In confirmation of the fact that psychology in the experimental, modern sense was unknown in America before James’ day, James himself claimed to have founded the first psychology laboratory in America in 1874, according to Sahakian’s text on the history of psychology. For 1874, Sahakian listed this significant item on page 456 as a landmark:

“William James’ (1842-1910) contention of having opened the first psychological laboratory in America (at Harvard University).”

Sahakian listed under 1873-1874:

“Publication of the first textbook in physiological psychology - Wilhelm Wundt’s (1832-1920) Principles of Physiological Psychology”

Furthermore, it was not until 1875 that Wilhelm Wundt of Germany (1832-1920) established what is generally acknowledged as the world’s first experimental-psychology laboratory to measure the responses to stimuli of individuals, from which concept Cattell’s “reading experiments” were ultimately derived.
(The 1875 date is given in the book, America’s Secret Establishment, by Anthony C. Sutton, Liberty House Press, Billings, Montana, 1986, page 86. A date for the opening of the formal laboratory is given in the Encyclopedia Britannica article on Wundt as 1879, but since Wundt went to Leipzig in 1875, 1875 seems appropriate.)

When William James studied briefly with Hermann Von Helmholtz at Heidelberg, Germany, in 1868, the psychologist Wilhelm Wundt had still been Helmholtz’s assistant, which position Wundt had held since 1858. Wundt, while Helmholtz’s assistant, had offered a new course on psychology from the viewpoints of natural sciences in 1862 and published his lectures the next year. Since James commented (as mentioned elsewhere in this history) that he particularly wanted to contact Wundt in 1868, he presumably had read Wundt’s 1863 book or a review of it. Wundt later went to Leipzig. (The preceding facts on Wundt are according to the Encyclopedia Britannica, 1963). Wundt’s great, worldwide influence as an experimental psychologist appears to date from after his arrival in Leipzig in 1875.

“...One of the younger pioneers of the “new psychology” in America and in fact the man who brought the phrase new psychology into use as indicating the non-philosophical experimental psychology that Fechner, Helmholtz, and Wundt introduced about 1860....”

Therefore, William James’ kind of psychology was, indeed, new, as Scripture’s phrase proves.

The earliest of the three innovators who were credited in the journal article quoted above with originating experimental psychology was Gustav Theodor Fechner (1801-1887) who was a German pantheist, and a sort of intellectual jack-of-all-trades in service to his pantheism. The son of a minister, Fechner was a Leipzig graduate in 1822, with a degree in biological science, and he became a professor of physics in Leipzig in 1834. He was then ill, and even partially blind, for a long time, and he then began to study philosophy and aesthetics in 1843.

The Encyclopedia Britannica (1963), Volume 9, page 132, said that Fechner became famous largely because of the experimental work which he summarized in his 1860 book, Elemente der Psychophysic, but that Fechner only undertook that work to prove his thesis that, although the mind and body appear to be separate, they are in fact only the two sides of one reality. Subjectively, reality appears as the mind, but objectively, it appears as the body.

The Encyclopedia Britannica article commented:

“Fechner’s originality lies in his development of psychophysical methods by which experienced sensation could be measured in relation to the physical magnitude of the stimulus.

“.... Through his influence on Wilhelm Wundt, Fechner’s psychophysical methods and formulation became one of the cornerstones of early psychology...”

It is wryly amusing to learn that Wundt’s experimental materialistic psychology actually originated in the attempts of that dedicated pantheist, Fechner, to prove the “truths” of Fechner’s version of pantheism!

Fechner was very much admired by William James. That is obvious from reading William James’ 1904 “Introduction” to Mary C. Wadsworth’s translation from the German of an 1835 work by Fechner that had been only slightly revised in Fechner’s later editions. Its title was The Little Book of Life After
Death. It was published in 1904 by Little, Brown, and Company in Boston. The printing was done, interestingly enough, by The University Press, Cambridge, U. S. A., the same press that had figured in the critically important non-Leigh editions of the Franklin Primer in 1877 and later, discussed elsewhere in this history. The Little, Brown edition was reproduced in 1977 by Arno Press, Inc., a New York Times Company, as part of its series, The Literature of Death and Dying.

After Fechner, Herman Ludwig Ferdinand Von Helmholtz (1821-1894) and Wilhelm Max Wundt (1832-1920) were mentioned in the 1965 article as founders of work in experimental psychology about 1860. That was the year Fechner's book was published, which is the obvious reason for the choice of that date, the earliest meaningful date for "experimental psychology." Helmholtz’s famous work was overwhelmingly on physics and physiology, not psychology, whatever contribution he may have made in that area, so the article's citing Helmholtz may not be very meaningful. Wundt had still been Helmholtz’s assistant in Heidelberg at the time William James sought Wundt out in 1868, as described elsewhere in this history. As mentioned, in 1862-1863 Wundt had given a psychology course at Heidelberg and in 1863 published his lectures which had been based on a natural sciences viewpoint.

Therefore, the year 1862 was obviously the meaningful date for the beginning of Wundt’s work on psychology. Yet Wundt did not open what is generally credited to be the world’s first psychological laboratory until 1875, after Wundt had moved to Leipzig.

Nevertheless, William James claimed to have had the first such experimental psychological laboratory in America at Harvard in 1874, which would make James’ experimental psychological laboratory the first in the world! However, James’ warm endorsement of Fechner’s The Little Book of Life After Death certainly suggests that James may have shared some of Fechner’s pantheistic motivations in setting up his own laboratory.

The experimental work that Ebbinghaus did which might have seemed to confirm James’ and Cattell’s ideas on reading instruction was not really pertinent to reading instruction. Ebbinghaus had done research on memorization of meaningless syllables and the memorization of meaningful material and found meaningful material could be memorized more quickly. In their faulty frame of reference, however, James and Cattell might have been convinced that this supported their “sentence” ideas.

Dr. Hilde L. Mosse in The Complete Handbook of Children’s Reading Disorders, Human Sciences Press, New York, 1982, quoted Dr. Wilder Penfield, the famous neurologist/surgeon and made comments herself concerning conditioning, or learning. The thrust of Dr. Mosse’s and Dr. Penfield’s remarks is that we can learn, or remember, only those things on which we focus conscious attention at the time we are learning them. Yet, once learned, or “conditioned,” many actions then can be carried out without focusing conscious attention on them. Therefore, all that Ebbinghaus’s work showed, in relation to memorization, is that it is easier to focus conscious attention on meaningful material and to organize it into meaningful, related categories to aid memorization than to do the same on unmeaningful material. Unmeaningful material can have no such organization on which to focus attention and with which to support memorization by its relationships. That Ebbinghaus’s unmeaningful material took longer to learn is exactly what might have been anticipated. Ebbinghaus’s research has no real pertinence to learning reading skills, despite the fact that it contrasted “syllables” to “meaningful” material.

Although William James had made the grammatical item, the sentence, the unit in his famed “stream of consciousness” ideas which appeared in his 1890 Principles of Psychology, he must have had the basic ideas a very long time before 1890 and before the seemingly agreeable test data arrived from Romanes by 1884, from Ebbinghaus by 1885, and from Cattell probably at least by 1886 (but very possibly as early as 1883 since Cattell’s professor at Johns Hopkins, G. Stanley Hall, had been James’ graduate student only five years before). By a curious “coincidence,” the sentence as a basis for a new reading method had
appeared in Binghamton, New York, in 1870, where a man named George L. Farnham used whole sentences instead of whole words to teach beginning reading. (He had only arrived in Binghamton as superintendent the year before.)

In a letter Colonel Parker wrote the School Journal on August 12, 1899 (page 118), he said, concerning practices twenty-five years before (which would be in 1874):

“Psychology in education, especially in New England, was tabooed. It was called ‘splitting hairs.’”

That was a curious comment. Parker very probably was using the term, “psychology,” in the modern Wundtian sense, which is very much like the general meaning we give to the term today. It is probable that the only psychologist in that narrow, modern sense in New England, or in the entire United States, for that matter in 1874 was William James. James’ work in his psychological laboratory at Harvard, whatever that work was, would almost certainly have been viewed by the general public in 1874 as “splitting hairs.”

Yet, Farnham, a superintendent of schools in Syracuse, New York, until 1863 after having been a teacher, who then sold insurance in Syracuse until January, 1869 (as shown by clippings and other material in the Syracuse Public Library), stated he carried out psychology experiments in 1870 which would have been the first in the United States, and, except for Fechner, Wundt and Helmholtz, in the world. That was four years before James said he opened his experimental psychology laboratory at Harvard and five years before Wundt opened his experimental psychology laboratory in Germany, and four years before the date when the word, “psychology” in education was still “tabooed” in New England!

G. L. Farnham discussed his work in his 1881 book, Sentence Method of Teaching Reading, published by C. W. Bardeen of Syracuse, New York, the publisher of the School Bulletin. In his 1881 book, Farnham said:

“These (teaching of reading) experiments and their results led to further investigation, especially in the line of psychology. From a close observation of the action of the mind, and of the relations of language to thought, it was seen that the unit of thinking is a thought, and therefore that the unit of expression is a sentence. The obvious deduction was, that the sentence ought to be made the basis of reading exercises.

“In 1870 a series of experiments was instituted in the schools of Binghamton, N. Y., to subject this theory to a practical test....

“This little manual is substantially a record of the plans adopted, and of the principles involved in these experiments in Binghamton....”

Parker had said, to mention psychology in education was “tabooed” in 1874. Yet Farnham had confidently moved from selling insurance in Syracuse, New York, to instituting the first large scale psychology experiment in education - correction: the first psychology experiment of ANY size - that was ever done in America, and, except for Fechner and probably Wundt and Helmholtz, in the world! Further, Farnham actually obliquely admitted it was NOT all his own idea:

“The author would hereby express his obligations to his friend James Johonnot for valuable assistance in the final preparation of this work. The large experience of this gentleman as an educator, and his sound judgment in all matters of education, were constantly laid under contribution when this problem was worked out. Council Bluffs, Iowa, January 1, 1881.”
As will be shown, a possible tie to James can be made through Johonnot, who is documented as being associated in 1873 with Agassiz, and may have been associated with Agassiz earlier.

In five short years, by 1875, (the year Wundt’s laboratory opened!) Farnham’s sentence method was widespread and well known, so Farnham must have had some access to influence-peddlers.

The first report of Farnham’s work I have found in print is Farnham’s paper in the 1873 Report for the National Education Association, in which it came immediately before a paper by Dr. Leigh (both papers already having been given in person by both men at the NEA meeting). Leigh by 1873 was famous, but Farnham was a relative unknown and was writing in total contradiction to Leigh, so it is apparent Farnham had to have influential associates to have been given the opportunity to make such an address. The placement of those two addresses in the widely read NEA Journal, one after the other, was obviously deliberate. That placement must have been engineered by Farnham’s influential contacts, who were obviously also Leigh’s opponents, since Farnham’s “psychological” report, the first paper given, implicitly condemned Leigh phonics without mentioning it by name. Yet Farnham’s specious “psychological” reasoning was obviously convincing to far too many school superintendents, since it was almost immediately after Farnham’s paper appeared that Leigh print went almost totally out of use. It was Farnhams’ carefully placed 1873 paper in the widely read and widely respected NEA Journal that constituted the explosion that blew Leigh print off the American education map.

By 1881, Farnham’s book on the sentence method was published. What makes both his 1873 paper and his 1881 his book so remarkable is that portions of both certainly sound as if they were written by a psychologist.

According to The First 120 Years, by George W. Fowler, the 1968 history of the Syracuse, New York schools, Farnham had been born in Richfield, Otsego County, New York, in 1824, attended Black River Academy in Watertown, New York, in 1840, and, after a period teaching, graduated from Albany State Normal School in 1847. He was superintendent at Syracuse from 1855 to 1863, and was an insurance salesman in Syracuse after that until he became superintendent at Binghamton in 1869. There is nothing in such a background that would suggest that such a man could invent a teaching method with a psychological justification in 1870. This was before there was a single psychologist in the modern sense in this country except William James.

Farnham’s 1870 work raises the possibility that he had some kind of professional input. The rapid and widespread success of Farnham’s 1870 method, and Farnham’s breaking into print in the NEA paper only three short years after he first started using the method suggests that he had powerful friends.

In Farnham’s 1881 book, he referred, without actually naming either Syracuse or the Longley (Pitman) print, to his having tried phonetic print and next the word method. Farnham was replaced as Syracuse superintendent in 1863, and Syracuse records show they were still using the Longley print at that time. Farnham said he had tried the word method after the phonetic method, which would have had to be on his arrival as Binghamton superintendent in January, 1869. These were the “experiments and their results” which he had in mind with his comment, quoted earlier:

“These experiments and their results led to further investigation, especially in the line of psychology....”

This comment makes it clear, therefore, that his “experiments” in “psychology” began only AFTER he had tried the word method in Binghamton in 1869, which would bring his “psychology” up to 1870.
Farnham left Binghamton in 1875, which raises questions about the purported great “success” of the sentence method, but Farnham made it clear in his book written in Iowa in 1881 that Johonnot had been at least a partial source for his ideas.

James Johonnot, born in Bethjel, Vermont, on March 3, 1823, had completed his education in 1848 at the State Normal School, Albany, where Farnham had graduated the year before. Farnham and Johonnot might have met at Albany State Normal School. Johonnot began to teach in 1850. The Board minutes for Syracuse, New York, for June 2, 1859, written in Farnham’s own handwriting as superintendent/clerk, (and notable elsewhere for Farnham’s misspellings) stated:

“Resolved, that the thanks of this board be tendered to... Mr. James Johonnot for his recent lecture on the European War and for the preparation of the map exhibit on that connection. Adopted.”

Farnham, therefore, knew Johonnot at least from 1859, and possibly much earlier at the normal school.

From 1861 till 1866, Johonnot from New York State was in charge of the Joliet, Illinois, schools, and then was President of the State Normal School, Warrensburg, Missouri, in 1872-1875 which suggests a tie in 1872 to the associates of William Torrey Harris, Superintendent of Schools in St. Louis, Missouri. What is of great interest is that the Appleton’s Cyclopaedia of American Biography, 1888, stated that Johonnot “was a member of the institute faculty of New York state for many years preceding” his taking the position in Missouri in 1872, or presumably at least from 1866 to 1872. Members of the institute faculty went from town to town to lecture during very widely-held teachers’ institutes for teacher training, which took place during released school time or in summers.

Wilson, Hinkle & Co. of Cincinnati, the publishers of the McGuffey Readers, published a book in 1870 by William H. Cole entitled The Institute Reader and Normal Class Book, “For the Use of Teachers’ Institutes and Normal Schools, and for Self-Training in the Art of Reading.” Its “Preface” read, “TEACHER’S INSTITUTES are now held periodically in nearly every county of the states in which Free Schools have been established; and Normal Schools are annually increasing in number and influence...”

Cole therefore implicitly stated that teacher’s institutes were not only a kind of teacher training school but that they had almost blanketed most of the country before 1870.

In speaking of practices twenty-five years before, Colonel Francis W. Parker said in the August 12, 1899, issue of The School Journal (page 118):

“Many teachers institutes were supplementary to regular school work, and were held for the purpose of aiding candidates for teaching to pass their examinations."

That remark made the real purpose of institutes clear. They were meant to standardize “correct” teaching methods by control from the top.

The Meaning of “Institutes” in the Nineteenth Century

The term, “institute faculty,” is almost meaningless in the frame of reference provided today concerning the history of American education. To give that term concrete meaning and to show how institute lecturers influenced the teaching of beginning reading, it is pertinent at this point to give concrete information on institutes and their lecturers and on institute programs as they related to reading instruction.
Teachers’ institutes were apparently first held in 1837, but in a form different from that which dated from 1843, according to The School Bulletin, Syracuse, New York, June (?), 1876, page 177:

“The First Teachers’ Institute.

“We have received the following letter from James B. Thomson, LL.D., author of Thomson’s Arithmetics:

“Will you allow me to correct a slight mistake into which the BULLETIN of May seems to have fallen, as to the time and place of holding the second and third Teachers’ Institutes in the State of New York. I have before me a printed account of these Institutes, the date of each of which is anterior to that held in Wyoming, as stated in the May number of the BULLETIN.

“According to the documents referred to, the first Teachers’ Institute held in the Empire State was organized at Ithaca, April 4th, 1843, by J. S. Denman, Esq., the honored superintendent of Tompkins Co. The second was organized at Auburn, Oct. 3d, 1843, by E. G. Starke, Esq., the indefatigable Supt. of Cayuga Co. The number in attendance was over two hundred. The third was held at Ithaca, commencing Oct. 10th, 1843, under the direction of Mr. Denman.

“The fourth was opened at Wethersfield Springs, Wyoming Co., Oct. 18th, 1843, under the charge of A. S. Stevens, Esq., the popular Supt. of the Co. of Wyoming, as stated in the May No. of the Bulletin.

“This correction, though apparently trifling, may be important to the future writer of an authentic history of Teachers’ Institutes.

“In conclusion, permit me to add, that I had the privilege of taking part in the instruction of the one in Auburn and one of those in Ithaca, and can vouch for the correctness of these dates.

“Respectfully, your obdt. servt., J. B. THOMSON
Brooklyn, N. Y., June 21, 1876”

“This matter was somewhat fully discussed in the BULLETIN for April, 1875 (Vol. I, p. 67)....”

The School Bulletin then quoted a conflicting report on the first institute, which had appeared in a footnote on page 80 of the District School Journal for June, 1844:

“Mr. Sprague established and conducted in Fulton county the first Teachers Institute opened in this state.’

“In the same volume (p. 14) we find

“Fulton county established the first of these Institutes through its efficient county superintendent, F. B. Sprague, and although this was but two years since,’ etc.

“In the Superintendent’s report for 1844, we find the report of Mr. Sprague, dated Jan. 1, 1844:
“‘The first normal school in this county, and I believe the first of the kind in the State, was established at Kingsboro one year ago last September, and continued eight weeks. * * * We held another term of eight weeks last spring. * * * and another of eight weeks the past fall, etc.’

“We have not been able to find in the (District School) Journal for 1844 the references quoted by M. M. B. to Institutes in 1837. They may occur in the number of February, 1845, which is missing from our volume. We feel positive that the diversity of statement arises from the fact that teachers’ institutes were first called temporary normal schools, and were of a somewhat different character from that held at Ithaca, which seemed to set a pattern for all that followed. For instance, in the report of the Superintendent of common schools for 1849, the communication from S. Town, Esq., on the subject of Teachers’ Institutes, contains this passage, italicized as here printed:

“‘The first Teachers’ Institute held in the State of New York, and probably the first in the world, according to the present mode of organizing them and conducting their exercises in detail, was in Tompkins county, in April, 1843.’”

The School Bulletin, therefore, gave credence to the claim that a kind of temporary normal school was in existence by 1837 (and probably pre-dated 1837), but it held that teachers institutes, in the form in which they ultimately were conducted, dated from the institute held in Ithaca in April, 1843, organized by J. S. Denman, the superintendent of Tompkins County.

It is fitting that J. S. Denman should get the credit for organizing the first teachers’ institute. J. S. Denman was the author of The Student’s Series of readers, the first of which was apparently published in 1850. The series consisted of The Primer, The Student’s First through Fourth Reading Books, The Student’s Speaker, and The Student’s Spelling Book. An eleventh edition of the speller appeared in 1853 and Harvard has a copy of the primer and first book published in 1852 so the series obviously achieved some popularity. However, The Student’s Primer of 1850 was based on articles published starting in 1846 in a monthly journal, The Student. A note on the inside cover of The Student’s Primer, copyrighted in 1850, said it was:

“...designed as an aid to those... teaching children the first principles of written language.... The late David P. Page, then Principal of the Normal School at Albany, N. Y., said... ‘It is the best system I ever saw for teaching the first principles of reading.’”

Denman made his opinions clear in the “Preface” to his First Reading Book, copyrighted in 1851 and published in 1852:

“Those who are engaged in instructing the young, should bear in mind that the practice of reading without comprehending what is read (a habit frequently acquired in school) is highly injurious to the learner, and should never be allowed in the smallest child.”

Denman obviously disagreed with the twentieth century Russian Soviet psychologist, Elkonin, whose paper on reading was included in Brian and Joan Simon’s Educational Psychology in the USSR, 1963. Elkonin said (page 165):

“In the present paper we start from the proposition that reading is a reconstitution of the sound forms of a word on the basis of its graphic representation. Understanding, which is often considered as the basic content of the process of reading arises as a result of correct recreation of the sound forms of words. He who, independently of the level of understanding of words, can correctly recreate their sound forms is able to read.”
In sharp contrast to Elkonin, Denman was endorsing “meaning” over “sound” and his Code 3 book showed it.

Denman has dropped from history, not appearing in Nila Banton Smith’s nor Reeder’s history, nor in Mathew’s, Nietz’s or Johnson’s, although his Second and Fourth Reading Books are listed on page 81 of Early American Textbooks and copies of at least some of his books are in the Harvard library. Yet Denman’s long-range influence through his promotion of “institutes” was apparently enormous and hurtful. Denman’s materials were published by Pratt, Woodford & Company of New York, and were out of print when the 1876 American Catalogue was published. They certainly deserved to be out of print, not solely because they were Code 3 “meaning” materials. Some of the “stories” meant for little children were exceedingly ugly in content. The First Reading Book of 1850 also fitted the texts Brownson described which de-emphasized religion. The First Reading Book had only one religious entry, a poem on pages 107-108, which was extraordinary in the highly religious America of the period.

What Denman’s primer establishes, however, is that any teachers attending his institutes would be told that “meaning,” not “sound,” was the correct way to teach beginning reading.

Institutes spread in America after the first ones appeared with the new pattern in 1843. They were very widespread by the late 1860’s, with New York State, and probably other states, having state-appointed institute instructors. As was made clear in an 1843 advertisement for a teachers’ institute which had been reproduced in the May, 1876, The School Bulletin, and which is included in Appendix A, the training at institute programs as early as 1843 was supposed to help teachers pass “tests” which entitled them to employment. Therefore, their primary purpose was just as Parker had defined it in his 1899 remarks: to assure that teachers thought “correctly “ according to the “experts.”

Yet, as the comments from William Andrus Alcott quoted earlier establish, young candidates for town schools had always been examined by school committee or school board members, to establish their suitability, though they did not get “certificates” as became the case much later when the state governments became involved. When William Andrus Alcott had been a young man applying for his first teaching job, one of the qualifications had been to know the make-up of Webster’s “sound” speller. Yet, by the time institutes like Denman’s took place in 1843, the town superintendents and trustees charged with examining young candidates at that time would have been “taught” to expect candidates to parrot opinions like Denman’s, rejecting “sound” and endorsing “meaning” for beginning readers.

Change-agents were using, way back then, two of the Three T’s to control the education of the public’s children and to shape education to their liking: “Teachers” and “Tests.” The third “T” is “Textbooks,” such as the Scott, Foresman 1930 readers with their teacher’s manuals, which have damaged our country so cruelly. However, the emphasis of the change-agents today who are attempting to shape the education of America’s children to their liking is on only one of the Three T’s, “Tests,” which tests are meant for both teachers and students. Shadowy figures authorized to write nation-wide tests (and tests are the most virulent of the Three T’s) will have the power to control the content of the curriculum and to shape the minds of America’s future citizens. What ever happened to the Bill of Rights and to the free speech it guaranteed, in education as well as everywhere else?

Reports on institutes dating from 1880 appear in Circulars of Information of the Bureau of Education, No. 2, 1885, Teachers’ Institutes, Government Printing Office, Washington, D. C. Some excerpts from this circular follow, to establish that the “institutes” of which Johonnot had long been a part were shaping American education in the nineteenth century and that they were endorsing the teaching of reading by “meaning.” The following comment on page 91 is from “Report of the Normal Institute of South Carolina for 1881,” by Professor L. F. Soldan, Principal of the Normal School in St. Louis, Missouri:
"Normal institutes are all important. Let one be ... held in every educationally dark corner of the land and soon the light of education will shine there. All the States which are eager for general education have normal schools or institutes."

This also implicitly confirmed that “institutes” were widespread and were a form of “normal school.”

The 1885 Government publication, Teachers Institutes, also proved that neither McGuffey’s nor true phonics were dominant at that time. Appleton’s, a phony phonics series, was frequently mentioned. Most of all, the institute reports showed that the word method was the norm, or the word method with some phonics (“phony phonics.”) For instance, on page 99 appeared a summary of comments on reading made by H. P. Archer, the principal of the Bennett School in Charleston. Soldan said on page 88 that Archer was one of the “corps of instructors” at the 1881 South Carolina institute, which Soldan said (page 87) was attended by 335 teachers:

“The introduction of the word method of teaching reading was recommended as the only rational method suited to the books used in the state.... The stopping to spell is avoided because we should learn words as words.... Reading at first should be sentence reading.... There are variations of the word method. Advised combination of the word and phonic methods.... Used Appleton’s first (book for the) first lessons to illustrate: Make children say my cat as one word.... (Stress) the elements of good reading in the beginning; (with) practice on the sounds.... After drill on the words, let the class read sentences. Then converse about the picture, after which phonic analysis and the writing in script follow.... The old plan was to have the children “print” the words on their slates.... The topic of new methods led to a brief exposition of the so-called Quincy plan and the method tried by Superintendent Parker. The so-called ABC method was in particular spoken of, and its great shortcomings illustrated practically and theoretically. The phonetic and phonic methods were fully set forth and practical exercises given to the institute.... Reading in higher grades... drill until words can be recognized at sight.... Drill the class until they can read well in concert. Make frequent changes between class and individual reading. This plan secures attention. Practice until each word is recognized and understood. Next ask a few questions in order to teach the pupils to read thoughtfully and to remember what they read.... A selection from Appleton’s Fifth Reader, p. 161, was read for illustration.”

Note the endorsement of the “sentence” method in South Carolina by 1881. Note the implicit attributing of the new use of script for beginners in South Carolina to the influence from Quincy, where Parker and his methods had only arrived six years before! Also, combining the word and phonic methods as discussed above produced phony phonics, the kind used in the Appleton readers, and not unlike basal reader phonics of today.

In the South after about 1880, teachers’ institutes were held with support from the Peabody fund.

Professor L. F. Soldan of St. Louis said the Appleton’s series and the Walker, Evans & Cogswell’s series were in use in South Carolina (page 76 of his 1880 “Report of the First Normal Institute of South Carolina”). The Harvard library has an 1869 copy of the second book of the series published by Walker, Evans, and Cogswell Company of Charleston, South Carolina, entitled Reynold’s New Pictorial Readers for Schools and Families, by James Lawrence Reynolds. The series was also mentioned by R. R. Reeder in his history on page 52. Early American Textbooks... lists an 1870 edition of Reynolds New Fourth Reader published elsewhere than Charleston, by Duffie and Chapman of Columbia, South Carolina, and by E. J. Hale of New York. The dates and locations suggest Reynolds’ was in general use in South Carolina from 1869 to after 1880. It is probable the series was “meaning” oriented, like Appleton’s.
This remark was made at the 1881 South Carolina institute (page 95), apparently by Soldan, echoing what was being said about the same time in New England and across the water in “Old England”:

“When children have read for too long a time in a reader, they are apt to know the pieces by heart and rereading is no longer an exercise in pronouncing words at sight....”

