as shall express their meaning by their appropriate use; and we think this end has been attained as effectually as though the words had been selected from regular reading lessons.... Children very rapidly learn the meaning of words by their use - and this is Nature’s method; but the mind requires a considerable degree of maturity, and the knowledge of a large store of words, before definitions can be of much utility.... There are the same objections to words grouped as synonymous; for although a pupil may be told that three words have nearly the same meaning, yet, if he is ignorant of the meaning or use of all three, what does it profit him?*

However, throughout much of the nineteenth century in America, heavy phonetic elocutionary drill in reading started at fourth grade, and phonetic drill in spelling started in the fourth year from the 1830’s until the 1870’s. Therefore, failures in primary grades because of the sight-word methods were alleviated to some extent for many of the children who remained in school for four or more years. Nineteenth century children who remained in school long enough to get some real phonics are paralleled by those few children today, taught by the sight-word approach, who are lucky enough finally to be taught true phonics.

In summary, the record indicates that “sound” was replaced by “meaning” in beginning reading materials and in teaching methods in schools starting in 1826. The switch was completed in most places not long after 1830, and by 1840 even the fact that there had been such a change was almost forgotten. The record demonstrates that the move from “sound” to “meaning” for beginning readers resulted in a sharp drop in spelling (and therefore reading) ability at upper grades. The move from “sound” to “meaning” had been the result of hard work by the same group of activists on both sides of the ocean who were promoting government schools.
PART 5
The Opposition to a Return to “Sound” in the 1860’s.
The Resultant “Meaning” Materials.
Pollard Failed in the 1880’s to Promote Synthetic Phonics,
But Spelling Promoted “Sound” by 1890.
The Massive Use of “Supplemental Phonics” After 1900 and
the “Meaning” Opposition.
Chapter 22
The Educational Setting by the 1860’s and the Surprising Entry of Alexander Graham Bell on the Scene

True spellers did remain in use at upper grades after 1826 and still began with the syllabary, (ab, eb, ib, ob, etc.), but they were no longer meant for beginners. However, even in the upper grades, meaningful practice with the printed syllabary and syllabic oral spelling itself were dropped.

The syllable pages with the “abs” in such spelling books after 1826 were seldom used, even at the fourth grade when such spellers were usually introduced. The fact that such syllable pages were not used is shown by their excellent condition in surviving spellers printed after 1826. Yet, in spelling books surviving from before 1826, the syllable pages are often tattered or missing. Before 1826, the syllable pages became tattered or worn out because little beginners were using them very heavily in learning to read by “sound.”

The dropping of “sound” spellers for beginners, and their replacement by “meaning” primers, had become institutionalized in America by a quarter century or so after 1826. That fact can be demonstrated by the records from four cities: Syracuse, New York City, Boston, and Cambridge, each of which will be considered in turn.

The ABC-syllable method which had previously been used to teach beginning reading from the spellers had been sound-bearing, but the ABC word method which was now being used to teach beginning reading from such readers as Sanders’ was meaning-bearing. Therefore, government schools, such as those in Syracuse, New York, Boston, and Cambridge which used readers like Sanders’, were producing the same kinds of reading disabilities in children as we see today. The extraordinarily high literacy level of Americans had disappeared after 1826 because the spreading government schools promoted such material as Sanders’ which taught beginning reading by “meaning” instead of “sound.”

Sanders books were very widely used. An 1844 edition of Sanders’ The School Reader, First Book, copyrighted in 1840 and published by Sage & Brother, Rochester, claimed that more than 2,000,000 of his textbooks had been sold. His series contained five school readers, a spelling book, a book for academies, and two music texts. Since most children never went far in school in those days, most of the 2,000,000 were obviously the lower level books, including the sight-word primer, and many children may never have reached the fourth-grade “speller” level.

The Syracuse, New York, curriculum in 1852, as recorded in their records for that year, specified that Sanders speller, which began like Webster’s with the “abs,” and was a great deal like it in every respect, was not to be used till fourth grade. To teach reading in grades one, two, and three, Syracuse was using Sanders’ Primary School Primer and Sanders’ The School Reader, First Book, which were straight sight-word books.

An entry in an 1872 yearbook indicates that New York City, like Syracuse, had also been using sight-word readers for many years, the Harper “meaning” materials. However, textbook adoptions as in New York were not normally exclusive, since books from many different publishers were often adopted “officially” in various cities. The Year Book for 1872, (I am uncertain of the exact name, possibly Harper’s, Barnes’ or Publishers and Stationers Weekly Trade Circular) page 45, stated:
"The standard school books published by [Harpers] which for 30 years past were used in the New York public schools were excluded last year by the Tammany ring on account of the persistent attacks upon that corrupt body by the Harpers’ Weekly. Now that the ring is defeated... these same school commissioners... have restored the books they excluded by a unanimous vote."

That does not, of course, mean that Harper’s materials were necessarily used exclusively, and it obviously refers to other schoolbooks published by Harper as well as to reading texts. Yet “for 30 years past” would have placed Harper’s books, presumably including some kind of reading books, in the New York City schools from 1842.

What the Harper reading texts may have been which were used for thirty years previously by New York City can only be surmised, but they were almost certainly “meaning” materials, since I have found no reading texts published by Harper which were not “meaning” materials.

After 1860, the reading texts would almost certainly have been Marcius Willson’s widely used Code 1 to Code 3 School and Family Series, published by Harper.

Since Harvard library has an 1860 Harper reprint of an English beginning reading text, it is very possible that Harper had been reprinting that text from England before publishing Willson’s Code 1 to Code 3 materials in 1860. That English Code 3 to Code 5 text was Reading Without Tears, or a Pleasant Mode of Learning to Read, by Mrs. Favel Lee Bevan Mortimer. Harper was still selling Reading Without Tears in 1876, according to the American Catalogue. Therefore, if New York City had been using Harper reading books from long before 1860, the readers may have been earlier reprints of Reading Without Tears or some similar English “meaning” reprints.

However, if Reading Without Tears and the Willson readers were the kind of actively harmful materials that the New York City schools had been buying for 30 years to teach beginning reading, it is no wonder so many New York City children could not read in the early 1870’s. Contemporary testimony to that fact is referred to later.

The practice of using sight words in the teaching of beginning reading in Syracuse and New York City matched that in Boston. Boston Schools Superintendent John Dudley Philbrick recorded what he found to be the practice in his first inspection of the Boston Primary Schools in 1857. His comments appear in the Boston Annual School Report for 1874, pages 283-285:

“In respect to the initiating of children into the art and mystery of reading, - the teaching of them the elements of the art, the enabling of them to pronounce at sight the words of easy prose or verse, - I found the Primary Schools on my first inspection of them in 1857, in a deplorable condition. The old-fashioned method, by ABC syllables and spelling, had been nominally abolished by the abolition of the usual appliances for teaching it, and it had been so much ridiculed that the teachers were very shy in using it in the presence of visitors. The reading books and charts in the schools were designed for the ‘word-method,’ a method of very limited capabilities.... In recalling the slow and tedious processes by which they brought their pupils up into only semi-fluent reading, I am reminded of what Milton says of an arduous path, -

‘Long is the way,
And hard, that out of hell leads up to light.’

“All that has been changed, but long and hard has been the road by which the change has been reached: A publishing interest joined hands with old-fogyism in interposing obstacles in the way of progress. But, at length, books and appliances for teaching reading phonically were
introduced, and the teachers were gradually initiated into the phonic method. Then came Dr. Leigh with his ‘pronouncing type,’ the result of years of study and labor, a new and valuable instrumentality for facilitating the teaching of the phonic method. The use of this is now nearly universal in our schools. The phonic method may be taught with ease and success by an expert, without the aid of Leigh’s type, but with it the average teacher will teach the first steps of reading with much greater ease and success.”

Probably the first book that could be used to teach phonics in the Boston schools after the change-over to “meaning” after 1826 was David B. Tower’s The Gradual Primer or Primary School Enunciator, first published in 1845 and revised in 1853. It was adopted for the Boston schools on September 2, 1856, and so was supposed to be introduced just about the time Philbrick took over as superintendent by 1857. The intent of the book, however, was to teach elocution to little beginners, not decoding skills, although it would accidentally achieve that end. The Harvard library has two copies with 1853 copyright dates carrying the sub-title, “Boston School Edition” and the pencilled-in dates of 1857 and 1859 for their actual date when printed. The Harvard library also has an edition of 1853 without the sub-title, “Boston School Edition.”

The same year, 1845, that Tower wrote the first version of The Gradual Primer, he also first published his Gradual Speller. An edition of that spelling book in 1857, published by Sanborn, Bazin and Ellsworth in Boston, contained a “Preface” written in 1845, in which Tower confirmed that the use of the spelling book for beginners was a thing of the past. Therefore, it also confirmed that it took the “experts” less than twenty years, from 1826 to considerably before 1845, totally to change the Massachusetts practices of two hundred years! Tower said in the “Preface” (page 7):

“The Spelling Book was formerly the only text-book used in teaching a child to read. Its place in that respect, is now supplied by Primers and Reading Books expressly adapted to that end, and better suited to the purpose. The Spelling Book now falls into its appropriate sphere of giving the learner the orthography and orthoepy of the language; and it should be confined to these specific objects. Nor is it by any means to be neglected in its proper place; it should go with the pupil through his schooldays, and be the last book to leave his hands.

“December 1, 1845.”

This attitude helps to account for the massive sales of about a million copies a year of Webster’s inexpensive speller in those years, if the publisher’s claims of such sales can be believed.

Tower’s reading books had obviously been popular elsewhere than Boston for some time before 1859. The city of Cambridge, Massachusetts, Regulations of the Public Schools Adopted by the School Committee June 19, 1851, read on page 13:

“2. Studies and Books in Alphabet Schools. In the Alphabet Schools, the pupils shall be taught the Alphabet, Reading and Spelling. The books used shall be Tower’s Gradual Primer, Tower’s Introduction to the Gradual Reader, and Fowle’s Common School Speller. No child, under the age of five years, shall be received into the Alphabet Schools.

“3. Studies and Books in Primary Schools. In the Primary Schools the pupils shall be taught Reading, Spelling, Mental Arithmetic, and the first principles of Geography by oral instruction. The books used shall be Fowle’s Common School Speller, Greenleaf’s Mental Arithmetic, Tower’s Intermediate Reader, and Tower’s Gradual Reader. Drawing may be introduced at the discretion of the teachers. No pupil shall be admitted to the Primary Schools, unless five years of age, and able to read and spell the Alphabet lessons.”
Yet Tower’s texts had represented a major change in Cambridge schools from Worcester’s sight word texts used only two years previously for beginners in reading. In the 1849 report, only two years before the 1851 report, the following had appeared on page 23:

“2. Studies and Books in Alphabet Schools. In the Alphabet Schools, the pupils shall be taught the Alphabet, Reading and Spelling. The books used shall be Worcester’s Primer, Worcester’s Second Reading Book, and Fowle’s Common School Speller. No child, under the age of five years, shall be received into the Alphabet Schools.

“3. Studies and Books in Primary Schools. In the Primary Schools the pupils shall be taught Reading, Spelling, Mental Arithmetic, and the first principles of Geography by oral instruction. The books used shall be Worcester’s Second Reading Book (continued); Swan’s primary School Reader, Part Second; Bumstead’s Second Book; Fowle’s Common School Speller, and Greenleaf’s Mental Arithmetic. Drawing may be introduced at the discretion of the teachers. No pupil shall be admitted to the primary Schools, unless five years of age, and able to read and spell the Alphabet lessons.”

Note that the Cambridge children had to read Worcester’s sight-word materials before they could begin Swan’s book, “Part Second.” Swan’s was an elocutionary series like Tower’s which also could accidentally function as a phonics series. Yet in 1849 the little Cambridge children were not to use Swan’s until they had become firm sight-word readers through Worcester’s dreadful Code I books (on which, of course, they orally “spelled” the meaning-bearing sight-words). Cambridge was also using Fowle’s speller, which has been described earlier. However, it was never intended for teaching beginning reading, even though in Cambridge, unlike Syracuse and elsewhere, it was in use in the primary grades. Note that the Cambridge primary schools were also using Bumstead’s Code I sight-word book.

Yet, by 1851, Cambridge had introduced Tower’s material, undoubtedly to benefit “elocution.” By doing so, they were accidentally introducing phonics for beginning reading.

All three Harvard copies of the Tower’s books mentioned earlier were titled, Tower’s First Reader. The Gradual Primer or Primary School Enunciator. The original edition had been copyrighted in 1845, and the “New Edition” in 1853. The “Preface” read as follows:

“Since the publication of the ‘Gradual Reader,’ or ‘Exercises in Articulation,’ the author has been repeatedly urged to prepare a set of Primary Readers on the same principle, using only such of the ‘Exercises’ as are especially adapted to beginners. To supply the demand for such a series, the want of which has been so often seen or so extensively felt by others, this little book has been prepared.... public opinion now requires that they should be understood and taught, as the ‘first step’ in reading. Their utility has been so clearly demonstrated, that teachers now ask for them to be used at the very outset; that the ‘first step’ may be taken in the right place. Hence, easy examples have been culled from those ‘exercises,’ and the Primer is now offered with the hope that it will prove as useful in its place.... The author claims an improvement on his original ‘Exercises,’ in giving full and explicit directions for the utterance of these elementary sounds... Amid the conflicting opinions on the best method of teaching a child to read, - whether letters or words shall take precedence, - the author hopes that his new plan, while it escapes the objections advanced against either, will be found to imbody the advantages of both.... The new feature in this little book consists in giving the child only a few letters before he is called upon to read words composed of those few letters. Thus the child is taught words long before he has learned the whole alphabet; and yet no words are given him, of which he has not previously learned the letters....”
The “phonic” appearance of Tower’s books should not lead anyone to forget that after about 1830 teachers pronounced all words in the readers first for the children to imitate. In no sense were children being taught to sound out words for themselves.

The Boston School editions, marked 1857 and 1859 by the Harvard library, were like the above, a “New Edition.” Yet they began with sight word teaching! A picture of a girl appeared first, and the words, “the good girl, a small bird, the great girl, a girl and a bird.” Five more pages continued like this, with many words and sentences, finally followed by the complete alphabet on page 6. The alphabet was not at the beginning of the plain 1853 edition. Yet the rest of the books were the same as the 1853 edition. The beginning pages of the 1853 edition (and from page 7 of the 1857 and 1859 editions) were concerned only with visual analysis of letters, not sound, and after that moved into letter sounds.

Elocution was clearly Tower’s purpose in writing The Gradual Primer, or Primary School Enunciator, so that he could give “full and explicit directions for the utterance of these elementary sounds.” Tower did not use phonics so that children could learn to read independently. The very name of his text confirms that enunciation was his purpose. The preface and content of the book make it crystal clear his phonics was meant for elocution. The book could, however, very easily be used to teach real phonics which Philbrick would have understood. Nevertheless, the kind of attitudes Philbrick encountered is obvious from the Boston Schools’ copies of Towers’ primer, because the first five pages before Tower’s material consists of sight-word sentences and pictures, which section is clearly titled, “Word Teaching.” As an explanation for this bizarre beginning, the “Preface” remarks:

“To meet the views of all, several pages have been introduced for the convenience of those teachers who prefer to teach words before letters.”

Some one in Boston insisted on the insertion of five pages of sight-word material at the beginning of the 1857 and 1859 editions for the Boston schools, but it obviously would not have been Philbrick.

Teaching children phonics on syllables had been abolished after 1826, but, with a few works like Towers, phonics began to come back in the 1850’s, but now it was teaching letter sounds in whole words instead of letter sounds in syllables. Nevertheless, this whole-word phonics could repair much of the damage that had resulted from moving from the sound-bearing ABC syllable method to the meaning-bearing ABC word method. The phonic word method was, of course, a sharp improvement over the ABC word method, but the loss of emphasis on the syllable remained as a great defect, and still does so today in almost all phonic methods.

Historical records establish, therefore, beyond any doubt, that Cambridge in 1849, Syracuse in 1852, and Boston in 1857, and probably New York City since about 1842, were teaching beginners to read with the sight-word approach. Philbrick’s allusion: “long and hard has been the road by which the change has been reached,” referred to the fact that it was only that year, 1874, that Leigh’s phonics had finally won out in Boston after years of gradually spreading voluntary use. Poor Philbrick did not know then that both Leigh’s phonics which he had introduced - and Philbrick, himself - would be thrown out of the Boston schools only four years later, in 1878.

In the 1850’s, a flurry of interest had appeared in Longley’s primers which used Pitman’s phonetic alphabet. Pitman’s phonetic alphabet had been invented in England, where they were having the same problem with “reading” as in America, as will be shown. (Possibly Lovell’s phonics readers of the 1850’s were inspired by Pitman print. So far as is known, however, the Lovell readers were never in wide use.) The Longley primers were used briefly in Syracuse, but the interest flagged.
As reported by James Pyle Wickersham, Principal of the Pennsylvania State Normal School, Millersville, in his book, Methods of Instruction, J. B. Lippincott & Co., Philadelphia: 1865, some few teachers attempted to teach true phonics, but it was considered very technical and difficult. The norm, as Wickersham pointed out, was sight-words.

In 1864, Edwin Leigh’s phonic pronouncing print appeared. Although it used the regular alphabet, the letters had special marks if needed to distinguish silent letters, variant vowel sounds, and so on. (William L. Robinson’s similar method had appeared shortly before in England. It will be discussed in the chapters on Great Britain. Robinson had invented his special marks for letters of the alphabet having variant sounds after having previously used Pitman’s extended alphabet, in which new letters had been invented for every variant sound.)

With letters already marked to show their variant sounds and all the vowel sounds, the Leigh method sidestepped the problems caused by not teaching children how to syllabicate words. That is because pronouncing vowels correctly automatically results in correctly dividing syllables.

Teaching phonics, which had been abolished in America after 1826, was coming back in force in America in the late1860’s by the use of Leigh’s method. Yet it was coming back in a changed form: as the teaching of phonics on words instead of on syllables. By 1870, Leigh’s method was enormously successful all over the United States, particularly in Boston which had generally used the word method.

Ferdinand Buisson of France visited the Centennial Exposition in Philadelphia in 1876 as an education representative of the French government, and while in America visited schools as well as the Exposition. In 1878, he wrote his Rapport Sur L’Instruction Primaire a L’Exposition Universelle de Philadelphie en 1876. In a footnote on page 232, in his chapter on reading instruction, he said:

“Mr. Philbrick, after five years’ experience in the schools of Boston, wrote, in view of its (Leigh’s) striking results, ‘The word method must fall before the phonetic.’“

The “sound” challenge to the dominant whole-word “meaning” approach was most pronounced in the Boston of Superintendent John Dudley Philbrick. It was there that the meaning vs. sound war broke out again, and it lasted from 1870 to about 1880. But, to understand the roots of this second war, it is necessary to look first at Cambridge, Harvard’s home town, across the Charles River from Boston, in the year 1862.

It was in Cambridge in the year 1862 that the first challenge to the “meaning” approach in reading started, and it concerned the teaching of language (both spoken and written) to the deaf. Alexander Graham Bell told of the challenge’s beginning, in his October 10, 1917, address on the fiftieth anniversary of the founding of the Clarke School for the deaf at Northampton, Massachusetts. However, to understand better the situation on the teaching of the deaf with which the opponents to the “meaning” approach had to deal in 1862, the following summary, largely from the Encyclopedia Britannica (1963), may be of help.

What the report given below will also make clear is that schools for the deaf, intended originally to be supported by private subscriptions and churches, rapidly became after 1818 the recipients (for the times) of relatively huge government grants. This was the same period in which government-supported primary schools and infant schools were widely promoted but also widely opposed. However, the very successful establishment of government-supported schools for the deaf produced a major change in the perceptions of the public. Unlike the proposed government primary and infant schools, the proposed government schools for the deaf met no apparent opposition. Education of every type had once been seen as a necessary but private activity. Yet the massive government sponsorship of education of the deaf had
capitalized on natural public compassion for the deaf. Such government-subsidized education was obviously widely supported by public opinion and was firmly in place before 1830. By the success of the movement to establish government schools for the deaf, the public had been conditioned to consider the promotion of education in general to be a legitimate government activity.

Yet, in American schools for the deaf, because of Gallaudet’s influence, the “meaning” method was the only one in use by 1862. Gallaudet is known for three major campaigns, all of them fundamentally bad: the promotion of the teaching of deaf and hearing children to read by “meaning” instead of by “sound,” which campaign was highly successful; the promotion of government schools for hearing children which was also highly successful; and the promotion of government teacher-training schools, which was, again, highly successful. All three campaigns can be seen as facets of the same bad two-pronged campaign that was instituted by change agents after about 1818: the promotion of government control of education, in tandem with the promotion of the “meaning” method to teach beginning reading.

Background is given in the article, “Deaf and Hard of Hearing,” in the Encyclopedia Britannica (1963), Volume 7, page 120 and following concerning the founding of schools for the deaf. The reader will notice small inconsistencies with some of the reference materials quoted elsewhere in this text.. That is understandable, considering the widespread lack of general information available today on the subject of education of the deaf.

The article states that the first known effort to teach a deaf mute in this country was made in 1679 by Philip Nelson in Rowley, Massachusetts, and the next by Francis Green of Boston who sent his deaf son to Thomas Braidwood’s school in Edinburgh. The article reported that Green tried a census of the Massachusetts deaf in 1803, and found 75, from which it was estimated that there must have been about 500 in the whole United States. An 1812 estimate raised the figure to 2,000. Green unsuccessfully proposed that a deaf-mute school be founded. However, Rev. John Stafford tried to teach several deaf children that he found in the New York City almshouses in 1810. The Encyclopedia Britannica article said that Stafford’s work eventually produced in 1818 the New York Institution for the Deaf. However, it is instead more likely that the 1818 foundation was sparked to a considerable degree by Gallaudet’s apparently highly publicized Hartford school which opened in 1817.

The article reported the fact that in 1815 a Hartford society to educate the deaf was started, and that it raised money to send young Thomas Hopkins Gallaudet to study in Europe, which he did in Abbe Sicard’s school. The result was that the silent sign-language methods of Sicard’s school were used for the deaf in America for years afterwards. The article reported that Gallaudet opened his Hartford school on April 15, 1817, with some $12,000 in donations from other cities, and $5,000 from Connecticut. Then, the federal government allotted 23,000 acres of public lands to the school, and the proceeds eventually produced a fund of $339,000. In 1819, the New York state legislature granted $10,000 to the New York school, and partially state-supported schools spread, in Pennsylvania about 1821, in Maryland in 1827, in Delaware in 1835, and in many other states later. Further large grants of government land were made for these schools, as had been done for Gallaudet’s school. The first wholly state-supported school was in Kentucky in 1823. However, until the foundation of the Clarke School in Massachusetts, and in a New York City school by 1867, only the sign-language approach was used in teaching the deaf. No mention was made in the Encyclopedia Britannica article about Boston Schools Superintendent Philbrick’s founding of the first public day-school for the deaf in 1869, which highly-successful public school taught lip-reading and phonics to deaf children.

Bell’s general remarks in 1917 on deaf education were considerably better than the Encyclopedia Britannica (1963) article discussed above. Bell had expanded his original remarks, given at the fiftieth
anniversary of the founding of the Clarke School, into a 33-page paper with an annotated bibliography, The Growth of the Oral Method in America. Following are excerpts from Bell’s paper:

“In 1862 a little child of four and a half years of age completely lost her hearing from an attack of scarlet fever. She was the daughter of the Hon. Gardiner Greene Hubbard of Cambridge, Mass.

“It was well known at this time that the loss of hearing at such an early age was usually followed by loss of speech. It was therefore with the greatest anxiety that the parents of little Mabel Hubbard watched the speech of their child gradually begin to fade away...

“Mr. Hubbard found that there was no school in America which would receive deaf children at an early age, and that all the schools of the country were employing a foreign language as the basis of instruction - the French Sign-language of De L’Epee and Sicard - and that little or no attention was paid to articulation. He was assured by experts that if his child did not receive special instruction in the use of her vocal organs she would become a deaf-mute-in-fact long before she would be old enough to attend any of the existing schools.

“Mr. Hubbard found that conditions were very different abroad. He was assured that the deaf children of Germany were taught to speak and read the lips....

“Encouraged by this news Mrs. Hubbard determined to attempt the instruction of her own child. By persistently talking to her as though she could hear and directing her attention to the movements of the mouth the little girl began to read the lips.... Mother-love soon devised means of stimulating the recollection of words that were half-forgotten, and of teaching her the pronunciation of new words hitherto unknown....

“I take a deep, personal interest in this phase of the child’s education; for, as you all know, little Mabel Hubbard is my wife, and I have daily and hourly reasons for blessing the memory of that dear mother....

“The results... convinced Mr. Hubbard of the very great importance of articulation teaching for the Deaf; and he determined that since there was no oral school in America one should be established, and right in his own state, too. In 1864, therefore, he applied to the legislature of Massachusetts for a charter and an appropriation for a new institution for the education of those deaf children who were too young to be received at Hartford.... The method of articulation was to be employed in the proposed Institution...

“This application was opposed by... the Hartford School on the ground that “The instruction of the Deaf by articulation was a theory of visionary enthusiasts....”

“The hearing before the legislative committee received considerable public attention, but the experts were against Mr. Hubbard, and the proposed bill was defeated.

“But Mr. Hubbard was not a man to be discouraged, and he entered into a vigorous public campaign of education. He saw the futility of attempting to argue with the experts and thought that the best way of attaining his object would be to have a small private oral school established and then bring the deaf children before the members of the legislature. The voice of a little deaf child might, he thought, prove a more convincing argument than the opinions of the learned professors of the Hartford School. His opportunity soon came.
“The attention of Mrs. Cushing of Boston, who had a deaf daughter, was attracted by the discussion in the Massachusetts legislature; and after careful consideration she determined that her child should be taught articulation.... Mrs. Cushing applied to Miss Harriet B. Rogers, then known as a skilful [sic] teacher of hearing children, who with some hesitation undertook the task.

“Her experience with Fanny Cushing convinced Miss Rogers of the great possibilities of oral instruction; and she expressed the desire to devote her whole life to this work, if only a suitable number of pupils could be secured and the means to support a school provided. This was Mr. Hubbard’s opportunity to carry out his plan....

“Mr. Hubbard and a few of his friends subscribed a sum sufficient to defray the expenses of the undertaking; and in November, 1865, published an advertisement of the proposed school....

“As a result of these efforts Miss Rogers was enabled to open her school at Chelmsford, in June, 1866, with five pupils, and within a few months had the full (seven) enrolled.

“In 1867 the time seemed ripe for another application to the legislature of Massachusetts. Miss Rogers, the pioneer of oral teaching, was beginning to attract attention by the success of her little Chelmsford school....

“In 1867, Mr. Hubbard, feeling that the time had come when another application to the Massachusetts legislature might meet with a more favorable reception than his application of 1864, called upon Governor Bullock with the object of requesting him to make some reference to the subject in his forthcoming message, and recommend legislation to establish a school for the Deaf in Massachusetts.

“To his surprise Governor Bullock informed him that he had that very day received a communication from Mr. Clarke of Northampton offering to give fifty thousand dollars towards the founding of a Massachusetts School for the Deaf, if it should be established in Northampton.

“Governor Bullock communicated this information to the legislature of Massachusetts, and in his (1867) message recommended (such) legislation....

“The legislature referred this part of the Governor’s message to a joint special committee... and hearings were opened.

“Dr. Howe, Mr. Sanborn, Hon. Thomas Talbot, Mr. Hubbard, and a large number of Deaf-mutes from Boston and the vicinity favored the Governor’s recommendation.

“They were opposed, on behalf of the Hartford School in Connecticut by Rev. Collins Stone, W. W. Turner, Hon. Calvin Daye, and Hon. H. A. Stevens of Boston....

“...the two bills were passed and the Clarke Institution incorporated.

“At the time of organization the incorporates were not pledged to any particular method of instruction, and the majority of them had no decided opinions on the matter, but Mr. Hubbard was among them, and was elected President of the Board. The school committee appointed by the Board then rendered a report recommending among other things:

“...That an articulating school under the charge of Miss Rogers be established at Northampton.’
“The report was adopted; and the Chelmsford School was removed to Northampton, and became the Clarke Institution with Miss Harriet B. Rogers as principal. ...”

“On the first of October 1867 the Clarke School at Northampton was opened with Miss Harriet B. Rogers as principal, and the Hon. Gardiner Greene Hubbard as president of the Board of Corporators....”

“The successful establishment in 1867 of oral schools, not employing the sign-language, both in Northampton and New York City made a profound impression upon the older schools of the Country....”

So, from the years 1864 to 1867, the residents of Cambridge, and Boston across the Charles River from Cambridge, were witnesses to an unusual public discussion: the arguments for and against methods for teaching deaf children. Just as the young medical student Keagy must have been aware of the public discussion in Baltimore and Virginia between 1812 and 1818, so must another young medical student in Harvard in Cambridge, Massachusetts, in 1864 and later have been aware of the public discussion and the newspaper articles it must have generated concerning the problems in teaching the deaf. That young medical student at Harvard was William James (1842-1910).

Nor did the discussion in the Cambridge and Boston area on the teaching of the deaf end in 1867 with the establishment of the Clarke School. In 1869, forward-looking Superintendent Philbrick founded in Boston the first city-supported school for deaf children in the United States, and it is highly likely he was inspired to do so at least in part by contact with Alexander Melville Bell, who wrote a highly successful “sound” based program for teaching the deaf.

The previous year, 1868, the elocutionist and speech teacher, Alexander Melville Bell, Alexander Graham Bell’s father, had visited the Boston schools. In his address to the National Association of Elocutionists in 1895, the elder Bell recalled:

“When I first visited the City of Boston in 1868, we met our distinguished professional brother, the late Lewis B. Monroe, who was the superintendent of elocution in the city schools. I was taken by Professor Monroe on one of his rounds of visits to the schools and witnessed with delight the affectionate greeting of the various classes to their beloved instructor.... I had been particularly struck with the way in which his pupils spoke out. I could not get my young lady classes in Edinburgh or London to deliver the voice with anything like the same energy and clearness....”

That elocution teacher, Monroe, wrote a reading series for beginning readers in 1871-1873. New words were shown on top of the pages, easy ones on the left to be read “By Sound” and those on the right “By Sight.” This arrangement was a common practice after the 1870’s. It had originated in the teaching of “elocution” but was also obviously in response to the agitation for some kind of phonics on whole words that had started in the 1850’s. This inadequate late-nineteenth-century whole-word phonics paralleled our “phony phonics” of today, which began as a response to Dr. Rudolf Flesch’s 1955 bestseller, Why Johnny Can’t Read. Therefore, despite his concern for elocution, in no sense was Monroe teaching reading by real phonics. Furthermore, elocution in the last century had nothing to do with teaching reading. To illustrate what elocution meant in those days, Monroe’s text, Vocal Gymnastics, is advertised and described in the front of an 1873 edition of his First Reader:

“A New Work on Physical and Vocal Training.... No Teacher, Pupil, Clergyman, Public Speaker or Reader can afford to be without this little Manual. It contains a complete system of
instruction for the proper training of all the Physical and Vocal Organs concerned in the production of the Tone.”

“Elocution,” therefore, by the 1870’s, had become a form of vocal gymnastics. Philbrick made this clear in his 1871 report, when he said:

“I am sorry to say that the requirements of the programme in respect to physical training are not generally carried out. Thirty minutes each are to be given to vocal and physical exercises. These exercises should be short, but frequent, especially in the lowest classes. All the teachers have been furnished with copies of Monroe’s Manual, and they should regularly exercise their pupils in accordance with the system which it illustrates.”

However, unlike the elocutionist Monroe, the elocutionist Alexander Melville Bell did concern himself with true phonics in reading. He reminisced in his 1895 talk:

“My own studies were for many years of the elements. The tables of vowels, of consonants, and of tones which I published in 1849 represented a long antecedent of study and experiment. My days being filled up with practical work in teaching, the nights - strictly limited to the hours from 10 p. m. till 2 a. m. - were devoted to theoretical work in investigating the mechanism of sounds and in tabulating all appreciable varieties.... In the organs of speech....I discovered that my schemes of studies were susceptible of a self-explanatory symbolism by which writing became a real Visible Speech.... I may add that the system has been used hitherto chiefly in teaching the deaf to speak....”

That the elder Bell meant his Visible Speech also to be used to teach reading to people with normal hearing there can be no doubt. He said, in an 1868 paper, “English Visible Speech for the Million,”

“Any person who can merely pronounce the NUMBERS 1 to 8 in the ordinary way and name the objects represented in the Alphabet Table... may be immediately taught to READ or may easily TEACH HIMSELF.”

Unlike Monroe, Bell had invented a purely phonic “sound” system, divorced from “meaning,” for teaching reading - and for teaching the deaf to speak. It was also famous in its time. Anyone who has seen Rex Harrison as Henry Higgins in My Fair Lady, based on George Bernard Shaw’s Pygmalion, will recall the phonic charts on which Higgins unmercifully drilled Eliza: Higgins called them Bell’s charts.

According to the Encyclopedia Britannica, 1963, Vol. 3, p. 439, it was in 1867 that Alexander Melville Bell (1819 - 1905) first published Visible Speech: The Science of Universal Alphabets. That was only the year before the visit of Alexander Melville Bell to the Boston schools. Surely, his book must have been at least a topic of conversation with the school personnel like Superintendent Philbrick when Bell visited in 1868, the year before Philbrick instituted a Boston city school for the deaf.

Apparently, from its beginning, the Boston school for the deaf taught “articulation,” the teaching of deaf children to speak. Despite the elder Bell’s visit, however, the school may not have begun to use his Visible Speech until a year and three months after the school was founded, at which time Alexander Graham Bell gave its teachers lessons on his father’s program.

Philbrick said in his 1874 report (page 371)

“...the establishment of this (Deaf-Mute School) which was opened November 10, 1869, must be reckoned one of the most interesting and important. It is believed to be the first in the country
for day-pupils, that is, for pupils boarding at home and attending the daily sessions of a school like speaking children, and also the first established by a municipality for the benefit of its inhabitants.... The method of instruction employed is that of articulation, the pupils being taught to speak and to read the speech of others from their lips, the sign language not being taught and the manual alphabet only for temporary purposes.”

In Philbrick’s 1871 report, covering the school year 1870-1871, he said:

“The steady progress which has been made by (the Deaf-Mute School) from its commencement in 1869 and more particularly during the past year, is most gratifying to the committee as well as to many others who were at first inclined to regard its establishment as a doubtful experiment. The pupils have made excellent progress in their studies and exhibit great enthusiasm and pride in their daily achievements. Parents and friends express their surprise and pleasure that the pupils accomplish so much. Letters of commendation are constantly received from prominent educators who have visited the school and examined the plan pursued. Much interest is also manifested in various parts of the State as well as beyond its limits in regard to the school....

“Perhaps nothing has contributed so much during the year to the value of the instruction in this school as the introduction of Prof. Alex. Melville Bell’s system of ‘visible speech,’ which was done by his son, Mr. A. G. Bell, in a course of lessons to the teachers and pupils in March and April (1871). By means of this system, deaf mutes can be readily taught to articulate correctly, and with proper inflections, even the most difficult sounds and words....”