The following preceded the above remark:

“In this State there is uniformity of textbooks by law; but perhaps it cannot be well enforced. I think teachers should try to convince parents and school officers of the benefits of uniformity. If a teacher cannot get all his pupils to get the same book, he should form classes which use uniform books. This can be done in some studies like reading even when there is a variety of books; the teacher may let two or three read from one book. Even where one series of books is used as a rule, it has been found a good plan to have children read from one book a while and then another... if the teacher has succeeded in convincing the great majority of parents to (pronounce) in favor of a uniform series of books, the question of a single individual parent ought not stand in the way. At the beginning of instruction, there is no necessity at all for several classes in reading, on account of the variety of books which the pupils have brought to school. The teacher should use the blackboard in teaching the element(s) of reading and print the words or letters on it. Even if its members have ten different books, the class can thus be kept together. It is still better to use charts in teaching reading.”

The expression, “ten different books,” for beginners in reading in 1881 in South Carolina hardly supports the McGuffey Myth, nor even that parents had themselves learned from McGuffey’s since the books the children brought to school sometimes have been very old.

The recommendation of printing words given above was soon replaced by script, as shown by the previous quotation. The change to script was an obvious result of Quincy influences. Giving words to children initially in which all the letters were tied together as in script was a move towards teaching children to perceive words as “wholes.” This was particularly so since learning the alphabet first and oral “spelling” or the naming of the letters in sight words had generally been dropped by that time.

Starting on page 122 appeared the summary for “The Institute for Colored Teachers,” by H. P. Montgomery, Principal, held in South Carolina in 1882.

“Primary reading. No branch taught in our schools presents more difficulties to the minds of children than elementary reading.... The absurdity of the old and tedious methods was pointed out and the new and excellent method by Mrs. Rickoff, as set forth in the Appleton Readers and Chart substituted. Frequent drills in phonic spelling and reading were given.”

Phonic “spelling” meant proper pronunciation of learned sight-words, not decoding of new words: walk: w - au - k. Nila Banton Smith reproduced comments made shortly after this period, quoted elsewhere in this history, which confirmed that oral phonic drill on already memorized sight words left children helpless when faced with unknown words.

At the end of James Johonnot’s The Sentence and Word Book, published by D. Appleton and Company, New York, 1885, was the following advertisement, which confirms that the Appleton charts were not teaching true phonics:

“These Charts are designed to give a thorough exposition of the Word and Phonic Method especially, and at the same time all that is best in all other methods of teaching reading. The Charts are 27 x 34 inches in size....”

A full-page advertisement in the back of Appletons’ School Readers. The First Reader, printed in 1883, said the charts were:

“...Designed to cultivate the observing powers of children. Designed to teach young minds how to think. Designed to educate the child by philosophical methods.... They are in accord with the educational spirit of the day, and with the methods followed by the best instructors. They are the only charts planned with special reference to the cultivation of language and the power of expression. They follow the natural method of teaching, appealing to those faculties of the child that are most easily awakened, and inciting correct mental processes at the outset....”

“Philosophical methods...” that incited “correct mental processes at the outset” were exactly what one would expect from movers-and-shakers after 1878. The date Mrs. Rickoff produced these charts is not known, as they were not listed in the American Catalogues. However, Appleton’s Chart Primer by Mrs. R. D. Rickoff was shown in the 1885-1890 American Catalogue as published in 1884, presumably a book form of the charts which were advertised in the 1883 Harvard copy of The First Reader.

Appleton was unlike most other publishers from the mid-1860’s to the mid-1870’s, since I have found no record anywhere that they ever published a Leigh-print edition. Appleton apparently avoided producing the editions of its first and second readers in Leigh pronouncing print that would have permitted children to learn to read by “sound” instead of “meaning.”

The probability is that it was Appleton’s non-Leigh-print, vastly used 1878 series, and Farnham’s very carefully placed paper at the 1873 NEA meeting proposing the sentence method, that were deliberately used to kill off Leigh print at the height of its success. However, since the Appleton series’ principal author, William Torrey Harris, must have personally known Leigh for over twenty years, as noted elsewhere, for Harris to have been involved in publishing the first important non-Leigh-print series in many years was an extraordinary snub to Leigh. Also, it is just one more indication that our “leading educators” over the years have been a rather nasty bunch.

Mrs. Rickoff’s Appleton reading charts probably paralleled the Reading Disentangled charts by Mrs. Mortimer, discussed elsewhere in this history. Mrs. Mortimer’s phony-phonics charts had been published in England since the 1830’s and were authorized for government textbook subsidies there when such subsidies were first provided in the late 1840’s. The use of such charts was an outgrowth of methods in Lancaster’s monitorial schools from the early 1800’s, which methods relied heavily on charts for teaching groups of children. Charts were apparently heavily used later in infant schools and elsewhere. Charts appeared in Harper’s 1860’s series and Butler’s 1880’s series, and undoubtedly in many other places.

Blackboards were also used as charts. The use of blackboards for teaching any subject probably was not common in America before the 1840’s. Horace Mann told glowingly of their use in Prussia in the early 1840’s. The 1843 advertisement for a teacher’s institute in New York State, which is reproduced in Appendix A, states, “…Particular attention will be paid to... the use of the slate and black board.... Blackboards and other apparatus will be provided....” John Goldsbury wrote Exercises and Illustrations on the Blackboard in 1847 recommending American use of blackboards.

As mentioned in PART 3, the earliest reference I have seen to blackboards was Pere Demia’s recommending the use of a “table noire” in France in 1668. Presumably blackboards were an
already-existing European device by 1668, and could serve to illustrate material to any group, whether composed of adults or children.

Yet the massive and almost sole use of blackboards for teaching beginning reading shortly after 1875 was apparently the result of the Quincy influences. Blackboard use for beginning reading generated clouds of chalk dust in first grades all over America for some thirty years. Sight words were first presented to children in script form, not in separated letters. In his 1912 Beacon reading series, James Fassett found fault with the use of blackboards and chalk and recommended instead the use of his reading charts for beginning reading. The extent of blackboard use in first grades appears to have lessened about that time.

Starting on page 143 is the report, “The Normal Institute for Colored Teachers at Petersburg, 1882” by H. P. Montgomery, Principal. Mrs. E. V. Montgomery had charge of the sessions on primary reading and language. Concerning primary reading, the report said (page 144):

“The waste of time and nerve in the old methods struck everyone when the more excellent and natural way, as set forth in the Appleton Readers and Chart, was seen. In connection with the reading, phonic spelling received special treatment.”

The phony-phonics Appleton Readers were apparently making almost a clean sweep in the southern institute sessions after 1880.

Professor M. A. Newell (no other identification) was in charge of the four-week “Institute for White Teachers,” in August, 1882, in Columbia, South Carolina. He said (pages 115-116) that the memorizing of definitions was not “merely useless” but -

“...positively injurious. It does not improve the memory and it does weaken every other mental faculty.”

Newell said it contributed more largely than any other agency to the:

“...artificial production of stupidity in schools.... The most essential of all mental habits for a student, whether young or old, is the habit of attaching some definite meaning to every sentence which he reads.”

Newell had possibly been reading Dugald Stewart or a summary of Stewart’s work.

Newell’s institute in Abingdon, Virginia, in 1881, was four weeks long, with 20 days of sessions and teachers from 25 counties. The following remark was made (page 135) by “Principal” Newell:

“The class exercises of the principal, with the exception of a few lessons on word building and the history of words and on verbal parsing, were confined to reading..... Untrained teachers will find the word method simpler in theory and quite as effective in practice. The theory is that words of one syllable are simply objects whose names must be learned as names of other objects are learned.”

These following comments appeared on page 97, and were from the “Report of the Normal Institute of South Carolina for 1881” by Professor L. F. Soldan. They apparently were Professor Soldan’s own remarks.
“Children learn to do things by doing them. They learn to talk by talking... so a child should learn to spell by spelling, to read by reading....”

The recommendation, “learning by doing” was obviously from the Parker influence, later called the Dewey influence. Mitford Mathews quoted John Dewey on page 104 of Teaching to Read, Historically Considered (The University of Chicago Press, Chicago: 1966):

“Writing in 1930, John Dewey said that Francis Parker ‘more nearly than any other one person was the father of the progressive educational movement.’”

M. A. Newell, the “Principal” of The Abingdon Normal Institute, 1881, which lasted four weeks, gave an evening lecture on “The New Education” (page 137):

“growth from within, not accretion from without.... The new education makes a distinction between productive and unproductive knowledge.”

How can anyone possibly know, ahead of time, what knowledge ultimately is going to be “productive” and what knowledge ultimately is going to be “unproductive”? I met an elderly mathematician once, on a trip to the Galapagos, who was a delightfully cultivated man. He said (not altogether in jest) that the only mathematics which was really interesting to mathematicians was the mathematics that was useless. It is this kind of dizzyingly difficult and contemporarily “useless” mathematics, however, that may ultimately get “used” by people like Einstein.

It is strange that Angela Medici of France wrote L’Education Nouvelle, Presses Universitaires de Paris, France (1940, 1948) and apparently had no knowledge that the roots of “The New Education,” the history of which she was writing, possibly lay with Colonel Parker at Quincy and Chicago. The New Education possibly spread abroad through Parker’s influence on tourists attending the 1893 Chicago Worlds’ Fair.

“The Normal Institute for White Teachers at Salem, 1882,” had two co-conductors, Professor W. B. McGilvray of Richmond, Virginia, and Professor E. V. De Graffe of Paterson, New Jersey. The ten-day institute started August 7, 1882. The institute summary report included these comments which confirmed the continued devotion to teaching sight-words and concentrating on “meaning,” which was called “reproducing thought”:

Institute reports from Michigan confirmed the use of the word method there, instead of real phonics. County Institutes in Michigan were reported, and on page 154 this appeared:

“How can anyone possibly know, ahead of time, what knowledge ultimately is going to be “productive” and what knowledge ultimately is going to be “unproductive?” I met an elderly mathematician once, on a trip to the Galapagos, who was a delightfully cultivated man. Institute reports from Michigan confirmed the use of the word method there, instead of real phonics. County Institutes in Michigan were reported, and on page 154 this appeared:

“A county institute in Indiana in 1882 (page 176) reported reading lessons. One was on silent reading, confirming that the teaching of “silent reading” has been around for a long time. Another reading lesson was one hour long, spent drilling on reading a single paragraph of 75 words! The change-agents of 1826

570
were still casting a long shadow with “elocution,” though it was to disappear from schools by the twentieth century.

Institute reports from West Virginia for 1882 and 1883 reported institute lessons on teaching beginners to read with the “sentence “ method, the “word method,” and the “abc method.” The 1883 institute session was illustrated by a class of little children who had never attended school. Many of the poor little ones involved in these West Virginia demonstration lessons probably never did learn to read, or, at the very least, never did learn to spell accurately.

The “word method” with which those little West Virginia children were being afflicted in 1882 did not originate with J. Russell Webb as was wrongly claimed, but he certainly deserved credit for increasing its use. The vicinity of Watertown in Jefferson County, New York, is where J. Russell Webb first tried his whole word method about 1845, about which Nila Banton Smith wrote, crediting 1846 as the date Webb’s first book was published. On the closely printed back cover of Miles’ United States Spelling Book, published by Lamport, Blakeman & Law of New York in 1854 and which advertised their many materials, appeared an advertisement for Webb’s Normal Readers. It was followed by a paragraph which read:

“These readers are used in the principal cities and villages throughout the United States, and are rapidly coming into use in the smaller towns of the country. Their merits have been fairly tested, and they have universally been pronounced superior to any series of Readers extant; not only for the improvement in the system of teaching, which is the WORD METHOD; but also in the high moral tone...” (etc.).

That 1854 New York advertisement testified that Webb’s “word method” was only then “rapidly coming into use in the smaller towns of the country,” so, obviously, it was moving even later into the isolated little country schools. If the date Nila Banton Smith gave for the first edition of Webb’s material is correct (which is questionable), Webb’s series first appeared in 1846. Yet sight-word primers had preceded Webb’s 1846 version, such as Worcester’s (1826), Angell’s (1830), Bumstead’s (1838), Sanders (1840), and others. Their use had been dominant in the larger towns and cities, particularly in Massachusetts, since not very long after 1826, which seems to be confirmed by the fact that Noah Webster, himself, wrote a primer by 1832 to precede his speller.

Outlying country schools were outside the change-agents’ network until later. The switch from “sound” to “meaning” did not reach them in force until the “institutes” finally spread in number and influence in “certifying” teachers. That most probably was not until the 1860’s. The institutes which were injecting “whole word” poison into the little country schools by the 1860’s and which had originated in their final form only in 1843, had simply not become powerful enough by the time of the comment quoted above from 1854 to influence all the schools, those in the small towns and rural countryside as well as in the large towns and cities. Therefore, old methods, like the use of Webster-type spellers, did linger longer in the countryside until they were finally displaced by the “institute” influences.

An anecdote from a northern New York rural teacher confirmed that Webster’s speller was still in dominant use in some of those northern New York State country schools in 1847, before the massive spread of the institutes. The anecdote was quoted on pages 500 and 501 of Readings in American Educational History, edited by Edgar W. Knight and Clifton L. Hall, published first in 1951 by Appleton-Century- Crofts, Inc., and reprinted by Greenwood Press, Publishers, in New York in 1970. The short anecdote is titled, “Description of a School in New York State, 1847,” and was taken from J. W. Hooper’s Three Score and Ten In Retrospect, published by C. W. Bardeen, Syracuse, New York, in 1900. Hooper began to teach as a very young man, apparently about eighteen years of age, in a little country
school in 1847, and presumably taught for at least a few years after that. The school was near Antwerp, which was, like Webb’s Watertown, in Jefferson County. Hooper wrote:

“...I found myself surrounded on Monday morning by forty or forty-five as bright, as intelligent-looking a class of boys and girls as I have ever met in school.... I am unable to find a full list of the books in use. I find the Old English reader, Daboll’s arithmetic, Webster’s speller, and Kirkham’s grammar. I do not remember to have used any geography.... All from seven years old up were expected to read, write, spell and cipher from the same text-book.

“The school was organized and ready for work. I think I never felt more proud than when standing at my little home-made table in about the centre of the room, surrounded by that class of boys and girls. And, think of it, they called me master! And I was their teacher.”

Hooper implicitly confirmed that the little children under seven in his country school were using Webster’s speller in 1847, since they never could have moved into the use of those other textbooks at age seven if they had been unable to read independently. But, with Webster’s “sound” speller to begin with, they learned to read by seven, just as the old Scottish Schoolmaster’s little students had done for some thirty years when they were taught by “sound.” Another implicit confirmation that the young teacher was working with a literate class is the way he felt about them, at that time and in retrospect. If many of his students had been unable to read those books (and Murray’s “Old English” reader was very demanding!) Hooper would have been a very frustrated instead of a very contented young teacher. Since he said that some of the students were as old as he was, he might have found the experience a very difficult one if they had not all been able to succeed.

A second confirmation that the “sound” speller was still in use in such country schools until perhaps about the 1860’s is the statement concerning Webb’s “meaning” readers, quoted previously. The 1854 advertisement quoted above testified that Webb’s “improvements” had not yet reached little country or small town schools by 1854 (and therefore should not have done so until appreciably after 1854). It was not until the institutes blanket the states that the “best” methods of teaching beginning reading finally forced out the “sound” spellers like Webster’s for beginners.

The experiences of members of my mother’s family in Jefferson County, New York, confirm the sequence of changes in reading instruction methods that took place over those years. My mother, Katharine Geraldine Murtha Rodgers, was born in 1884 in northern New York State on the farm of her parents, Thomas and Mary Ann McCartin Murtha, outside the small town of Carthage in Jefferson County, New York. Carthage is about 18 miles from Watertown, also in Jefferson County, in the vicinity of which Webb “invented” his whole-word method first published reportedly in 1846, and about 30 miles or so from Antwerp in Jefferson County, where Hooper was still using Webster’s speller in 1847 and probably later.

My mother had said that, when she was growing up (and she would have been from six to sixteen from 1890 to 1900), there were some people nearby who were “bright in every other way, as with their hands, but they never could learn to read.” When I had asked her how reading was taught in the little country school to which she had gone, she said, “They just showed you the words.” That was, of course, Webb’s beginning method, and the standard whole-word method, and the undoubted reason some of her adult neighbors in the 1890’s had never learned to read.

By the 1860’s, institutes had become massive in New York State, and actually used a corps of institute instructors officially appointed by the state. By the 1860’s, therefore, even the little country schools could have “certified” teachers. By the 1860’s, such Jefferson County institute-trained teachers, unlike Hooper in Antwerp in Jefferson County in 1847, would use whole-word “meaning” methods like
Webb’s. Such “expertly” trained teachers turned out illiterates like those my mother remembered, and undoubtedly phalanxes of functional illiterates, as well.

As discussed elsewhere, phonic exercises in spelling returned to the schools at second grade and above between 1885 and 1890. Since my mother probably started school in 1890 at six years of age, she was probably given, in that little country school, a heavily phonic spelling book before second grade. One such text was Stickney’s 1889 second grade spelling book, and it taught the heavy phonics that had been omitted in the sight-word first grade reading texts of the period, and so did other spelling books that came out in the late 1880’s. My mother was a rapid reader and flawless speller, as were her younger brother and sister as demonstrated by their letters, and the probability is that they became so because they were exposed to such spelling books.

So apparently were her father and mother rapid readers, since they were both reportedly avid readers. They had also been born in Jefferson County in northern New York in 1843 and 1849 respectively, and educated in Jefferson County country schools in Carthage and Redwood respectively. However, as discussed, that was before the spread of institutes and their baleful effect on country schools. The continued use of Webster’s or some other speller, and the failure to use the “improved” materials like Webb’s, is the probable reason both of my mother’s parents really learned to read in little country schools in Carthage and Redwood in Jefferson County about 1849 and 1855. Their first-grade experiences were not far in either time or space from Hooper’s little country school in Jefferson County outside Antwerp in 1847 and later, which is known to have been using Webster’s speller.

My mother’s six-years-older and intelligent sister would have started school about 1884, by which time Webb-type “improvements” would have spread into the country schools through the teachers’ institutes, and after the speller had been dropped even in upper grades because of the later 1875 Quincy influences. It is therefore not at all surprising that she was a bad speller. As a teen-ager, I was startled by the inaccurate spelling in her letters, particularly in contrast to the highly literate letters of my mother’s younger sister and brother. It is sadly obvious that my mother’s intelligent older sister was one of the hosts of children in America since 1826 who were hurt by our powerful - and unpunished - education “experts.”

The little beginners being taught to read by “meaning” methods at the 1883 West Virginia institute demonstration classes would also have been harmed by the “meaning” approach, just as my aunt was about 1884 in rural northern New York State. The highly organized octopus of harmful, standardizing “experts” operating largely through the teachers’ institutes had succeeded long before 1883, probably from the 1860’s, in reaching into and spoiling almost every school in the United States of America.

They succeeded in doing so under a hullabaloo and very expensive cover of “expert” noise about “improving” education. That is the same kind of “expert” thing we are getting today on America 2000, which, if it succeeds, will tighten the vise of centralized education control until it finally chokes the Bill of Rights to death.

My mother’s older sister did not, however, achieve the heights of sparkling originality in spelling that I found much later in the Lyndhurst Board of Education minutes from the 1890’s (then called Union Township), referred to elsewhere in this history. The men writing those minutes would all have learned to read, probably in New Jersey, when the word method was dominant, as shown by the institutes which have been described, one of which was run in 1881 in Virginia by Professor E. V. De Graffe of Paterson, New Jersey. This suggests that “experts” traveled a lot in those days, too - undoubtedly with all their expenses paid by somebody else, just like today. Yet De Graffe would have spread his wisdom first in New Jersey, and so would have other New Jersey institute instructors like him. They affected teachers in
such schools as those that had been attended by the men who wrote the Lyndhurst (at that time, Union) Township school minutes in the 1890’s.

By some very early date, teachers were required to pass “tests” to earn state “teaching certificates,” and expressing original thinking on how to teach reading on such tests was not likely to result in getting a teacher’s certificate. Colonel Francis Parker referred to institutes in the School Journal, August 12, 1899 (page 118), when he was describing conditions twenty-five years before, or about 1874:

“Many teachers’ institutes were supplementary to regular school work, and were held for the purpose of aiding candidates for teaching to pass their examinations.”

Confirmation on the influence of Farnham’s “sentence” ideas at these omnipresent teacher’s institutes is given on page 11 of the September, 1883, issue of The School Bulletin, Syracuse, New York. Each month, the paper ran a contest for the best answers to that month’s questions which had been submitted by subscribers. However, the publisher of the School Bulletin, C. W. Bardeen of Syracuse, New York, was also the publisher of Farnham’s book in 1881, so there may well have been some vested interest in the choice of the prize selection mentioned below! The prize for the July questions was awarded to Harold S. Smith of Indianapolis, Indiana. Smith’s “prize” answer follows question “171”:

“I ask for information in regard to teaching reading by the work (sic: obviously word) method. Will some one be so kind to inform me how it is done? C.E.C.”

“171. The Word Method of teaching reading consists in giving the beginner entire words from the first, instead of first teaching the letters. The letters are learned only incidentally. In effect, the child is taught that C A T is a certain sort of picture of a cat, and that it always means a cat, just as the pictorial illustration means a cat.

“This method is best carried out by reading charts, especially Appleton’s, but may be taught from the blackboard.

“There is no longer any discussion as to the value of the word-method, among intelligent teachers. It is accepted as at least an element of the proper way to start the beginner. But there are two other methods sometimes used to accompany it. One is the Phonic Method, which teaches the sounds of the letters, and thus enables a child to make out a word not before seen. The other is the Sentence Method, which gives at first a sentence instead of a word; as, This is a cat. This is a prominent feature of the Quincy system, and is explained fully in Superintendent Farnham’s “Sentence Method of Teaching Reading,” price 50 cents, which has been a prominent text-book in Iowa institutes, this summer.”

It seems probable that Smith of Indianapolis must have attended the Iowa institutes, possibly as an instructor. His short 1883 comments confirmed the dominance of “meaning” methods in teaching beginning reading in the 1883 schools, the influence and widespread existence of teacher’s institutes by 1883, and the widespread acceptance of Farnham’s “sentence-method” material by 1883. His reference to the “Phonic Method” would most probably concern two-step whole-word phony phonics, like that endorsed by the Boston schools’ report, also of 1883, which will be described.

Concerning Institute Instructor Johonnot’s Influence on Farnham

From 1866 till 1872 as an institute instructor, Johonnot would have been in the midst of all the fermenting “new” ideas coming from the “experts” in education and would have been free to attend lectures elsewhere than New York State concerning such “new” ideas - lectures like those, perhaps, being
Farnham had stated that his “psychological” sentence theory was influenced by Johonnot. Johonnot was influenced by Agassiz definitely in 1873 and as a member of New York State’s institute faculty was in a position to have been “influenced” by Agassiz and those around him since 1866. (Johonnot’s use of widespread influence appears to be confirmed by his prestigious 1872 appointment in Missouri, far from New York State.) Agassiz very definitely influenced James. These connections are very slender, indeed, between Farnham and James, but it is my conjecture that Farnham was only the “laboratory equipment” used by James to test his “sentence” ideas in Binghamton in 1870. James could not have tested his ideas openly in New England as Parker referred to hostility there to “psychology” in education.

No evidence beyond the foregoing relationships is yet available, except that about 1930 someone went to the trouble to steal some unidentifiable volumes from James’ personal collection of his own writings that had been donated to a Harvard faculty room, as will be mentioned later. No such theft from the shelves in the faculty room had ever occurred before, according to the professor who had stocked those shelves for years. Furthermore, copies of James’ formally published works (but not his unpublished works) were on the open library shelves at Harvard and would probably have been easier to steal. The probable target of the 1930-1931 thief was the unpublished James material. What was in that unpublished James material? However, two additional facts are certainly suggestive. One is that there is a remarkable similarity between Farnham’s ideas and James’ ideas. The other is that the kind of experimental psychology to which Farnham referred was virtually unknown in the United States in 1870 except in the mind of William James.

Concerning the Post-Philbrick Reading Methods in Boston

The Suggestions Accompanying the Course of Study for Grammar and Primary Schools, School Document No. 17, 1878, put out by the Boston schools a few months after Philbrick was fired, made the following statements under “Reading,” on pages 11-14:

“The object to be sought in this branch of instruction is twofold. The pupils should be taught (1) to take in, with the eye and the mind, the meaning of the printed sentences; and then (2) to express this meaning intelligently by the voice.... The methods used to accomplish this result in the different grades must vary with different teachers....

“The following suggestions may be of use: -

“After children have learned to recognize simple words they may be taught to read short simple sentences from the black-board or chart and from the book, the teacher aiding them by reading each sentence; for at the outset they can be expected to do little except by imitation.”

The emphasis on the “sentence” is obvious, as is the assumption that the children would be incapable of sounding out words in these sentences but would have to be told them by their teachers.

This 1878 document sounded remarkably like Farnham’s 1881 book. The 1878 paper also said (page 14):

“The classes should have as much supplementary reading as possible, outside the book assigned.... As soon as a child can read easy sentences he should be encouraged to read other books than the reading-books.”
Supplementary reading was Colonel Parker’s special enthusiasm, and it was moved right into the Boston schools with the new curriculum of 1878. The supplementary reading which the 1878 curriculum guide endorsed for lower grades was the use of other first grade books than the official books, all of which had very limited vocabulary. However, with L. H. Marvel, Parker wrote Supplementary Reading for Primary Schools, First Book and Second Book. These had revised editions in print in 1882, according to Leypoldt’s 1876-1884 American Catalogue. Harvard has a copy of the first edition of the First Book which came out in 1880, and it is a terrible thing consisting of very high frequency words and is almost devoid of sense.

What can be shown from the above curriculum guide of 1878 is that it made it impossible to teach Leigh phonics to beginners. Leigh’s method required the use of his wall chart for rank beginners to learn letters and their sounds before being given words. Instead, this studiedly vague course outline in reading for Boston schools gave a casual emphasis on sentences. Chanting a sentence after a teacher had already read it can hardly be called “reading,” but this is what replaced Leigh phonics for beginners. So, sight-word sentence-reading was moved in and Leigh phonics moved out of the Boston schools with NO OPEN RECOGNITION in the Boston school document that a major change was taking place! A table was included which listed curriculum at each grade level. In the last half of first grade, it showed “Spelling, by sound and by letter, some easy, common words from the reading lessons.” Note that, in the last half of first grade, “sound” is used only on SOME EASY words in the reading lessons! Leigh phonics had obviously been outlawed for beginners without even mentioning it by name.

Under the section, “Spelling,” on page 15, this statement is made:

“Pupils in the upper classes may be led to perceive the few fundamental rules of orthography and pronunciation which belong to our language.”