Philbrick had said further in his later 1872 report (page 213):

“The use of Prof. Bell’s system of visible speech as a means of instruction, during the past year, has justified the opinion of its utility as an instrumentality in the instruction of deaf-mutes, which was expressed by me in a former report. I am highly gratified to learn that Prof. A. Graham Bell, a gentleman of the highest respectability, and of the rarest ability as a teacher, has opened a Normal Training School in this city, for the purpose of qualifying teachers for the application of visible speech to deaf-mute instruction. It would be a decided advantage to all teachers of speaking children to possess some acquaintance with the new science - the true science of vocal utterance.”

The Encyclopedia Britannica, 1963, Volume 3, page 439, in its article on Alexander Graham Bell (1847 - 1922), who was born in Scotland, recorded that he moved to Canada from Great Britain in 1870, and opened his Boston school to train teachers of the deaf in 1872. In 1873, Bell joined Boston University as a professor of vocal physiology. The American Association to Promote the Teaching of Speech to the Deaf was founded by Alexander Graham Bell.

So, the year that William James received his doctorate from Harvard, 1869, was the same year that the first day-school for the deaf in America was opened in November across the river from Harvard, in Boston, most probably with much publicity. It used phonics to teach the deaf to speak orally instead of teaching them to communicate by sign language. This was an innovation in America, just as having a day-school for the deaf was an innovation in America. By 1871, “prominent educators” were visiting that school and interest was being exhibited in the school from outside the state. By March, 1871, only a year and three months later, Alexander Graham Bell was teaching his father’s phonetic system to the pupils in that Boston public school for the deaf. By 1872, the same year James started teaching at Harvard, Alexander Graham Bell had opened a “Normal Training School” in Boston to train teachers for the deaf. Furthermore, as mentioned also in Lawrence A. Cremin’s American Education - The National
Experience: 1783-1876, (Harper & Row, New York: 1980) page 333, Alexander Graham Bell had an exhibit at the 1876 Philadelphia Centennial Exposition, at which he personally demonstrated his new electric telephone. The Centennial planners, therefore, probably knew of Bell before 1876 or his exhibit probably would not have been arranged.

According to the March calendar in the 1998 Monthly Monitor, a personal calendar pad published by Baldwin Cooke Company of Northbrook, Illinois and Scarborough, Ontario, Bell reportedly received patent #174465 for his telephone, an “improvement in telegraphy” on March 7, 1876. Bell and his public activities including the education of the deaf must have been well known in the 1870’s.

In summary, starting with the public activity of Bell’s future father-in-law in Cambridge to obtain legislation for deaf children in 1864, Boston and Cambridge probably had more direct publicity on the teaching of the deaf in the years 1864-1872 than any area has ever had anywhere on earth, including the Paris of the Abbe de l’Epee in the 18th century. It is only reasonable to assume that James must have acquired an unusual amount of knowledge concerning the problems of the deaf just from living in Cambridge during these years.

William James had been, briefly, a student of Hermann Von Helmholtz in Germany in 1868. Surely he would have been interested in Alexander Graham Bell’s paper, “Vowel Theories,” concerning one of Helmholtz’s ideas, read before the National Academy of Arts and Science, April 15, 1879. Bell said that Helmholtz had claimed that:

“...a vowel is a musical compound consisting of a mixture of musical tones of different pitches...”

Bell wrote:

“...the hypothesis that the ear perceives them only and that it is unable to appreciate the quality of the vowel directly should be received with caution...”

Bell said at the end of his highly technical paper:

“...a point of maximum resonance should be perceived having the absolute pitch characteristic of the vowel uttered.”

The paper, of course, concerned phonetics and the psychology and physics of phonetics, and implicitly even philosophy: the topic of whether the mind can or cannot know objective data instead of just subjective impressions. Such a paper should have been of interest to William James, the psychologist/philosopher, then writing a book on psychology in which, on page 340, he specifically referred to Helmholtz’s ideas on mixtures of tones.

It is unlikely that William James in Cambridge in the early 1870’s could have been unaware of the activities of Alexander Graham Bell across the river in Boston, since Bell’s work with the deaf, and particularly his astonishing research, must have been receiving publicity at that time. James would almost certainly have disagreed with Alexander Graham Bell about teaching the deaf by “sound,” but it is a fact that James could show a lively interest in such well-known personalities with whom he disagreed.

For instance, James certainly would have disagreed with G. K. Chesterton’s world views. The famous author, Chesterton, said things like:

“Hamlet failed to act because he had been taught to think at a German university.”

523
Chesterton’s remark was quoted in Peter Kreeft’s article, “G. K. Chesterton, A Radiant Thunder,” in the National Catholic Register, reproduced in Ignatius Press’s The Serious Reader’s Guide to Good Catholic Literature, Summer, 1990, Harrison, New York. In contrast to Chesterton, James was intrigued with the German philosopher Immanuel Kant. However, according to Leon Edel’s Henry James - The Master: 1901-1916, pages 366-367, when William was visiting his novelist brother Henry in England in 1908, William was so curious about Chesterton that he borrowed the gardener’s ladder to peep over the wall to see Chesterton in his own back yard next door. That anecdote came from H. G. Wells, the famous science fiction author, who said when he called that day for William and his wife and daughter to take them on a visit to his own home, Henry told him with disapproval of the ladder incident. Yet William was amused. When leaving by car with Wells that same day, they passed Chesterton who invited William to visit him. Edel said William James recorded in his diary that he had gone at nine in the evening to Chesterton’s house with his brother, Henry. Hilaire Belloc was there also. Belloc was a renowned author and friend of Chesterton’s, and Belloc’s philosophical views were diametrically opposed to William James’ views. Yet William James and his brother, Henry, had stayed at the Chesterton home drinking port with Chesterton and Belloc until midnight.

Residents of the Boston area from the 1860’s to the 1880’s were exposed to more than the conflict of phonics vs. no-phonics only for the deaf. It was in Boston during those same years that a large, spontaneous and successful opposition arose to the entrenched sight-word reading method for hearing children. The most visible (but not the only) opposition came from those who endorsed Leigh phonic print, copyrighted in 1864 and widely used in reading books all over the country in the following decade. Leigh’s print used ordinary letters but, by special markings, demonstrated silent letters, vowel sounds and alternate consonant sounds. Leigh had astonishing success all over the country until the mid 1870’s. It is not unlikely that William James may have been familiar with that resurgence of “sound” in the teaching of beginning reading in Boston.
Chapter 23
How Phonics in Beginning Reading Re-entered in the 1860’s, Followed by a New Generation of “Meaning” Activists

The advent of Leigh’s print in Boston in 1866 had been preceded by texts published in Boston by the Reverend J. C. Zachos in 1864 and 1865. Zachos had developed a purely phonic method (actually re-invented Noah Webster’s approach), and these 1864 and 1865 texts contained his method, which he presumably used when he taught Black illiterates at Paris Island, South Carolina, in 1863. However, since the 1876 American Catalogue, under “Primers,” listed an 1859 Analytic and Phonic Word Book by Rev. J. C. Zachos, as published by “Wilstach,” Zachos must have compiled his material for teaching reading to beginners before the Civil War.

The copy in the Harvard library of Zachos’ 1865 work, Phonic Primer and Primary Reader, Published by a Committee under the Auspices of The American Phonic Association for the Advancement of Reading Among the Unlettered Classes, has a beautifully inscribed note in a Harvard bookplate inside its cover, “The Gift of the Author, Rev. John C. Zachos, of Newton, 2 Nov., 1865.” It is the note written in ordinary handwriting above the formal bookplate that is of interest: “Reading Room for the present.”

The implied interest at Harvard in his book is understandable: a great need existed in the fall of 1865, about a half-year after the end of the cruel Civil War, to remove illiteracy among the newly-freed Blacks. Zachos’ text, outlining his phonic method, was therefore available in Harvard’s Reading Room after November 2, 1865.

In Leon Edel’s Henry James, The Untried Years: 1843-1870 (Avon Books: 1978, page 241-242), Edel said:

“William James returned from Brazil in March 1866 and resumed his medical studies.... William spent this summer as an interne in the Massachusetts General Hospital and in the autumn the brothers were reunited, under the family roof which was moved (to) 20 Quincy Street... facing the Harvard Yard.... In the spring of 1867 (William) interrupted his medical studies and left for Germany...”

Therefore, in March, 1866, William James returned from his close association with Agassiz of Harvard as a member of Agassiz’ Amazon expedition and would have been one of the students using the Harvard Reading Room less than six months after Zachos’ phonic text was placed there. Presumably, he would have periodically used the Reading Room until the spring of 1867.

James is famous for his “stream of consciousness” ideas, or, as described in a chapter in his text, The Principles of Psychology, 1890, “The Stream of Thought.” James wrote, on page 165:

“What must be admitted is that the definite images of traditional psychology form but the very smallest part of our minds as they actually live. The traditional psychology talks like one who should say a river consists of nothing but pailfuls, spoonfuls, quart-potfuls, barrelfuls, and other moulded forms of water. Even were the pails and the pots all actually standing in the stream, still between them the free water would continue to flow. It is just this free water of consciousness that psychologists resolutely overlook. Every definite image in the mind is steeped and dyed in the free water that flows round it.”
James was discussing what he perceived as the failure of psychologists to understand the nature of “the stream of thought.” In Zachos’ 1865 book on phonics which was in the Harvard Reading Room from November, 1865, very possibly into the spring of 1867, here is what Zachos said about what he perceived as the failure of teachers to understand “the stream of sound”:

“But the teacher is guarded, and so must be the pupil, against the impression that these spaces indicate any hiatus or stoppage of the voice between elements in spelling by sound. There is no such hiatus even between the syllables of words, or even between words of the same grammatic phrase, such as, to the man, in the house, &c. No; the stream of sound, like a stream of water, flows freely through the vowels, and with more or less obstruction through the consonants, but never actually stops, except at the natural pauses of the voice in speaking. This has not been generally observed by teachers.”

The resemblances in vocabulary and parallel structures are striking. James said:

“It is just this free water of consciousness that psychologists resolutely overlook. Every definite image in the mind is steeped and dyed in the free water that flows round it.”

Zachos said:

“...the stream of sound, like a stream of water, flows freely through the vowels, with more or less obstruction through the consonants.... This has not been generally observed by teachers.”

It seems exceedingly probable that James read Zachos’ work, and, probably unconsciously, produced parallel prose. There is, of course, nothing wrong with that as we probably all do so continually, as unaware of the source for many of the phrases we use in thinking as we are of how we learned our language in the first place. The point is that these are exceedingly RARE phrasings. It seems probable Zachos’ work was the source for James’ famous phrases. It is known that Zachos’ work was probably available for young James to read immediately after his return from the Amazon. During this trip, James had an intimate association with Agassiz who is on record (as will be shown) as despising empty sound (in grammar) divorced from objective meaning (observation of real objects in the real world). Zachos’ paper, concerned solely with the sound of language and not its meaning, would therefore have contrasted diametrically to Agassiz’ views, to which James had been intimately exposed for months, and would probably have seemed extreme to young James.

James’ paraphrasing of Zachos’ phrases is, of course, of no direct importance to the history of reading. What is of importance is that the existence of these parallel phrases powerfully suggests that young James was becoming intimately acquainted with the subject of beginning reading instruction since James was apparently reading and absorbing Zachos’ arguments concerning the teaching of phonics in 1866 or 1867. Zachos’ views must have made a strong impression on James or James would not have retained the shell of Zachos’ arguments in his memory: Zachos’ peculiar analogy to a stream of water which flowed freely, which free-flowing stream was not understood by his peers.

Zachos’ work never reached the Boston schools, as far as any records I have seen would indicate. But the Leigh print did. In Philbrick’s report for 1870, covering the 1869-1870 year, he said:

“Several years ago, an order was passed by the board, authorizing the district committees to introduce into the schools of their respective districts, Leigh’s phonic system of teaching the first steps of reading, making use of the phonic charts and Hillard’s first and second readers, printed in the pronouncing type. In the Lincoln district the experiment was immediately commenced. In the course of six months or a year, several other districts followed the example of the Lincoln...."
“One year ago I referred with commendation in my report to the extraordinary success of a
teacher at East Boston, in teaching the first steps in reading, by the phonic method, but without
using Dr. Leigh’s pronouncing type. The success in that case was clearly the best I had then seen.
But I have now to report that it has been surpassed by Miss Catherine A. Dwyer, of the Lawrence
District, who has made use of Dr. Leigh’s system. I examined her class, in company with the
master of the district, near the close of the month of February. It consisted of about fifty boys,
between five and six years of age, from homes little calculated to develop their intelligence.
During the six months, these pupils had read the first reader, and eighty five pages of the second,
an amount of reading exceeding what the programme requires during a year and a half.... Each
individual pupil was examined on a piece taken at random in the second reader, and they read
with but little hesitation. Five or six of the best boys...were then tried on a NEW PIECE in the
same book, printed in the common type, which they read with considerable fluency. Such results
in teaching the first steps in reading I had never before witnessed in any school whatever....”

In Philbrick’s 1872 report, on page 159, he quoted Dr. Leigh, concerning the successful results of the
Leigh phonic print:

“...these are the results of several years’ experience, in various parts of the country, with all
sorts of teachers, in several thousands of schools, and... as yet I know of not one real exception.”

The 1871 Annual Report of the School Committee of the City of Boston, published in 1872, read on
pages 7 to 9:

“A teacher who has had the advantage of observing (Leigh’s) method at the Training School,
and has learned the art of oral instruction, and of using the blackboard for illustrations, who has
the vital qualities that engage the attention of children, and the sweet, firm temper that retains
hold upon them, will be able, with Leigh’s phonic exercises, to conduct a whole class over the
irregular field without a stumble - “forty reading as one.”... We beg leave to say that six years of
careful experiment in several schools in this city have shown the best results from this system.
Pupils learn the sounds belonging to phonic type very readily; and, as those sounds are
unchanging, the labor is much less than in gaining the mastery of a less number of letters, most of
which are liable to arbitrary variations. But whether this reason is satisfactory to doubters or not,
the fact leaves no room for dispute. Within six months ordinary pupils under this system get
nearly through the second reader; - a point which pupils by the old method are always eighteen
months, and often two years in reaching. This is a constant, unvarying result....

“But this is not all. The way is not only shortened, but the lessons are made attractive... There
is no listlessness, no writhing upon hard benches, no longing for release. The system, further,
cultivates both perception and reason. Words are never parroted either in reading or spelling; no
word is used that is not understood.... Intelligence advances with every progressive step. By
instructing the pupils together, not only is time saved, but discipline is maintained without
effort.... Phonic characters are used only until pupils have become familiar with the ordinary
monosyllables and most common words. These are acquired with a facility that is astonishing.
Taking each sound in order, the sharp perception runs through and aggregates them into a word,
as a needle takes up beads on a string. When this point is reached the difficulty is over; the
leading strings are no longer needed. The pupil takes up the next book in order, in common type,
and with scarcely a blunder reads off fluently. At an exhibition of a primary class in the Lincoln
District, several pupils, who had been less than eighteen months under instruction, read at sight
from books they had never seen. Other pupils, who had never used any but phonic type, were put
to the severe test of reading from common type for the first time in the presence of an audience;
and they not only read well, but uttered their words with a distinctness and purity of tone that ordinary pupils never attain.

“...we therefore suggest that the results of the new system should be carefully considered by a special committee, and if they are found as here stated, that it be introduced as speedily as is practical into all Primary Schools....”

In Philbrick’s 1870 report, from page 151 to 153, he said:

“The spelling book is the symbol of popular education, and justly so, for it is the first word-book and words are the medium of all teaching. [Ed.: Stickney named her 1889 speller the “word-book” and said it was to be started in second grade. Philbrick was not saying that word-books were first grade books.] Normal schools would do a good thing if they would teach their pupils how to use the spelling-book in the school room. The greatest blessings are liable to the greatest abuses. No school-book in these latter days has fared so hard as the dear old spelling-book. In the first place, the book-makers have metamorphosed it into an ugly shape. Most modern spelling-books that I have seen ought to be entitled “spelling made repulsive.” But the great antagonist of the speller has been the modern educational maxim, “Ideas before words,” a maxim which is good within certain limits, but which is bad outside those limits.

“But the spelling-book is probably destined to a great longevity. The witty description of it, as a collection of nonsense columns, did much to cause its neglect for a time. But that bon mot has lost its power, and the spelling-book is regaining favor. [Yet] .....formal writing and formal spelling should occupy very little time in the graduating class. How preposterous to drill our pupils, at the age of fourteen or fifteen, on spelling, until they can get ninety-nine per cent on hard words, while they know little or nothing of the elements of science....”

On page 151, Philbrick gave the 1844 course of study for the first class of Grammar schools in Boston, which is historically very interesting. (The Boston Grammar schools followed the Boston Primary schools.) Philbrick listed Emerson’s National Spelling Book, Goold Brown’s First Lines of English Grammar, Olmsted’s Rudiments of Natural Philosophy and Astronomy, or Parker’s Compendium of Natural and Experimental Philosophy, Woodbridge’s Geography and Atlas, Pierpont’s American First Class Book, Worcester’s Elements of General History, exercises in composition and declamation, writing, penmaking, North American Arithmetic, Part Third, and Robinson’s Bookkeeping. Philbrick gave the following quotation from 1844:

“Members of the first class who shall have nearly completed the course of exercises in Arithmetic may be instructed in Algebra and Geometry. The following studies and books may be introduced at the discretion of the master: -Smellie’s Philosophy of Natural History, Goold Brown’s Institutes of English Grammar, Whately’s Rhetoric, and Parker’s Exercises in English Composition.”

Parker’s Exercises in English Composition were widely used in the Boston area in the 1840’s. The Harvard library has many early copies.