Being “led to perceive” was Agassiz’s teaching method. He liked to leave a student alone in a room with a natural history specimen. Agassiz then expected the student to “discover” the truths about the oyster, or whatever it was that had been placed in front of him. Now upper grade Boston students were to be “led to perceive” the rules of orthography and pronunciation, which they would have acquired long before if they had learned to read with phonics.

The 1878 Boston curriculum was highly influential. On page 229 of the December, 1878, The Primary Teacher, published in Boston but sent all over America, this appeared:

“...owing to the great interest felt in all parts of the country, in the course of study recently adopted for the Boston Primary Schools, which, is, in some respects, a “New Departure” in this grade, we print the entire course in this issue of The Teacher. In subsequent issues, we shall furnish the courses of other leading cities.”

The similarity between the specific lessons outlined in Farnham’s 1881 book and the specific lessons outlined later in School Document No. 1, 1883, Method of Teaching Reading in the Primary Schools, Boston, “Prepared by The Board of Supervisors for the Public Schools of Boston,” is striking. Both teach individual new words, as would be expected in the atmosphere of the time, from objects, but always in the context of sentences. Both then move to reading whole sentences. Both emphasize that the sentence is the natural unit, the 1883 material starting with the opening statement:

“Reading may be defined as the act of the mind in getting thought by means of written or printed words arranged in sentences.”
The 1883 report referred back to the Outline Course of Study of 1878 and was an obvious outgrowth of it. Any phonics, according to that earlier document, was to be held off until the last half of first grade, and even then it was minimal. The alphabet was obviously not taught before reading was begun, according to the table entitled “1878 Outline Course of Study - Primary Schools,” and only a few script letters were given for copying in writing lessons in the first half of first grade and then used to copy simple written words. The rest of the written script letters were not shown till the last half of first grade. Copying a few script letters and words as pictures, with no reference to their sound, of course, had nothing to do with teaching reading by sound.

In the Boston schools which had so enthusiastically adopted Leigh print, there must have been great resistance to the 1878 edict, so the 1883 document included a section, “Phonics,” which purported to allow its use after the beginning stage. When analyzed, however, it is nothing but elocution plus elaborate phony phonics. The real emphasis of the “Document” remained on “meaning,” not “sound,” as shown by the following at its beginning:

“...The main point, therefore, to which the attention of the teacher should be directed at every step, from first to last, in the teaching of reading is this: Are the pupils led to get the thought?....

“... When children are trained to utter sentences by merely imitating... there is established the vicious habit of uttering words without perceiving their sense, - a habit which is broken up later with extreme difficulty.

“A written or printed word is used to recall an idea; it has no other use. A word which has been associated with a particular idea in the mind will, when seen, recall that idea, faintly if the association is weak, vividly if the association is strong. An association grows stronger by repetition of those acts which first produced it. A word is learned only when this bond of association has grown so strong that the word instantly at sight recalls its appropriate idea. It follows that the teaching of reading consists essentially in evoking acts of association between written or printed words and their appropriate ideas. That teaching which assists these acts of association assists the child in learning to read; that which does not assist these acts is useless. If this be so, the best method of teaching reading will include all those devices, and only those, which aid efficiently in causing associative acts between ideas and written or printed words....”

It should be superabundantly clear that this was written by a psychologist in Boston, by 1883. (The overuse of italics is striking: William James was given to an overuse of italics in his 1890 psychology book. Note also the use of the subjunctive tense, “If this be so...” which had been common in ordinary writing before 1826 but was rare by 1883 except in the writing of highly educated people like William James.) Mitford Mathews thought Colonel Parker may have written this unsigned Boston report, but it does not sound like Parker’s writing nor his ideas. Apparently, the only psychologists in the modern sense in the Boston area before 1883 were Hall and James (although Royce, for whom psychology was only a sideline, had arrived as James’ substitute at Harvard for the 1882-1883 year). Hall was incapable of writing anything lucidly, and could not have written the above. Having read later material by Thorndike, James’ ex-student, in which so much of the above vocabulary occurs (“bond of association”), and having read some of James’ material which sounds so much like the above, I have little doubt in my own mind that at least the last paragraph of the above selection was written personally by James. Leigh phonic print had been thoroughly defeated by then, so the 1883 text could be more far outspoken than the 1878 text. It is even likely that substantial portions of the 1883 text had been written long before 1883 but that it was only safe to publish them in Boston by that date.
The 1883 report was a “teacher’s guide” for almost all of the wrong approaches in the teaching of reading which have afflicted America ever since. Given below are excerpts from various pages. They are obviously drenched in “psychological” language.

(Page 7:) “THE WORD AS A WHOLE. Spoken words are learned as wholes. That is, there is no conscious analysis of the word into its elementary parts; or sounds, in learning to talk. Indeed, most people use words all their lives without a conscious knowledge of phonic analysis. Again, in respect to written words, it is to be remarked that they are first visually grasped as wholes. Any attempt to see a part before the whole is seen only weakens the mind’s power to take in the whole. A too early struggle with the parts of a word, whether spoken or written, absorbs the attention, and thus prevents the only act of importance - the act of association between the word and the idea - from taking place.

“The written word, to be effectually associated with its idea in learning to read, must be dealt with as a whole, just as the spoken word is dealt with as a whole when first associated with its idea in learning to talk.”

(Page 8:) Under “The Sentence and the Thought,” it read, “Words arranged in sentences recall ideas in their relations... The use of sentences should begin after a few single words and phrases have been taught....”

(Page 18:) “...For the convenience of teachers a list has been prepared, consisting of all the words found in the first forty pages of the Franklin (new) Primer, in the whole of Monroe’s Chart, and in the first forty pages of Supplementary Reading - First Book.... [Ed. Obviously, this was Parker’s.]

“It is believed that from one hundred to one hundred and fifty of these words may profitably be taught in script, on the black-board, before the change is made from script to print....

(Page 19:) “...It is of the utmost importance that the words taught be thoroughly learned....”

(Page 25:) “...A few words, well taught, is a far better result than one hundred words poorly taught.

Immediately under this clear admission that sight words were being taught as wholes, came this seemingly placating section:

“PHONICS.
“There should be frequent drills on the elementary sounds in all the primary and grammar classes, varying in character according to the needs of the pupils. The Chart of Sounds here given for reference is nearly identical with the lists given in Monroe’s “Physical and Vocal Training,” an authorized book of reference. The chart, without the illustrative words, should be placed on the black-board in script at first, and later, when the children begin to read print, in both script and print.”

The chart consisted of vowels and consonants marked very much like the keys in today’s dictionaries. The children worked their way down the columns, imitating their teacher’s pronunciation. Yet the report made it clear that, at the beginning of first grade (which is the critical part), a teacher was only to exercise the children orally on repeating words after her slow pronunciation, without reference to a written chart on the board.
The intent in many places giving such training was only to train the voice, but this 1883 report claimed the chart ultimately could help children to read independently. Yet the 1883 report, when read as a whole, makes it very clear the only “phonics” it was endorsing was phony phonics, Code 3 at the best. While it claimed to teach analytic phonics on long and short vowel sounds, it openly relied on “analogy,” the comparing of whole words to each other, or two-step phony phonics, and provided lists of words on which to use such analogies. Page 18 of the report stated that “All the words... in the whole of Monroe’s Chart...” were included in the basic sight-word list given to the teacher, so they obviously were to be taught as wholes. Therefore, Monroe’s “phonics” chart was certainly not being used to teach real phonics, but only whole-word, two-step phony phonics.

Synthetic phonics was almost totally rejected:

(Page 29:) “In the exceptional cases, where children cannot be led to the pronunciation of new words by the analogies of the language, they may be helped by the use of diacritical marks. The premature and too frequent use of diacritical marks may lead to rapid word-calling, and away from the expression of thought, and should therefore be avoided.”

The 1883 remark quoted above was the first clear and outspoken dumping of Leigh print in Boston, because Leigh print essentially consisted of diacritical marks. Aside from material written to promote phonic methods such as Leigh’s and Pollard’s, it is also the first of only two known references in American “reading instruction” literature to the fact that children learn to read far faster and more accurately with synthetic phonics than with sight words (with “sound” instead of “meaning”). At least two such admissions, however, have occurred in the European literature promoting the sight-word “global” method, one by Robert Dottrens in Switzerland in Au Seuil de La Culture in 1965, and the other by J. E. Seegers in Belgium in La psychologie de la lecture et l’initiation a la lecture par la methode globale, 1939 in Belgium, both of which will be referred to later.

The 1883 report also stated (page 29)

“The dependence upon analogy gives valuable training in language, and should be early and constantly encouraged.”

The “analogy” to which it referred is Gallaudet’s visual comparison of whole words already learned by their meaning, not by their sound: “bread, spread, thread,” or “pin, tin, spin.” E. L. Thorndike, James’ student, wrote an article, “Word Knowledge in the Elementary School,” in the Teachers College Record for September, 1921. It included a section, “Material for Phonic Drills,” in which he showed “phonograms,” or parts of words, followed by words which contained them, one of which was: “own - brown crown down town.” (This was an interesting choice, as “own” has a second sound!) Since Thorndike endorsed only whole words, however, this was pure visual phonics, or two-step phony phonics, the comparing of whole sight words to each other to see like parts. However, as mentioned earlier, visual analysis of meaning-bearing sight words was common in sight-word books after about 1826. Its intent was very different from the grouping of like words by sound in the pre-1826 analytic phonics spellers, all of which words were learned by emphasizing “sound” and not “meaning.”

Visual analysis compared whole words learned for “meaning” to new words so that the new words could also be memorized as meaning-bearing wholes. After 1826, such words were pronounced first by the teacher and not worked out by the pupil.

Yet, by contrast, before 1826, if Webster-type synthetic phonics was not used, phonic analysis was used by a pupil to compare parts of known syllables or words to parts of new words to determine the sounds. Words of similar sounds and spellings appeared in meaningless columns, and “meaning” had
nothing to do with their arrangement. There cannot really be any doubt whatsoever that the old spellers using such analytic phonics were “sound” and not “meaning” oriented, since it was precisely because of all the old spelling books’ lack of “meaning” that they were drummed out of beginning reading.

As is implied by pages 30 and 33 of the 1883 report, Boston beginners in 1883 were to be given in script, apparently on the blackboard, the first thirty-nine pages of the Franklin Primer, (apparently the “new” edition set up by University Press), “Monroe’s Chart,” and the first forty pages of Colonel Parker’s unspeakably poor Supplementary Reading - First Book. They were then to change to print, as outlined on page 30, by practice from the blackboard. Afterwards, they were to read the following in print, not script:

“It is recommended that Monroe’s chart be read first; then the first forty pages of the Franklin (new) Primer; then the whole of Supplementary Reading-Book First; then the Franklin Primer, from page 41. After these use the First Readers of the circulating supplementary reading books.

“Pupils should not begin the Second Readers until they have full and ready command of the First Reader vocabulary.”

Note the reference to the Franklin Primer - obviously not in Leigh print. As discussed elsewhere, before the change-agents threw out Philbrick, the publishing information on copies of surviving primers at Harvard shows the change-agents had made sure they had non-Leigh editions of the Franklin Primer printed by University Press a year ahead of time so that non-Leigh-print copies would be on hand by the fall of 1878 when they needed them.

In this connection, a very queer comment appeared in Boston School Document No. 6 of 1883, Committee on Examinations. That official committee of the Boston schools had asked all the Boston schools to send them statistical data dating back to 1869. The committee made this comment on page 6 of their May 22, 1883, report:

“The committee were much disappointed at the imperfect returns received in answer to several of the questions issued. But many of the masters state in their replies that, during the summer vacation of 1878, the record-books, especially of their Primary Schools, were gathered up and carried off, together with other school property, and never returned. The books were probably destroyed, as no trace of them can be found.

“The loss of these books is greatly to be regretted, as it renders it impossible to procure exact information, however much desired and important, in relation to the statistics of former years.”

Philbrick had been fired some six months before these record books disappeared. Leigh-print primers were obviously replaced with the “new” Franklin Primers in ordinary print in September of 1878. However, after the convenient theft of the primary school records in the summer of 1878, no one would ever be able to compare the sight-word primary classes of 1878 and later to the Leigh-phonics classes before 1878.

A further possibility might be considered: Did the other school property that was “carried off” in the summer of 1878 by unknown persons, who apparently had legal access to the Boston primary schools, possibly include the Leigh classroom phonic charts and the Leigh-print Hillard/Campbell texts that had been used right up to the spring of 1878 when Philbrick was fired? If those phonic texts and charts were gone by September, 1878, even unwilling teachers would be forced to use the new, non-phonic materials.

This School Document No. 1 - 1883, Method of Teaching Reading in the Primary School, “Prepared by the Board of Supervisors, for the Public Schools of Boston” is the single most important text ever
published in this country on the teaching of reading. Its influence has been massive. It provided the
formula and the philosophical justification for every one of the dominant reading programs used in this
country ever since. Even Gates’ and Gray’s deaf-mute readers were ultimate elaborations on the ideas it
contained.

Its roots, of course, lay in Gallaudet’s deaf-mute method, which used a visual “phony phonics,” but
the document incorporated a far more elaborate phonics in the pattern followed ever since, even by
Gates and Gray. Its elaborate phonics was also possibly inspired by Code 3 contemporary texts
from England, discussed later, but the philosophical justification behind all of its recommendations is
pure psychological jargon.

In my opinion, the ideas and even some of the phrasings which School Document No. 1 - 1883
contained show the clear influence of that very earliest American experimental psychologist, William
James, though it is abundantly clear that the move to “meaning” in the Boston schools had to be the result
of work by a determined group of activists, and certainly not by one man alone. The record suggests the
activists were the disciples of Agassiz, who had died in 1873.

The record also suggests that these activists included the “philosophers” spoken of in the 1871 Boston
school report, mentioned in a quotation given below, who were enormously disapproving of Leigh
phonics, and William James was a philosopher, even in his youth. James’ work was first published in a
journal edited by William Torrey Harris, mentioned elsewhere. It is an intriguing fact that America’s
leading philosopher at the time, William Torrey Harris, was the principal author on the massively used
1878 Appleton series, which had no Leigh-print edition and which was primarily responsible for pushing
the earlier reading series in Leigh print out of American schools.

William James was unemployed in 1870 and the usual references to this period in his life, after he
received his doctorate in 1869 and began teaching at Harvard in 1872, is that he was in a state of nervous
semi-collapse. That is a very long nervous collapse, to put it mildly: from 27 to 30 years of age. He
undoubtedly shared his family’s tendencies to hypochondria, but could act when he saw fit. On page 20 of
Leon Edel’s biography of Henry James, Edel referred to a letter Henry James wrote Charles Eliot Norton
shortly after Henry James returned to America in May, 1870. Henry James mentioned William James’
activities, and his comments suggest that his brother was very well in the late spring of 1870, despite
William’s famous and frightening psychic experience in March of 1870 (quoted, for instance in William
James, a Biography, by Gay Wilson Allen, page 166. His father, who became a Swedenborgian
afterwards, had had a similar horrifying psychic experience many years before.) Concerning William
James’ activities in the late spring of 1870, Edel said William James had finished his medical training,
and according to Henry James’ comments in his letter to Norton, was mixing with intellectual young men
who had started a metaphysical club, in which they argued humorlessly and stayed to the topic chosen.
Henry wrote that just to think of their activities gave him a headache.

According to Allen’s biography on page 168, William James wrote in his diary on April 30 that he
had passed a crisis in his life the day before, and had determined to believe in free will. For the rest of the
year, he intended to avoid speculating, and would concentrate on moral freedom, by reading books
supporting it, and by his actions. After the beginning of the next year, he felt he might return to his
philosophical studies of skepticism without having such studies interfere with his ability to act.

Allen wrote concerning the period after May, 1870, on page 172:

“During this period when both William and Henry were at home in Cambridge, William was
not writing many letters, and therefore documentary evidence for this year in his life is scarce. He
was not even keeping his diary, but this is a good indication that he was successfully avoiding

581
emotional stress, for it was during periods of strain and crisis that he wrote most copiously in his
diary.”

Therefore, during the most of 1870, when Farnham was first using the sentence method, James was
healthy and in a frame of mind to “act.”

William James had been a student of Agassiz of Harvard, who, for a few years before his death in
1873, had urged his followers to go out and do something about education. James Johonnot, who wrote
Principles and Practice of Teaching in 1878 included a chapter on Louis Agassiz, the Harvard biologist
whose expedition to the Amazon in 1865 William James had joined. Johonnot had attended Agassiz’s
famed natural history course at Penikese Island off Massachusetts in the summer of 1873, just before
Agassiz’s death. Johonnot wrote:

“The life of ‘the master,’ as he was affectionately called by his pupils, was cut short at the
very commencement of this most important enterprise of his life, and it is left to others to carry
on to a successful termination the work he had begun....”

Concerning Agassiz’s “enterprise,” Johonnot had said earlier, as previously quoted in part:

“(Agassiz) saw that, in the prevailing education, language largely took the place of thought; that more
attention was given to the symbols of knowledge than to the knowledge itself....

“Those errors, he saw, could be corrected only by a radical and fundamental change in the
whole system of education, in which the scientific spirit and methods should play a prominent
part. He commenced the work of reform with his characteristic caution and energy, calling
attention to some of the prominent defects of education in his public lectures.... His success was
so great, that he resolved to try and reach the public schools by instruction offered to teachers....”
(at Penikese in 1873).

That Agassiz was campaigning for major changes in education in the school year 1870-1871 is
evident from Philbrick’s comments. In the Annual Report of the School Committee of the City of Boston
- 1871 for the school year 1870-1871, on page 142, Philbrick said:

“I find around me conflicting opinions, not only as to what should be the aim in education,
but also on the details of means and methods. I am often button-holed and lectured by persons
holding opposite and extreme, and, what seem to me, one-sided views on educational matters. In
this way, I am sometimes entertained and instructed, and sometimes not. I am, on the whole,
rather fond of hearing what the enthusiast and the man of one idea has to say.”

He outlined his experiences in a number of such encounters, and then said, on page 149:

“Being an honest seeker of truth, or at least imagining myself to be such, and appreciating
very highly the privilege of listening to the instruction of learned and wise men, I make a point of
attending a meeting where a truly great man is to speak to teachers on education. I am charmed
and edified with what he says of the importance and the ways and means of teaching in our
elementary schools the rudiments of natural science. EVERY PRIMARY SCHOOL, HE SAYS
MUST HAVE ITS LITTLE MUSEUM OF NATURAL HISTORY. That sentence I felt sure
would live and be quoted the world over, for he who uttered it was the very best authority in such
a matter. He then goes on to depreciate the value of the study of words, and finally declares that
the study of English Grammar should be abolished as a useless waste of time. Here the query
naturally arose, whether a man who was an acknowledged authority in one department of learning is equally entitled to respect as an authority in those branches which are outside his specialty?"

There can be no question that Philbrick was referring to Louis Agassiz, and that fact is confirmed by Johonnot’s comments. Therefore, Agassiz (the idol of a near cult, eventually, as Johonnot made clear) was publicly downgrading in lectures the value of “words” in education, during the school year 1870-1871, the same school year that Farnham introduced the sentence method into Binghamton, which method could eventually be “justified” by William James’ sentence “stream of consciousness” ideas which would only come out in print in his psychology book of 1890. That year, 1870, was also the same year that John Quincy Adams, Jr., chose to join the Quincy school board, with the presumed desire to aid education.

It is probable Agassiz’ proselytizing had something to do with the winds for change blowing in Quincy, through the actions of the Adams’ brothers, starting with John Quincy Adams’ school committee membership in 1870 and that of his brother, Charles Francis Adams, Jr., by 1872.

It is very clear that Charles Francis Adams, Jr., agreed with Agassiz on the uselessness of teaching much grammar. Charles Francis Adams, Jr., was on the Quincy School Committee in 1872-1873, two years before it hired Colonel Parker. In the Harvard copy of the Report of the School Committee of the Town of Quincy for the School Year 1872-73, someone has put an asterisk after the word, “me” in the following sentence on page 14, and, at the bottom of the page, written in pencil in an old-fashioned script, “C. F. Adams, Jr.” Here is that sentence and some of the comments which followed, a portion of which has been quoted previously:

“Under the division of duties during the past year, the examination of all the schools in grammar was assigned to me. As a general conclusion from my observations during that time, I am compelled to say, that, although there is abundant evidence of much honest labor and drilling on the part both of instructors and scholars, yet, as now taught in our schools, English grammar is a singularly unprofitable branch of instruction. The children are indeed taught the names of the parts of speech, and are drilled to parse the words of an ordinary sentence, - in the better schools they may even attain to some slight knowledge of analysis. I am, however, wholly unable to see that this labor at present results in any thing more than a dry, useless, and unattractive mental discipline. This I do not understand to be the object of a common-school education, in which utility is the one end which should always be kept in view....”

Adams was obviously not endorsing the idea that all men should have access to all wholesome knowledge, or that such learning is, of and by itself, a good thing, or that the human mind hungers after truth for its own sake just as the human body hungers after food. Adams’ ideas on the “utility” of the kind of education that should be available for ordinary citizens sounds uncomfortably like the old marauding Vikings’ practice known as the drowning of the books.

Adams continued:

“In this respect, an immediate reform is called for....

“The object of studying English grammar is to learn how to speak and write the English language correctly... The fact is, nevertheless, apparent, that the study of grammar, as now pursued, wholly fails to accomplish its object. It fails also, not because too little, but because too much, is attempted. The theory of a science is taught, and the practice of a thing is neglected.
“I would respectfully urge that a new system ought to be adopted to secure a better instruction. More time - a great deal more time during, at any rate, the last year of the grammar school course - should be directed to that practice which alone enables any one to put his thoughts on paper, either correctly or legibly.... the best instruction...is apt to be that which is least pretentious. Half of the labor now expended in mastering abstract rules would produce accomplished penmen; and any child who can talk can, if the pen is familiar to his hand, with but little practice, learn to write what he thinks...”

That last comment certainly has Parker overtones. Parker was famous for having said, more or less, that he wanted children to “talk with their pencils.” It should be noted that Adams, who was himself no authority on language, was diametrically opposed in his opinion on grammar to one of the greatest authorities on language who has ever lived, Professor Mario Pei of Columbia University. As mentioned elsewhere, Pei considered the study of grammar to be indispensable. So, it is interesting to note, did the early Irish monk scholars (and presumably their lay associates) who, as outlined by Louis Holtz of France, mentioned elsewhere, produced a rash of Latin grammars in the seventh century, not too long after Latin learning had arrived in Ireland with St. Patrick in the fifth century. It was these Irish monk scholars who helped to bring learning back to England, and then with the English monks, back to the Continent in the centuries that followed. Would these Irish and English monks before the tenth century have been such missionary scholars if they had not also been such grammarians?

It is not unreasonable to assume that Agassiz’ belief that language in schools largely took the place of thought may have also affected his ex-pupil, William James that same academic year, 1870-1871. If the idea was familiar to audiences attending Agassiz’ public lectures that year, certainly James must have known of it.

His relationship with Agassiz was hardly casual. In James’ comments at the reception of The American Society of Naturalists December 30, 1896, which comments were printed in Cambridge in 1897, as Louis Agassiz: Words Spoken by Professor William James,” the following is recorded on page 8:

“I had the privilege of admission to his society during the Thayer expedition to Brazil. I well remember at night, as we all swung in our hammocks in the fairy-like moonlight, on the deck of the steamer that throbbed its way up the Amazon between the forests guarding the stream on either side, how he turned and whispered, “James, are you awake?” and continued, “I cannot sleep; I am too happy; I keep thinking of these glorious plans.” The plans contemplated following the Amazon to its head-waters, and penetrating the Andes in Peru....

“There is probably no public school teacher now in New England who will not tell you how Agassiz used to lock a student up in a room full of turtle shells, or lobster shells, or oyster shells, without a book or word to help him, and not let him out till he had discovered all the truths which the objects contained. Some found the truths after weeks and months of lonely sorrow; others never found them.”

In the three empty years in James’ life, it seems possible he may have “acted” to improve reading with the sentence method, a kind of simplified version of his “stream of consciousness” ideas. After all, the sentence method concentrated on the teaching of “meaning,” instead of the presumed meaninglessness of Leigh phonics, and should have been justified by the ideas of Agassiz. Interestingly enough, the “sentence method” is the variety of the “sight-word” method that Parker used at Quincy starting in 1875, six years before Farnham’s book on the method appeared in print, but only two years after Farnham wrote his NEA paper. When Edwin Austin Sheldon of the Oswego, New York, State Normal and Training School published his insufficiently phonic readers in 1875, he specifically mentioned the sentence method
(but considered it to be only a variation on the dominant whole-word method). (His co-author was E. Hubbard Barlow, Professor of Rhetoric and Elocution at Lafayette College, Easton, Pennsylvania, where J. M. Cattell’s father was President and from which school Cattell graduated in 1880.) Obviously, by 1875, the sentence method was very, very well known. Yet no one had ever heard of the sentence method before 1870!

William James was almost certainly acquainted with the three Adams’ brothers who were involved in the Quincy schools: Charles Francis Adams, Jr., John Quincy Adams, and Brooks Adams, all direct descendants of President John Adams and President John Quincy Adams. As already mentioned, one of young William James’ close personal friends in Boston was young Oliver Wendell Holmes, Jr., and a fourth Adams’ brother, Henry Adams, was on the staff of Harvard, when William James began teaching there in 1872, and Henry Adams was also a personal friend of William James’ brother, the novelist, Henry James, by 1870. That was the Boston/Cambridge social circle in which James moved in the 1870’s and it must have included all of the Adams brothers.

William James was married on July 10, 1878, to Alice Howe Gibbons, a teacher in Miss Sanger’s School for Girls in Boston. On page 17 of The Death and Letters of Alice James, Ruth Bernard Yeazell’s book about James’ sister, Yeazell wrote:

“In May of 1878, (William James’) future wife put an end to an uneasy courtship of several years by accepting his proposal of marriage.”

During the time of his courtship of a schoolteacher, James must have listened to a lot of conversations on school matters besides reading the public relations releases in the newspapers which were bringing people from as far away as Syracuse, New York, to visit the Quincy, Massachusetts, schools in April, 1878, only a month before James became engaged to a Boston schoolteacher.

Although James did not complete his Principles of Psychology until 1890, he had contracted with Holt and Company to write it in June, 1878, a month after his engagement in 1878 (according to Yeazell). Therefore, James’ ideas about language expressed in his 1890 text may well have been conceived by him in 1878 or before. It is impossible to assume that James was unaware in 1878 of the nearby Quincy experiment. It seems likely from James’ later written comments on language in his psychology text that James would have agreed with Colonel Parker in 1878 concerning Parker’s ideas on teaching beginning reading by “meaning.”

Yet Parker only came to the Boston schools in 1880, and the sight-word and sentence “meaning” approach was adopted in the Boston schools at the end of the 1877-1878 school year, for use the following September, 1878. Parker was therefore not personally responsible for the initial move in Boston from “sound” to “meaning.”