With the advent of Leigh print, phonics had returned in America. Tower had been teaching elocution in his primer in 1864, with the happy side effect of giving practice in sounding out new words, but the market obviously had not been demanding phonics for beginning reading at that time. Yet an awareness of the benefits of phonics for teaching beginning reading had been slowly growing, but the awareness was vague. This can be seen by Charles Sanders’ revision of his 1840 Code 1 sight-word primer. His 1866 revision was only a Code 1 book, too. Sanders had given his whole new series the name, “Union,” when it
was published in 1861, obviously choosing the title because of the Civil War. Sanders did not, however, revise the pictorial primer of his first series until 1866. It was then entitled *The Union Pictorial Primer*, Ivison, Phinney, Blakeman & Co., New York. “Introductory to the Union Readers,” by Charles W. Sanders, A. M., copyrighted in 1866 (and the following is from a copy published in 1867):

> “Preface. The Union Pictorial Primer is designed as an introduction to SANDERS’ UNION SERIES OF READERS AND SPELLERS. The plan of the book is similar to that of Sanders’ Pictorial Primer, - a work which has been more extensively used in the schools of this country than any other of the kind ever published.

> “This unparalleled success, doubtless, lies in the peculiar fitness of that work for the juvenile mind.

> “The book is so arranged as to be adapted to the word method, the phonetic method, or to the ordinary method, - that of teaching the names of the letters first, - just as the teacher may prefer.

> “The engravings, which have been designed and executed by one of the most skillful artists expressly for this book are all entirely new. These are highly attractive, and will aid the learner in understanding the lessons which they illustrate, and, at the same time, afford numerous subjects for OBJECT-TEACHING.

> “NEW YORK, 1866.”

Yet The Union Pictorial Primer was a straight Code 1 sight-word primer, despite its claim that it could be adapted to the “phonetic method.” The “phonetic method” had been growing in popularity since the 1850’s, which part of the market the publisher was obviously trying to capture. However, it would be impossible for a child to learn to read phonically with Sanders’ 1866 primer. But 1866 was the year that Leigh’s phonetic pronouncing print, copyrighted in 1864, finally began to spread.

Concerning the prevalence of disinformation on reading instruction today, it should be noted that it is nothing new, as Sanders’ primer demonstrates. Another source of confusion is a 1900 “reading instruction history.” In 1900, Rudolph R. Reeder, then at Columbia Teachers College, wrote *The Historical Development of School Readers and of Method in Teaching Reading* (The Macmillan Co., New York). As will be mentioned, Reeder totally omitted mentioning the widespread and popular series, the Appleton readers, which are unheard of today even though “everyone knows” McGuffey’s was used “almost everywhere” (even though it was not). The McGuffey fiction seems first to have appeared in Reeder’s book, and in my opinion was put in to deflect attention from Appleton’s and the Franklin series of the 1870’s for reasons unknown (neither series being mentioned by Reeder who omitted naming any series after 1860 but the Heart of Oak). Yet, on pages 81 and 82, Reeder at least discussed at length the widespread use of Leigh’s print some years before. Reeder’s peculiar material at least recorded Leigh firmly into reading history so that anyone following Reeder should have had that information.

When Nila Banton Smith wrote *American Reading Instruction* as her dissertation at Columbia Teachers College in 1932, published later by Silver, Burdett and Company in 1934 and 1962, and in a revised edition by the International Reading Association in 1965, she should certainly have had access to Reeder’s book in the Columbia library since he, himself, had written it while at Columbia Teachers College only thirty-two years before. Yet, important as Leigh was in American reading instruction history, Leigh’s name (and the Heart of Oak books) were omitted in Nila Banton Smith’s index in her revised 1965 edition (and presumably her earlier ones). On page 394 in her 1965 edition, in discussing modern-day ITA (Initial Teaching Alphabet) phonetic print, Smith did mention that between 1870 and 1920 several phonetic alphabets had been used, and said:
“The Leigh, Shearer, Funk and Wagnell, and Ward systems all made use of augmented alphabets...”

In the paragraph before this, she said that St. Louis schools had used a phonetic alphabet from 1866 to 1886 and saved from one to two-and-a-half years in teaching reading, but she never mentioned that it was Leigh’s material that was being used! Yet these remarks on page 394 are obviously only in the 1965 edition, as they occur in her discussion of present-day ITA phonetic print, which was not available in 1932. With the fervor for ITA print that was prevalent in 1965, and with John Downing, the well-known English advocate of ITA print, certain to read her book, her 1965 remarks are not surprising, since she gave, as a footnote reference for the remark about St. Louis, an article by John A. Downing of England.

However, in the section of her book dealing roughly with 1880 to 1910, on pages 127-129, which would presumably have been in the original 1932 material, she said that a development of that period (roughly 1880 to 1910) was special alphabets, and she discussed at length an obscure phonetic alphabet published in 1902 called the Scientific Alphabet, and another obscure one called The Shearer System written in St. Louis in 1894. After discussing these two obscure materials, she then totally omitted the famous and enormously successful Leigh print of 1864. The effect of the dates she gave for actual phonetic alphabets (1894 and 1902) moved the use of phonetic print away from their real years of popularity: 1866-1880, and buried the Leigh history.

Smith also made no mention of the enormously successful Appleton series of 1878. Yet Vail, the 1911 historian of the McGuffey series, reported that Appleton’s fought McGuffey’s to a draw in the McGuffey home territory in the early 1880’s. Nor did she mention the Heart of Oak series which had been described by Reeder at length. Her mention of Hillard’s “Franklin” primer is totally misleading, moving its publishing date back from 1873 to 1831, as has been discussed elsewhere in this history. Nila Banton Smith’s “history” is full of such “discrepancies.” They are all equally difficult to refute because of the amount of print it takes to do so. As a result, Smith’s classic disinformation continues to be used as a reference source for reading history. One of the effects of Smith’s book has been the burying of the history of the once enormously successful Leigh print.

By 1872, Leigh print was successfully spreading in the Boston schools, all of which had adopted it voluntarily. Philbrick said:

“A year ago, it was used in eleven districts and about thirty schools; it is now found in twenty-three districts and upwards of sixty schools.”

In Philbrick’s 1874 report, he said that the Leigh print had spread to 31 of 37 districts in Boston, and he said that the Board:

“...should adopt the system and make it obligatory in all the Primary Schools.”

Philbrick said on page 191 of his 1874 report:

“The method of teaching the first steps of reading by means of the pronouncing type, invented by Dr. Leigh, has been used in some of our schools for eight or nine years. After an experiment with it in three or four schools for a year or two, an order was adopted by the Board, permitting its introduction where the district committees should choose to do so. Since that provision of the Board was adopted some six or seven years ago, no further action in regard to the matter has been taken. In the meantime, the system, without any compulsion, or pushing by outside agencies, has quietly made its way into nearly all districts. In my circular recently
addressed to the masters, requesting information in relation to the progress of this method, I requested them to give their opinions as to the results of its use.

“The analysis of the replies shows, that of the masters of the six districts in which it has not been introduced, five expressed no opinion, and one thinks the advantages are counterbalanced by the disadvantages. Of the thirty-one masters of the districts where the system has been tried, two are undecided (one of them having had but a brief period of observation), and one is decidedly opposed to it; one would not go back to the old method, but thinks it not favorable to spelling, two who have not had time to test it fully approve as far as they have observed; four are rather doubtful as to its advantages; three express unqualified satisfaction with its results, and eighteen endorse it in emphatic terms.”

Philbrick was no “mover or shaker” trying to control society through half-truths, so he reproduced only the bald, undoctored results of his survey. They speak for themselves. Of the 31 Boston districts using Leigh phonics in 1874, 28 had used it long enough to form an opinion. Of these, the method was decidedly opposed by only one master, but emphatically approved by at least 21 masters, or seventy-five per cent of the total.

Philbrick reproduced comments from the masters, such as:

“The children learn to read in half the time it formerly took, and do not contract that old habit, so hard to eradicate, of reading one word at a time, as though they were pronouncing a column of words from the speller.”

“Pupils do four times as much reading; they read more intelligently; the vocalization has been greatly improved. Dr. Leigh’s method had revolutionized the reading in every school under my charge where it has been well taught.”

Philbrick concluded:

“From the examination of the replies of the masters, it is evident that the positive testimony in its favor is overwhelming.”

A New Generation of Activists Enters the Scene

Yet the fantastically successful Leigh phonics ran into trouble with “experts,” one of whom was Colonel Francis W. Parker of the Quincy, Boston and Chicago schools. Parker had arrived in Quincy, Massachusetts, in April, 1875, as the new broom of John Quincy Adams and Charles Francis Adams, Jr., and later received a great deal of (probably programmed) newspaper coverage.

The year 1870 appeared to be the starting point for the Louis Agassiz type of “reformers,” to which group the Adams brothers, the grandsons of President John Quincy Adams, very probably belonged. James Johonnot, who wrote Principles and Practice of Teaching in 1878, published by D. Appleton and Company, included a chapter on Louis Agassiz (1807 - 1873) in which Johonnot described the Agassiz movement:

“(Agassiz) saw that, in the prevailing education, language largely took the place of thought; that more attention was given to the symbols of knowledge than to the knowledge itself....

“Those errors, he saw, could be corrected only by a radical and fundamental change in the whole system of education, in which the scientific spirit and methods should play a prominent
part. He commenced the work of reform with his characteristic caution and energy, calling attention to some of the prominent defects of education in his public lectures....”

The most noticeable Boston/Cambridge/Quincy movement to replace “language” (“sound”) with “thought” (“meaning”) began about 1870. However, reasons exist for thinking the Agassiz-inspired reforms pre-date 1870, and that the Agassiz clique may even have influenced the choice of a president for Harvard, and, through him, its actual curriculum.

Charles Francis Adams wrote Theodore Lyman (1833-1897) and Robert Charles Winthrop, Jr. (1834-1905) Two Memoirs for The Massachusetts Historical Society in 1906. It is interesting that the material was published by John Wilson and Son, University Press, Cambridge, in 1906 and that Adams was using that press. That arouses thoughts of the Franklin Primer of the 1870’s, to be discussed elsewhere in this history.

It is evident that Adams knew Lyman personally. That is very interesting because Lyman had been a student of Agassiz and worked with Agassiz for some years, and obviously idolized him. Did Adams, who “reformed” the Quincy schools, with his brother John, also know the school-reformer, Agassiz? Lyman was also a cousin of Charles William Eliot, who became Harvard’s reforming president, and worked to have Eliot appointed president of Harvard. Eliot had also been a co-worker with Agassiz at Harvard while Eliot was an instructor there. Was the choice of Eliot part of the school improvement program being fostered by Agassiz?

Adams wrote (page 153-155):

“Already, even before graduation, Lyman had come under the influence of Professor Louis Agassiz. Intellectually and morally, even more perhaps than scientifically, he became one of that teacher’s disciples. As is well known, Agassiz was endowed with remarkable personal magnetism; he was, furthermore, always instinctively on the lookout for young men to attach, not to himself personally, but to his pursuits....

“For three years after graduation the acolyte worked under the eye of the master and in personal touch with him; and the impression Agassiz then made on him he recorded in a published paper nearly twenty years later, shortly after Agassiz had died (1873). [footnote: Atlantic Monthly, vol. xxxiii, pp. 221-220] He took his degree of S.B. in 1958....”

Adams wrote on page 165-166:

“By virtue of an act passed in 1865, the members of the Board of Overseers of the [Harvard] college were thenceforth elected by the alumni; and, in 1868, Lyman was chosen. His cousin and intimate personal friend from childhood, Charles W. Eliot, was chosen at the same time; but the name of the latter was shortly after submitted to the Board by the Corporation for confirmation as president of the University. Lyman contributed efficiently towards securing favorable action on the nomination. His assistance, too, was needed; for, strange as it now seems in view of what has since occurred, the choice of President Eliot was at the time by no means unopposed. [footnote: The final vote in the Board of Overseers was sixteen ayes and eight noes] It constituted in fact a new departure [Ed. Note “new departure” is the same phrase Adams used to describe his program in Quincy] for the University, entered upon with hesitation and, at the time, viewed in many and influential quarters with grave distrust.

“The nomination was ventured upon by the Corporation only as a last resort, and in a spirit close approaching desperation, - the result of an instinctive conviction, slowly and reluctantly
reached, that the old order of things was gone, - a radical organic change had come about in the community and body politic. To it the University must respond. Yet before Mr. Eliot was named, the position had been offered to at least one eminent gentleman more clearly in the line of established and therefore safe precedent; and declined most wisely. Thus no nomination at all similar had ever been sent down by the Corporation to startle the Overseers except that of Josiah Quincy, made close upon forty years before and with five administrations intervening....

“A young scientific instructor, of more than questionable theological orthodoxy, a professed believer in Darwinism, suspected of agnosticism even, was to be formally approved of as president of the typical Congregational University. The nomination was referred to a committee of the Board of Overseers; the report of that committee, when made, was not acted upon immediately, much eloquence was expended; many doubts expressed. Colonel Lyman was then thirty-six, and only recently chosen a member of the Board.... Colonel Lyman, however, not only took a broader view, but he knew his kinsman well. He was so placed also as to be able to render efficient aid. Thirty-seven years after the event, the outcome of the experiment does not need to be dwelt upon. The cousin’s faith has been justified.”

As Colonel Parker was later the “new broom” in the Quincy government schools, so was Eliot the “new broom” at Harvard. Eliot’s appointment must have pleased Agassiz and his supporters enormously. The appointment was probably made possible only by the 1865 change in selecting Harvard’s Board of Overseers which must have made quite a difference in its make-up by 1868. The change had apparently resulted in 36-year-old Lyman’s and presumably others’ appointments, to provide the sixteen “yes” votes out of the twenty-four finally cast. Who initially promoted that 1865 act which changed the method of appointing the Board of Overseers? Was it the Agassiz circle at Harvard?

There is a striking similarity between President Eliot’s move to drop required courses at Harvard some time after he arrived in 1869, and the move in Quincy in 1875 to drop the speller and grammar. Both Colonel Parker in the elementary schools in Quincy and President Eliot at Harvard proclaimed that learning could only be achieved by personal involvement and personal interest in subject matter that was meaningful from the student’s point of view. In a very real sense, however, such views were only an extension of Dugald Stewart’s views. In effect, Stewart had said that learning for its own sake, without personal involvement and personal use, was a bad thing. Obviously, all such views can be clearly identified as a “drowning of the books.”

According to the 1963 Encyclopedia Britannica, volume 8, page 282, Charles William Eliot (1834-1926) was an 1853 Harvard graduate who taught mathematics and science there from 1854 to 1863, after which he studied in Europe for two years and then went to the Massachusetts Institute of Technology where he was a professor of analytical chemistry. This scientist, who must have worked earlier with Agassiz in the teaching of science at Harvard, became president of Harvard in 1869.

Concerning the teaching of reading, the former president of Harvard, Thomas Hill, LL.D, had been quoted in 1866 as praising both the Leigh print and the Zachos phonic system (thereby in effect endorsing “sound” and not “meaning” in teaching beginning reading).

In 1866, First Lessons in Reading: A New Method of Teaching the Reading of English was published in Boston by Lee & Shepard, written by Richard Soule, Associate Editor of Worcester’s Quarto Dictionary, and William A. Wheeler, Associate Editor of Webster’s Dictionaries. The Preface said:

“This book has been prepared by the subscribers substantially on the plan proposed by the Rev. John C. Zachos, and with his concurrence. Its aim is to teach the art of reading by enabling the pupil, in the first place, to analyze spoken words into their elementary sounds, and, in the second place, to recognize the signs used for these sounds in the ordinary printed text.”
Zachos had developed the system, as mentioned elsewhere, after working with freed slaves in the south in 1863. In the advertisement for the book on the back cover, appeared this statement:

“The Rev. Dr. HILL, President of Harvard University, says of it, ‘I consider your “First Lessons” a very superior work, and destined to very great usefulness.’”

Among the testimonials on the back of Leigh’s Pronouncing Edition of Hillard’s Primer, Brewer and Tileston, Boston: 1866, appeared the following:

“From Thomas Hill, LL. D., President of Harvard College.
“Teacher an adult to read English from ordinary type is a matter of the very gravest difficulty; ranking, for ordinary men, very near to impossibility. With the aid of a phonetic dress, like Dr. Leigh’s beautiful and ingenious type, it becomes a matter of comparative ease.”

Mitford Mathews in his 1966 book, Teaching to Read, Historically Considered, The University of Chicago Press, wrote of the use of the Pitman phonetic print in the Boston area:

“From 1852 to 1860, an experiment involving eight hundred pupils was made with the new method in the schools of Waltham, Massachusetts. The chairman of the Waltham Committee responsible for the test was Thomas Hill, later President of Harvard University.”

Mathews added in a footnote:

“These experiments, especially the ones at Waltham, have often been described.”

“This book is of unusual interest and value.”

That was obviously because of its historical content. However, Mathews said that the Waltham experiments had also been discussed by Thomas Hill in Hill’s book published in New York in 1882, True Order of Studies.

Therefore, in addition to having endorsed the Pitman phonetic print in the 1850’s, Hill had also given endorsements to the Leigh phonetic print and to the Zachos phonetic method by 1866, which latter two endorsements appear on 1866 textbooks published on those materials.

Background on that interesting one-time president of Harvard, Thomas Hill, who had endorsed THREE phonic or “sound” beginning reading programs, which means he implicitly rejected “meaning” beginning reading programs, is given in the Biographical Dictionary of American Educators, Volumes 1,2 and 3, Greenwood Press, edited by John F. Ohles, copyright 1978 by John F. Ohles, reproduction with permission of Greenwood Publishing Group, Inc., Westport, Connecticut. Thomas Hill (1818-1891) graduated from Harvard in 1843 and from Harvard Divinity School in 1845. Hill was obviously a very clever man, since his biography stated:

“While at Harvard he invented the occulator for calculating eclipses and was awarded the Scott Medal by the Franklin Institute.”
After some years as a pastor in Massachusetts, Hill:

“...succeeded Horace Mann as president of Antioch College at Yellow Springs, Ohio (1859-62) and was president of Harvard University (1862-68). At Harvard, he initiated the academic council and introduced elective courses for students. He finished his active career as pastor of the First Church in Portland, Maine (1873-77). Hill was a member of the Massachusetts legislature from Waltham (1871) and accompanied Louis Agassiz on an expedition to South America....”