Philbrick, who had supported Leigh phonics, was fired as of March 1, 1878, being replaced by Samuel Eliot as Superintendent of the Boston schools. Whether Samuel Eliot was related to President Charles W. Eliot of Harvard, who lived directly across the street from the James’ family on Quincy Street in Cambridge in the 1870’s, is not known. (Leon Edel’s Henry James: The Conquest of London - 1870-1881, page 20, recorded that Eliot’s home was opposite the James’ family home.) What is evident from the quality of Philbrick’s reports compared to Samuel Eliot’s reports, however, is that the highly intelligent and competent Philbrick was replaced by an academic hack.

So, two years before Parker arrived, the sight-word method had already been moved into the Boston schools, displacing the phonic Leigh print which had been so successful before Philbrick was fired. Therefore, Philbricks’ Leigh phonics obviously had determined enemies long before Parker showed up on
the Boston scene. It must have been they who hired Parker in 1880! As the School Committee said in the Annual Report of the School Committee of the City of Boston - 1871, pages 7 to 9, in telling of the great success of the Leigh phonics method, before it had spread into almost all the Boston schools through the voluntary choice of the schools themselves:

“When the system of Dr. Leigh is mentioned, many excellent people, committee men, teachers and parents, shake their heads incredulously. It has been stigmatized as a ‘fancy method.’ Philosophers have proved (to their own satisfaction) that the plan is vicious. Practical men (who have never examined it) declare that its results are barren. Teachers (averse to change) say they have no difficulty now; that the old way is good enough for them.

“We beg leave to say that six years of careful experiment in several schools in this city have shown the best results from this system... Within six months ordinary pupils under this system get nearly through the second reader, - a point which pupils by the old method are always eighteen months, and often two years in reaching. This is a constant, unvarying result.... At an exhibition of a primary class in the Lincoln District, several pupils who had been less than eighteen months under instruction read at sight from books they had never seen.”

But the facts in the report for 1870-1871 on the success of Leigh phonics did not move Philbrick’s opponents, including, very interestingly, the “philosophers,” who “have proved (to their own satisfaction) that the plan is vicious.” It was only a year before the School Committee’s 1871 comment about “philosophers” that Henry James spoke of his brother’s metaphysical club, in which they argued humorlessly and never left the topic. Was William James one of the “philosophers” disapproving of Leigh phonics?

Rudolph R. Reeder (1859-?), who in 1900 was Instructor in Theory and Practice of Teaching, Teachers College, Columbia University, wrote The Historical Development of School Readers and of Method in Teaching Reading, Columbia University Contributions to Philosophy, Psychology and Education, Volume 8, No. 2, The Macmillan Company, New York, May, 1900. Bound immediately after it in the same volume, but dated 1901, appeared Vol. 8, Nos. 3-4, Notes on Child Study, by Edward Lee Thorndike, Adjunct Professor of Psychology, Teachers College, Columbia University. Reeder and Thorndike must have been well acquainted with one another, and since Thorndike was so closely associated with Cattell of Columbia University, it seems likely Reeder would have also been an associate of Cattell.

It is highly interesting that Reeder, writing in 1900, knew enough to check Philbrick’s annual report from Boston 28 years before in 1872 (page 77) when Reeder himself was only thirteen years old. Reeder quoted Philbrick’s strong plea for the spelling book and Philbrick’s comment that the spelling book’s antagonist was “the modern educational maxim, ideas before words.” The Boston annual reports each year were encyclopedic, yet Reeder could put his finger on a specific pertinent quotation from one 28 years before, even though he apparently had no personal connection with Boston. Reeder said that Philbrick had stated further that “Reading is spelling on the book, naming the letters, and syllabicating.” Yet poor Philbrick was fired in 1878, 22 years before Reeder wrote, and “spelling on the book, naming the letters, and syllabicating” were not only thrown out of Boston with Philbrick but were largely forgotten along with Philbrick himself.

It is unlikely that Reeder could have known Philbrick, who died about 1885 and whose name dropped into oblivion. It is probable that Reeder was directed to Philbrick’s comments buried deeply in the many annual volumes of the encyclopedic Boston schools’ reports by someone else. That would have been someone who knew there had been a conflict in Boston back in 1878, and who could isolate specific
items from the encyclopedic Boston school reports back to 1872 (which indicates, interestingly, a period of conflict running from at least 1872 to 1878).

That person might have been Cattell, who was then at Columbia University as was Reeder, and who could have learned of Philbrick’s comments through his close friend, William James, or possibly through his teacher at Lafayette College, Professor Francis A. March. It is highly improbable that Cattell could have found Philbrick’s comments by himself, as Cattell was only twelve years old in 1872 and was living in Pennsylvania, while his close friend in later years, William James, was thirty years old in 1872 and living in Cambridge, right across the Charles River from Philbrick’s Boston. In 1872, James had just begun teaching at Harvard, across the river from Boston. James’ former professor and close associate, Agassiz, was also still teaching at Harvard, and Agassiz had been campaigning against empty language at least from the 1870-1871 academic year. The neighbor who lived across the street from the James’ family home in Cambridge, President Eliot of Harvard, had possibly already begun his campaign for real literature in school readers by 1869, to judge from his collected writings mentioned previously.

The founding of the “Board of Supervisors” operating under the Boston School Committee, of which board Parker eventually became a member, dated from the school year 1877-1878, and presumably only from March 1, 1878, the date Philbrick was fired. The board filed its “sixth annual report of their work as a Board and as Supervisors, for the school year beginning Sept. 1, 1882, on September 25, 1883, which supports the presumed date of their organization as March 1, 1878. They were obviously a very busy group in 1882-83, as they said in their 1883 report they had held seventy-four meetings in the year from September 1, 1882 to September 1, 1883. According to this report, their duties were “specified in the Rules and Regulations of the School Committee under Sections 136-153 inclusive,’ which it would be of interest to see. This 1883 report of the board referred to its 1883 paper on reading, which has been discussed, and said further, under “Reading:”

“No subject has attracted more attention among the teachers of the country than ‘Reading’ as taught in the public schools. No one subject comprehends so much nor is so far-reaching in its effects upon the training of the child.

“During the present year the Board of Supervisors, at the request of the School Committee, undertook to revise the whole plan of teaching reading in the Primary Schools, and, if possible, to present some method that might be adopted, and followed by all the Primary teachers of the city.

“In the plan presented (School Document No. 1, 1883) the pupil begins by learning a few familiar words as names of objects equally familiar. A few other common words are also learned, that short sentences may be formed and written on the black-board. These sentences are carefully copied by the children upon their slates, more to impress the form of the word or the sentence upon the child’s mind, than because of its value as an exercise in writing.

“Constant effort is made to associate the spoken or written word with the idea it is intended to convey.

“Very soon the pupil’s attention is called to the sounds of the letters, uttering them only in imitation of the teacher, that the ear of the pupil may be carefully trained from the first to recognize correct sounds.”

Note the clear admission here that “phonics” at this beginning stage was concerned only with pronunciation and had nothing to do with decoding.
“When so much has been accomplished the progress becomes exceedingly rapid. Each new word learned is a help to the learning of analogous words, and the skill of the teacher is shown in the selection of such new words as will present the fewest difficulties to the pupil.

“A large number of words has been arranged in classes, and printed in a convenient form in the school document referred to for the purpose of assisting the teacher in her selection, and facilitating her work in its earliest stages.”

Note the clear endorsement of two-step phony phonics: the comparing of one whole meaning-bearing word to other whole sight words.

“It is confidently believed by the Board of Supervisors that when the plan is thoroughly understood, and skillfully carried out in all its details by the Primary teachers, excellent results will be gained.

“Individual preferences as to methods must give way to the general good, and if the best, as we conceive it, cannot be had, the best that we can have, ought to be accepted in good faith.

“This document has been issued by the authority of the School Board; and a copy has been placed in the hands of each Primary teacher as a guide in this department of her work in the future.”

This so-reasonable-sounding document is a cushioned announcement that any primary-grades teacher who used “sound” to teach beginning reading could anticipate being fired. It was the underpaid and overworked women teachers with enormous primary grade classes in Boston who had been doing the real work of teaching. They had, almost without exception, been using Leigh phonics successfully for some years before 1878, since almost every school district in Boston had freely chosen to use Leigh phonics. Yet after five years of “change,” by 1883, the controlling vise of the change-agents had tightened: if first-grade teachers in 1883 did not drop the Leigh phonics they had used so successfully and teach sight-words in its place, they could anticipate being fired.

Most meaningfully, portions of the unsigned 1883 paper, Method of Teaching Reading in the Primary Schools, published by the Board of Supervisors for the Public Schools of Boston in 1883, sound exactly like James’ prose and certainly contain his ideas about “meaning” and sentences. Furthermore, the portions could only have been written by someone trained in psychology, in the modern sense. It is my opinion that they were written by James sometime before 1882, at which time he left Harvard on a year’s leave of absence.

Concerning the only other probable authors, Colonel Parker had absorbed a lot of Hegelian ideas in Germany from 1872 to 1874 but had not studied with the psychologist Wundt. The psychologist G. Stanley Hall by 1883 was in Baltimore training the future psychologists Cattell and Dewey at Johns Hopkins. Josiah Royce had studied logic briefly with Wundt and practical philosophy and metaphysics with Lotze in Germany, and, it is true, formed a Psychology Club at the University of California in 1880, but a dominant influence on Royce was from William James, whose friend he had become when James gave lectures at Johns Hopkins University in 1878. By September, 1882, Royce had left the University of California to fill in for James while James was on sabbatical leave in the academic year of 1882-1883. Royce stayed permanently at Harvard and remained a close friend of James, but Royce was primarily a philosopher. (Biographical data is contained in The Letters of Josiah Royce, Edited and with an Introduction by John Clendenning, The University of Chicago Press, Chicago: 1970.) Royce would hardly have become involved in writing a tract for the Boston public schools immediately upon becoming a substitute instructor at Harvard in the academic year 1882-1883. That left William James as the only
psychologist, in the modern sense, other than Hall and George Trumbull Ladd (1842-1921), anywhere in America before 1883.

According to the Encyclopedia Britannica (1963), George Trumbull Ladd, an experimental psychologist and philosopher, was born on January 19, 1842, in Painesville, Ohio. In 1864, he was graduated from Western Reserve College and in 1869 from Andover Theological Seminary. For ten years until 1879, in Ohio and Milwaukee, Wisconsin, Ladd was a preacher, not a psychologist or professor. It was not until 1879-81 that Ladd became professor of philosophy at Bowdoin College, Brunswick, Maine. He next became Clark Professor of metaphysics and moral philosophy at Yale from 1881 to 1901, and then became the head of the graduate department of philosophy and psychology. He became professor emeritus in 1905 and died in New Haven on August 8, 1921. The brief biography stated Ladd had been influenced by the German, Lotze, whose Outlines he translated in 1877 and that Ladd was one of the first to introduce in 1879 the study of experimental psychology into the U. S., the Yale psychological laboratory later being founded by him. Ladd wrote a major psychology text published in 1887, three years before William James’ text, begun in 1878, was finally published in 1890.

However, the above shows that Ladd was still a preacher while James and Hall were actively concerned with experimental psychology, William James having made the claim that he founded the first psychology laboratory in America in 1874. Ladd’s first public contribution came with his 1877 translation of Lotze’s work (Lotze being the man with whom Cattell had first intended to study, but Lotze died). It is very unlikely that Ladd would have been working in psychology before 1879, or that his Bowdoin or Yale psychology students who began studying with Ladd only in 1879 could have had enough influence by 1883 to affect the Boston curriculum. The psychologist, G. Stanley Hall, was incapable of writing anything as lucid as the 1883 Boston material. That leaves James as the probable author of the 1883 Boston material which was so obviously written by a psychologist, in the modern sense of the word.

It is an intriguing fact, as referred to previously, that some of James’ personal literature, left for faculty use in a faculty room at Harvard, was stolen in 1930 or 1931, much to the shocked indignation of a faculty member who left his written reactions to this ungentlemanly theft in the Harvard library.

The following card is in the card catalog of the Harvard library:

Also in the library is a handwritten sheet of paper, about four by seven inches, with the note:

“This set of the writings of William James was given by Professor George H. Palmer to the Faculty Room, Emerson Hall, and after the loss of several volumes was transferred by him to the William James collection in the college library, January 5, 1931.”

Another note on Harvard College Library letterhead, dated July 1, 1932 was initialed G P W (G. P. Winship, who was assistant librarian):

“This is one of the volumes that Professor Palmer placed in Emerson B and which he withdrew and gave to the college library when he ‘fancied’ that the books in Emerson B were disappearing.”

That note suggests that the separate collection was broken up by G. P. Winship in July, 1932, and mixed in with other library materials. In addition, the use of the word, “fancied” by Assistant Librarian
Winship over a year and a half after Palmer first made his claim of a theft made Professor Palmer out to be a fool, and discounted the reality of a theft. Yet it seems highly unlikely that Palmer was a fool, and had imagined such a theft, since Palmer had stocked the room with other rare books for many years, and apparently had never previously made such a claim. Palmer’s outrage in his letter quoted below implicitly confirms that he had never previously claimed a theft of other rare books.

However, what is particularly interesting about the Harvard theft of some of the personal books of William James is its time frame, late 1930 or very early 1931. That is because of a comment in Charles F. Heartman’s third edition of his Bibliographical Check-List of the New England Primer, published in 1934. Heartman remarked on the:

“...most curious fact....”

It was the fact that some primers could no longer be located:

“...probably due to the crime wave which spread, a few years ago, over all the libraries in the country.”

That library crime wave all over America took place in 1930 or 1931. However, as mentioned later, periodic sweeps of Soviet libraries to remove “objectionable” books had been common in the Soviet Union in the 1920’s and were not considered to be a crime there. Those library “sweeps” were carried out at the behest of Lenin’s widow, Krupskaya (recorded in Robert H. McNeal’s biography, Bride of the Revolution, The University of Michigan Press, Ann Arbor, Michigan: 1972.)

Palmer’s letter published in The Harvard Crimson on January 31, 1931, page 2, was addressed, “To the Editor of the Crimson:”

“In Emerson Hall many years ago a room was provided and put under my charge where advanced students might find a chance for quiet study or talk. It was made in every way comfortable, books even. Its walls were paneled. There was a long leather lounge, closets for overcoats, a round work center table, portraits along the walls, and two cases filled with rare books, each book bearing a label, “Not to be taken from the room.” Of the books of William James, a complete set had been given by his son. These were precious and impossible to duplicate. Yet from this set a handful have been stolen - how many I cannot say, half a dozen, I should guess.

“Dirty business, this! A generous return for abounding kindness! I do not write this paper in the hope of recovering the books. All William James’ books are now safe in the college library, with a record of the facts. This paper will merely tell the great body of Harvard students how contemptible a person lurks among them. G. H. Palmer. 64.”

His letter in the Harvard files was dated on the back l/5/31, ll Quincy Street Street.

Professor Palmer used the terms, “the books of William James,” and “all William James’ books,” and indicated he could only guess how many were missing from what had been the complete set which was “impossible to duplicate.” Yet the library used the term, “This set of the writings of William James.” By 1931, twenty-one years after the death of world-famous William James, a published bibliography of James’ formally published writings must have been available in some fashion, or at the very least a record in the library catalog of James’ formally published works. A collection of his formally published works certainly should not have been “impossible to duplicate.” It should have been very simple to check off missing books in any such set by consulting a bibliography of James’ formally published work. Professor
Palmer’s comment that he could only guess how many were missing from the set of materials donated to Harvard by William James’ son was therefore senseless if the books consisted only of James’ formally published work. Instead, the volumes must have been just what Palmer said they were, ‘the books of William James,’ or James’ personal library, which would, of course, have included James’ own formally published work mixed with his other more casual writings. Such casual writings might have included material prepared for the many psychologists’ meetings in which he was involved or, most significantly, any material he might have prepared for the use only of local schools. Without a written record of the titles in such a complete personal collection which would have included such informal pamphlets and studies written originally only for limited circulation and short-term use (some of which possibly were published in book form with the writings of associates), no one could have done anything but hazard a guess on how many had disappeared.

One of the catalog cards in the Harvard libraries for a book that had probably originally been among the collection referred to by Professor Palmer in January, 1931, which collection apparently was broken up by Winship in July, 1932, showed the following call number and information:

Since the corrections were assumed to be in James’ own handwriting, this suggests this copy was among the materials in James’ personal collection donated to Harvard by his son. It would be of interest to learn what was on pages 5, 6, and 7 that were cut out of the copy.

Note, however, that in 1905, Macmillan had a Lancaster office, where Science Press was later - and possibly at that time - located. This suggests ties with James McKeen Cattell and the publishing of The Psychological Review by Macmillan in Lancaster. That periodical was very possibly printed in Lancaster for Macmillan by Science Press through Cattell’s influence. Cattell was closely associated with Science Press in Lancaster, and Cattell’s daughter, Psyche, founded and ran a nursery-kindergarten school in Lancaster for many years, possibly from as early as the 1930’s until her recent death.

However, that theft of material from the collection that had been owned by William James, himself, was a very curious one. That unknown and unknowable material was stolen about December, 1930, three months after William Scott Gray’s Dick and Jane deaf-mute-method readers first arrived in American schools, with no reference, of course, to the fact those 1930 reading books used the deaf-mute method to teach reading. Yet it was that same deaf-mute method that had really been used in Farnham’s 1870 Binghamton so-called “sentence method,” and in the new method that had been introduced in the Boston schools in 1878. Perhaps those missing volumes of William James might have confirmed whether or not William James, himself, was involved in the origin of that deaf-mute-method that was invading American schools in 1930. As has been discussed, the record certainly does suggest that James may have been involved in Farnham’s 1870 Binghamton sentence method and in the removal of real phonics from the Boston schools in 1878.

James’ lengthy account in his 1890 psychology text of a deaf-mute’s highly intelligent thoughts before acquiring any language, James’ “stream of consciousness ideas” and James’ contempt for “empty” language, seem to provide an excellent rationale for the pure deaf-mute method in teaching reading, with only phony phonics, which is the visual comparison of meaning-bearing whole words to each other to see like parts.
I suggest that Cattell’s 1880’s experiments seemed to give James’ ideas “laboratory” proof, and may have been the initial reason for the friendship between Cattell and James. I further suggest that James’ disciples deliberately carried out in the twentieth century what James probably attempted to do in the nineteenth: They removed all pure phonics (the “sound” of print, divorced from the “meaning” of print) from the teaching of reading.
Chapter 25
The Reading Texts of the Seventies and Eighties

The “expert” view on reading instruction in 1882 showed up in The Dictionary of Education and Instruction by Henry Kiddle and A. J. Schem,( N. Y., E. Steiger & Co.; London, Sampson Low & Co., 1882). That publication was based on the Cyclopedia of Education that had been published a few years before in England. (Kiddle was apparently still the superintendent of schools in New York City.) The following is from the article, “Reading.” (pages 245-246). Note that at its end Johonnot is cited as a kind of ultimate authority, but he is only parroting the “sentence” ideas that seem to have originated with William James.

“The alphabet method, or A-B-C method requires that the child should learn the names of all the letters of the alphabet, and, then, by means of a spelling process, learn the proper pronunciation of their combinations. This process is condemned by most teachers of the present time, as long and tedious, as well as illogical; the method most generally preferred being that denominated the word method, by which the child learns at once to pronounce short words, and is taught the sounds and names of the letters, by an analysis of them. When the sounds of the letters are used instead of the names, the process has been called the phonic method, which in modern didactics, is most generally approved....”

This approval was not given to real phonics but to a variety of “phony phonics” which was actually elocution. The children were taught the whole words first as sight words, and afterwards were drilled in reciting their letter sounds, as a review of American and English reading texts shows. (“Walk” might eventually be recited as “w - au - k.” It is obvious such “phonics” was really elocution.). That real phonics was not meant was shown by the following remark:

“...the teacher must always bear in mind, that what the child is learning to pronounce is a symbol of thought; and hence, at every step, the pupil’s understanding is to be addressed. ‘Each sentence read,’ says JOHONNOT (in Principles and Practice of Teaching, N. Y., 1881, ‘should be the embodiment of a thought which the pupil thoroughly understands, and should be delivered precisely as it should be spoken. The practice of allowing the words of a reading lesson to be pronounced separately should never be permitted.'”

Another statement by Kiddle which will be quoted shortly showed he did not endorse real phonics.

The Scots philosopher/psychologist, Bain, in his book, Education as a Science, 1881, was quoted in an article on the ABC method on page 19 of The Dictionary of Education and Instruction. It confirms that by 1882 the “word” method in both England and America was the norm for beginners, but that the ABC method which it had replaced after about 1870 had really been the same thing.

“Much stress is now laid by teachers on the point of beginning to pronounce short words at sight, without spelling them; and a strong condemnation is uttered against the old spelling method. The difference between the methods is not very apparent to me; after a few preliminary steps, the two must come to the same thing.”

No indication exists that the Scottish philosopher/psychologist Bain was concerned to any real extent with beginning reading theory, except to report on prevalent practices. Bain’s general background has been mentioned earlier.
Confirmation that the pure “word” method, and before it the ABC method, had been producing disabilities for a very long time also appeared in The Dictionary of Education and Instruction (pages 228-229), in the article, “Orthography.” The best indication of reading disability is spelling disability and good spellers are the norm with the “sound” method. Yet the 1882 article assumed that such good spelling was a rare achievement. Elsewhere in this history, it is noted that nine out of ten civil service candidates in England failed spelling tests during the 1880’s!

“The standard spelling of our language is so irregular, that continual practice for many years is necessary to make any approach to the mastery of it.... with all aids and arts, good spelling is one of the most rare and costly accomplishments....”

Therefore, by the 1880’s, “meaning” had effectively defeated the movement back to “sound” in the teaching of beginning reading in the English-speaking world, and it was producing its customary disabilities in spelling and reading. Note the disgusting influence of the male “experts,” Bain, Johonnot, Kiddle, et al, who were meddling with first grade reading, even though they had probably never taught it. Women teachers, who lacked status, had to do what they had been told to do by the normal schools and by the appalling reading texts if they did not want to be fired.23

To demonstrate the effectiveness of the nationwide publicity in America from before 1878 until after 1883 given to both the Quincy and Boston change-agent programs, which endorsed teaching beginning reading by “meaning” and which rejected teaching beginning reading by “sound,” three excerpts from two nationally distributed teachers’ magazines are quoted below.

The term, “new departure,” in the first excerpt from 1878 had apparently been used first in connection with the Quincy program under Colonel Parker starting in 1875. (Confirming the association of the term with Quincy, Estes published a book in 1879 by Charles Frances Adams, Jr., entitled New Departure in the Common Schools of Quincy, and Other Papers on Educational Topics.) The second excerpt from a teacher’s magazine from 1880 seems to suggest that the famous and widely praised Colonel Parker was very much of an intellectual lightweight, and a confused one, at that. The theme of the third excerpt from 1883 was “off with the old, on with the new,” or change for the sake of change, itself. That, of course, was nicely Hegelian. It legitimized the switch from “sound” back to “meaning” in the teaching of beginning reading. That switch had started in Quincy, Massachusetts in April, 1875, and in Boston, Massachusetts in March, 1878 (two years before Parker left the Quincy schools and went to the Boston schools), and had made an almost clean sweep in America by 1883, except in parts of the Midwest using the 1879 McGuffey phonic edition or Leigh print.

The following appeared in The Primary Teacher, T. W. Bicknell, Publisher, Boston. December, 1878, Vol. II, No. 4, page 119:

23 The “progress” fallacy is perhaps nowhere more noticeable than in relation to women’s welfare. In its article on double monasteries, The Catholic Encyclopedia, 1913 (Vol. X, pages 452-453) discussed the norm in the fifth to tenth centuries for such establishments in England, Ireland, and the Continent. Separated by a wall, women members were in the monastery on one side, and men on the other, both meeting in the church which was common to both. The women in these monasteries were often famous for their learning. The advantage of double monasteries was that priest monks could say Mass for both groups. Yet, customarily, the head of BOTH monasteries was the nun in charge of the women’s monastery! The Anglo-Saxon author, Caedmon, worked and wrote his great work, presumed to be the source for Milton’s Paradise Lost, in just such a monastery. Giving the principal authority to a woman seemed normal enough to the monks in the so-called Dark Ages. Compare that to the “enlightened” nineteenth century, when women had virtually no authority anywhere and customarily were paid only half of a man’s salary for the same teaching job, as confirmed by published records from that period.
“Our Notebook... Owing to the great interest felt in all parts of the country, in the course of study recently adopted for the Boston primary schools, which is, in some respects, a ‘new departure’ in this grade of instruction, we print the entire course in this issue of THE TEACHER. In subsequent issues we shall furnish the courses of other leading cities....”

This appeared in The Primary Teacher, September, 1880, page 24:

““Our Note-Book... In all sections of the country there is an intense interest felt in regard to the admirable reformatory work in elementary instruction, which has been largely stimulated by Col. Parker, recent Superintendent of Schools at Quincy, Mass., and now one of the Board of Supervisors of Boston. That our readers may have the benefit of all his helpful suggestions, we quote some of his remarks made at the National Educational Association at Chautauqua:

““The richest fruitage of the past is the ability to move forward, and the essential condition of progress is freedom, - freedom to grow and help others to grow. What superintendent is not hampered? The teacher who is looking out for a re-election can’t advance. The principal with one eye on a book-publishing house can’t carry his school forward. A teacher chained to examinations can’t be free. Our great battle is for freedom: freedom from interference; freedom from methods. Have our own plans, and carry them out....

““Let the end be mind-development of yourself and pupils, - the power to see and think. Whatever best develops the mind, that is the most practical education....

““God determined how the child’s mind shall grow. All the teacher can do is to aid that growth. But you must have freedom to do this. Well, suppose your school-committee stands in your path. Take your life in your hand and say, “Turn me out if you will; here I stand for children’s rights.” We are a servile set, thinking too much of our bread and butter.

““A superintendent who don’t allow his teachers freedom, is a nuisance, and ought to be put out. A teacher who has no ideal, no lifting horizon, is a nuisance. I say to my teachers, Don’t follow me, go your own way to work. Do a little well. But one thing I do demand. You shall move. Move on, like poor Jo. Do nothing twice alike. Don’t do things you have done before. If the child stood up before, have him set down now. Whatever you do, do something different. Have no patterns. Uniformity is death, - unity is life. If we all study the principles that underlie education and the child-nature, we won’t quarrel so much.”“

It might be noted in passing that Parker threw out the grammar in the elementary schools, but it is obvious Parker badly needed to study grammar himself. It is also obvious that his much-praised “wisdom” as contained in the above remarks was largely emotional, unfocused nonsense.

This appeared in Vol. 1, No. 1, September, 1883 of the periodical, The American Teacher, which had been newly formed from The Primary Teacher, The Public School, and The Kindergarten Messenger. Its Editors were Thos. W. Bicknell, Wm. E. Sheldon, and W. N. Hailman:

““Editorial Notes... We are in the midst of the greatest educational activity that our country has ever seen. Old methods are laid aside; new ones meet with a hearty reception. The best teachers are inquiring for the better ways, and thoughtful minds are discussing principles and weighing theories. None can afford to stand still, or go backward. Forward is the only line of motion, that is rational or consistent with the spirit of the true teacher. The good must give place to the better, the better to the best, and the old and useless must go by the board....””
What had actually gone “by the board” by 1883 was Leigh phonics for teaching beginning reading, and the developing phonics “sound” revival of the 1860’s and 1870’s in beginning reading, even though the “sound” revival, and Leigh phonics, had reached almost a flood tide by 1875 when Parker first arrived in Quincy. Yet by 1883, after far greater opposing floods of nation-wide publicity on teaching beginning reading “meaningfully,” Parker (or, more accurately, Parker’s promoters) had succeeded in having almost all American children taught to “talk with their pencils,” copying script “meaning-bearing” sentences from the blackboard before the children knew even the letters of the alphabet. By 1883, after that massive publicity, “meaning” had won out once again over “sound” in the teaching of beginning reading.

Even during the short-lived popularity of the Leigh phonic approach, most of the primers of the 1870’s had remained sight-word readers, with only lip service given to phonics. Yet, before 1875, most of the major series also had a Leigh-print edition as well as the standard print edition, so the effect in those places using the Leigh phonic print editions had usually been to teach by “sound.” The 1879 new McGuffey series continued the phonic emphasis of the 1870’s, as it was written to support real phonics, marking letters in a similar fashion to Leigh’s system. However, the new McGuffey series covered only a fraction of the textbook market of the day, despite statements in the literature to the contrary.

By the time the pro-phonics new McGuffey series was published in 1879, the death-blow to Leigh phonics had already been dealt by the Appleton sight-word, phony-phonics series of 1878, on which the “philosopher,” William Torrey Harris, was the principal author. The Appleton series dominated the market after 1878, displacing the earlier popular series, most of which had Leigh-print editions. Except for Sheldon’s 1875 series, and in sharp contrast to most earlier major series, Appleton’s was the first new major series in many years without a Leigh-print edition. By displacing those earlier series and dominating the market, the Appleton series killed off Leigh pronouncing print. The Appleton series, in combination with the Franklin series in its non-Leigh-print editions, appears to have been used by the change-agents starting in 1878 to remove Leigh-print editions with their true phonics from beginning reading instruction in America.

The year the Appleton readers were published, 1878, was the height of the “meaning” activism emanating from Colonel Parker’s Quincy schools. In Colonel Parker’s Quincy schools, first-grade children were being taught to “talk with their pencils.” The children copied whole sentences in script from the blackboard at the very beginning of reading “instruction” even though they may not have known a single letter of the alphabet. Real phonics was verboten in Parker’s Quincy schools. Despite its window-dressing phony phonics, real phonics was verboten in the Appleton series, too.

Articles about the Appleton materials in The Primary Teacher, which articles were written by Rebecca Rickoff who wrote the beginning charts for the Appleton series, make it clear the Appleton readers rated only a Code 3, phony phonics label.

It was in 1873 that Dr. Edwin Leigh had given a defensive paper on his phonic method before the National Education Association, obviously trying to placate opposition by claiming his materials could be combined with the word or sentence method. He obviously did not succeed in quelling opposition. Leigh print was essentially gone before 1880 except in St. Louis and in the McGuffey adaptation being used in parts of the Midwest like Missouri and Ohio. The newest enthusiasm of gullible school administrators was Parker’s Quincy “meaning” methods. As a result, by 1880, real phonics or “sound” in the teaching of beginning reading was gone from almost all American schools except some in the Midwest.

Evidence of texts in use by 1879, after the Parker influence was in full bloom, is given in the Primary Teacher, Boston, January, 1879, pages 151-152. However, it is ALSO impressive that the “psychology” jargon had reached that Boston publication full-blown less than a year after “psychology” pushed phonics
out of the Boston public schools. The job the activists did was very thorough, indeed, just as with “whole
language” today, and they succeeded in enlisting the Primary Teacher in their campaign.

“A Kansas teacher asks us for a general course of study for the first year in a primary school.
We publish below a course of instruction:

“FIRST HALF......Suggestions and References...Thought and Expression, Part I.24, Munroe’s25 Chart and Chart Primer, Appleton’s First Readers,26 Model First Reader27 Harvey’s First Reader,28 Sheldon’s Primer,29 Franklin First Reader,30 How to Teach31, Calkins’s New Primary Object Lessons....32.”

One curious thing which all of the highly recommended materials in The Primary Teacher in January,
1879, seemed to have in common was that they did NOT have editions in Leigh-print, except for the
Franklin, even though most widely used series had Leigh-print editions by then.

Yet, as shown by the history of the Franklin series written by Hillard and Campbell, the use of
Leigh-print earlier Hillard and Campbell editions in Boston had suddenly ceased in 1878. They were
apparently replaced in September, 1878, by non-Leigh print editions set up by University Press in
Cambridge only the year before, at which time apparently almost all schools in Boston had been using
Leigh-print editions of Hillard’s and Campbell’s earlier readers for beginners. That bizarre fact, the
printing of non-Leigh-print readers in Harvard’s Cambridge by Harvard’s privately-owned but official
press, for which reading books no apparent market yet existed across the river in Boston in 1877, should

24 I have not located the text, Thought and Expression, Part I. However, it obviously concerned drilling beginners
on the “meaning” of print and not its “sound.” Appleton’s, Sheldon’s and the Franklin readers all used phony
phonics with the primary emphasis on “meaning.” Sheldon’s Primer would have been part of E. A. Sheldon’s
1875 series published by Scribner, and it did not have a Leigh-print edition according to the 1876 American
Catalogue. “Sheldon’s Primer” was obviously not from Sheldon & Co’s later 1881 Model School series, which
apparently had no primer. See Appendix C on the two different “Sheldon” series. See extensive remarks on the
critically important Appleton’s and Franklin texts elsewhere in this history. The approach of Harvey’s 1875 series
which was put out by McGuffey’s publishers is unknown but the series is briefly discussed later. According to
the 1876 American Catalogue, Harvey’s did not have a Leigh-print edition, even though the earlier McGuffey edition
by the same publisher is shown with a Leigh-print edition.
25 Monroe’s: a “meaning” approach with inadequate phonics, which is discussed in Appendix C. According to the
1876 American Catalogue, Monroe’s First Reader published by Cowperthwait did not have a Leigh-print edition in
1876, although Early American Textbooks shows that it did have one in 1873. This primer material dates at
least from 1875 since it is listed in another Monroe text published by Cowperthwait in 1875. Yet it was not listed
in the 1876 American Catalogue, nor is it listed in Early American Textbooks.
26 See footnote 25.
27 See the comments later on Webb’s 1873-1876 Model Readers published by Sherwood which used a “meaning”
approach. Edwards’ and Webb’s 1st to 6th, plus “Intermediate” Analytical Readers of 1866-1871 listed in the
1876 American Catalogue as published by Sherwood of Chicago and Taintor of New York., show a Leigh-print
edition. For that Leigh edition, a Harvard copy of the First Reader confirms a date of 1871, which is late in
comparison to other leading series. Yet according to the 1876 American Catalogue, Webb’s four-volume (1st to
4th) 1873-1876 Model Readers listed as published by Sherwood of Chicago did not have a Leigh-print edition,
nor did his much earlier five-volume (1st to 5th) Normal Readers listed as published by Taintor of New York in
1876.
28 See footnote 25.
29 See footnote 25.
30 See footnote 25.
31 Probably the text written in 1873 by Henry Kiddle, City Superintendent of Public Instruction in New York City.
Kiddle did not endorse real phonics for beginners. See the later comments on Kiddle.
32 In 1873, Calkins was First Assistant Superintendent of Primary Schools in New York City. Calkins did not
endorse real phonics for beginners. See later comments on Calkins and object lessons.
be considered along with the following fact. This January, 1879, magazine recommending the Franklin series by Hillard and Campbell was published in Boston less than a year after the switch had been made from Leigh-approving Superintendent Philbrick to a non-Leigh-approving superintendent, and only about four months after the switch had been made in the Boston schools from Leigh-print to non-Leigh-print Hillard and Campbell materials, apparently using the readers that had been printed by University Press only the year before.

Why was University Press used? Non-Leigh editions had been available from the publisher at that time and could easily have been ordered directly from them. No publisher objects to filling book orders and taking profits from them. Yet, such a publicly-placed very large book order for non-Leigh-print editions in 1877, of course, would have had to be placed by someone who had no authority over the Boston schools, since then-Superintendent Philbrick wholeheartedly endorsed the Leigh-print-editions. Yet, if enough copies were to be available to provide all Boston primary schools by 1878, when the switch was apparently planned, those copies would have to be ordered and set up a year or so in advance. The record suggests, therefore, that people with no official authority whatsoever chose to subsidize financially (and secretly so that their names and their plans would not be known) the printing of a very large number of beginning reading books in ordinary print in 1877 (or 1876). They did so in order that enough books would be available when their planned take-over of authority in the Boston schools was completed by 1878. That kind of underhanded, distasteful manipulation is characteristic of change-agents.

As has been discussed, Leigh phonic print was a special type of print, in which words were spelled in their dictionary spellings, but the letters were made to serve the function of diacritical marks by giving them various shadings and changes in shape. Beginners learned, not the regular alphabet, but the Leigh-print alphabet, and with that as a key, could sound out and read anything which had been transposed into Leigh print. Apparently, it was Dr. Edwin Leigh himself who took beginning reading books in their normal spellings and translated them into his specially marked letter spellings. Leigh’s transposed materials are read without any difficulty by anyone who can already read English. However, their advantage for beginners was that, once the beginners knew the sound of each specially marked letter, all they had to do to read new material in Leigh print was to string the learned sounds together: true sounding-and blending phonics. As Boston Superintendent Philbrick made clear, the Leigh materials were spectacularly successful in teaching little beginners to read, since the children had no trouble in switching to regularly printed materials in second grade, which regularly printed materials they then read with far greater fluency than previous second-graders had read.

This 1879 Primary Teacher list of recommended readers omitted any of the widely used series published by three very large companies, Ivison, Barnes and Harper. Since the first two were publishing Leigh-phonic-print editions of their reading series as well as standard editions, their reading series may have been excluded precisely because those companies published such Leigh-print editions. The history strongly suggests that all Leigh-print materials, and their publishers, were subject to blackballing since perhaps 1875 (or possibly 1873).

However, no indication exists that Harper’s 1860 material by Marcius Willson was in Leigh print by 1879. Yet it was an old and therefore perhaps outdated series and would most probably have reasonably been excluded for that reason. (See Appendix C for a listing of readers by these three companies.)

In 1876, as in 1890, the largest American textbook companies were probably Ivison, Barnes, Appleton, and Wilson (later Van Antwerp), which four companies became American Book Company in 1890, and Harper, which sold its textbook section to American Book Company in 1890. After that 1890 merger and purchase, which is discussed more completely elsewhere in this history, the textbook sales from these five companies were estimated at 80 per cent of the American market total. Presumably, even by 1876, these five companies made most of the reading text sales in America, with Brewer of Boston and
the Sherwood/Taintor associated companies of Chicago and New York also making large reading text sales. There were, of course, many other American companies such as Cowperthwait and Scribner whose reading texts were listed in the 1876 American Catalogue, but their sales were much smaller.

Edwin Leigh first published his phonic method in 1864. Therefore, its success by 1873 can easily be judged by the relative influence of Leigh print on these eight American reading text publishers: the six companies of Ivison, Barnes, Appleton, Wilson (which became Van Antwerp), Harper, and Brewer, and the two associated companies of Sherwood and Taintor.

By 1873, Ivison, Barnes, and Wilson (later Van Antwerp) were publishing Leigh phonic print editions, as well as standard editions, of most of their beginning readers, as were Brewer and the two Sherwood/Taintor related companies. All these companies had been publishing Leigh editions since about 1866 and 1868. (The smaller Philadelphia publisher, Cowperthwait, published a Leigh edition of the readers of the Bostonian, Monroe, in 1873, according to Early American Textbooks, but dropped it by 1876, if the 1876 American Catalogue is correct. Yet none of E. A. Sheldon’s series by Scribner, which were apparently not widely used, were ever in Leigh print.) In 1876, Barnes even published the beginning books of its brand-new 1873 reading series in Leigh print as well as standard print. Therefore, of the eight major reading-text publishers which were listed above, only Appleton and Harper stood clear of Leigh influence by 1873. (Obviously, most of the smaller series did not appear in Leigh print, as translating the readers from standard print to Leigh print was apparently done by Dr. Edwin Leigh himself, and the job must have been very time-consuming. Leigh also did some work on pronouncing foreign languages by using his print, so he may have been very busy.)

It was in 1873 that Leigh received a medal at the Vienna exposition for his Leigh print. That year, 1873, was the high tide of Leigh print, after which the tide receded with astonishing speed because of the NEA paper by Farnham. The influence of Leigh print was almost totally gone by 1879, even though earlier Leigh editions of Sherwood/Taintor materials seemed to have remained available on the market, to judge from the advertisements on the back of Sherwood/Taintor book-covers into the 1880’s.

Whether Leigh-print orders would have been filled by Sherwood/Taintor is another matter. No Leigh-print editions have turned up after 1876 of any of Sherwood/Taintor’s various reading series. By 1878, those series included not only materials by Edwards and Webb which had a Leigh edition by 1871, but materials by Hillard and Campbell which had been handled by Brewer before 1878. The 1864 Hillard and Campbell series had Leigh editions of the first reader in 1866 and the second in 1868. The Hillard and Campbell Franklin series had a Leigh edition which possibly dated from 1873 when its primer was first published by Brewer. Brewer went out of business by 1878. The record suggests it was the power-play of blackballing the sales of those textbook companies which promoted Leigh print which succeeded in forcing those companies to drop Leigh print materials in such an astonishingly short time. In the case of the Brewer company of Boston, the possibility exists that the Brewer company was forced out of business in 1876 or 1877.

The Primary Teacher was a new magazine published in Boston from October, 1877, which apparently immediately had nation-wide distribution, to judge from the letters it received and published. It was very much in tune with the “New Education” emanating from Colonel Parker’s Quincy schools since 1875. The views of the new magazine concerning beginning reading instruction were also in tune with all the “improvements” in reading instruction being promoted by the Parker clique. As quoted above, The Primary Teacher listed recommended reading series in January, 1879, less than a year after the pro-Leigh-print Boston Schools Superintendent Philbrick had been fired. As discussed elsewhere, the Brewer Leigh-print editions had obviously been removed from the Boston schools by September, 1878, and had been replaced by non-Leigh-print editions (now published by Brewer’s successors, Taintor and Wm. Ware). The Primary Teacher of Boston, which was apparently read all over America, flatly rejected
real phonics in the first-half year of school (thereby rejecting Leigh-print without naming it) and listed a number of acceptable reading series. Except for the Taintor/Ware (ex-Brewer) materials so unhappily associated with the Boston change-over, discussed at length elsewhere, not a single reading series it listed was available in Leigh print in 1879!

Wilson (before 1879 renamed Van Antwerp) had published Harvey’s new readers in 1875, curiously without a Leigh edition, even though its McGuffey readers had a Leigh edition ever since about 1868. That seems to suggest some kind of non-Leigh influence on Wilson in 1875. Non-Leigh-print Harvey’s was listed by The Primary Teacher in 1879, but not the earlier Leigh-print McGuffey’s which was shown in the 1876 American Catalogue as still available in that year. Cowperthwait’s Monroe materials were listed by The Primary Teacher in 1879, and they were apparently without a Leigh edition by 1876. The non-Leigh print Appleton series of 1878 was listed. Webb’s newer series published by Sherwood, which had never been available in Leigh print, was listed, but none of the earlier materials that had been available in Leigh print. Yet omitted from The Primary Teacher listing of recommended series were ALL of the formerly massively used reading series of Ivison and Barnes! The record suggests that all of Ivison’s and Barne’s beginning materials had been available in Leigh print in 1876, including Ivison’s very elegant new 1873 series, a portion of which was reproduced by Buisson in his 1876 report, referred to elsewhere.

The Parker/Quincy/Boston clique had become the single most authoritative voice in American education by 1879, apparently as the result of a massive publicity campaign. It was that clique which determined the “correct” way to teach just about any elementary subject, and it had pronounced, through such avenues as The Primary Teacher, what were “correct” beginning reading materials. NONE of the formerly massively used Ivison and Barnes reading materials were included as “correct” materials in The Primary Teacher listing of 1879. It is obvious that the reading textbook sales of the Leigh-supportive Ivison and Barnes companies were being choked off by The Primary Teacher and its associated clique in 1879. It is therefore hardly surprising that by 1882 both Ivison and Barnes were putting brand-new “meaning” reading series on the market, neither of which were available in Leigh print, which new series could meet the “discriminating” tastes of the change-agents! Leigh print, which had been the toast even of the Vienna exposition in 1873, passed into near oblivion by 1880. It obviously did so because of painstaking work by change-agents.

Of the eight major publishers of reading materials listed above, only Harper had remained outside both the “approved” list of 1879 and the list of Leigh publishers. Harper was a major publisher of all kinds of materials, so its textbook sales, even though large, probably represented only a small part of its total sales. Harper had the famous Marcus Willson “meaning” series on the market by 1860, but it had apparently published no new reading series in the intervening 19 years to 1879. That The Primary Teacher omitted Harper’s, despite the fact it was not available in Leigh print, seems only natural. Harper’s series was simply outdated. Yet, by 1889, Harper had the new Baldwin “meaning” series on the market, the year before it sold its textbook section to American Book. By 1901, Baldwin had rewritten the 1879 McGuffey series for American Book, who was the publisher of McGuffey’s by that date. The 1901 Baldwin McGuffey’s used a “meaning” instead of “sound” approach in the beginning reader. Yet that 1901 “meaning” Baldwin edition is virtually unknown today. It is only the 1879 “sound” McGuffey edition published by Van Antwerp, Wilson’s successor, that is commonly thought of as the McGuffey material.

The history on Leigh print, outlined above, provides a frame of reference in which it is far easier to understand that 1879 McGuffey edition, which used a phonic approach to teach beginning reading. In Vail’s 1911 history of the McGuffey readers, in which Vail identified himself as the editor of that 1879 McGuffey series, he stated the first reader as originally presented to him by his staff was unsatisfactory. Therefore, Vail, himself, rewrote the first reader as it was finally published. It is evident that Vail
invented a kind of variation of Leigh print. The material in the book itself is carefully arranged in a truly phonic sequence, and Vail stated he edited the book so that it could be used to teach phonics. Yet, Vail also said it could be used for the “word” method.

Since Harvey’s 1875 edition by Wilson, Van Antwerp’s predecessor, had not been published in Leigh print, that fact suggests some kind of anti-Leigh pressure on Wilson in 1875. Vail also did not use Leigh print in 1879, suggesting Vail recognized the power of anti-Leigh forces in 1879. Instead, Vail wrote material which he said could be used either for the phonic or word method. All of the phony phonics materials which began to come from the presses after Appleton’s 1878 series made the same claim, so that made Vail’s material seem like the rest of the “approved” materials. Appleton’s famous series also had claimed it taught phonics.

The record suggests, therefore, that Vail outsmarted all the “experts” in 1879. The new McGuffey’s rejected Leigh, which made it very au courant, and it seemed to endorse both the word and phonic method, like Appleton’s, which also made it au courant. Yet it was, sub-rosa, the real thing: it taught by phonics! What Vail did was very clever, indeed. He had invented a kind of phonetic print for use in his book, but he focused very little open attention on that phonetic print, and in addition he used a true phonic sequence. Then Vail announced that his new materials could be used to teach either the word or phonic method, making him acceptable to the “experts!” It would be of great interest to learn whether Vail was deliberately trying to outsmart the anti-“sound” forces in 1879, or if the 1879 first reader he produced was simply the product of his own common sense about teaching reading, combined with his knowledge of the widespread bias against Leigh-print by those who endorsed the “word” and “sentence” methods.

Yet both Barnes and Ivison dropped their support of Leigh-print and true phonics by 1882, as shown by their new series which began to be published in that year, so they obviously fell in line with the change-agent steamroller which was apparently centered in the Boston area.

Concerning Methods Endorsed by The Primary Teacher in January, 1879

The Primary Teacher “instructions” of January, 1879, for the first half year in primary school clearly demonstrated that none of the materials it listed were to be used to teach phonics during the psychologically critical first half year of school. (The alphabetic codes after the items below have been copied, although they were unexplained in the excerpt.)

“READING.
“Steps (c) Vocabulary of First Reader taught on blackboard.
Incidentals and Directions. - (c 1) Use script alone in teaching reading. (c 2) Associate words with familiar ideas, using objects, blackboard sketches, pictures, and stories, in order to make the ideas vivid in the acts of association. (c 3) Repeat these acts of association until the words taught recall instantly, in any sentence, the ideas of which they are signs. (c 4) Teach single words, phrases, and sentences; adjectives, prepositions, conjunctions, etc., should be taught in phrases and sentences, and not alone. (c 5) Pupils must never be allowed to try to read a sentence aloud until the thought it expresses is in their minds.
“Suggestions and references. - (S 3) The child should be taught to read by the same methods by which it learned to talk; the main thing is, that the acts of association of ideas and words be made effective. (S 4) Pupils should remain unconscious of the parts of a word until at least one hundred words have been taught. (S 5) The words should be arranged for teaching in phonetic order, under the different vowel-sounds: for example, - a, e, i, o, u, a, e, i, o, u, a, a, o, oi, ou. Words may be taught, however, not in this order.”

601
The vowels listed above had distinguishing diacritical markings which it is not possible to show here, and so they are omitted here. The reason for the “phonetic order” was that children would be drilled in “orthoepery,” or pronunciation, AFTER the teacher had told them the words. It was not for decoding.

Concerning the failure in decoding that resulted from such teaching, Dr. Joseph Mayer Rice reported the following concerning Kiddle’s and Calkin’s New York City by 1893, although both Kiddle and Calkins were probably gone by then. Rice’s remarks appear on page 38 of Rice’s The Public School System of the United States, 1893, quoted by Dr. Mitford Mathews on pages 110-111 of Mathew’s Teaching to Read - Historically Considered, The University of Chicago Press, Chicago, 1966. Edward G. Ward of the Brooklyn schools in New York City published his famous phonic series, The Rational Method in Reading, in 1894, stating it was such failure which had made him write his materials. Ward’s comments are further confirmation that reading failure was pandemic in New York City government schools before 1893. Reports on reading failure in New York City before 1876 were also specifically noted by Buisson in his 1876 report on the Philadelphia Exposition, as noted elsewhere.

Rice wrote:

“In reading, the word method is followed. The pupils are taught to read the number of words prescribed for the grade and no more, and they are taught to spell the words as they learn to read them. They are not encouraged to acquire the ability to read new words, each new word being developed before it is shown to the child, which means practically that the child is told what the word is before he is allowed to name it. But this method is typical of the New York primary schools. I asked the principal whether the children in the highest grade (third-year class) were not able to read new words without being told what they were. She answered in substance: “How can they know what a word is when they have never seen it before? Could you recognize a thing that you had never before seen?”

The Primary Teacher of January, 1879, made the following comments on writing and spelling:

“WRITING AND SPELLING

“Steps. - (d) Copy from the blackboard, on slate or blackboard, every word, phrase, and sentence taught. (e) Train pupils to make the letter i on slate and black board.... No matter how awkwardly the child begins to copy, notice and encourage every effort... Pupils should read all that they write upon their slates....”

The children were obviously copying whole words without knowing the alphabet, since at that point they were only practicing one letter, “i.” “Expert” advice of the period specifically said beginning children were NOT to be taught the alphabet! In November, 1881, the Primary Teacher, Boston, quoted on page 150 this remarkable advice given by William M. Giffin, Principal of the Newark (N.J.) City Training School in his manual, How Not to Teach, or One Hundred Things the Teachers Should Not Do:

“A teacher should not take time to teach the youngest children the names of the letters.

A child can be made to understand that certain lines placed thus... form a right-angled triangle, and that other certain lines placed thus, leg, form the word ‘leg.’ His knowing that the first letter is l, the second e, and the third g, does not help him any; in fact, his natural reasoning might lead him to think the word was ell - e - gee (elegy).”

Giffin was not recommending much spelling for older children, either, as he wrote:
A teacher should not ask pupils of ten years of age, or less, to learn more than five new words a day in spelling. Five words a day for four days will be twenty words a week, giving one day for review. Twenty words a week will be eight hundred a year, quite enough for pupils of this age to learn.

Giffin was telling a sad truth with the last advice. In contrast to sight-word trained children, most children (not all) who learn by phonics in first grade pick up “spelling” with almost no exertion of effort. My first graders astonished me with the ease with which most could spell before the end of the year most of the 300 commonest words in English. They did so with only casual study. Nor am I alone in recognizing how easy “spelling” is for phonically trained children. One very important phonics reading series omitted a spelling book entirely, because it was considered unnecessary! Yet, for thirteen years, the great majority of my third graders from about seven to eight years of age, who had learned with the basal reader sight-word approach in first grade, could not achieve the same success with the 300 commonest words as my first graders did later. It is very doubtful that most of Giffin’s sight-word-trained ten-year-olds could really learn to spell correctly as many as 800 words in a year.

It is my conjecture that the difference in spelling achievement between phonically-trained and sight-word-trained children is the result of the permanent establishment of different and opposite conditioned reflexes at the time children are first taught to read. Presumably, those reading “global,” whole sight-words by “meaning,” like pictures, establish a conditioned reflex to the right angular gyrus area of the brain, and the right side of the brain operates “globally,” or all at once, and processes pictures. Those reading by “sound,” presumably establish a conditioned reflex to the left angular gyrus area of the brain, and the left side of the brain operates sequentially, and processes language. Therefore, those with a conditioned reflex for “sound,” using the left side of the brain, would automatically perceive and record letters in words in their natural sound sequences, so spelling for them of these recorded visual memories would be remarkably easy. Yet those with a conditioned reflex for “meaning,” using the right side of the brain, would perceive and record only “global” and therefore non-sequential memories of words as soundless pictures. Spelling or reproducing those generalized visual memories of whole “words” should correspondingly be far more difficult. The vast difference in spelling achievement of “meaning” versus “sound” trained pupils supports my above conjecture. (I discussed this conjecture at length on pages 18 and 19 of my unpublished book dated January 5, 1985: On the Production of Permanent and Faulty Conditioned Reflexes in Reading Skills, and in some of my later writings.)

Webster’s speller to teach children to read was just a memory by 1879! Any kind of imitating scrawl of whole words, of which beginning “readers” and “writers” could not even name the letters, was to be “encouraged.” Notice in the above excerpt from The Primary Teacher of 1879 that the only isolated letter the children were actually to be taught in this lesson in the first half of first grade was the letter i! Obviously, “whole Language” educational malpractice is anything but new. Needless to say, the emphasis in teaching reading was totally on “meaning,” and had nothing to do with “sound.” The “generation of bad spellers” referred to in the preface to J. H. Stickney’s Word by Word, An Illustrated Primary Spelling Book, Ginn and Company, Boston, 1889, came from such shameful “teaching.”