That Agassiz expedition had ended in 1866, the same year that Hill had enthusiastically endorsed on the covers of two textbooks the use of “sound” in teaching beginning reading. One textbook used Zachos’ phonics, and the other, a Hillard text, used Leigh’s phonic print. Hill’s presidency at Harvard ended not long after, in 1868, for some unexplained reason.

William James had also been on that small Agassiz expedition to South America, so both James and Leigh had been intimate associates of Agassiz for a considerable period of time. The biography showed that Hill’s academic career, which had been on the fast track for years, had suddenly ended in 1868 when Hill was only 49 or 50 years old. Why did that happen? Did Hill perhaps see differently from those with “influence” such as Agassiz? Might such persons have been pleased to see Reverend Hill removed from the presidency of Harvard?

Hill certainly thought differently about the value of Leigh print than the “philosophers” to whom Philbrick referred, who are mentioned elsewhere and of whom James may have been one. Perhaps Reverend Hill thought differently from such people on other matters, as well. Judging from the titles of two of Hill’s books, Geometry and Faith (1849) and Jesus, the Interpreter of Nature and Other Sermons (1859), Reverend Hill was possibly a conservative Christian. Yet, as mentioned elsewhere, others at Harvard in that general time-frame such as Agassiz were being chastized for their enthusiastic attempts to commune with disembodied spirits (spiritualism). Perhaps clever but possibly conservative Hill just did not fit into the Agassiz post-Christian clique which apparently had the most influence.

The background on Leigh, the inventor of Leigh phonetic print, whose work Hill had endorsed, and whose work Philbrick promoted, is also included in the Biographical Dictionary of American Educators, edited by John F. Ohles, Greenwood Press, Westport, Connecticut, 1978. Edwin Leigh (1815-1890) was born in Maine and died in Kerr County, Texas. He graduated from Bowdoin College in Brunswick, Maine, and then from Andover Theological Seminary in Massachusetts. Leigh was ordained as a Congregational minister in 1839, so, like Hill, Leigh was a clergyman, but he also became a medical doctor. Leigh received the M. D. degree at Harvard in 1850, just as William James later did in 1869.

However, it is surprising to learn that Leigh worked at Harvard as an assistant to Louis Agassiz for two years. Therefore, Leigh must have known Agassiz intimately and very well indeed from about the time Agassiz first arrived at Harvard in 1848. Agassiz had been lecturing in this country since 1846. Like William Russell, who left Boston in 1828, abandoning both his wife and his bills, I have read somewhere that Agassiz in leaving Europe in 1846 abandoned his wife, and it is apparently true that Agassiz never returned to Europe before her death in 1850. His first wife was Cecile Braun, the sister of a botanist, and she died in 1850, according to the Encyclopedia Britannica (1963), Volume I, page 320. It says nothing about where she died. Agassiz later married Elizabeth Cary Cabot of Boston.

Leigh’s work with Agassiz was apparently before Leigh’s graduation or almost immediately afterwards, as his biography said Leigh practiced medicine from 1851 to 1854. It stated:
“Leigh served churches at Kennebunk, Maine, Winchendon, Massachusetts, and Woonsocket, Rhode Island, and he taught school in Bristol, Rhode Island. He practiced medicine in Townsend, Massachusetts (1851-54) and then spent several years in commercial pursuits in St. Louis, Missouri. Leigh taught in the high school and at St. Louis City University for seven years. He designed a transitional phonetic system, described in his book, Pronouncing Orthography (1864). The system was designed to improve primary instruction in reading and assist in teaching English to foreigners. The system was introduced in the Clay School in St. Louis in 1866 by the principal, William Torrey Harris. Leigh’s program was later adopted in all St. Louis schools. He also wrote Bird’s-Eye Views of Slavery in Missouri (1862) and New Guide to Modern Conversation (1872). He edited many school readers in pronouncing orthography, including those of William H. McGuffey, G. S. Hillard, Epes Sargent, J. M. Watson, and Charles W. Sanders. An essay he wrote in 1849, ‘The Philosophy of Medical Science,’ was awarded the Boylston Prize for essays.”

Despite the above statement, the record is not clear on whether or not William Torrey Harris (1835-1909) was the person who initially promoted Dr. Leigh’s Code 10 phonetic print in St. Louis. (Harris ultimately became U. S. Commissioner of Education. According to the Encyclopedia of Education, Macmillan, 1971, he eventually published 500 books and articles.) Although it is probable Harris endorsed “sound” for teaching beginning reading by September, 1866, Harris’s school at that date may merely have been the one chosen for the trial on Leigh print, after that trial had already been approved by the school board. Harris may not have been the one who had asked for that board approval, which request obviously had to have been made some time, and probably some considerable time, before September, 1866, when the actual trial began. There was a two-year interval between the time Leigh’s book was published (1864) and the trial of his material in Harris’s St. Louis school (September, 1866). That was a considerable promotional period, but no record exists on who was carrying on that promotion. It may not have been Harris and Leigh in tandem, even though both were located in St. Louis in those years.

Nevertheless, it is a fact that Harris made the first St. Louis trial on Leigh print in his own St. Louis school. Yet something made Harris change his mind considerably less than twelve years later, when the Appleton readers were published in 1878, on which Harris had been the principal author. The Appleton 1878 readers were the first new American series to appear in many years WITHOUT an edition in Leigh print (Code 10), which means Harris had deliberately ignored Leigh when publishing his Appleton readers, even though Harris had been the first administrator in St. Louis to use Leigh’s print! At the very least, Harris must have had an unusually close personal relationship with Leigh as a result of that 1866 trial. Nevertheless, Harris snubbed Leigh when publishing his own readers. That snub was made even worse by the fact that Leigh-print editions on major reading series had become the norm by 1878! Harris’s Appleton material used phony phonics and heavy teaching to read by “meaning” (Code 3).

Harris had therefore made an extraordinary about-face, from 1866 when he used Leigh’s Code 10 “sound” materials, to some considerable time before 1878, when he first began to prepare the Appleton readers in which he used a Code 3 “meaning” approach. That must have been around 1875, the same year that Colonel Parker arrived in Quincy and began his own massive promotion of the “meaning” method to teach beginning reading. Parker’s interest in the “meaning” method was something that had never been noticeable in Parker’s own background, either. Parker’s career, before and after his service in the Civil War, had been as a school teacher and school administrator, and then as a middle-aged graduate student absorbing Hegelian and other ideas in Germany. (Harris was also a dedicated Hegelian!) Parker had returned from his graduate study in Germany immediately before being employed at Quincy by the Adams brothers.
Both Parker and Harris must have been drinking from the same philosophical fountain to come up with the same ideas about teaching beginning reading by “meaning” instead of by “sound.” That idea did not come from fuzzy old Hegel, even though Parker was an acknowledged Hegelian, and Harris had been promoting Hegelian philosophy for some years and had a network of “philosophers” in the country. By 1880, Harris had even founded a philosophical center in Massachusetts, right after he left... was fired in?... St. Louis, which kept right on using Leigh print which apparently means they could not have been using Harris’s new Appleton readers. Where, then, did the “meaning” ideas for teaching beginning reading come from? The answer appears obvious: it must have been from some one known to the Adams brothers and known to all these “philosophers” before 1875, and it must have been someone who had been vociferously promoting “meaning” in teaching. It is obvious that only one man fitted that description: Agassiz, himself.

Using Agassiz as a key name makes a lot of other associated names tumble out of the file drawers. Leigh, himself, had worked with Agassiz for two years before 1851. Agassiz almost certainly would have known of Leigh’s later invention of a phonetic print for beginning readers. Thomas Hill, President of Harvard, had enthusiastically endorsed Leigh print on the back cover of an 1866 Leigh edition of Hillard’s Primer, and Hill had also endorsed Zachos’ phonic system in the preface to Soule and Wheeler’s 1866 primer based on Zachos work. Considerably before he became Harvard’s president, Hill had been Chairman of the 1852 Waltham Committee (board of education) that had introduced Pitman phonetic print into Waltham’s schools. Yet Hill ceased being president of Harvard in 1868, only two years after Hill had returned from Agassiz’s South American expedition, where he would have been very intimately associated with Agassiz. Hill was replaced as Harvard president by Eliot, who had previously taught science courses at Harvard, where he would have had to have been an associate of Agassiz. In contrast to Hill, Eliot had never endorsed “sound” in beginning reading but instead was famous for promoting “real literature” (“meaning”) in children’s readers.

William James had also been on that South American expedition with Agassiz and Hill from 1865 to 1866. William James’ “sentence” ideas are the probable source for the sentence method of teaching beginning reading by “meaning” that was in common use by 1875. Yet the sentence method had never been heard of before 1870, when Farnham first introduced it on “psychological” grounds in Binghamton, New York. The fact that the sentence method was famous by 1875, only five years later, certainly suggests it was promoted by people with “influence.” It is a fact that E. A. Sheldon referred to the sentence method as one of the established methods, when Sheldon wrote his own 1875 reading series. The sentence method was used by Parker in Quincy in 1875 and by Harris in his Appleton readers in 1878.

The most notable tie of all to Agassiz is in poor old Superintendent Philbrick’s career. It was Philbrick who introduced Leigh print in Boston, and then later gave glowing reports on its success. It was Philbrick who told of hearing an Agassiz lecture in 1870 or 1871 which railed against the teaching of grammar. Agassiz opposed the study of formal grammar because he thought it was a waste of time. It was Philbrick who told of the adamant opposition of “philosophers” by 1871 to Leigh print, as will be shown. Philbrick was fired as Boston superintendent in 1878, and Leigh print was effectively outlawed by the new curriculum only a few months later.

Then the Leigh-print editions of the Hillard/Campbell primer appear to have been immediately replaced in 1878 in the Boston schools by an edition of the “Franklin” Hillard/Campbell primer in ordinary print. That edition had apparently been printed in 1877 (or possibly 1876) by University Press in Cambridge instead of by the usual press. University Press, although privately owned, was also Harvard’s official press. Some knowledgeable and foresighted person or persons (at Harvard?) had the non-Leigh-print edition printed by University Press apparently the year before, in 1877, (or possibly 1876) at a time when there was apparently no market in that area for such an ordinary print edition!
The fact that there was no market in the Boston area before 1878 for non-Leigh-print editions of the Hillard/Campbell texts certainly seems to be confirmed by the surviving Hillard/Campbell beginning readers I found in the Harvard library. The pre-Franklin Hillard/Campbell beginning readers which I found on the shelves from some time after 1866 up to 1877 were all in Leigh print. Yet all the Hillard/Campbell materials in the Harvard library which are NOT in Leigh print, including their Franklin materials, apparently date only from 1877 (or 1876).

Agassiz died in 1873, but these developments can be tied to his influence through the work of his devotees. Johonnot’s further comments, quoted previously, make it clear that the Agassiz devotees amounted to an actual cult. If a flow chart with the known names of educators and activists were constructed so as to show the vectors of influence among those names from the mid-1860’s, it would be astonishing how many vectors would point OUTWARD from Agassiz. Agassiz was a likely 1860’s source for the promotion of the “meaning” method for teaching beginning reading in the 1870’s, since Agassiz is a known source for the movement to drop the teaching of real grammar because it was supposed to be a waste of time to concentrate on mere empty “language.” With that kind of reasoning, the teaching of reading by “sound” instead of by “meaning” would also qualify as concentrating on mere empty language. Philbrick reported Agassiz’ comments after Philbrick heard Agassiz’ 1871 lecture, in which Agassiz denounced the study of grammar as a waste of time. Philbrick’s report is quoted elsewhere in this history.

Charles Francis Adams wrote in a Quincy school report about his own distaste for the teaching of grammar because it was supposed to be a waste of time. That Quincy annual report is presently in the Harvard library and is referred to elsewhere in this history, Adams may well have acquired his distaste for the study of formal grammar from Agassiz. It seems clear that Agassiz was the real inspiration for the so-called Quincy movement begun by the Adams brothers when they employed Colonel Parker in 1875.

The initial contact between Charles Francis Adams and Francis Wayland Parker (1837-1902) is supposed to have been serendipitous. When serving as school-committee members (i. e., board-of-education members), they are on record for publicly (and violently) opposing old school practices at the Quincy “graduation” in the spring of 1873, as discussed shortly. Yet the Quincy schools did not employ Parker until two years later, in the spring of 1875, when the Quincy schools were supposed to have been delighted to find such a man available. It seems unlikely that those two Adams brothers, as committee members, would have waited two long years to make the changes they wanted, and then only stumbled across Parker when they finally began to look for applicants for the new job of superintendent.

According to Webster’s American Biographies, G. & C. Merrian Company, Springfield, Massachusetts, 1974, on which Charles Van Doren was the editor, Parker was born on October 9, 1837, in Bedford, New Hampshire. He was orphaned in his early childhood. A farmer raised him and allowed him to go to school for only about eight weeks each winter. At the age of thirteen, Parker left his guardian and went to school in Mount Vernon, New Hampshire. He was reportedly an excellent student, after which he began to teach school himself at the age of sixteen. At the age of 21, he became the principal of a school in Dayton, Ohio. Parker was reportedly greatly interested in the use of Object Lessons by E. A. Sheldon and used them in his school. Parker had therefore established, apparently before his service in the Union Army during the Civil War (which resulted in his title, Colonel), that he was greatly interested in such “improved” methods of teaching. (The shortcomings of Sheldon’s well-meant improvements are discussed elsewhere in this history.)

The Van Doren biographical article stated further that, after the Civil War:

“[Parker] traveled to Germany in 1872 to observe the teaching methods and liberal school environment pioneered by Friedrich Froebel... Pestalozzi and others, and, much impressed,
returned to the United States in 1875 to become, at the [invitation] of Charles Francis Adams, Jr., superintendent of schools in Quincy, Massachusetts.... from 1880 to 1883 in Boston, he inaugurated his program of progressive [study] sometimes called the “Quincy Movement.” Called to Chicago as principal of the Cook County Normal School in 1883, he revamped the entire course....”

The tie with Charles Francis Adams, Jr. (1835-1915) therefore presumably dated only from 1875. In the same Van Doren biographies, Charles Francis Adams, Jr., was described as an “Historian and civic leader” who was born in Boston on May 27, 1835, the grandson of John Quincy Adams, son of Charles Francis Adams, and the brother of John, Henry and Brooks Adams. He graduated from Harvard in 1856 and joined the Bar in 1858. During the Civil war, he spent three and a half years in the Union Army, advancing from the rank of first lieutenant to the rank of colonel. In June, 1865, he left as as a brigadier general, after which, for reasons of health, he spent a year touring in Europe. The biography stated that Adams:

“...turned to the study of railroad corruption.... His New Departure in the Common Schools of Quincy, 1879, went through six editions.... He served on the Harvard Board of overseers for 24 years....”

References also show that in 1903, the brother of Charles Francis Adams, Jr., Brooks Adams, wrote The Theory of Social Revolutions. Yet two of the Adams’ brothers, John and Charles, were definitely concerned with one kind of “social revolution” thirty years earlier, an educational one, in Quincy. C. F. Adams, Jr., had been a colonel and finally a brigadier general in the Union Army by June, 1865. It is therefore entirely possible that he knew another colonel in that army, Colonel Parker, by 1865, long before the presumed accidental meeting of the two men about January, 1875. If so, Adams would have known by 1865 of Parker’s untraditional views about education, such as his adoption of Sheldon’s version of object lessons. If C. F. Adams, Jr., had toured Europe for his health for a year in 1866 or so, he very likely would have heard of other burgeoning educational developments there, of which the English version of object lessons used by Sheldon was just one. It is therefore possible that C. F. Adams, Jr., had some influence on Parker’s European study tour only about six years later, immediately after which “New Broom” Parker was hired by Adams at Quincy, largely because of his “impressive” European background. Did C. F. Adams, Jr., arrange in 1872 to groom Parker for the Quincy job?

Presumably Parker received an unexpected legacy at that time, which he immediately spent on his European study tour. Yet that story does not ring true. Parker had been an impoverished orphan, but his middle-aged study tour was supposed to have been financed because of a legacy he had suddenly received from an aunt who had obviously not been impoverished. Yet, why didn’t that aunt take Parker in when he was an impoverished orphaned child, instead of letting him be raised by some man who was not even a relative? How many aunts would turn away their brother’s or sister’s impoverished orphaned child from their homes and send that child to live with an outsider? No matter how limited that aunt’s means may have been when Parker was a little boy, it would have been only natural for her (or the relatives with whom she may have been living) to find a place in the home for his bed and a place for him at the table at meals. Therefore, it seems very possible Parker’s “legacy” in 1872 may have come, not from a strange aunt, but from a benefactor who wished to remain anonymous.

Parker’s “Quincy Movement” eventually became such powerful “change-agent” material that it has had few peers until the advent of “whole language” (although that fact has now dropped into education history’s black hole). Yet “foundations” did not exist about 1870, as they do today, to provide ample funds to finance such change-agent projects. Therefore, funds to finance change-agent projects had to come from within the ranks of the change-agents themselves. The record shows two other cases in that time frame, besides Parker’s possible case, in which financial support seemed to have such connections.
The first case concerns G. Stanley Hall’s study tour about the same time as Parker’s. His tour was unexpectedly financed through an acquaintance by a loan from a man previously unknown to him, as discussed by Anthony Sutton in America’s Secret Establishment, which anecdote was based on Hall’s own testimony.