Concerning Webb and Webb’s Model Readers Recommended in 1879 by The Primary Teacher.

According to the 1876 American Catalogue, J. R. Webb’s Model Readers in four volumes were published between 1873 and 1876 by Sherwood (the Chicago company which was bought out by Scott, Foresman, in 1894). Webb’s Model Readers were not available in Leigh print, even though Webb’s earlier materials written with Edwards from 1866 to 1871 were published by Sherwood in Leigh print in 1871. At least, the first reader is known to have appeared in Leigh print in 1871, as shown by the
copyright date for the Leigh edition on a Harvard copy, and the second reader may have appeared in Leigh print in that year or shortly afterwards.

Webb long before had wrongly claimed to be the author of the Word-Method. Whole sight-words, of course, had been in use since 1826, but beginners usually had to recite their letters orally. Webb’s only “contribution,” and even that was not original, had been to drop the spelling of sight words for beginners and then to call what was left the Word-Method. Webb promoted the Word-Method in his first book of 1846 (if the date given by Nila Banton Smith is correct). Yet Gallaudet and Mrs. Horace Mann (Mary Peabody) had dropped the spelling of the initial sight words for beginners in the 1830’s, but the approach had not been popular until Webb came along. Although the approach had been used sporadically before for years, Webb apparently did not know that.

Webb’s famous five-volume earlier series which began in 1846, the sight-word Normal Readers, which were discussed by Nila Banton Smith, were still being published by Taintor in 1876, and his Analytical series written with Richard Edwards, LL.D., president of the Illinois State Normal University, between 1866 and 1871 was being published by both Sherwood and Taintor. On page 98 of Early American Textbooks was shown The New Model First Reader Sentence Method, Chicago: Geo. Sherwood & Co., 1889, so Webb’s Model series was obviously revised by 1889. (As mentioned elsewhere, Edward’s Student series published by the Sherwood Company by 1880 was revised by Florence Holbrook for Scott, Foresman & Co. in 1897. Scott, Foresman & Company bought out Sherwood in 1894.) None of these series were in print when the 1912 United States Catalog was published. At that time Scott, Foresman was publishing Elson’s readers, and Taintor of New York as well as Sherwood of Chicago had disappeared from the listings.

The Analytical Speller, with a copyright of 1867, was published in New York by Taintor & Co. and in Chicago by Geo. and C. W. Sherwood. It had been written by Richard Edwards and Mortimer A. Warren, Principal of Avery Normal Institute, Charleston, S. C. On the back cover of a copy of the speller printed in 1868 was an advertisement for the Analytical First Reader through the Sixth Reader, and the advertisement included testimonials from normal school personnel in Oswego, New York; Westfield, Massachusetts; Minnesota; Illinois; and elsewhere.

Webb’s first series, the Normal readers, had been enormously successful, and endorsements from normal school personnel like those above for the Analytical readers probably accounted for the success of the Normal readers. Harvard has an 1854 copy of the United States Spelling Book of 1851, written by Josiah Miles of Watertown, New York. It was published by Lamport, Blakeman and Law of New York, who also published “Mr. Webb’s Readers” at that time. The speller, meant for upper grades, carried endorsements from B. F. Bush, Principal of Carthage Seminary of January 19, 1851, and Lysander H. Brown of Watertown, County Superintendent of Common Schools in 1842, 1843, and 1844, and Chairman of the (schools) Committee, New York State Legislature in 1845. An endorsement for the speller also appeared from George L. Farnham, Principal of Public School No. 8, Syracuse, dated February 21, 1851, the Farnham from whom so much would be heard later. Comments on the back cover of that 1854 speller concerned Webb’s books, which were published by the same company:

“These readers are used in the principal cities and villages throughout the United States, and are rapidly coming into use in the smaller towns of the country. Their merits have been fairly tested and they have universally been pronounced superior to any series of Readers extant; not only for the improvement in the system of teaching, which is the word method, but also in the high moral tone and inspiring character of the pieces selected. The author, Mr. Webb, was recently from the State Normal School in Albany.”
So, of course, were Farnham and Johonnot. However, Webb’s Normal readers received a kind of ultimate endorsement. Hon. S. S. Randall, Deputy State Superintendent, Common Schools, for New York State, wrote:

“They are the best Practical Readers that have come under my notice; they are all and everything they should be.”

B. F. Bush, Principal of Carthage Seminary on January 19, 1851, must surely have agreed with Hon. S. S. Randall and done his part to see to it that little beginning readers around Carthage, New York, had the “benefit” of the Webb readers. Some of those Carthage children must have become those adults my mother knew about when she was growing up in that area in the 1890’s, about whom I heard her say, as mentioned elsewhere, that they were “bright in every other way, as with their hands, but they never could learn to read.”

Yet the late Jean Crankshaw Ferrara, who is mentioned elsewhere, and who worked with retarded children in Newark, New Jersey, in the 1930’s, said that her school had success teaching children with intelligence quotients as low as 60 to read when they were taught with phonics.

The “Hon. S. S. Randall” back in the 1850’s, like most “honorable” today who sit on government panels and discuss the reading “problem” from typed material prepared by subordinates, simply did not know what he was talking about. I witnessed a New Jersey state governor address a group of educators in an auditorium in New York a few years ago, and his remarks seemed to be very relaxed and natural. Yet, directly ahead of me sat someone who was presumably one of the governor’s aides, or conceivably a reporter, with a copy of the same remarks in large print, which the aide or reporter was able to amend for any lapses in the governor’s choice of words. It seems highly unlikely that the governor’s pre-packaged, relaxed and natural comments on the “education problem” were really his own comments, instead of someone else’s. What good are such comments, if they are not really the official’s own? Why not let the subordinate give the talk, and have the official admit that he does not know enough about the problem to discuss it?

Webb’s Model readers, not in Leigh print, recommended by The Primary Teacher in 1879, would have produced the same result as Webb’s earlier materials: reading failure.

Concerning Calkin’s New Primary Object Lessons Recommended by The Primary Teacher in 1879, and Concerning the Background on the Object-Lesson Craze

Since Calkin’s original Primary Object Lessons had been published by Harper, as shown below, it is probable the New Primary Object Lessons were also published by Harper. How to Teach Phonics, Beckley-Cardy Co., undated, 80 pages, by N. A. Calkins is shown on page 78 of Early American Textbooks. However, it was not that book on phonics but Calkins’ book on object lessons that was one of those named in the list of recommended books in the Primary Teacher. Calkins would not have endorsed real phonics in any of his books. That Calkins of New York City, like Superintendent Kiddle of New York City, did not endorse real phonics is clear from other entries about his views in the Primary Teacher. Furthermore, Calkins had collaborated with a sight-word author. The original Calkins’ Primary Object Lessons (394 pages) was advertised on the back cover of Willson’s Larger Speller, from Willson’s School and Family Series, about 1863, which was written by Marcius Willson and published by Harper & Brothers, New York. Also advertised were Marcius Willson’s and N. A. Calkins’ School and Family Charts (22 colored charts), on reading, colors, animals and plants, which presumably was a kind of object teaching as well. The Larger Speller was preceded by Willson’s Primary Speller, a straight sight-word approach, dated 1863.
Object teaching had become a great enthusiasm in America by the early 1860’s. As previously described, Dr. John M. Keagy had written The Pestalozzian Primer in 1826 with an object-teaching approach. Keagy mentioned in his introduction that he was influenced in his ideas on education by Francis Joseph Neef, who had studied under Johann Pestalozzi before coming to America some years earlier. Neef had been one of the “experts” on the famed “boatload of knowledge” back in 1826. Keagy said he named his book after Pestalozzi because that “celebrated reformer in Education, who is still living in Switzerland...” began by using sensible objects and oral explanations. The theme of Keagy’s book was knowledge of real things, through the senses. Keagy had not been the only American author writing on object lessons long before the 1860’s. In 1832, Flagg and Gould of Andover, Massachusetts, published a 140-page book by Samuel R. Hall entitled, The Child’s Instructor, or Lessons on Common Things (call number PE III9.AIH.H3 pages 69-70 of Early American Textbooks, 1775-1900, OERI, U. S. Department of Education, Washington, D. C., 1985). Samuel R. Hall had started what was probably the first private normal school in America at Andover shortly before, and Hall was also the author of a very popular text in 1829, Lectures on School Keeping. Yet, despite this early emphasis by influential people, object teaching had never received much attention in America until E. A. Sheldon of Oswego Normal School had popularized the English version shortly before 1862.

The following quotations which shed much light on the thinking of the 1860’s and 1870’s are all from the book, Object Lessons: Prepared for Teachers of Primary Schools and Primary Classes, by A. S. Welch, Principal of Michigan State Normal School, published by A. S. Barnes & Company, New York and Chicago. The text was copyrighted in 1862 but an internal advertisement for The Independent Child’s Speller which it said was published in 1872 shows the copy of the book that I saw at Harvard was published by Barnes after 1872.

“Preface. The first instruction given to the child in school, should be based on the fact that his intellectual activity consists in seeing and hearing rather than in reasoning and reflecting. His restless curiosity about material things is natural and proper to childhood, and equally natural, also, is his aversion to abstract thinking. Any mode of teaching, therefore, which thwarts the former while it seeks to overcome the latter, is false in its philosophy and bad in its results. Since the senses of sight and hearing are first in exercise and development, the first step in school training should be to give them a systematic culture, and the period between the ages of five and ten years ought to be devoted mainly to this object.

“The order of instruction which I have thus briefly indicated, was announced sixty years ago by Pestalozzi, an eminent Swiss teacher, as the only natural order. Since that time it has prevailed in the schools of Germany and England, and is now being adopted in the better class of schools in this country.

“But the want of a suitable book, from which teachers could learn the best methods of training the senses of children by means of their appropriate objects, has proved a serious obstacle to the introduction of the Pestalozzian system into our primary schools. While lecturing on the subject before teachers’ institutes and educational conventions held in different States of the West, I have been invariably met with the question, ‘Where shall we find the right book?’

“It was this general inquiry that suggested the idea of publishing the series of Object Lessons which I had prepared in MS. for the experimental department of the Michigan State Normal School. These lessons have been given to large classes by the teachers of that department, and are found to answer fully the object designed. Similar lessons have also been given by normal pupils in various schools of the State, with similar success. It is hoped that the same matter, in the form of a book, will be equally acceptable to primary teachers generally. I may add that I have limited
the number of pages, so that neither its price nor the time required for its perusal, shall operate as a hindrance to its circulation. The youngest teachers will be able to prepare additional object lessons at pleasure from the models furnished.

“It is not intended that this book should supersede any of the text-books now in use. On following the plan of the first ninety pages, the teacher need not depart from the ordinary course of instruction first given to the child. I have only sought so to modify that course as to make it subserve the object of all primary instruction, namely, the cultivation of the senses of the pupil.”

Note Welch’s bizarre statement:

“...the object of all primary instruction, namely, the cultivation of the senses of the pupil.”

Senses of healthy living creatures do not need any cultivation. Their maturation in their normal environment is automatic, unless the creature has been damaged in some fashion. If Welch had said, instead, that the object of primary instruction was to teach children about the material world through their senses, that would be unobjectionable but very insufficient, since it left out the 3 R’s.

However, Welch very possibly meant exactly what he said, since the conflict persists today. “Experts” endorse education as a “process,” as with Welch’s apparent idea that the purpose of educating a child was to get his senses to perform more efficiently. Non-“experts,” like the writer, endorse education as a “product,” to be measured by what children manage objectively to learn (which means to “condition,” and it must be appropriate for their mental ages.) For instance, instruction in reading comprehension which is endorsed by “experts” concerns the vague and never-defined “process” of comprehending, but real instruction in phonics, which is a concrete “product” and something that can be learned or “conditioned,” is deplored by “experts.”

The open promotion of “process” over “product” is sometimes very sanctimoniously done at conferences run by “experts.” This was the case during the Open Classroom period in the early 1970’s. At that time, I was exposed to quantities of nonsense philosophy concerning “process” during the conferences arranged by the school system by which I was employed.

Welch continued:

“In the course of my labors I have consulted freely the English and German books on primary teaching, and in preparing my last sixty pages I have received valuable suggestions from the works of Miss Mayo.

“I gladly acknowledge my obligation to Mr. John Goodison for his aid in the Drawing Lessons and the first series of Lessons on Colors. I also proffer my hearty thanks to friends who have kindly commended the work in advance, especially to Mr. Wells, Superintendent of the Public Schools of Chicago, and to Mr. Gregory, Superintendent of Public Instruction for the State of Michigan.

“A. S. Welch. State Normal School, Ypsilanti, January, 1862.”

Welch’s “Preface” has been reproduced in full to demonstrate two things: to show the cosmopolitan nature of teaching theories at the time, and to show the pipeline through which such “correct” thinking reached the little, seemingly isolated American country schools. That pipeline was the omnipresent teachers’ institutes and the educational conventions, radiating out from the normal schools. The normal schools themselves were available to only a few teachers because of the cost of attending, and so they
were not directly the dominant influences on American education. The dominant and massive influences in
the nineteenth century came from the teachers’ institutes. Yet knowledge of these once massively-held
teachers’ institutes has almost totally dropped from today’s literature on the history of education.

Welch’s material from Michigan on object lessons was published in New York City by Appleton’s
and then, presumably, blanketed America. Concerning the material itself: it is typical of top-down
“expertise.” Welch, himself, was not a teacher of little beginners and probably never had been. Much of
his book is sheer nonsense and wheel-spinning activity, often either far below or far above the abilities of
normal children. To review it properly would require many pages. However, it had little to do with
teaching children to read by sound. The last half of the “First Series of Lessons” was concerned with
elocution and the first part of the “Second Series” was concerned with “Drawing Lessons Preparatory to
Learning the Alphabet.” After 45 pages of such drawing lessons, the last 26 of which finally were
cconcerned with drawing the letters (and the little-used capital letters first!!!), only three pages from pages
89 to 91 were devoted to “Sight and Sound Spelling.” In the rest of the 173-page book, nothing more
concerned the teaching of reading, which makes Welch’s opinion in 1862 of the utility of “phonics” very
clear. (With his 173 pages, it should be noted that Welch thought he had “limited the number of pages”!)

On page 89, Welch defined “sight” and “sound” spelling:

“Sight spelling is writing and naming in their order the letters that compose a written word.
Sound spelling is uttering separately and combining properly the sounds that compose a spoken word.”

Note that Welch’s definition said nothing about silent letters, patterned phonetic spellings, or irregular
spellings. What help could such “sound spelling” give a child in spelling or reading common words like
“plate,” “eight,” “climb,” “only,” “talk,” or “pretty?” Yet their silent letters and patterned phonetic or
irregular spellings are carefully covered in all true phonic programs.

“Sight spelling, being addressed to the eye, should be taught with the pen, pencil or crayon.
[Ed.: the term “chalk” was apparently not used then.] The pupil should be required to write the
word instead of merely naming its letters according to the old method.

“Sound spelling is addressed to the ear and should be made a simple vocal exercise, the
teacher pronouncing the word and the pupil uttering and combining the sounds that compose it.”

Note that the teacher pronounced the word first, which means that the pupil was being given the word
as a sight word, not working it out for himself.

Welch listed words for practice: me, he, be, at, up, no, on, “etc.” On the next and last page of
“phonic” directions, page 91, he directed that an object lesson on a hat should be taught, followed with
teaching these words: mat-pat-rat-cat; pig-gig-jig-rig, top-mop-sop. This, of course, is consonant
substitution on learned whole words, or two-step phony phonics.

Welch concluded:

“Such exercises may be continued until the class can print easily any word of one syllable.
The teacher may then teach words of two syllables in the same manner.”

What Welch was describing was not, of course, real phonics. The teacher was pronouncing and
teaching printed whole words to the children, which they then copied. The children were not learning to
read independently. In no way could Welch’s three ridiculous pages on so-called “phonics” take the place
of the extensive phonic teaching in Webster’s old speller. E. A. Sheldon of Oswego Normal School also claimed to be using phonics. His readers, when published, were only Code 3, using sight words and phony phonics. What Welch recommended would have been, in practice, probably the same.

A very sane critique on such object lessons - and on Pestalozzi - is given in Suggestions on the Principles and Methods of Elementary Instruction, by H. B. Wilbur, M. D., Superintendent of the New York State Asylum for Idiots, which was published in Albany by J. Munsell in 1862. Yet, not surprisingly, like most others of his generation, Wilbur endorsed sight-words, but his other views are more original and very wise. Wilbur said on page 19:

“It has quite frequently occurred, when the cultivation of the powers of observation has been made a leading end in early education, that the exercises to that end have run directly into scientific instruction. Thus lessons on form have passed into pure or mixed geometry; lessons on color into the science of color; lessons on the relations of numbers into all the intricacies of higher arithmetic; and lessons on language into grammatical analysis.”

He added a footnote at this point. (The blurred sections on my photocopy have been surmised and are enclosed in brackets.)

“In the brief discussion in the Association that this address elicited, the superintendent of the public schools of Oswego, where this ‘object system’ has been (instituted), arose and denied the fact that such a progression as I had described, was a feature in their system. To whom the credit of misstatement belongs, the reader may judge by the following quotation from a paper read before the education convention at Oswego last winter, by Miss E. M. Jones of London. Miss Jones, I hardly need to say, is an experienced teacher from the Normal School of the Home and Colonial Society of London. She came out to this country expressly to introduce their system of instruction into the Oswego schools, and has also (conducted exclusively) the training school for the Oswego teachers. She says, ‘We (go) from form to geometry, from place to geography, from weight to mechanics, from color to chromatography, from plants to botany... from human body to physiology, from objects to mineralogy...from actions to arts and manufactures, from language to grammar.’

“An illustration of the results of this process was afforded by a class examination... at this same convention, just alluded to. A class of bright children... were introduced in an exercise in the harmony of colors. In answer to questions propounded by the examining committee, it appeared that the pupils had been so confused by the attempt to learn the scientific (theory underlying) the harmony of colors, that they had absolutely lost the true idea, (that by ) ‘harmony of colors’ was meant such an arrangement of colors as is most (pleasing) to the eye.”

Wilbur made the following remarks from pages 22 to 31, in this paper which was originally a speech he had been invited to give before some group which he did not name.

“I trust that I may be excused for now transcending a little the boundaries of my own peculiar province. That eminent educational reformer, Pestalozzi, was at the outset of his labors, so opposed to the senseless use of language (words before ideas), that he even clamored against the art of printing, as contributing to it. But even he was guilty of committing the same error in practice....

“Observation,’ says he ‘is the absolute basis of all knowledge. The first object then in education, must be to lead a child to observe with accuracy; the second, to express with correctness the result of his observations.’ It will be observed that this second conclusion (is) a
‘non-sequitur’ from his premise. He says elsewhere, ‘out of the observation of an object, the first thing that arises, is the necessity of naming it.’ Von Raumer, one of his biographers, commented upon this among other notions of Pestalozzi, and well remarks, ‘Language itself has nothing to do with observation. Why (should) not I be able to form a perfectly correct notion of an object that has no name, for instance, a newly discovered planet?’ I would (add) that the uneducated deaf mute has such correct notions every day.

“But Pestalozzi is not content with this. In another connection, after lauding the power of language, he adds: ‘Therefore I make use of it, and endeavor by the guidance of its uttered sounds to reproduce in the child the self-same impressions, which in the human race, have occasioned and formed these sounds. Great is the gift of language. It gives to the child in one moment, what nature required thousands of years to give to man.’

“This was so grievous a lapse from his own principles, that his colleagues and successors repudiated such precepts almost without exception. So, too, did those American educators who almost forty years ago introduced into this country all that was valuable in the reformed system of education, inaugurated by Pestalozzi. To this point, let the early numbers of the American Annals of Education, and the early proceedings of the American Institute bear witness.

“In England, however, it was otherwise. A Mr. Mayo, one of Pestalozzi’s admirers, introduced his system into that country. He professes to have preserved Pestalozzi’s ideas, but modified their form. He professes to have discarded, in the books prepared at his suggestion, what in Pestalozzi’s text-book, was insufferably tedious.

“Through this man’s agency, a system of schools has grown up in England, known as the Home and Colonial Society System of Education, in which, the natural observation of childhood is so devitalized, in part by this haste for naming, and a clumsy method of naming, and in part by wrong principles of association; so subverted from its ordained purpose of imparting power and warmth and vigor to the whole spiritual nature, as to draw upon itself the scorning (anger) of the satirist.”

He put a footnote at this point, “(See) Dickens’ Hard Times.”

“Pestalozzi’s reason for this early and constant associating of names with objects and ideas was, that by repeating in language, the conception of objects and ideas, was fixed so as not to be forgotten. This is measurably true, only when the name given is one of frequent recurrence in the child’s hearing, in the child’s use - where it is a familiar word....

“No one can doubt who reads the criticism of Pestalozzi’s colleagues and successors, that he was most unfortunate in assigning the place he did, to language, in his educational scheme. And this though the nature of the German language is such as to obviate some of the evils arising from his mistake. But in the English adaptation of Pestalozzi’s system, the case is very different. Here we find his errors wofully (sic) exaggerated. The fact, that all our scientific terms ... are borrowed from the dead languages, involves the necessity of loading the child down with words, that he never hears elsewhere, but in the school room, if names must accompany all ideas...

“That I may do no injustice, let me quote from one of the English text-books. I have before me a book, on the title page of which is read, ‘Lessons on Objects as given to children between the ages of six and eight, in a Pestalozzian school.’ It is the thirteenth edition, imprint: London, 1853. It is written by Miss Mayo, also authoress of the manual of instruction used in the schools of the Home and Colonial Society. This book is also used as a text-book in the same schools.
On page seventy-six, lesson forty-five, I find an article described in this wise: It is fibrous, knotty, rapid, rough, jagged, inanimate, vegetable, tropical, foreign, aromatic, pungent, dry, dull, solid, hard, conservative, light, yellowish-brown, pulverable, medicinal, stimulating, wholesome, opaque and inflammable.

Now remember Pestalozzi’s definition of a definition. ‘A definition,’ he says, ‘is the simplest expression of clear ideas.’ (I give but a part of it), and now, pray tell me, what this object is, thus described. Or let me rather say, guess what the object is!

Here is another specimen of the abuse of language taken from the Society’s Manual. The pupils have had pointed out to them all the features of a geometrical solid, known as the rhombic dodecahedron. At the close of the exercise they are required to repeat the following and to treasure it up in their memories: ‘The rhombic dodecahedron is a solid bounded by twelve equal rhombs; it has eight solid angles, each of them formed by three obtuse plane angles, and six solid angles, each of them formed by four acute plane angles; it has twenty-four equal edges.’

Now I ask, will this memorized definition recall the peculiar features of the solid in question, if the conception of the solid is once lost by the child? Has this definition any utility, as a test of the child’s correct appreciation of the form of this solid?.... Finally is there any greater virtue, as a mental exercise, in learning by rote this complicated formula, than in committing any other dozen or more hard words arranged, I might almost say, without reference to their meaning?....

‘Observation is the absolute basis of all knowledge,’ says Pestalozzi, and then he draws two practical conclusions therefrom: ‘The first object then, in education, must be to lead a child to observe with accuracy; the second, to express with correctness the result of his observations.’ As I have before said, this second conclusion has no relation to the premise....

I would not have ventured on this digression, but that just now many earnest teachers in this country, dissatisfied with a routine system of instruction, that has had possession of our primary schools, and groping for an improvement - any improvement - are proposing to transplant on our shores, without any effort at acclimation, what I regard, as a misshapen, dry and fruitless production of English schools. This system does not embody the views or practice of the best educationalists of England, any more than the primers of the Sunday School Union, represent the highest talent of the American school book compilers. But rely upon it, no system of education, however humane its design, however complete its organization, or however successful its apparent results, can ultimate in any permanent good, with such dogmatic principles and such questionable methods.”

One of the effects of the “object lesson” movement was the inclusion of some kind of object teaching in the very first lessons in reading, including the first pages of some primers. After about 1880, from the Quincy influence, primers were usually not even begun until the teacher had given the children considerable work from the blackboard with script, and they commonly used “objects” to do so. In 1881, Farnsworth used a simplified version of the object-teaching approach in his manual for teaching reading by the sentence method.

Welch’s ridiculous book on object lessons nevertheless does serve a very worthwhile purpose. It is a window on attitudes and practices in the year 1862 when Welch wrote his book until sometime long after 1872, after which date the copy I saw was published by A. S. Barnes & Company. Such object lessons were still in very wide use in 1879, to judge from the recommended materials listed in the January, 1879,
Primary Teacher, which list included Calkin’s revised book on object lessons, and such object lessons were intimately associated with teaching beginning reading by “meaning.”

Concerning Barnes’ Widely Used Materials, Many of Which Were Available in Leigh Print, Not Listed in the January, 1879, Primary Teacher

In addition to Welch’s revealing comments from 1862, Welch’s book published by Barnes contains many pages at the back advertising Barnes’ numerous materials on sale some time after 1872 but probably considerably before 1882 when their new “meaning”-emphasis reading series began to be published. However, if Barnes’ 1882-1884 Code 1 reading series had reached the market by 1879, it is probable it would have been included in the Primary Teacher recommended list.

The Barnes’ advertisements confirm how ludicrous the McGuffey myth is for all those years. From these 1870’s advertisement alone, it is obvious the Barnes company must have outweighed Wilson, Hinkle and Company, the publishers of McGuffey’s, in the early 1870s. A further indication of the weaker position of the McGuffey publishers in the early 1870’s is that Vail said the 1879 McGuffey edition had been the best selling of all. Therefore, its publishers’ market share had probably expanded after 1879 but had been weaker previously.

Five of these advertising pages are devoted to two series of readers which Barnes was publishing until some time after 1872. The older, obviously more important and more expensive series was the Code 1 Parker & Watson’s National Readers. The newer, less important and less expensive was Watson’s Independent Readers which used some phonic approaches.

By 1832, R. G. Parker already had in print a second edition of his Progressive Exercises in English Composition. The shelves of Harvard’s remarkable collection of American textbooks are studded with copies of Parker’s composition books, which copies had been published over a period of many years. (Composition was obviously of great importance in schools of that period, and yet I read not long ago a remarkable statement by a current “expert” that American schools had not concerned themselves with teaching composition until after 1900!) According to Leypoldt’s American Catalogue of 1876, Barnes was also still publishing Parker’s earlier 1849-1852 six-volume set of school readers in 1876, even though they had not advertised it in Welch’s book from the 1870’s. Parker had joined with Watson in compiling the National Readers of 1857-1866 (the dates shown by Leypoldt’s American Catalogue of 1876). The Harvard library has a copy of The National Pronouncing Speller of 1858 by Richard G. Parker and J. Madison Watson, inscribed “1860, Jan. 24, Gift of Richard G. Parker of Cambridge (Class of 1817).” Its “preface” made Parker’s spelling philosophy very clear: “...It is now generally conceded, by eminent American and European educators, that the shortest and most successful mode of learning spelling is by the eye....”

The newer Independent series written solely by J. Madison Watson published a speller in 1872 according to an advertisement in the Welch book, so that reading series presumably was published about 1872. (The American Catalogue does not show the dates for the Independent series.) A further addition to that series, The Independent Primary Reader, was published in 1875. Barnes was therefore publishing three sets of readers by these men in 1876: Parker’s 1849-1852 series, Parker and Watson’s series of 1857-1866, and Watson’s series of about 1872. Only the last two newer series were advertised in Welch’s book.

The advertisements in the Welch book said the Parker & Watson’s National Readers used “The Word-Building System.” The “word-building” system was appalling: starting with a meaning-bearing whole word like “one,” letters were added, which produced other meaning-bearing whole words like
“tone” and then “stone,” etc. The system had nothing to do with phonics. It claimed to be original but certainly was not, and could be seen in less elaborate form in English readers from the 1830’s.

As discussed earlier, the method was promoted in America as early as 1802, in the Code 7 text, The Child’s First Book, Being an Easy Introduction to Spelling and Reading, which showed no author but only that it was published by Lincoln and Edmunds, Boston, in 1816, and that it had originally appeared in 1802. It had a syllabary and arranged words by sound analogies, but recommended building new whole words from previously memorized words: each, reach, preach. The author recognized the method’s novelty, as he said of his approach, “In teaching the monosyllables, I would recommend a different method than is usually practiced....”

This building of longer meaning-bearing words from shorter meaning-bearing words can be seen in a modified form today, by a careful reviewer, in the so-called “phonic” Scribner’s first-grade material. (That Scribner material is a 1987 and later revision of Basic Reading, the former J. B. Lippincott series first published in 1963 by Charles C. Walcutt and Glenn McCracken, which was a weak but truly phonic series. Walcutt was apparently the only author on later versions of the Lippincott material.) In the Scribner material, longer phonetically regular words are built from previously learned shorter phonetically regular words. The identical letters from one word are printed directly above the identical letters in the other word. That careful and obviously deliberate placement of the letters obviously is meant to aid in the visual comparison of the two whole meaning-bearing words, and to demonstrate where a letter or letters have been added to the previously learned whole, meaning-bearing word. Comparing one meaning-bearing word to another, to see likenesses and differences, is phony phonics.

The advertisement for the Parker and Watson readers read:

“This famous progressive method for young children originated and was copyrighted with these books. It constitutes a process with which the beginner with words of one letter is gradually introduced to additional lists formed by prefixing or affixing single letters, and is thus led almost insensibly to the mastery of the more difficult constructions. This is one of the most striking modern improvements in methods of teaching.... Each of the higher readers... contains... thoroughly practical treatises on elocution.”

The advertisement for Watson’s Independent Readers was different:

“This Series is designed to meet a general demand for smaller and cheaper books than the National Series proper, and to serve as well for intermediate volumes of the National Readers in large graded schools requiring more books than one ordinary series will supply... The Publishers believe that the aesthetic tastes of children may receive no small degree of cultivation from their very earliest school books, to say nothing of the importance of making study attractive by all such artificial aids that are legitimate. In accordance with this view, not less than $25,000 was expended in their preparation before publishing, with a result which entitles them to be considered ‘The Perfection of Common School Books.’

“Selections. They contain, of course, none but entirely new selections. These are arranged according to a strictly progressive and novel method of developing the elementary sounds in order in the lower numbers... The Type is semi-phonetic, the invention of Prof. Watson. By it every letter having more than one sound is clearly distinguished in all its variations without in any way mutilating or disguising the normal form of the letter.

“Elocution is taught by prefatory treatises of constantly advancing grade....
“All the Great Features. Besides the above all the popular features of the National Readers are retained except the Word-Building system. The latter gives place to an entirely new method of progressive development, based upon some of the best features of the Word System, Phonetics and Object Lessons.”

Watson’s imitation of Leigh by the early 1870’s is obvious, and so is the fact that Watson’s new readers came in on the phonic flood of the sixties and early 70’s, in contrast to earlier sight-word reading materials like the Parker and Watson series which was started in 1857 and completed in 1866. The tide had receded by the early 80’s because of the hard work of change-agents, as has been discussed. Barnes then put out a new word-method series which was more marketable in that changed educational climate, Barnes’s New National Readers. The series was written by Charles J. Barnes and J. Marshall Hawkes and copyrighted by A. S. Barnes & Co.

The advertisement in Welch’s book said, concerning Watson’s 1872 The Independent Child’s Speller (which was the first of his three-volume series in print by 1876, according to the American Catalogue):

“Published in 1872, [it] is the first to be consistently printed in imitation of writing; that is, it teaches orthography as we use it.”

Even though the quotation establishes that script was not consistently used for beginners before 1872, the total switch to script for beginners did not come from Watson, despite the fact that he used only script in his spelling book. Watson did not exclude the use of print for teaching reading, since he said in his 1875 book that words for beginners could be written on the board in either print or script. It was after Parker’s influence at Quincy dating from 1875 that beginners in reading were shown words only in connected script. After Parker’s Quincy influence, words were customarily written in script on the blackboard and almost always only in whole sentences, the use of reading books being held off for some time. The experience chart approach appears to have developed by the 1890’s at Parker’s Chicago school from this heavy use of the blackboard and the use of “meaningful” sight words written only in “meaningful” sentences. The use of experience charts there is described on pages 297 to 300 of Edmund Burke Huey’s The Psychology and Pedagogy of Reading, 1908, The Macmillan Company, New York (reprinted by The M.I.T. Press, Cambridge, Massachusetts in 1968).

Colonel Francis Parker of Quincy (not the textbook author, R. G. Parker) made a great issue after 1875 of having beginners “talk with their pencils.” Yet the remarks on Watson’s 1872 speller established that beginners before 1872 were seldom asked to write anything:

“Among the novel and valuable features of the lessons and exercises, probably the most prominent are their adaptedness for young children and their being printed in exact imitation of writing. The author belies that hands large enough to spin a top, drive a hoop, or catch a ball, are not too small to use a crayon, or a slate and pencil; that the child's natural desire to draw and write should not be thwarted, but gratified, encouraged, and wisely directed, and that since the written form is the one actually used in connection with spelling in after-life, the eye and the hand of the child should be trained to that form from the first. He hopes that this little work, designed to precede all other spelling-books and conflict with none, may satisfy the need so universally recognized of a fit introduction to orthography, penmanship, and English composition.”

Watson’s comments are additional confirmation of two facts not acknowledged today: spellers in 1872 were normally for upper-grade students, not beginners, and “English composition” in 1872 was a standard school exercise for upper-grade students. Watson therefore confirmed the schools’ teaching of “English composition” in 1872, continuing the practice so prominent since Parker’s book on composition
had appeared some forty years previously. Watson’s speller also acknowledged the spelling problems of
the period, since he said in his preface, “Success in teaching English orthography is still exceptional....”

Another page of advertisements in the Welch book contained “Specimen Testimonials” for both the
National and the Independent series published by Barnes.

“Rev. W. T. Brantley, D. D., late Professor of Belles Letters, University of Georgia” was
quoted, from his talk, “Text-Books in Reading,” which he had given before the Teachers
Convention in Georgia on May 4, 1870.

“The National Series by Parker & Watson, is deserving of its high reputation. The Primary
Books are suited to the weakest capacity; whilst those more (advanced) supply instructive
illustration on all that is needed to be known in connection with the art.”

President Robert Allyn of McKendree College in Illinois said:

“Since my connection with this college, we have used in our preparatory department the
Series of Readers known as the ‘National Readers’ compiled by Parker & Watson, and published
by Messrs. A. S. Barnes & Co. They... contain the right system of elocutionary instruction....”

Allyn referred to “that noblest of school arts, GOOD READING.” He obviously meant elocutionary
declaming. It should be remembered that children at that time actually memorized their reading texts at
the lower levels because they were read aloud in class so much, “with expression.”

H. T. Phillips of Atlanta said:

“The Board of Education of this city have selected for use in the public schools of Atlanta the
entire series of your Independent Readers.... As a member of the Board, and of the Committee
[on] Text-books, the subject of Readers was referred to me for examination. I [gave a] pretty
thorough examination to ten (10) different series of Readers and in endeavoring to arrive at a
decision upon the sole question of merit, and entirely independent of any extraneous influence, I
very cordially recommended the Independent Series. This verdict was approved by the
Committee and adopted by the Board.”

Note the mention of ten series of reading texts with no reference to McGuffey’s in this testimonial
which is probably from the early 1870’s. Yet far more reading series than ten were available then. The
1876 American Catalogue listed about 39 different reading series in print in America in 1876, without
even counting several series for Catholic schools, some series for Protestant schools, and American
reprints by Cassell, Nelson, and Macmillan of their series from England. Yet the Myth has it that all of
these publishers shared only ten percent of the American market, while McGuffey’s claimed the other
ninety percent!

D. N. Rook, Secretary of the School Board in Williamsport, Pennsylvania, wrote:

“I would say that Parker & Watson’s Series of Readers and Spellers give the (best)
satisfaction in our schools of any Series of Readers and Spellers that have ever been used. There
is nothing published for which we would exchange them.”

D. H. Harris, Superintendent of Public Schools, Hannibal, Missouri, said:
“The National Series of Readers are now in use in our public schools, and I [think] them the best that I have ever examined or used.”

W. T. Harris, Superintendent of Public Schools in St. Louis, Missouri, wrote:

“I have to admire these excellent selections... [whose qualities] I find still more admirable than in the former series of [National] Readers, which I considered models in these respects.”

S. Findlay, Superintendent of Akron Schools, Ohio, said:

“We use no others, and have no desire to. They give entire satisfaction.”

Whether he meant the National or Independent series is not stated, but what is clear is that the schools in Akron, which was McGuffey territory, were not using McGuffey readers at the time the letter was written, probably in the early 1870’s.

Professor H. Seele of New Braunfels Academy, Texas, wrote:

“I recommend the National Readers.... They inculcate good morals without any sectarian bias. [They] are truly National, because they teach pure patriotism and not sectional [next word not clear, probably prejudice.]”

Honorable J. K. Jillson, Superintendent of Education in the State of South Carolina, wrote:

“I have carefully examined your new and beautiful Series of Readers... ‘The Independent Readers,’ and do not hesitate to recommend it as the... most excellent ever presented to the public.”

Another advertising page in the Welch text listed states and cities where the Barnes’ reading series been adopted. It was headed, “The National Readers and Spellers. Their Record.” (Both the Independent and National were considered National readers, according to another advertisement in the back of Welch’s book.)

“These books have been adopted by the School Boards, or official authority, of the following important States, cities and towns - in most cases for [words unclear: apparently “exclusive use.”]

“New Jersey. Newark, Jersey City, Paterson, Trenton, Camden, Elizabeth, New Brunswick, Phillipsburg, Orange, \&c., \&c.

“Delaware. Wilmington.

“D. C. Washington.”

“Michigan. Grand Rapids, Kalamazoo, Adrian, Jackson, Monroe, Lansing, &c., &c.

“Ohio. Toledo, Sandusky, Conneaut, Chardon, Hudson, Canton, Salem, &c., &c.

“Iowa. Davenport, Burlington, Muscatine, Mount Pleasant, &c., &c.

“Nebraska. Brownsville, Lincoln, &c., &c.

“Oregon. Portland, Salem, &c., &c.

“Virginia. Richmond, Norfolk, Petersburg, Lynchburg, &c., &c.

“South Carolina. Columbia, Charleston.

“Georgia. Savannah.

“Tennessee. Memphis.”

A claim to exclusive use or even of heavy use can be taken with a grain of salt. On the opposite page, Barnes advertised the North Carolina First Reader, Second Reader and Third Reader:

“Prepared expressly for the schools of this State, by C. H. Wiley, Superintendent of Common Schools, and F. M. Hubbard, Professor of Literature in the State University.”

Yet North Carolina had been on Barnes’ long list of adoptions just quoted for the National and Independent readers. It is apparent that the National and Independent series were not for exclusive nor probably even for heavy use in North Carolina. Comments from institute meetings shortly after this time, quoted elsewhere in this history, concern the fact that children’s parents in some places still personally bought their children’s school books, and when they did they sometimes paid little attention to formal adoptions. Concerning those places where the school district bought the books used, the fictional story from the School Bulletin about this time, mentioned elsewhere, tells of textbook wars and pokes fun at the inflated claims of publishers for massive sales in every possible location.

However, the Barnes claim for sales of readers and other publishers’ similar claims in advertisements from the period which survive establish that in no conceivable way could the McGuffey readers have controlled eighty or ninety percent of the entire U. S. reading textbook market from 1850 through the mid 1870’s. Material published after the 1870’s provides the same proof until after 1900. Note the testimony about 1870 referring to the availability of ten series of readers for examination in Georgia, and another testimonial referring to the fact that a teacher’s convention in Georgia in 1870 had considered text-books in reading, and had pronounced National the best, not McGuffey’s.”
There were a great many reading series besides the Barnes’ series at that time, as confirmed by the 1876 American Catalogue listing of a total of about fifty in print in 1876, about 39 of which were domestic series aimed at the government schools, and not English series or series prepared for American Catholic or Protestant schools. (Unfortunately, most of the American Catholic school series, as well as the Protestant material, appears to have been largely “meaning” oriented, too, just like the government school series.)

Popular series for the government schools available from the late 1860’s to the late 1870’s included Lucius Osgood’s Progressive series popular in Pennsylvania after 1855 and published by A. H. English & Co. of Pittsburgh; Town and Holbrooks’s Progressive series very popular in New England and elsewhere after the late 1850’s (but apparently out of print by 1876) which was published in Boston by Sanborn, Carter, Bazin & Company, and Oliver Ellsworth; Hillard’s several series whose Boston and New York publishers are mentioned elsewhere; Epes Sargent’s old and new series by John L. Shorey of Boston and others, and his series with Amasa May of 1871 by E. H. Butler & Co. of Philadelphia; Marcius Willson’s series of 1860 by Harper of New York; Sanders’ new Union series about 1861 by Ivison of New York, and Ivison’s following series of 1873, the American Educational Readers; Bancroft’s Pacific Coast Readers which had a new edition in 1874; Edwards’ and Webb’s Analytical series of 1866-1871 by Taintor of New York and Sherwood of Chicago; J. L. Reynolds series of 1869 used in the South, by Duffie & Chapman of Columbia, S. C., and E. J. Hale & Sons of New York; and Lewis Monroe’s series about 1872 by Cowperthwait & Co. of Philadelphia. There were others, in addition to older series, some of which continued to be published in 1876 and even into the twentieth century.

Barnes was a publisher of a vast number of books on education. That the Barnes company was dwarfed by the publishers of McGuffey’s appears highly improbable, even judging solely from the list of books they advertised at the end of Welch’s text.

The Barnes materials included many spellers, but Barnes was not alone in publishing spellers in the early 1870’s and all presumably would have been profitable competitors of Webster’s, which was being published at that time by Appleton. Harper’s had its own series of spellers at the time and they were dreadful sight word books. Yet Webster’s was racking up enormous sales of over a million copies a year in 1885, as shown by the publisher’s comment in the back of Johonnot’s book published by Appleton, quoted elsewhere, and presumably Webster’s was also making huge sales in the early 1870’s. These sales were despite the fact that the spelling book had been dropped in many places after the late 1870’s for about ten years because of the influence from Parker’s Quincy. (See the quotation elsewhere in this text from Stickney’s 1889 speller referring to the fact that the speller had been generally dropped for a period of time.) The textbook market in those years must have been enormous to have supported so many spellers, particularly in view of the reported history that spellers were unpopular for a period of time after 1875.

As mentioned elsewhere, however, it appears probable that the massive sales of the Webster spellers were to families, and not to schools.

Like Appleton’s in 1885, Barnes had an Orthography Department in the early 1870’s, as shown by the advertisements in Welch’s book. Barnes published Smith’s Series of Spellers, in five volumes, Sherwood’s series in three volumes, Price’s English Speller and a few other books for spelling. They also published Pooler’s Test Speller, “The best collection of ‘hard words’ yet made... The book is designed for Teachers Institutes and ‘Spelling Schools,’ and is prepared by an experienced and well-known conductor of institutes.”
Notice again the recurring reference to the omnipresent “institutes” of the nineteenth century. Yet such institutes have faded almost totally from the history of education.

At the end of the Welch text, Barnes had its “Department of General Literature - The Teacher’s Library.” Welch’s book on object lessons was included, as was “The Normal - Holbrook.” The advertisement for that book read:

“Carries a working school on its visit to teachers showing the most approved methods of teaching all the common branches, including the technicalities, explanations, demonstration and definitions introductory and peculiar to each branch.”

Another text was “School Management - Holbrook:”

“Treating of the Teacher’s Qualifications: How to overcome Difficulties in Self and Others; Organization; Discipline, Methods of inciting Diligence and Order; Strategy in Management; Object Teaching.”

Another was “The Teachers’ Institute - Fowle:

“This is a volume of suggestions inspired by the author’s experience at Institutes, in the instruction of young teachers. A thousand points of interest to this class are most satisfactorily dealt with.”

Fowle had published Horace Mann’s Common School Journal shortly after it began, and, as described elsewhere in this history, Fowle certainly was not recommending “sound” in the teaching of reading. Whether “Holbrook” could have been the activist Holbrook from the 1820’s and 1830’s is unknown, but the possibility is intriguing. Since Fowle’s books were still in print in the 1870’s including his Bible Reader, so might Holbrook’s have been, if he wrote such books.

Another text in print by the early 1870’s concerning the training of teachers in “expert”-run institutes was the Teachers’ Handbook by William F. Phelps, Principal of Minnesota State Normal School, which discussed Teachers Institutes and covered “Methods of Teaching” “in detail.” The completeness of the book was praised in a review from the New York Tribune, which stated:

“The country schoolmaster... holds a position of vital interest in the destiny of the republic.... In view of the supreme importance of the teacher’s calling, Mr. Phelps has [written] an elaborate system of instruction in the elements of learning, with ...detail of methods and processes....”

Barnes also published:

“The Complete Examiner - Stone. Consists of a series of questions on every English branch of school and academic instruction, with reference to a given page or article of leading text-books where the answer may be found in full. Prepared to aid teachers in securing certificates, pupils in preparing for promotion, and teachers in selecting review questions.”

Teachers in the nineteenth century could only get the certificates they needed before they could be employed if they answered questions correctly, and the correct answers on how to teach reading were supplied to them by “experts” at institutes and in books. Now, in the 1990’s, the Carnegie group has been working on a test for teachers to certify informally that teachers passing their test are well “qualified,” which it is presumed would aid school districts when employing new teachers. This, of course, is a very public-spirited thing for the Carnegie group to be doing, even though the voting public whose taxes support the schools never authorized the Carnegie group to do so.
Other texts published by Barnes were:

“Institute Lectures - Bates. These lectures, originally delivered before institutes, are based upon various topics in the departments of mental and moral culture..."

“Method of Teachers Institutes - Bates. Sets forth the best method for conducting institutes, with a detailed account of the object, organization, plan of instruction and true theory of education on which such instruction should be based.”

The Ivison publishing company added to the publications on institutes. In the 1876-1884 Leypoldt’s American Catalogue, the Ivison company was recorded as having published their Institute Reader in 1880, at a price of 20 cents. According to Leypoldt’s 1876 American Catalogue, Wilson, Hinkle & Company, the publishers of McGuffey’s, put out the Institute Reader and Normal Class Book by W. H. Cole in 1870, at a price of $1.15. However, most of the literature on institutes probably appeared in the many educational journals published all over the United States after about 1840.

As the above material on the Barnes company demonstrates, the list of recommended books published in 1879 by The Primary Teacher in no sense covered the whole textbook market since it omitted books published by the two huge textbook publishers, Barnes and Ivison. At that time both Barnes and Ivison had materials on the market that had been influenced by the enthusiasm for phonics, and they either incorporated some phonics or were available in Leigh phonic print. Such materials were obviously being ignored by the “experts” recommending materials in The Primary Teacher. Therefore, it is not surprising that both Barnes and Ivison by the early 1880’s replaced those 1870’s semi-phonics materials and their series in Leigh print with reading series that instead focused on “meaning.”

Concerning Henry Kiddle’s How to Teach - A Manual of Methods Recommended in 1879 in The Primary Teacher

As discussed earlier, “phonics” when it was used after 1826 was commonly only for elocution, and this often continued to be the case as late as the 1880’s. Henry Kiddle, City Superintendent of Public Instruction in New York City, wrote How to Teach - A Manual of Methods, which was published by J. W. Schermerhorn & Co. in 1874 but copyrighted in 1873. On page 21, Kiddle said that phonetics for the lowest primary grade (a five months’ term), should be simple sounds “solely for training the organs of hearing and of speech.” Therefore, Kiddle who was responsible for all the children in the New York City government schools obviously did not endorse phonics for teaching beginners how to read.

Kiddle apparently adopted other views which were popular with the “advanced” thinkers of the time. The American Catalogue for 1876-1884 showed that in 1879 Kiddle published Spiritual Communications: Presenting a Revelation of the Future Life. Leypoldt’s American Catalogues for 1876, 1876-1884, and even later had numerous entries under “Spiritualism,” reflecting its popularity. What is most remarkable is that it was popular with many of the so-called intellectuals in America and Great Britain.

It was not popular, however, with everyone. The American Catalogue in 1876 showed that the Methodist Book Connection published a book by W. M’Donald, entitled Spiritualism; with Testimony of God and Man Against It, in 1866. The Southern Baptists published a book by J. R. Graves, Middle Life, listed as an “Exposé of Spiritualism and Swedenborgianism.” William James’ father was a Swedenborgian, which sect is not spiritualism but an unusual sect founded by a Swedish man in the eighteenth century. Yet the title of the books suggest that the groups had some connection at that time.
The same 1876 Catalogue showed that in 1874 Allen Putnam (whose lifespan was shown elsewhere as 1802-1887) had published Agassiz and Spiritualism, Involving the Investigation of Harvard College Professors in 1857. William James, a professor at Harvard fifteen years later, is also known to have been interested in spiritualism for many years and even wrote an article concerning a medium he thought might be credible. (See the comments in Yeager’s text on Alice James.)

Therefore, Agassiz and some other members of the Harvard faculty in 1857, even before William James attended Harvard and then later became a professor there, William James himself by the 1880’s, and Superintendent of Schools Kiddle in New York City in the 1870’s endorsed the practice of trying to arouse and to traffic with ghostly manifestations. Such activities received a blasting condemnation from both Methodist and Baptist publishers.

Yet Kiddle’s ideas on “how to teach,” which included omitting real phonics for beginning readers, apparently met with no opposition, so far as can be found.

Concerning Harvey’s Readers Recommended in 1879 in The Primary Teacher

Except as has been indicated previously, all the texts or authors listed by the Primary Teacher on pages 151-152 in January, 1879, are traceable today. Yet there was no mention of McGuffey’s, but only of Harvey’s which the McGuffey publishers were then publishing as their replacement for the old McGuffey series. If the old McGuffey series had been blanketing America in 1875, reaching nine out of every ten children when Wilson, Hinkle and Company put out the new Harvey’s series, why would the company have bothered to publish that new series? Vail noted that the new Harvey series failed to sell well, so an almost totally new McGuffey’s series was published in 1879, and Vail noted the 1879 series was overwhelmingly their most successful. Yet, why should the publisher have bothered with these revised series if they had already controlled the market?

Wilson, Hinkle & Company also published The Phonic Readers of A. Knell and J. H. Jones in 1868 and Little Teacher, First Book in Reading, on the Word Method, in 1855, both of which are referred to elsewhere in this history. Why should they have bothered with all these alternate reading texts, if the old McGuffey’s series had been in almost total control of the American reading textbook market over those years? The McGuffey Myth looks ridiculous when historical facts are trotted out.

What the method was that was used in Harvey’s series is unknown. Since the series was endorsed by The Primary Teacher, however, the possibility exists that it was “meaning”-oriented. At the very least, it omitted the use of Leigh print, according to the 1876 American Catalogue, even though the earlier McGuffey’s series had been available in Leigh print.

Concerning Lewis Baxter Monroe’s’ Chart and Chart Primer Recommended in 1879 in The Primary Teacher

This material is discussed in Appendix C and elsewhere in this history, published by Cowperthwait. It was written to promote “elocution.” For reading instruction, it used Code 3 two-step phony phonics. According to the 1876 American Catalogue, no Monroe material was available in Leigh print in that year, and no Monroe primer was listed, but only The First Reader. Yet Early American Textbooks reported Monroe’s The First Reader had a Leigh edition in 1873. There is a confusion in titles between this and Mecutchen’s later material for the Butler company. The Butler company also later published Monroe’s and Monroe’s widow’s materials.
Concerning Sheldon’s Primer Recommended in 1879 in The Primary Teacher

E. A. Sheldon’s materials published by Scribner were “meaning” materials with Code 3 two-step phony phonics. According to the 1876 American Catalogue, they were not available in Leigh print.

Concerning the Franklin First Reader and Appleton’sRecommended in 1879 in The Primary Teacher

These two series were critically important in stopping the 1870’s revival of phonics teaching, and are discussed at length later. These pro-meaning materials were, not surprisingly, included in the recommended list of materials given by The Primary Teacher in January, 1879. Appleton’s did not have a Leigh-print edition, according to the 1876-1884 American Catalogue. The Franklin series was available in Leigh-print, but, as discussed, only non-Leigh editions appear to have been used in Boston after 1877. Rather surprisingly, it was a non-Leigh-print edition by the original publisher, not set up by University Press, which Buisson saw at the Philadelphia Exposition in 1876 and on which he reproduced a few pages in his report, which report is discussed later.

William Torrey Harris and the Appleton Readers

The Primary Teacher article of January, 1979, had recommended the use of the Appleton readers, among others. The Appleton readers had been on the market at that time less than a year, and showed clear ties to “experts,” the most notable of whom was the “philosopher,” William Torrey Harris, who was then Superintendent of Schools in St. Louis, Missouri. Biographical material is given on William Torrey Harris (1835-1909) in Dictionary of American Biography, Charles Scribner’s Sons, New York: 1934-1962. Harris left Yale as a junior in the school year 1856-1857 and then went in 1857 all the way from his home state of Connecticut to St. Louis, Missouri to begin teaching.

The Dictionary of American Biography states the following on Harris but omits any mention of the vastly used 1878 Appleton series on which Harris was the principal author and which did not use Leigh print. (In Nila Banton Smith’s “history,” Harris, the Appleton readers, and Leigh and his print do not appear in her index, like so much else that is of real importance in reading history.) The Appleton series fought the famous McGuffey series to a draw in the Midwest, according to Vail. Considering the huge publicity on the McGuffey series, the omission of any mention of the Appleton series in Harris’s biography is, to say the least, peculiar:

“His rise in the educational system was rapid; he was soon made principal of the Clay School, became assistant city superintendent in 1866, and superintendent in 1868.”

Such a rapid rise for the unknown 22-year-old Yankee outsider who had arrived only in 1857 suggests sponsorship by someone with considerable influence. St. Louis was a big city with many teachers. Yet everyone else was passed over in favor of this young Yankee immigrant who became assistant superintendent of all city schools at the age of 31 and superintendent at the age of 33.