A second example in that time frame of unexpected largesse from a total stranger concerned Louis Agassiz. Harvard Library has a reprint of an article by Burt G. Wilder, “Agassiz at Penikese,” which does not show either its date or publication, but Harvard stamped it “October 20, 1900.” Comments in the article also date it to about that time. The author referred to his previous article in the Nation for September 11, 1873, and David S. Jordan’s article, “Agassiz at Penikese” in the Popular Science Monthly, April, 1892. Both Jordan and Wilder had been students at Agassiz’ famous and exceedingly influential summer school in natural history on Penikese Island in 1873. On December 14, 1872, Agassiz had announced that he would have a summer program in natural history for teachers at Nantucket. What is of interest in Wilder’s circa 1900 article, however, is the following comment:

“In the following spring the munificent offer by an utter stranger, Mr. John Anderson, of New York, of the island of Penikese in Buzzard’s Bay, together with a dwelling-house and barn and an endowment of fifty thousand dollars, not only led to the change of location, but enabled Agassiz to carry out certain parts of his plan more fully.”

Was Parker’s “legacy” real, or did Parker also have his tour financed by some one else, just as Hall’s unexpected loan financed his trip, and Agassiz’ unexpected gift financed the famous and enormously influential Penikese Island school? All three men, Agassiz, Hall, and Parker, eventually made an enormous impact on American culture, which means all three men were ballyhooed in the media of the time. That suggests busy public relations activities on someone’s or some group’s part. If all three cases represented a conscious “cultural” investment, then it must be admitted that all three “cultural” investments later paid off handsomely.

Agassiz appears to be the root cause of Colonel Parker’s much-publicized work in Quincy, Massachusetts, in which Parker endorsed “thought” (“meaning”) instead of mere “language” (“sound”) in the teaching of reading, spelling, and grammar. (In practice, of course, that meant dumping the real teaching of reading, spelling, and grammar!)

Certainly Agassiz was the real inspiration for the teaching of hands-on “natural history” in Quincy. Yet I have never seen any reference whatsoever that would suggest the Agassiz clique approached nature with a loving compassion instead of mechanically and coldly. Some years later, Thorndike, who had been William James’ student, wrote an essay criticizing what he considered sentimentality in science teaching, but which I would consider normal, healthy human compassion. The record seems consistently to suggest that the movers-and-shakers, such as Agassiz, James, Thorndike and Cattell, were a remarkably repellent group of people.

Excerpted comments from the letters of William James, now in a summary volume in the Houghton James Collection at Harvard, suggest that even William James did not find Agassiz an attractive personality. In his letter home of May 3, 1865, while on the Agassiz Amazon expedition, James reported that Agassiz’ aims were simultaneously both charlatan-like and worthwhile, and that Agassiz gave the impression that he wanted to be all-knowing. Yet James found Agassiz personally fascinating and admitted that he organized the Amazon project beautifully. Of those on the trip, which included 11 other assistants, James considered that the only worthwhile man was Agassiz. Nevertheless, James’ desire to be with Agassiz was lessening, despite Agassiz’ mental gifts, and James considered Agassiz to be selfish and inconsiderate to others.
Yet William James’ opinion of Agassiz had sharply worsened by the time of William James’ February 3, 1868[?] letter to his brother Henry. William James commented that he found Jean Renan’s “Questions Contemporaines” to have many worthwhile comments and points of view, and then added the astonishing remark that he considered Aggasiz, whom he actually called a scoundrel, to be not worthy to wipe the shoes of Renan!

The Harvard editor of these notes had added the initial, (A), before Agassiz’ name, to indicate that James’ comment concerned Agassiz’ son, Alexander. Yet Agassiz’ son had graduated from Harvard several years earlier, and, at that time and for some time after, was employed in the Midwest. Therefore, Agassiz’ son could only rarely have visited Cambridge in those years, if at all, and probably almost never visited Harvard where the younger William James was then a student. No indication has been given anywhere in any reference work that I ever saw that James had even met Agassiz’ son, and Agassiz’ son had certainly never been located geographically in William James’ everyday Harvard world so that they could have bumped into one another. Yet, it IS a known fact that James spent MONTHS in the intimate company of the senior Agassiz while on the Amazon expedition. It seems certain that William James meant the senior Agassiz in his blistering remarks in his 1868(?!) letter to his brother Henry, particularly in view of James’ negative earlier remarks in his letter home in 1865.

Therefore, the above comments demonstrate that William James’ private opinion of Agassiz was totally disapproving by 1868 after James had been in close association with Agassiz for months on the Amazon expedition. However, it differed greatly from James’ public opinion of Agassiz, demonstrated by the paper given by William James after Agassiz’ death, which is quoted elsewhere in this history. The fact that William James published that paper confirms that he was supportive of the general work of Agassiz, despite his obvious personal dislike of the man. The result, however, of such intellectual dishonesty as he and probably others demonstrated was the unofficial canonization of Agassiz, which was apparently anything but deserved.

Why Hill left the presidency of Harvard, apparently in 1868, is unknown. He remained active, however, for many years, as noted previously. In contrast to Hill, the next president of Harvard, Eliot, actively campaigned in the 1890’s for grammar school readers which contained real literature (“meaning”), instead of what he considered disjointed scraps. Eliot was clearly concerning himself with “meaning” but ignoring “sound.” Eliot was also repeating the theme of Professor Pillans and the Scottish activists in 1827 who belittled just such collections of excerpts, as discussed on pages 8 and 9 of Letters Addressed to the Parochial Schoolmasters of Scotland... By A Schoolmaster, Edinburgh: 1829, referred to previously. To discount such objections, the “Schoolmaster” had quoted the poet Robert Burns, from Currie’s Life of Burns:

“The earliest composition that I recollect taking pleasure in... was the Visions of Mirza, and a hymn of Addison’s, beginning,

“‘How are thy servants blest, O Lord!’

“I particularly remember one half stanza, which was music to my boyish ear:

“‘For though in dreadful whirls we hung,
High on the broken wave - ‘

“I met with those pieces in Mason’s English Collection, one of MY SCHOOL BOOKS.”
What was good enough for the national poet of Scotland was not, however, good enough for Charles William Eliot, the new president of Harvard.

One of Eliot’s published works listed by the Encyclopedia Britannica in their brief biography is Educational Reform, Essays and Addresses - 1869-1897 (published in 1898). Eliot therefore started writing on educational reform by 1869. By 1869, winds for educational change were clearly blowing strongly in Cambridge.

One of Agassiz’ public lectures in the 1870-1871 school year referred to elsewhere concerned the contempt he felt for the study of language. It was in that same school year of 1870-1871 that John Quincy Adams first appeared on the Quincy school committee. By 1873, John Quincy Adams occupied the apparently new post of chairman, to judge from the covers of the Quincy schools annual reports, and his brother, Charles Frances Adams, Jr., had joined him on the committee.

It is easy to find the connecting thread from the Adams brothers to Agassiz through Agassiz’ contempt for study of grammar. In the 1872-1873 Quincy school report, on pages 14 and 15, a section appears headed “Grammar.” On Harvard’s copy of this report, someone has marked this section, in an old-style penmanship, “C. F. Adams, Jr.” He was on the committee at that time. The section reads:

“Under the division of duties during the past year, the examination of all the schools in grammar was assigned to me. As a general conclusion from my observations during that time, I am compelled to say that, although there is abundant evidence of much honest labor and drilling on the part both of instructors and scholars, yet, as now taught in our schools, English grammar is a singularly unprofitable branch of instruction. The children are indeed taught the names of the parts of speech, and are drilled to parse the words of an ordinary sentence, - in the better schools they may even attain to some slight knowledge of analysis. I am, however, wholly unable to see that this labor at present results in anything more than a dry, useless, and unattractive mental discipline.... As now conducted... I greatly doubt whether one child in one hundred derives any practical benefit from it....”

For sheer meanness, it would be difficult to surpass the performance of the Adams brothers in the schools of Quincy at the 1873 year-end program which served as a graduation. To compound the offensive performance, it was actually boasted about in the activists’ publication, The School Journal, (not Bardeen’s superior The School Bulletin) for March 24, 1900, on page 316. At that 1873 spring ceremony, the article stated that the eighth-grade class was gathered, all dressed up in the presence of the parents and important town officials, for the ritual “examination” given by the teacher at the end of their schooling. Obviously, answers and material had been carefully selected for what was actually a public show. Instead of choosing some quiet and less humiliating time to begin to arrange educational changes if he felt they were necessary, this is what the article said John Quincy Adams did:

“The first class of children, well-dressed, nervous, and eager, were awaiting the routine questions, ready with their well-drilled answers. Proud parents and dignified representative citizens sat around the walls to see the great American common school justify the pride of the nation. The teacher, a man of most approved traditions, who had passed triumphantly thru many similar ordeals, was about to begin his questioning, when Mr. John Quincy Adams, president of the school board [sic: committee chairman] and descendant of the famous house of Quincy Adams, stepped to the front and said, ‘The committee will take charge of this examination, Mr. Teacher.’ ‘But, sir,’ stammered the appalled teacher, ‘I have prepared - in short - I think no one but himself can know so well - ‘ ‘The committee will conduct this examination,’ continued Mr. Adams calmly, and the discomfited teacher sat down. The examination accordingly proceeded and the school went to pieces.”
Instead of being ashamed of such a vile performance, they actually boasted of it. The School Journal further recorded:

“They felt the need of the educational expert... But they found the man made to their hand in the person of Colonel Parker, newly returned to his native land, shining in coat of German mail, seeking some evil to overcome, some beneficent imprisoned power to set free. Then things began to happen. The set program was first dropped, then the speller, the reader, the grammar, and the copy book. The alphabet, too, was treated with slight deference; it was not introduced to the children by name, but they were set at once to work making words and sentences.... The plan succeeded beyond the fondest hopes of its promoters. The quiet Massachusetts town became the goal for inquiring teachers from all over the country.”

As is obvious from the above quotation, Parker was also a sight-word man. Parker’s dropping of phonics (“sound”) and endorsing the reading of whole sentences (“meaning”) was certainly in agreement with Agassiz’ views. Agassiz rejected so-called “empty” language and promoted “understanding” of concrete facts, with emphasis on the facts of natural history.

It should also be noted that grammar which was being dropped at Quincy was a particular target for Agassiz. The source of the entire famed Quincy Movement which made a point of dropping grammar study and which elevated the study of natural history was most probably a group of “movers and shakers” at the naturalist Agassiz’ Harvard.

Colonel Parker instituted in the Quincy schools what today would be called progressive education or open classroom methods (the last of which, if properly followed, are indeed worthwhile). The word, “progressive,” should be carefully noted for its Hegelian content. Educational “movers and shakers” of that period were almost uniformly Hegelian in their philosophy, despite the silliness of that philosophy. In the Hegelian view of reality, a thesis is supposed to grapple with its antithesis, until both finally blend into a synthesis. After this “progress,” the synthesis then becomes a new thesis, which must in turn grapple with its own new antithesis, until both “progress” to their next level by forming a new synthesis, and so on eternally. Hegel is the apparent source for the “progress” fallacy with which we have been saddled. Those who believe in the certainty of cultural “progress” and who believe in the absolute necessity for cultural change are Hegelian fellow-travelers, as Karl Marx was, himself. (There is manifestly such a thing as material technical progress, where one material level is obviously the source of improved technology at the next material level, but “culture” is not material.) However, Hegelianism was too outlandish for William James, who rejected it but who found other dismal intellectual corridors down which to wander.

William James’ personal friend and student for an 1878 doctorate, G. Stanley Hall, later was Cattell’s, Dewey’s and Jastrow’s professor at Johns Hopkins. (All were psychologists.) A record exists of at least one visit by Hall to the Quincy schools, sometime between 1875 and 1880. Colonel Parker mentioned this visit in an anecdote in Parker’s silver jubilee article in The School Journal, April 28, 1900, page 451.

“A naturalist took the principalship of the Willard school. He brought specimens of stuffed birds. One day Charles Francis Adams and G. Stanley Hall were visiting the school. On request, the principal brought in a stuffed duck which the students had never seen. I asked the children (it was the third grade) to write about the duck. They went at it with a will, and their slates were soon filled with good writing, correct spelling, and withal excellent thought. The visitors watched the work with interest. Mr. Adams turned to me and said, “You are teaching natural history.” “No,” I replied, “this is language.” So it was, with a bit of thought behind it....”
The psychologist, G. Stanley Hall, was a close associate and graduate student of the psychologist, William James. Hall was also well enough acquainted with Charles Frances Adams so that he visited the Quincy schools in his company some time between 1875 and 1880, in which year Parker left. It is not unreasonable to assume that William James might also have visited the Quincy schools in that period of time and to assume that James was therefore personally familiar with Quincy methods.

The April 7, 1900, issue of The School Journal, page 363, published a testimonial letter on Parker by G. Stanley Hall, which said,

“The Quincy movement began just at the time when the Boston educators under the influence of Superintendent Philbrick had reached... a sense of finality which seemed to make further progress impossible....”

Note the “further progress.” Hall had absorbed Hegelian nonsense while studying in Germany. G. Stanley Hall was an instructor in English at Harvard the first year Parker was at Quincy (1875-1876) and “often took walks” with William James, according to Gay Wilson Allen in William James, a Biography, Rupert Hart-Davis, London, 1967, page 211. Both could talk about their trips to Germany, and Hall returned to Germany at the end of that year to study with the psychologist Wilhelm Wundt in Leipzig, with whom James had briefly studied in 1868, as mentioned elsewhere in this history. After this, Hall returned to Harvard to take his Ph. D. from James in 1878. It is very likely that both James and Hall knew of the Quincy work as early as the first year, 1875-1876. Hall had a book published in 1874 with the title, How to Teach Reading and What to Read in Schools. That 1874 date is cited, presumably correctly, in Edmund Burke Huey’s The Psychology and Pedagogy of Reading, 1908, although other references show a date of 1886 and Hall’s publisher as Heath of Boston. If Huey’s date of 1874 for the publication of Hall’s book on the teaching of reading is correct, and there is no reason to think it is not, then the subject of Parker’s ideas on how to teach beginning reading in Quincy may very well have been discussed on these walks by Hall and James. James may have become involved with Hall because of Hall’s 1874 book about reading, and James may later have become involved with Cattell because of Cattell’s 1880’s experiments on reading. Cattell began his experiments under Hall, who was Cattell’s professor at Johns Hopkins in 1883, five years after Hall took his Ph. D. at Harvard where William James had been Hall’s professor.

It had been Superintendent Philbrick who had moved the Leigh phonic method into Boston, with startling success, but Philbrick was fired as of March 1, 1878, after having been superintendent of schools, as shown by the annual reports, since December 22, 1856, with a brief period off because of health problems from September 1, 1874 to February 18, 1876. Only a few months after his having been fired, in the late spring of 1878, the sight-word method was approved for the Boston schools, aping the Quincy curriculum that had been installed in 1875 under the Adams brothers. However, since Colonel Parker, the Superintendent of Schools in Quincy, did not leave Quincy to become a Boston official until 1880, Parker could not have had any real part in writing the 1878 Boston curriculum which endorsed teaching beginners to read whole sentences for meaning and which had rules which made it impossible any longer to use Leigh phonics charts at beginning first grade to teach letter sounds.

It is astonishing that no mention of Leigh or of phonics appeared at all in that Boston 1878 curriculum guide, a few months after Philbrick was fired. “Movers and shakers” are usually sneaky: they do not permit an open, free forum on any area they are trying to control, which free forum would give their opposition a fair chance. The “movers and shakers” had the appalling gall in 1878 to dismiss the Leigh phonics from Boston without even mentioning it by name, even though it had been voluntarily adopted for first grades at that time by almost every primary school in Boston! It is evident unnamed persons who opposed the Leigh method had seized control of the Boston School Committee in 1878.
Who were they? Presumably, it would be easy enough to get the names of the actual Committee members but such names might be relatively meaningless today. However, it would be very difficult to get the names of those people who promoted the election of the new Committee members and through them obtained influence on the schools. The names of those promoters might not be meaningless today.

An apparent associate of the “movers and shakers,” whoever they were, was young Henry Cabot Lodge (1850-1924) who would have been about 28 in the spring of 1878. In Boston in 1879, Lodge published Six Popular Tales, Selected and Arranged by Henry Cabot Lodge. At the top of the title page appeared the words, “Authorized for Use in the Boston Public Schools,” so Lodge definitely had some association with the Boston schools after the spring of 1878. The tales included Jack the Giant-Killer, Jack and the Bean-Stalk, Little Red Riding Hood, Puss in Boots, The Sleeping Beauty and Cinderella, all obviously suited to the primary grades. In his “Preface,” Lodge said:

“The chief object of the editor was to obtain for this little collection the oldest English texts. These were found in the great Boswell collection of chapbooks and penny pamphlets of the last century owned by Harvard College. From these, and from the versions in Halliwell’s collection of English tales, the texts here given have been taken with but two exceptions. For Jack and the Beanstalk and Cinderella, the editor has, in the main, followed the texts of Mrs. Craik’s “Fairy Book,” the best of modern English collections, but he has thought it desirable to make many alterations in these versions. Changes in the old texts have been made very sparingly.... Aug. 11, 1879.”

It is interesting that Lodge used Harvard’s resources to improve the curriculum in Boston schools, after Philbrick’s dismissal, suggesting another possible tie to someone in Agassiz’ group at Harvard. James was teaching at Harvard in that year, 1879, and Agassiz’s influence was undoubtedly still strong there, six years after his death. What moved Lodge to collect and publish these stories and to have them approved for use in the Boston schools in 1879, only a year after Philbrick was fired? Why would a 28- or 29-year-old-man of the privileged class in Boston in 1879 suddenly become interested in digging into the Harvard collections to compile and publish fairy tales for the Boston public primary schools?

An answer is suggested by School Document No. 16, Superintendent’s Report, September 2, 1878, part of School Document No. 25, Annual Report of the School Committee of the City of Boston, 1878. The new Superintendent, Samuel Eliot, who had recently replaced Philbrick said on page 13:

“It will be easier to carry out the revised course of study if that part of it depending upon text-books can have some better books to depend on. Indeed, one might say that it would be more successful in some respects without any books, or any of a technical character. Spelling-books, for instance, block the way they profess to open. Children should learn to spell partly from their reading-books, partly from the other books they use, and partly from oral and written exercises.... The work is to a large extent unconsciously done, and there is no better way of doing such work as spelling, at least after its first stages are passed.

“On the other hand, while dispensing with some books, we should introduce others, particularly books to be read. We not only want more reading-books, but different ones; not Readers, not fragments of writings, but writings, however brief, - a story or a history, a book of travels or a poem, - associated as vividly as possible with the author who wrote them, not a mere book-maker who has patched together pieces of them. With such reading books, intelligently used, the inability of our children to read at sight and with expression would become less common and less painful. As for grammar, it would almost develop itself from such reading as this.... As they grow older they will be helped by a general, yet perfectly trustworthy, treatise on grammar, provided they are kept from committing any of it to memory.”
The above comments by Boston Superintendent of Schools Samuel Eliot in September, 1878, suggest that Lodge was merely filling a kind of Boston-schools’ work-order with his 1879 collection of old stories for which Lodge used the Harvard library. However, the similarity in Samuel Eliot’s ideas on “readers” and the ideas of Harvard’s President Eliot, and the similarity in Samuel Eliot’s opinion on grammar, and the opinion of Harvard’s Agassiz, should be noted. The influence of members of the Harvard faculty on the Boston schools by 1878 appears obvious and enormous. Samuel Eliot appears to have been the “new broom” for the Agassiz clique in Boston in 1878, as Colonel Parker had been the Adams brothers’ “new broom” in Quincy in 1875. It should be duly noted that William James was on the staff of Harvard in September, 1878, when Superintendent Samuel Eliot made these comments. Furthermore, James had lived across the street from President Eliot of Harvard until James’ marriage the previous July, and had accompanied Agassiz some twelve years before on Agassiz’s expedition to the Amazon. In addition, the two Adams’ brothers involved in the ruination of the Quincy schools had a third brother, Henry Adams, who was not concerned with the Quincy schools but who was on the faculty of Harvard and who was a close friend of William James’ brother, Henry James.

Henry Cabot Lodge, who had filled the Boston schools’ “need” for a “meaningful” reading book in 1879, was certainly an associate of the Adams brothers. Leon Edel mentioned a letter that Henry Adams wrote (which Edel partially quoted in Henry James - The Conquest of London: 1870-1881.) That letter certainly suggests that the Adamses, the Jameses, and the Lodges were close associates. Edel commented on page 377 that Henry James, William James’ brother, had seen a great deal of Henry Adams and his wife, Clover Adams, while they were in London. Edel said further that Henry Adams had written from London to Henry Cabot Lodge in America on the Sunday afternoon of February 22, 1880. Adams had said in that letter to Lodge that Henry James was standing on the rug in front of the Adams’ fireplace in London, with his hands beneath his coat-tails, chatting with Adams’ wife, Clover, and Adams remarked to Lodge that it was just as if they were all back home in Marlborough Street in Boston.

Henry Adams was never concerned with the Quincy schools as his brothers were, but the above letter does show a close and apparently long-standing association between members of the Lodge and the Adams families and strongly suggests that Henry Cabot Lodge was also acquainted with Henry James, William James’ brother.

In 1893, Lodge was elected to the U. S. Senate where he served for 31 years until 1924. His highly successful career paralleled the spectacularly successful career of Oliver Wendell Holmes, Jr., a close friend since at least 1865 of William James and Henry James (Henry James - The Untried Years: 1843-1870, by Leon Edel, Avon Books, New York: 1953, 1978, pages 229-231). One of the young men in 28-year-old William James’ metaphysical club in 1870 (mentioned by Edel) possibly was Holmes. However, William James’ opinion of his close friend, Holmes was apparently tempered with reservations. According to a volume which summarizes much of the James family correspondence, which volume is in the Houghton Library at Harvard, William James said in one of his early letters that the sizable gifts of O. W. Holmes, Jr. were spoiled by Holmes’ egotism.

According to Edel, Henry James did not meet Henry Adams until about 1870 (Henry James - The Conquest of London: 1870-1881, page 20). However, that means that after 1870 there was a tie between the Adams brothers and the James brothers, between the school-improving Adams brothers and Henry James whose brother, the young psychologist, William James, still lived with him in the family home. The change-agents in the Boston schools in 1878 were certainly in some way tied to the Adams brothers of the Quincy schools, and included young Lodge, at least to the extent of Lodge’s writing a school text for the Boston School Committee in 1879. The Boston change-agents therefore may also have included William James.
Apart from the Boston School Committee’s unfair and irrational opposition to Leigh phonics, Philbrick’s dismissal as the Boston Superintendent of Schools was grossly unfair, since Philbrick was an extraordinarily competent man.

One confirmation of his competence, for instance, is the following, reported in the Annual School Report of the School Committee of the City of Boston - 1876 (pages 243-244). At the Vienna Exhibition in 1873, Boston had been one of only four cities which received the Grand Diploma of Honor for their exhibits (Vienna, Berlin, Paris, and Boston). Dr. John W. Hoyt of Wisconsin was quoted as saying:

“(The Boston exhibit) reflected much honor upon the efficient superintendent and honorary commissioner, Dr. J. D. Philbrick, who was at once the moving spirit and executing hand in the whole matter, and fairly entitled the City of Boston to the very handsome recognition, in the form of the Grand Diploma of Honor, which it received on the UNANIMOUS recommendation of the International Jury.”

Since Parker was receiving highly favorable (and probably programmed) publicity before 1881, this should be kept in mind when reading the following comments on January 8, 1881, in The Standard, a morning paper in Syracuse:

“Superintendent Philbrick has written an ugly letter in criticism of the public schools of Quincy, Massachusetts. These schools owe their present fame to the successful efforts of Superintendent Parker, who was... supported by John Quincy Adams, Jr., and by other intelligent and influential gentlemen. The marked success at Quincy did much to throw a shadow over the Boston schools which were then under the supervision of Mr. Philbrick. In the subsequent efforts made to advance the schools of Boston, a number of changes were made, in the midst of which Mr. Philbrick lost his place....”

Poor Philbrick and his phonics lacked the public relations resources of the experts of the day, so phonics (and the children) lost out again.

However, after the public relations releases from 1875 to 1883 had faded away, little attention appears to have been given to actual achievement in Quincy. Parker’s ultimate successor by 1901 in the position of Superintendent of Schools in Quincy was Frank Edgar Parlin, and Parlin had apparently held the post for some years before that date. Parker had thrown out spelling, and so apparently did the superintendent or superintendents who immediately followed Parker in Quincy, but Parlin not only put spelling back into the schools but wrote his own speller, The Quincy Word List, Over Six Thousand of the Commonest English Words Carefully Graded for Elementary Schools, published by The Morse Company, New York and Boston. It is interesting to hear what Parlin had to say of the famed “success” in Quincy of teaching children to read without either real phonics or ABC word-spelling. Parlin began his “Preface”:

“Some years ago the author of this Word List, being convinced that spelling learned incidentally, by absorption, was a failure, prepared a list of words for use in the schools under his supervision without any intention of making a ‘spelling book,’ but repeated calls for the list have induced him to make it available by publishing it.”

The 1901 Quincy superintendent was not the only one writing a speller who testified to spelling failure from the “new” Quincy methods. In 1889, J. H. Stickney published her primary speller for second grade and higher, Word by Word. Stickney said in her “Preface”:
“The action of the mind in learning to read and spell has been of late years a favorite study of educators. Theories have been advanced and experiments made which, though disastrous in certain lines, have been on the whole of great value.

“Reading has undoubtedly gained both fluency and expression; loss falling, if anywhere, on the strength of impression - a fault not wholly chargeable to the school. But in many quarters a generation of bad spellers are testifying to failure somewhere, and the most zealous advocates of incidental spelling recognize the need of specializing the work at that stage in a child’s life when forms and images are most readily fixed...

“Since the agitation of the subject came through educators from whom have been derived some of the best fruits of educational progress, it will be useful to look closely into the grounds upon which the work of the spelling-book was first banished and is now being restored to the schools.”

Stickney made the same admission that Horace Mann had implicitly made some fifty years before: activists had ruined spelling. American spelling had actually been pretty bad ever since 1826 when the ABC syllable “sound” method was dropped at first grade and replaced by the ABC word “meaning” method, but it became, as Stickney said, “disastrous” after the Quincy methods threw out spellers at all grades after 1875.

It should be noted here, however, that most (but NOT all) children taught to read by TRULY phonic methods in the first six months of first grade may not need spellers after first grade. Some truly phonic programs are Sue Dickson’s Sing, Spell, Read and Write, Samuel Blumenfeld’s materials, Sister Monica Folzer’s materials, Char Lockhart’s materials, Mona McNee’s materials from England, and the Open Court series (but certainly NOT the Scribner’s series). The reason that formal spelling books may not be needed for most children using these programs is that the great majority of children taught to read phonically can file correct spellings in their visual memories with astonishing ease, just from frequent exposure to them in reading. Yet most children taught by the sight-word method or by phony phonics have only fuzzy visual memories of most word forms.

I know this to be so from my twenty-three years of teaching experience, since I have corrected so many thousands of primary-grades “essays” from children who had been taught with or without real phonics in first grade. It is my conjecture that children taught by Code 10 programs in first grade file their word memories through the left angular gyrus, which would operate sequentially, since it is on the left, “sequential” side of the brain. The sequential “sound” structure of words would be instantly apparent to such children. I further conjecture that children taught by Code 1 or other low programs file their memories through the right angular gyrus. The right side of the brain operates globally, or “all at once.” That works against the child’s remembering words by their sound structure.

The kinds of misspellings I found children making in the primary grades (massive for sight-word “meaning”-trained children, minimal for phonic “sound”-trained children) support my conjectures.

As early as 1878, the Syracuse, New York, schools had already succumbed to the publicity on Quincy. In Edward Smith’s A History of the Schools of Syracuse, 1893, he reported the following concerning Syracuse activities in 1878:

“At a meeting of the Board April 4, 1878...considerable (attention) having been attached to the schools of Quincy under the supervision of Colonel F. W. Parker, a committee consisting of J. W. Durston and the superintendent was appointed to visit those schools to observe the work done by the pupils, the methods employed, etc., and to report to this Board. The committee returned
from the visit impressed with the personality and energy of Colonel Parker and with the results he had accomplished in the schools under his charge. He was filled with enthusiasm and energy and believed in breaking away from routine practices, in discarding everything which was merely formal in school methods and in so conducting all school work as to stimulate observation and awaken thought. His most efficient work at that time had been directed toward better methods teaching reading, spelling and arithmetic and in doing this work to throw the burden of it upon the pupil. Composition and sight reading were included in language and common business transactions in arithmetic. The course of [Syracuse] study was revised and some of the principles advocated by the superintendent and teachers of the Quincy schools incorporated. Miss Belle Thomas, a Quincy teacher, was made principal of the primary department in Madison School [Syracuse].”

The phrase, “...to stimulate observation and awaken thought” was, of course, pure Agassiz doctrine.

It is significant that the Franklin Primer, not in Leigh print, was in use in the Syracuse schools as late as 1888, as shown by a Syracuse library copy of the Webster-Franklin Primer (the same book with Webster’s spellings), which had apparently originally belonged to a teacher. That Syracuse copy had written inside on the fly leaf in an adult’s flowing hand, “Josephine E. Lane, Syracuse, N. Y., Porter School, 10th Ward, Feb. 14th, 1888.” The copy did not use Leigh print. Belle Thomas arrived to teach in Syracuse following the Syracuse school authorities’ visit to Quincy about April, 1878. Some time after her arrival, Belle Thomas may well have been responsible for bringing into the Syracuse schools the non-Leigh-print “meaning” edition of the Franklin Primer that arrived in the Boston schools in September, 1878. That non-Leigh-print edition (but eventually with Webster’s spellings) remained in use in Syracuse for about ten years or more.

So Colonel Parker’s “New Education,” a probable tribute to Agassiz’s influence, was firmly in place in 1878 in the city of Syracuse, New York, only three years after Parker’s arrival in the small town of Quincy, Massachusetts. One does have to admire the public relations job that was done.
Chapter 24
Was the Deliberate Promotion of a Deaf-Mute Method for Hearing Children in the 1870’s Originally William James’ Misguided Idea?

James McKeen Cattell’s 1880’s experiments on sight-words are discussed in William James’ 1890 psychology book. It is evident from the oldest surviving letter from James to Cattell which is presently in the Cattell manuscript files at the Library of Congress that they were close friends by the date of that December 30, 1893, letter, and that earlier correspondence must have been missing. They would, of course, have known each other professionally from the fact that the American Psychological Association had been formed on July 8, 1892 in G. Stanley Hall’s study at Clark University, Worcester, Massachusetts22, but one does not address a mere casual professional associate in the tone of that letter of December 30, 1893.

The letter had a teasing, mocking, tone which could only be used between close friends who had known each other for some time. In it, James archly complimented Cattell for showing tact, flexibility and amiability at a recent meeting. James’ exclamations marks in the margin opposite those compliments were meant, obviously, to be humorous.

James’ comments demonstrated that he knew Cattell well. Cattell was known for his battles with people, and later had rows in public with Nicholas Murray Butler, Columbia’s president, while Cattell was a professor there, as reported in An Education in Psychology, James McKeen Cattell’s Journal and Letters from Germany and England, 1880-1888, edited by Michael M. Sokal, The MIT Press, Cambridge, Massachusetts, 1981, page 332. Sokal also said on page 332:

“Such was Cattell’s reputation that in 1913 a book about Columbia bragged that his presence showed how committed the institution was to academic freedom.”

Though some eighteen years younger than James, Cattell had obviously been James’ close friend for some time before 1893. William James had been G. Stanley Hall’s professor at Harvard, who in turn had been Cattell’s professor at Johns Hopkins. At what point after Cattell came to Johns Hopkins in 1883 that he met James is unknown.

A bias against spoken language (“sound”) and in favor of “meaning” is clear in William James’ renowned book on psychology which he began in 1878 and which was published in 1890. He quoted examples of empty speech (footnotes on pages 170-171 and elsewhere), demonstrating it was possible to use perfect word order in sentences and yet arouse no awareness of meaning. James quoted the psychologist, M. G. Tarde of France:

“Thus we have the extraordinary fact that the words called each other up, without calling up their sense.... on the whole, nothing is commoner than trains of words not understood.”

Then, most meaningfully, James quoted at length (pages 172, 173, 174) the memories of a deaf-mute man, Mr. Ballard, a deaf-mute instructor at the National Council of Washington, who was not introduced to written language until the age of eleven and only later to oral language. Yet Mr. Ballard remembered wondering about the origin of the universe at the age of eight. That proved the child COULD think

without words, and they were very deep thoughts, indeed. James gave as a footnote, “Is Thought Possible Without Language?” in the Princeton Review, 57th Year, and G. J. Romanes, Mental Evolution in Man, pp. 81-83.

James was refining his “stream of consciousness” ideas at the time he was compiling his Principles of Psychology. For the most part, that book is an anthology of work done by others before the book’s publication date: 1890. James read very widely in his field but did little experimental work of his own. James’ mentor at Harvard, Louis Agassiz, had heaped scorn on purely speculative theorizing, and had patience only with conclusions based on concrete evidence. Therefore, it is extraordinary that James’ famed “stream of consciousness” theory is pure speculation.

James distinguished between verbal and non-verbal thought, as with the childhood memories of the deaf-mute to whom he referred. Nevertheless, he equated his “stream of consciousness” to the grammatical item, the sentence.

James does not appear to have been a very original thinker. The source for his ideas concerning the sentence may very well have been German. A book available in New York and Massachusetts after its publication date of 1853 was The Sentential Reader, “By a Literary Association,” and copyrighted by John L. Chapman and James Scott “For a Literary Association.” The book was published in Boston by Frederick Parks and in New York by Alexander Montgomery, and a copy is presently in the Harvard library. The probable intent of the book was to teach a child to read, but it was unspeakably obscure. It consisted of an exhausting, word-wadded account of an imaginary conversation between a child with a mental age of about eighty or ninety years and his exceedingly boring father. In the course of these conversations, a German named Becker was referred to and partially quoted to the effect that a sentence is:

“...a thought made known in words’.”

James’ “stream of consciousness” is thought, and the German, Becker, (whoever he was) before The Sentential Reader’s publication date of 1853 had already equated “thought” with “a sentence.” That the 1853 book is presently in the Harvard library suggests it may well have been available to James. Furthermore, its publication date of 1853 in New York as well as Boston raises the possibility that the book might have had some connection with James’ “literary” father, since the James family was living in New York at that time, with “literary” visitors to their home such as Ralph Waldo Emerson. William was eleven at the time, and Henry was ten years old. According to Henry James’ biographer, Leon Edel, in Henry James, The Untried Years, 1843-1870, (page 90), the guest room in their New York home was referred to by the five James children as “Mr. Emerson’s room.”

In his chapter entitled, “Stream of Thought,” on page 181-182 of his psychology book, James said:

“An analysis of what passes through the mind as we utter the phrase the pack of cards is on the table... may condense into a concrete example a good deal of what has gone before.... Now I believe that in all cases where the words are understood, the total idea may be and usually is present not only before and after the phrase has been spoken, but also whilst each separate word is uttered. It is the overtone, halo, or fringe of the word as spoken in that sentence. It is never absent; no word in an understood sentence comes to consciousness as a mere noise. We feel its meaning as it passes, and although our object differs from one moment to another as to its verbal kernel or nucleus, yet it is similar throughout the entire segment of the stream.... The consciousness of the ‘idea’ and that of the words are thus consubstantial. They are made of the same ‘mind-stuff,’ and form an unbroken stream.”
On page 181, he showed his speculative diagram of “the stream of consciousness” with his sentence under it, “the pack of cards is on the table.” Therefore, the unit in William James’ famed “stream of consciousness” WAS equivalent to “the sentence.” Yet Charles H. Judd could state the following, in a paper written for the February, 1926, issue of Teachers College Record in honor of his ex-classmate Thorndike, but for some reason not printed until three months later in the May, 1926, Teachers College Record (page 777):

“I sometimes tell my students that the reason why Thorndike does not include in his psychologies a chapter on language is that William James because of some curious blindness of human nature was never interested in the psychology of language.”

Judd’s statement sounds like disinformation, considering William James’ enormous interest in his 1890 Principles of Psychology in “the sentence” and in the capacity of deaf-mutes to think and reason before they have learned language. That it was disinformation is suggested additionally because of Thorndike’s famed three articles in 1917 on reasoning in reading concerning sentences and words, as well as Thorndike’s ten-year long study between about 1911 and 1921 to identify the 10,000 commonest words in English. Judd had personally studied the James text with his fellow-student Thorndike at Wesleyan University many years before, as Judd admitted in this same paper.

James had briefly studied with the psychologist, Wilhelm Wundt, in Germany in 1868, while Wundt was still Hermann Helmholtz’s assistant (as will be referred to again). James’ student, G. Stanley Hall, also studied with Wundt in 1877. James recorded on page 365 of his Principles of Psychology that G. Stanley Hall had been one of Wundt’s subjects in Wundt’s experiments on reaction time, when a spoken word was answered by a spoken response of some associated word. Hall went on, after returning from Germany and taking his doctorate from James at Harvard in 1878, to become James McKeen Cattell’s and John Dewey’s professor at Johns Hopkins, Baltimore, in 1883.

William James, himself, had lectured at Johns Hopkins, as reported by Gay Wilson Allen in William James, a Biography, Rupert Hart-Davis, London, 1967, page 219:

“Dr. D. C. Gilman, president of the newly founded Johns Hopkins University, modeled after German universities, was interested in obtaining James for his Psychology Department and invited him to give ten lectures in February 1878 in Psychology. James accepted and chose for his subject ‘The Brain and the Mind.’“

Allen’s term, “Psychology Department,” is obviously in error. Johns Hopkins had no specific “Psychology Department” in 1878, and neither did any other college or university in America, because there were no “psychologists” in the modern sense anywhere in America in 1878 except for William James. Concerning the earliest American psychologists who appeared immediately after James, G. Stanley Hall did not receive his doctorate under William James at Harvard until 1878 after his return from studying with Wundt in Germany. Harvard had no “psychology department.” As discussed later, the entry of George Trumbull Ladd into psychology began with his employment at Bowdoin in their philosophy department in 1879 before he went to teach at Yale. Although Ladd had already translated the German Lotze’s work in 1877, Ladd was still a preacher in 1877. As will be discussed, Josiah Royce was James’ friend from the time of James’ lectures in 1878 at Johns Hopkins where Royce was a graduate student. Royce, who later taught at Harvard, had studied with Lotze and Wundt in Germany, but was himself primarily a philosopher, not a psychologist.

Five years later, at Johns Hopkins University in 1883 under Hall, Cattell obviously adapted the work Wundt had done with Hall as a subject. Cattell originally must have learned of the work from Hall and then changed the spoken word stimulus to a printed word or letter stimulus. On page 365-366 of his 1890
psychology text, James quoted Cattell on Cattell’s work. (However, for emphasis, the order of the sentences given below differs from the order in James’ book.)

“I pasted letters on a revolving drum, and determined at what rate they could be read aloud as they passed by a slit in a screen... in the case of words and letters, the association between the idea and name has taken place so often that the process has become automatic...I find it takes about twice as long to read (aloud, as fast as possible) words which have no connection as words which make sentences....”

That is hardly surprising. Words have meaning only in relation to syntax, which is demonstrated by the multiple meanings given for words in dictionaries (bear, bear, etc.). It is unnatural to pronounce words out of syntax. It would have been interesting if Cattell had also compared the relative speed of pronouncing meaningless syllables, which are the building blocks of syntax, with the speed in pronouncing disjointed words, which are the end product of syntax. Such experiments could show whether meaningless syllables could be pronounced more rapidly than disjointed words, which, on the face of it, appears likely.

James quoted Cattell again on page 343:

“Prof. Cattell calls attention to the fact that the time for distinguishing a word is often but little more than that for distinguishing a letter:

“‘We do not, therefore, distinguish separately the letters of which a word is composed, but the word as a whole. The application of this in teaching children to read is evident.’“

Cattell’s experiment timed the subject’s speed in pronunciation. Since letter “names” are actually only words themselves, Cattell should have anticipated the result he got, that it took about the same time to pronounce a “word” as a “letter,” and should not have thought he had discovered something. His mistake can be seen when the “word” “eight” is placed next to the “numeral” “8,” because numerals are analogous to letters. Should there be any appreciable difference in the speed in pronouncing either?

It should be noted that William James, in his psychology text, was in debt in various ways to Dugald Stewart, whose ideas on reading were discussed earlier in Chapter 17. Stewart’s critic, Rev. J. Wills, by 1844 said we read, “By means of habit, groups of signs...” and not by individual letters. James and Cattell were therefore plowing an already plowed field, but gave no indication that they were aware of Stewart’s ideas on reading, or the ideas of Stewart’s critic, Rev. J. Wills.

There was, of course, some truth behind Cattell’s and James’ reasoning, but they were wrong in applying their reasoning to this particular faulty experiment. Certainly, we do not read a letter at a time, but either a syllable (objective reading) or a word (subjective reading) at a time, but that was not proved until 1903 with the work of the German, Oskar Messmer.

However, James also quoted Cattell’s worthwhile work to the effect that grouped objects could be perceived or recognized better than objects randomly placed. This is, of course, true, as with five dots arranged on the faces of dice compared to five scattered dots, which I think Cattell cited as an example in his report. That worthwhile work of Cattell’s proving that patterned groups can be perceived more readily than unpatterned groups might be considered to anticipate Messmer’s 1903 work, that letters are “read” normally either in patterned syllable groups (“objective” reading) or patterned word groups (“subjective” reading).
On page 263, James quoted another statement of Cattell’s concerning Cattell’s rapid-exposure experiments with letters, words and sentences:

“The sentence was then apprehended as a whole. If not apprehended thus, almost nothing is apprehended of the several words, but if the sentence as a whole is apprehended, then the words appear very distinct.”

Therefore, Cattell had apparently produced “laboratory proof” for James’ “sentence” ideas. (The foregoing statements hardly support the usual view that James had no deep interest in the subject of reading theory, or that Cattell’s interest was probably only casual and fleeting.)

What James did NOT choose to mention with that quotation was one of Cattell’s comments concerning Cattell’s experimental results on the reading of sentences, which was later quoted by E. B. Huey on page 73 of Huey’s book, The Psychology and Pedagogy of Reading (1908):

“...the observer constructs an imaginary sentence from the traces he has taken up.”

In other words, Cattell admitted the reader was simply guessing, not reading.

Nor was Cattell the only psychologist producing what James must have considered soothing data. In James’ section on page 538 and 539, “Perception-Time,” James quoted George John Romanes of England, from page 136 of Romanes’ book, Mental Evolution in Animals (1884). Romanes said he had found:

“...an astonishing difference between different individuals with respect to the rate at which they are able to read.... My experiments consisted in marking a brief printed paragraph in a book which had never been read... which contained simple statements of simple facts.... Having pointed out to the reader upon (a) sheet of paper what part of the underlying page the marked paragraph occupied, I suddenly removed the sheet of paper with one hand, while I started a chronograph with the other. Twenty seconds being allowed for reading the paragraph.... Now the results... show... astonishing differences in the ... rate of reading which is possible to different individuals, all of whom have been accustomed to extensive reading. That is to say... one individual may be able to read four times as much as another. Moreover, it appeared that there was no relationship between slowness of reading and power of assimilation; on the contrary... the rapid readers... usually give a better account of the portions of the paragraph which have been compassed by the slow readers than the latter are able to give.... I have tried the experiment with several highly distinguished men in science and literature, most of whom I found to be slow readers.”

It is that evident Romanes uncovered massive reading disabilities in England among highly educated people when he did his experiments some time before 1884. This fact should be contrasted to what the Scottish Schoolmaster had said in 1829 of the oral reading of little children, after he had spent 30 years teaching such little children by the syllable “sound” method:

“Between the age of five and eight, a child may be taught to read, with fluency, any of our best authors in prose or in verse....”

The disabilities that Romanes uncovered should also be contrasted to the remarks quoted previously by the ancient Greek Dionysius of Halicarnassus about 20 B.C., given by Mitford Mathews on pages 6 and 7 of Teaching to Read, Historically Considered, The University of Chicago Press, Chicago, 1966. Mathews took the quotation from W. Rhys Roberts’ book, Dionysius of Halicarnassus, London, 1910, page 269:
When we are taught to read, first we learn off the names of the letters, then their forms and their values, then in due course syllables and their modifications, and finally words and their properties, viz. lengthenings and shortenings, accents, and the like. After acquiring the knowledge of these things, we begin to write and read, syllable by syllable and slowly at first. And when the lapse of a considerable time has implanted the forms of words firmly in our minds, then we deal with them without the least difficulty, and whenever any book is placed in our hands we go through it without stumbling and with incredible facility and speed.”

Dionysius and the Scottish Schoolmaster were talking of those who had learned to read by syllables and “sound,” but Romanes was testing nineteenth century Englishmen who had learned to read by “meaning.” The “meaning” method had produced massive disabilities in England by the 1880’s, just as it does all over the English-speaking world today. Many of the men Romanes tested before 1884 who were intellectually superior could not read with the fluency of the Schoolmaster’s 1829 Scottish eight year olds. They certainly could not read with the fluency (“incredible facility and speed”), of Dionysius’s day about 20 B.C. when words were not even separated in texts and when everyone read everything out loud. Learners in the ancient world are reported to have been taught how to separate such connected texts into syllables, but no mention is made of teaching learners to separate texts into words. Yet the disabilities of these adult British men were only to be expected. Most schools in Great Britain had switched shortly after 1826 from the “sound” syllable method to the “meaning” whole-word (but not the deaf-mute whole-word) method as the result of their activists like John Wood of the Edinburgh school and others in the 1820’s.

English beginning reading books which were being reprinted in America for home sale in the mid-nineteenth century are very illuminating on the attitudes towards teaching beginning reading in England in the mid-nineteenth century. No copyright laws were in existence then between Great Britain and the United States, and the pirating of literary works was enormous on both sides of the ocean. One such English beginning reading book reprinted in America was Aunt Mary’s Primer, Adorned with A Hundred and Twenty Pretty Pictures, which was published in Providence by Mather & Burr in 1851. It is very obvious that it was a reprint of an English book. For instance, in describing the months, it said, “November, when London is covered with fog.” On other pages were pictures of “The Lord Mayor’s Coach,” of “A Man Ploughing” (the English spelling) and “A Man thrashing Corn” which was obviously not American corn, but wheat. Not the least of the proofs of English origin was a nice collection of English birds on the “small birds” pages which included the English sparrow, it had only been introduced into America in 1851, and so was still a rare bird to Americans.

Since there was obviously no attempt anywhere in the book to adapt the content to American users, it is reasonable to assume it reflected the English approach to beginning reading about 1851. The alphabet was shown at the beginning of the book in large and small letters and then mixed, out of order. Immediately afterward came a page of whole words and some few disconnected syllables. Some of the words were in similar columns: at, cat, rat, grate, but there was nothing consistent in the arrangement of the 70 shown. On the next page came pictures and sentences: “Here is a Cat, and here is a Rat.” On the following page came a collection of words, some of which had analogous parts, but without enough examples to make most children absorb the sound patterns. That was followed by another page of complete sentences with pictures, a half-page of two-syllable words, and the “reading instruction” was over. The rest of the book was connected text, reading with pictures. No child could learn to read by “sound” with such a book.

What is of particular interest, however, concerning ideas about teaching reading, is the page at the beginning, signed only J. C., and titled “A Few Words to the Teacher.” That the omission of phonic teaching was deliberate is shown by the instructions on that introductory page:
“When Little Mary (or any other little girl or boy) knows all the letters perfectly, let the teacher turn over a page and pronounce one of the monosyllables. Do not say, a, m, am - but say am at once, and point to the word. When the child knows that word, then point to the next, and say as, and be sure to follow the same plan throughout the book. Spelling lessons may be taught at a more advanced age; but it will be found that a young child will learn to read much more quickly if they be dispensed with in the Primer. In words of more than one syllable, it is best to pronounce each syllable separately, car, pet, - po, ker, - and so on. In the lesson on “Things in the Room,” point out each thing as the child reads the word, and indeed, wherever you can, try to associate the word with its actual meaning. Show a child the word coach as a coach goes past, and she will recollect that word again for ever.....Never weary a child with long lessons....”

The approach was clearly “meaning” and not “sound.” Yet such a picture book would have been relatively costly and out of the reach of the working classes in England, and was obviously not for school use. What happened over the years to beginning reading instruction in standard school books in England is covered in PART 6.

With William James’ mind-set on “sentences,” Romanes reading experiment in England would have appeared to James to justify teaching reading by whole sentences instead of by isolated words. That was because Cattell’s experiments had actually “proven” that whole sentences could sometimes be read, when isolated words sometimes could NOT be read in the same elapsed time. The psychologists’ explanation would have been, therefore, that Romanes’ good readers were able to read whole sentences, faster, for meaning, while Romanes’ poor readers could only slowly read isolated words for sound, missing some of the meaning.

They were right, concerning “subjective” readers, some of whom would have read their whole “words” more slowly than others. As discussed elsewhere, Messmer’s German research early in the next century turned up two types of readers: objective and subjective. The objective read by syllables; the subjective read by whole words and guessing. Virtually all of Romanes’ readers who had learned by sight words should have been subjective readers, some more crippled than others. The best of the crippled English readers had managed to memorize a sizable store of sight words and could sample the page quickly, “psycholinguistically,” picking up key sight words and guessing those ignored. The worst of the crippled English readers did not know automatically, at sight, enough sight words to breeze their guessing way through the text and so laboriously tried to work words out by memory and context, which slowed them down enormously.

Ebbinghaus, James, and Cattell, with their experimental psychology, were a different kind of psychologist from those who preceded them. Psychology in general dates back to before Aristotle, though the term, “psychologia” dates only from 1590. An excellent general history of psychology is given in the article, “Psychology,” in Volume XII of The Catholic Encyclopedia, 1913. A superb source for critically important writings on psychology (and probably the only such source of collected writings) is History of Psychology, by William S. Sahakian, Revised Edition, F. E. Peacock Publishers, Inc., Itasca, Illinois, 1981. Sahakian’s book starts with “Ancient Greek and Latin Psychology,” beginning with mentioning Anaxagoras (500-428 B. C.), and it ends with a selection by Jean-Paul Sartre.
Sahakian’s section at the end of his book, “Landmarks in the History of Psychology,” pages 445-483, is arranged in historical order and is actually a mini-course in the history of psychology. In that section, Sahakian listed some material on psychology in the broader sense that had been written in America for some time before William James’ day.

Concerning such material on the earlier kind of psychology, the Leypoldt American Catalogue of books in print in America in 1876 showed 28 such books, including Mental Science by the Scot, Alexander Bain, published by Appleton, Elements of Psychology by V. Cousin of France, published in 1856 by Ivison, and Elements of Psychology by H. N. Day, published in 1876 by Putnam. The next issue of the American Catalog for 1876-1884 showed an enlarged edition in 1877 by Putnam of J. Bascom’s Principles of Psychology, first published in 1869 and 1876, and a few others. However, all these books most probably were the speculative kind of psychology of Stewart which was wedded to philosophy and which had been around ever since the ancient Greeks, not the experimental psychology of which we know today.

A brief biography of Alexander Bain (1818-1903) is given in the Encyclopedia Britannica (1963), Volume 2. The encyclopedia said he was born in Aberdeen, Scotland, and for a period worked in his father’s trade, as a weaver. After graduating from Marischal College in Aberdeen in 1840, he went to London where he worked in education and the civil service, and where he became very friendly with John Stuart Mill and Mill’s associates. Bain returned to Aberdeen and became a professor of logic and English, at which time he began to work for reform in Scottish teaching methods. He wrote books on English grammar, rhetoric, and logic, but also on psychological theory, and, in 1861, he published On the Study of Character, in 1868 Mental and Moral Science: a Compendium of Psychology and Ethics, and in 1873, Mind and Body, the Theory of Their Relation. Bain was the founder of the important periodical, Mind, in 1876. His work in association psychology is considered to have been important, although it was largely in the tradition of the earlier speculative psychology instead of the newer experimental psychology. Yet, Bain did urge a strictly scientific approach in solving psychological problems, based on the brain and nervous system, instead of using the former purely speculative approach.

However, as the above makes very clear, Bain did not publish a book on psychology, in the modern, experimental sense, until 1873, and that was considerably after Wundt and James had become interested in experimental psychology. It was not until George John Romanes’ very casual reading experiments, published in Romane’s Mental Evolution in Animals (1884), described previously, that any British psychologist appears to have concerned himself with reading experiments.