“...in 1908 he was able to say that he had read Hegel’s Philosophy of History sixteen times, while even more important to him was Hegel’s Logic, which became his philosophical Bible. In the exposition of Hegel’s thought and in the application of his principles to every department of knowledge but especially to education, Harris found his lifework. Hegel’s doctrines of the solidarity of the individual with society and of the importance of the state temporarily met the needs of the new American feeling for national unity.
“In 1867 he founded the Journal of Speculative Philosophy... in it such later writers as... Dewey and James made their debut... In 1880... he resigned his St. Louis position and moved to Concord, Massachusetts, to assist in the establishment of the Concord School of Philosophy.... In 1889... Harris accepted the position of United States Commissioner of Education... (till) 1906... when he voluntarily resigned.... He labored especially to place education upon a psychological basis....”

In 1878, D. Appleton and Company, a very large publisher with offices in New York, Boston, Chicago and San Francisco, published The Appleton’s School Readers, which were phony phonics texts.

Appleton was only following its past history in rejecting real phonics. According to Early American Textbooks, in 1838, D. Appleton & Co., New York, and George S. Appleton, Philadelphia, published E. Hazen’s Code 1 The Symbolical Spelling Book; in Two Parts, Part I, which had first been published in 1829 and which was pure Code 1 material. That material, however, had many publishers, and Appleton was only one of them. By 1844, they published the “First American from the Sixth London Edition” of Very Little Tales for Very Little Children, “In Single Syllables of Three and Four Letters.” Appleton’s said it had put out four editions of the book in eighteen months so sales must have been good. The writer of the book from England said it was hard to write stories for “infants” with only three or four letters, and her book “is meant only for children who have just acquired their alphabet.” The book was a straight sight-word approach. In addition to that text, Geo. S. Appleton of Philadelphia had copyrighted in 1848, and both the Philadelphia and New York branches published in 1850, Little Annie’s First Book, in words of three letters, by “A Mother” for children from three to five years old. It was a straight Code 1 book and was appalling. Other appalling books Appleton’s was publishing in 1850 were Little Lessons for Little Learners in words of one syllable, Little Annie’s Second Book in words of one syllable, and Mother Goose in Hieroglyphics. (Of course, all their sight-word books for children were hieroglyphics, anyway!) Appleton’s included a catalog of its books at the end of Little Annie’s First Book, which catalog establishes that Appleton’s was large and important in 1850 and must greatly have overshadowed the publishers of the McGuffey Readers in that year. Among Appleton’s books were “Miss Sinclair’s A Series of Tales,” with a review from the Edinburgh Advertiser, Divine and Moral Songs by Isaac Watts, and books by Maria Edgeworth and Mrs. Sherwood.

Appleton’s also published Little Annie’s ABC in 1850, purportedly “Showing the Use and Sounds of the Letters, in Words of One Syllable.” Yet its philosophy was Code 1, since inside its title page was an advertisement for Little Annie’s Primer which makes that fact clear:

“The idea on which this little book is founded, although not an original, is a useful one. It was suggested by Mr. Wood, of the celebrated Edinburgh Sessional School. It is simply this: that as soon as a child learns the letters of the alphabet, and even while engaged in learning them, he should be taught their use and sound in real words, such as he is uttering every day, and not in unmeaning syllables, which convey to his mind no ideas, and are associated with no real objects.... Uttering sounds without meaning and being told that b, a, spells ba, he justly esteems rather dry work. But at the moment he is able to connect the sounds he is acquiring with the objects he sees, he may easily be induced to learn his letters without repugnance.”

The reasoning in this excerpt is obviously defective. A normal child cannot deduce the functioning sounds of letters in a sight word, if he has only been taught to recite their names: “see-aye-tee, cat.”

Appleton’s was only continuing its devotion to “meaning” over “sound” by its publication of the 1878 Appleton reading series. It was copyrighted by D. Appleton & Company of New York in 1878 and written by William T. Harris, Superintendent of Schools, St. Louis, Missouri; Andrew J. Rickoff, Superintendent of Instruction, Cleveland, Ohio, and Mark Bailey, Instructor in Elocution, Yale College.
(Mark Bailey had previously written a treatise on elocution for The Franklin Fifth Reader, part of the widely used Hillard and Campbell Franklin series, and also for an earlier Hillard series.) On page 1 of The First Reader of the Appleton series (not called a primer) in the address “From the Authors to the Teacher,” it said, “...the experience of many years has convinced us that a judicious combination of the word and phonic methods is the best.”

The first three lesson pages are headed, “Words and Phrases to be Learned by Sight only.” By the third page, two full sentences have been introduced: “Has the cat a rat? The cat has the rat.” On the top of this page is a picture of a cat biting into an obviously terrified, conscious rat, a sickeningly inappropriate picture for a little child beginning school.

The next two pages are analytic/synthetic phonics on some of the words used, not all of them. (Having taught beginning reading to six first grade classes, I can state it would be impossible to teach normal children to read phonically with these grossly inadequate and incompetently designed phonic lessons.) The following two pages have two short lessons labeled “By Sight and Sounds” and two much longer lessons, “By Sight only.” each with complete sentences. The phonics is very heavily mixed with “sight” teaching, and it is all done with the sentence approach. The effect on children would be to teach them to read for “meaning” and not for “sound.”

William T. Harris, as principal author of this series, had the series on the market in 1878, only ten years after the St. Louis schools, of which he was Superintendent, had switched officially to the Leigh print. Yet there was no sign of Leigh print in his Appleton first book, though towards the end vowels and silent letters were marked.

Since it takes several years to assemble and publish a reading series. Harris and the others must have been working on it at least since 1875. According to the 1876-1884 American Catalogue, the 1878 Appleton series was not available in Leigh print.

An advertisement promoting Leigh print appeared on the back cover of Leigh’s Hillard’s Second Reader, (Brewer and Tileston, Boston: 1868). It said that, in St. Louis, Missouri, Leigh’s print:

“...was put on trial by order of the School Board September, 1866. In June, 1867, The SUPERINTENDENT reported a satisfactory result. The BOARD, August 9, 1867, in view of this success, and of ‘its promising a great saving of time, and great increase of efficiency in teaching to read,’

“Resolved, That its adoption in the primary grade of our Schools be made general, as early as practicable, the coming year.’ The SUPERINTENDENT writes, February 19, 1868, ‘The phonetic plan has proved a far greater success than was at first anticipated. Not only has it proved effective in eradicating defects in enunciation, but it has also proved a great saving of time, so that classes have been able to gain a whole quarter, in the course of this year, upon classes taught by the other method.’

A record of who the superintendent was in 1866 (possibly the same man who was quoted in 1868, above) is given on the back of the Leigh’s Pronouncing Edition of Hillard’s Primer, Boston: Brewer and Tileston: 1866:

“Testimonials

“From Ira Divoll, Supt. of Public Schools, St. Louis.
“I believe it will facilitate the teaching and learning of reading, spelling, proper pronunciation, and the distinct utterance of words, and shall be glad to see such editions introduced into our primary schools.

“From Chas. W. Irwin, Esq., Chairman of the Text-book Committee.

“I am so well pleased with your phonotypic text, that I shall recommend the introduction of that system into the St. Louis Public Schools.

“From Emil Ulrici, and other members of the School Board, St. Louis.

“I concur in the opinion of Mr. Ira Divoll, and expect of the introduction of the method into our public schools great advantages to both teacher and scholar.”

None of the 1866 testimonials mentioned Harris, who has been credited with having introduced the Leigh print, and none was from an assistant superintendent. The actual months in which Harris was appointed Assistant Superintendent in 1866 and Superintendent in 1868 are not known. However, if both appointments were in September, then the Board’s decision to install Leigh print in the St. Louis schools by September, 1866, would have been made before Harris became assistant superintendent in 1866. Also, if Harris were appointed Superintendent in September, 1868, then he would not have been the Superintendent who was quoted first in February, 1868, praising the Leigh print (probably still Ira Divoll).

Harris would not, then, have been an administrator at any time when the Leigh print was introduced and may actually have had nothing to do with it. An indication that he probably had nothing to do with it, even as a school principal, is given by one of the statements already quoted from the back of an 1866 edition of Leigh’s Pronouncing Edition of Hillard’s Primer (Harvard call number EducT 758 66.510). That statement establishes that St. Louis had a textbook committee which was authorized to make textbook recommendations to the administrators, and that the recommendations were not the responsibility of school principals like Harris in 1866:

“From Chas. W. Irwin, Esq., Chairman of the Text-book Committee.

“I am so well pleased with your phonotypic text, that I shall recommend the introduction of that system into the St. Louis Public Schools.”

The title page of this primer clearly carries the date, “1866.” Therefore, at some time before it was printed in 1866, it was the chairman of St. Louis’s text-book committee (and St. Louis HAD a textbook committee) who personally recommended the introduction of Leigh print. There is nothing in any of these clearly established facts to suggest that Principal Harris in and before 1866 was in any way responsible for introducing Leigh print in St. Louis.

It is possible that the same thing happened to the 1868 St. Louis Superintendent, probably Ira Divoll, which happened to Superintendent John Dudley Philbrick. He would have displeased the “philosophers,” of which Harris was certainly one, by supporting Leigh phonics, and they may have used influence to have that superintendent fired. The young 33-year-old Assistant Superintendent Harris replaced him. Harris, of course, would not have displeased “philosophers” because he was a particularly influential “philosopher” himself, and by 1878 was an author on a “phony phonics” series which achieved massive use in the United States but which was NOT available in Leigh print, according to the 1876-1884 American Catalogue.
What is exceedingly strange is that Harris’s reading textbook series was not, apparently, used in St. Louis since it is recorded that St. Louis used Leigh print till 1886. The record suggests that Harris, himself, may well have been fired as Superintendent of Schools in St. Louis in 1880, in which year he is reported to have “resigned,” only two years after the Appleton’s series was first published.

Nevertheless, in his history of the McGuffey readers, Vail testified that the sales of the Appleton series were enormous. Vail said that Appleton’s and McGuffey’s fought to control the market (obviously in the Midwest) but that the battle ended in a draw, although he felt that the McGuffey’s series succeeded in selling considerably more than the Appleton’s series afterwards, also obviously in the Midwest.

Appleton’s won in some other areas. According to Early American Textbooks, 1775-1900, published by the U. S. Department of Education in 1985 (page 86), Appleton’s series was adopted as The Minnesota Text Book Series published by D. D. Merrill in St. Paul, Minnesota. The Department of Education listing showed a second and third reader published there in 1878, and a first reader published in 1887, so the series was in use in Minnesota for at least nine years.

At the back of James Johonnot’s The Sentence and Word Book, published by D. Appleton And Company, New York, in 1885, is an advertisement for Appleton’s American Standard Geographies, “Based on the Principles of the Science of Education.” The advertisement read:

“The remarkable success which Appleton’s Readers have attained is due to the fact that no effort or expense was spared to make them not only mechanically superior, but practically and distinctively superior, in their embodiments of the best results of modern experience in teaching, and of the methods followed by the most successful and intelligent educators. In the same spirit, and with the same high aim, this new series of Geographies has been prepared, and it is in harmony, therefore, with the active educational thought of the times.”

However, the department at Appleton’s which was preparing its readers was not in apparent contact with the department at Appleton’s which was working on “Orthography and Orthoepy.” That department also had a page at the back of Johonnot’s book advertising its publications, one of which was Webster’s Elementary Spelling-Book (obviously the gutted 1857 edition prepared long after Webster’s 1843 death.) That advertisement read:

“The enormous sale and remarkable popularity of this famous Speller are among the marvels of the age.

“The original of this work, by Noah Webster, was published in 1783, and since that time nearly 50,000,000 copies of it have been made and sold. It would be impossible to say how many of the men and women of our country, now living, and under sixty years of age, began their education with this book, learned from its pages to distinguish between the shapes of those terrible tormenters of child-life, the twenty-six letters of the alphabet, and were initiated into the great mysteries of a, b - ab, and kindred combinations. The number is very large, but of the rising generation certainly a great majority will be of this class. We still print considerably over 1,000,000 copies of the famous old ‘Blue Black’ per annum.”

This 1885 figure of over one million copies a year for the Webster speller should be compared to the presumed blanketing sales of McGuffey’s. In 1885, Webster’s single speller, with sales of considerably over a million copies a year, was apparently selling more copies than all grades of the McGuffey readers, to judge from the probably firm figures given by Dillman for 1888 and 1889, discussed elsewhere. Those 1888 and 1889 sales figures must have been compiled to be used in the discussions that preceded the
merger of the McGuffey publishers with three other publishers. The merger took place in 1890 and produced the new, massive American Book Company.

Yet the 1885 Appleton advertisement for Webster’s speller still only claimed that “a great majority” were using it, not virtually all American children. That advertisement, of course, was singularly blind. The advertisement on the very next page told of the “remarkable success which Appletons’ Readers have attained...” and the Appleton series began with a sight-word book meant for beginning readers, not with a spelling book.

Soon after Webster’s death in 1843, Geo. F. Cooledge & Bro. of New York had become the publishers of Webster’s spelling book, as shown by an advertisement on their 1847 book, The Illustrated Primer. The fact that the Cooledge company had become the “Proprietors of the Copyright of Webster’s Elementary Spelling Book,” is shown by the title page and the page opposite it from a Webster speller of 1848. Both of these 1848 pages are reproduced on page 117 in Early American Textbooks - 1775-1900, Office of Educational Research and Improvement, U. S. Department of Education, Washington: 1985. Wrongly identified as from their item 2592, page 123, it is obvious the reproduced pages are instead from their item 2595, page 123, “New York: G. F. Cooledge & Bro., 1848.”

As the reproduction showed, by 1848 Cooledge claimed that 30,000,000 copies of Webster’s speller had been sold, and that 1,000,000 were still being sold annually. The Cooledge company had made the same claim of sales of 1,000,000 a year on their 1847 copy of The Illustrated Primer, mentioned above. Webster’s speller is known to have been enormously popular also between 1783 and 1809, a period of 26 years, selling 3,000,000 copies in those years. If Cooledge’s claim of total sales to 1848 of 30,000,000 copies is correct, then 27,000,000 copies would have been sold between 1809 and 1848.

Although another source referred to elsewhere indicates that G. and C. Merriam copyrighted a revised Webster speller in 1857, also copyrighted by Webster’s children, which is puzzling, it is reported that the Appleton company became the publishers of Webster’s speller in 1855. American Book Company, formed in 1890 by the merger of Appleton and other companies, became the publishers in 1890.

As has been discussed, in 1848, the Cooledge company claimed 30,000,000 copies of Webster’s speller had been sold and announced that their annual sales were about a million copies. Thirty-seven years later, the 1885 Appleton company claimed that sales were over a million a year, but that a total of only 50,000,000 had been sold. Therefore, in the intervening 37 years between Cooledge’s and Appleton’s statements, that would mean that only 20,000,000, and not the anticipated 37,000,000 had been sold. Yet it can be seen that this reasonable assumption is flatly contradicted by an 1880’s statement from Appleton quoted below.

Appleton clearly claimed in 1880, as quoted below, that 40,500,000 copies were sold from 1840 to 1880 and that sales had been steady, except for one bigger year, at about a million copies a year. If 8,000,000 are subtracted from Appleton’s 1880 figure (for the years 1840 to 1848, the year of Cooledge’s estimate) and the resultant figure, 32,500,000, is added to the 1848 Cooledge figure of 30,000,000, a total of 62,500,000 is reached by 1880. Yet, in 1885, five years and a presumed 5,000,000 copies later (or 67,500,000 total), the Appleton company claimed in its advertisement in the Johonnot book that only 50,000,000 had been sold! The Webster speller sales total certainly has a chameleon-like nature, but the total is, nevertheless and beyond any question, a very big chameleon.

Information on Webster’s speller is given in the article, “Webster, Noah,” in the Encyclopedia Britannica (1963), Volume 23, page 476. It stated that editions of Webster’s dictionary after his death were published by G. & C. Merriam Co. The last dictionary published under Webster’s control would have been in 1841, since he died in 1843. The first edition after his death was in 1847. Presumably,
therefore, at some time in or after 1843, Merriam obtained the dictionary rights, and it must have been about that time that George F. Coolege & Bro. obtained the speller rights. The Coolege company was definitely publishing the speller in 1847, as mentioned previously. The speller rights passed to Appleton, presumably from Coolege, but possibly with some connection with Merriam as noted above, in 1855. The rights then went to American Book Company in the 1890 merger in which Appleton was one of the principals. The encyclopedia article claimed that a total of more than 70,000,000 of Webster’s spellers were eventually sold, but truly firm figures are probably unobtainable. Nevertheless, total sales were unquestionably enormous.

On page 126, Volume 2 of Mark Sullivan’s series, Our Times, he said:

“In 1855, the plates of the [Webster] Speller were taken over by D. Appleton & Company. The Speller was then seventy-two years old, a longer life than any other text-book had ever had. [Ed.: not true: the small Donat Latin grammar lasted over 1,500 years, as mentioned elsewhere, from the days when St. Jerome was a schoolboy in the fourth century until the twentieth century.] But the Appletons took it up with as much enthusiasm as if were the newest and most up-to-date manuscript. By 1880, William H. Appleton was able to reply* to an interviewer who asked him what was the best selling book published by his firm:

“Webster’s Speller; and it has the largest sale of any book in the world except the Bible. We sell a million copies a year. Yes, and we have been selling it at that rate for forty years. The year following the emancipation of the slaves we sold one million five hundred thousand, because every negro in the South thought it only necessary to have Webster’s Speller to read. After that year it fell back to the original million, and has never varied. We sell them in cases of seventy-two dozen, and they are bought by all the large dry-goods houses and supply stores, and furnished by them to every cross-roads store.’

“One of the largest presses in the Appleton plant ran day after day, on this one book, until it was completely worn out. By 1890, the sales of “old Blue-Back” had reached the astonishing total of over 35,000,000 copies, in which some five generations of American youths adventured among the mysteries of English orthography.”

* “Quoted in the Youth’s Companion, May 27, 1880.”

Obviously, Sullivan’s “astonishing total of over 35,000,000” is hopelessly wrong. Appleton’s comments that Sullivan, himself, had quoted JUST IN THE PREVIOUS PARAGRAPH had accounted for a total of 40,500,000 copies JUST FROM 1840 TO 1880, and NOT INCLUDING THE VAST AMOUNT SOLD FROM THE TIME SPELLER CAME OUT IN 1783 UP UNTIL 1840. But Sullivan and the rest of the “experts” obviously would have made very bad accountants. They just liked to babble big numbers.

Of course, Appleton’s 1880 claim that “we” had been selling Webster’s speller for forty years was also wrong. Forty years before 1880 was 1840, and, while it is true that Appleton was in business long before that year, Webster’s speller was probably still being sold in that year by Noah Webster, himself, who did not die until 1843!

It is pertinent to repeat here some of the background material on Webster’s speller which was given in Part IV. Webster’s speller had provided income for Webster and his family for years, so its copyright was an important financial resource. Sometime before 1847, but probably after 1843, the year of Webster’s death, Geo. F. Coolege & Bro. had become the “Proprietors of the Copyright of Webster’s Elementary Spelling Book,” as shown by the title page and the page opposite it from a Webster speller of 1848.
Yet the first year that the Cooledge company turned up in sources accessible to this writer was 1839, when Cooledge’s United States School Primer showed Cooledge’s location as “George F. Cooledge, Second Story of M. Day & Co.’s Book Store, 374 Pearl Street, New York.” Cooledge (without his “bro.”) was apparently just starting out in 1839, leasing the floor above Mahlon Day’s very well known book store in New York City. By 1840 Cooledge had moved to 323 Pearl Street, so he must have prospered. However, George Cooledge, starting out alone without his brother could hardly have been important enough in 1839 to have been used by Webster as Webster’s sole printer. Furthermore, Webster had never used only a single printer, but had always used many local printers in cities and towns all over America as his publishers. The fact that the Cooledge company became the sole proprietors of the copyright on the Webster speller was an enormous change from Webster’s former practice. Such a change almost certainly would not have taken place before Webster’s death in 1843. It appears probable that the Webster family sold the copyright for the Webster speller to the Cooledge company on Webster’s death in 1843, or shortly after.

As the reproduction mentioned previously showed, by 1848 Cooledge claimed that 30,000,000 copies of Webster’s speller had been sold, and that 1,000,000 were still being sold annually. (From the Webster figures quoted earlier of 3,000,000 copies sold between 1783 and 1809, that would mean 27,000,000 had been sold between 1809 and 1848.) Early American Textbooks - 1775-1900, also shows by its entries on page 123 that D. Appleton & Co. of New York had become the publishers of the Webster speller by 1857. Yet, as indicated elsewhere in this history, the actual date of the change was probably 1855, not 1857. Nevertheless, another source referred to elsewhere indicates that G. and C. Merriam copyrighted a revised Webster speller in 1857, also copyrighted by Webster’s children, which is puzzling. At what date Cooledge went out of business or was absorbed by another publisher (possibly Appleton) is not known, but Early American Textbooks of the U. S. Department of Education shows that G. F. Cooledge and Brother published, along with Thomas, Cowperthwait & Co. of Philadelphia, The National Speaker by Henry B. Maglathlin in 1851. Therefore, the Cooledge company may still have been in existence in 1851, if the report is correct, and possibly went out of business in 1855 when Appleton’s acquired the Webster speller.

On page 126, Sullivan reproduced the title page, “D. Appleton & Co., Revised Edition of The Elementary Spelling Book, Being an Improvement on ‘The American Spelling-Book‘“. The “Revised Edition” was, of course, not the 1829 Elementary Spelling Book which Webster, himself, wrote to replace his 1783 The American Spelling Book, but the gutted 1857 revision of Webster’s 1829 book prepared long after Webster’s 1843 death (and curiously copyrighted by Webster’s children). The 1857 gutted revision, heavy with the addition of sight-words at its beginning, was useless for teaching beginners to read by “sound.” The reproduced Appleton title page carried the note:

“The Cheapest, the Best, and the Most Extensively Used Spelling Book Ever Published.”

The 1880 comment of William H. Appleton which Sullivan quoted is very helpful, however, despite the inconsistency concerning actual numbers published. Although the numbers given in various sources concerning Webster’s actual sales volume are unreliable, they are consistent in one thing. It is reasonably certain that the Webster speller was sold in enormous numbers until after 1890. Yet, there is an apparent contradiction, even shown on the 1885 Appleton book mentioned above, which simultaneously advertised the Appleton reading series for beginners, claiming enormous sales, and a few pages later the Webster speller, commonly assumed to be for beginners, also with enormous sales. Appleton’s 1880 comments quoted earlier accidentally contain the explanation for the seeming contradiction. The explanation is that Appleton’s readers and Webster’s speller were really meant for different markets, and the following confirms that explanation.
The School Bulletin, Syracuse, New York, June, 1878, carried chapters from the book, Roderick Hume, by the Managing Editor, C. W. Bardeen, one of which chapters was titled, “A Change of Text-Books.” (A copy of that chapter is included in Appendix A.) The chapter poked fun at the swarms of book agents which descended on schools in those days, and it poked fun at their inflated claims. One agent said to Hume, who was a school principal in a village:

“All the big cities use [our books] exclusively. They have just been re-adopted in Boston, and when Smintheus’s tried to displace us in Hong Kong, we not only held them in there, but drove out theirs for ours in Yang tsi Kiang.”

Hume decided to write leading publishers for sample copies.

“So he got what addresses he could from the advertisements in a school journal...”

One of the book company answers read:

“We are delighted to get your letter, intimating that at last you are prepared to adopt a uniform set of books. News of your remarkable success at Norway had already reached us, and we have been hoping that our Mr. Hook would find time to call upon you. Don’t fail to come and see us, the first time you visit the city. Our establishment turns out fifteen million books an hour.... Our publications are used in all the best schools.... Most of [our books] are in such universal use that you may feel under obligation to adopt them, because children who move into or out of your village will thus have the same books which are already in use.”

Most book companies were more than willing to send sample copies:

“Other letters flowed in, followed by express packages, till Roderick’s shelves, and table, and floor, were successively over-flowed....”

Bardeen was associated with schools in the 1870’s and knew the real state of things. So did his contemporaries. His contemporaries must have been very familiar with high-pressure salesmanship and overblown advertising from book companies or Bardeen would never have chosen to parody them. Publishers’ claims for book sales in the 1870’s and for years before, therefore, may reasonably be taken with the gravest reservations. However, what Bardeen’s 1878 parody clearly establishes is that schools were NOT buying their textbooks from cross-roads stores or dry-goods establishments, but from book agents or directly from the publishers.

Yet Appleton’s 1880 comments, only two years after Bardeen’s 1878 comments, made it absolutely clear that, unlike other textbooks, Webster’s very cheap little speller was being sold to dry-goods establishments and to cross-roads stores all over the United States. What, then, was the nature of the market for the very cheap little Webster speller if it was necessary to market it so differently from school books?

A very early nineteenth-century copy of Webster’s speller which is in the New York Public Library suggests one class of users: immigrants learning English. The copy is carefully marked with notations from an adult who was obviously German. A second and probably far larger class of users was the rural adult population. It is certain, from many sources, that “spelling” was in a near-catastrophic state for large numbers of American adults in the nineteenth century, because of the switch to “meaning” in teaching beginning reading after 1826. Just reading the letters in The School Bulletin from school board members, or the board minutes in various parts of the country, can attest to that. If even a small proportion of those spelling-disabled adults recognized that they had a spelling problem, the presence of a Webster speller in
the house would be a great help when letters were to be written, which must have been often, since there were no telephones available then to call friends and relatives! Some, of course, of those spellers might well have been bought by parents to help their children, or for children to use when doing school assignments. However, what is near certain from Appleton’s comment is that the Webster spellers were not being sold to most schools at that time.

Average Americans had little “cash” money in those days, and the very cheap Webster speller could obviously fill the family need for a dictionary, a far more expensive volume that most American families certainly could not afford to buy. That is the obvious explanation for the unflagging sales of the cheap Webster speller until after 1890. It was sold to American families, when most of America was still rural, and it was sold through the rural cross-roads stores. Most of those Webster spellers did not reach children through the normal route for textbooks: by way of the swarms of book agents who worked so hard to supply books to the schools.

The contradiction may be more apparent than real, therefore, in the two advertising pages in the Johonnot 1885 text, since the probability is that the bulk of these Webster speller sales were to families, and not to schools. Nevertheless, although its sales had remained at about the million-a-year mark for many decades, they were proportionately far, far less in the 1880’s than in the 1840’s since the American population had become enormously greater.

The fact that the St. Louis history might have been the reverse of the history in Boston is suggested further by some excerpts from John Dudley Philbrick’s Circulars of Information of the Bureau of Education, No. 1 - 1885, City School Systems in the United States, Government Printing Office, Washington, published seven years after Philbrick had been fired as Schools Superintendent in Boston:

“Recently the plan of supplementing the readers by the introduction of other reading matter has come into vogue, quite extensively. With a view to meet the demand for this supplementary reading, a good many books have been compiled and published. Besides books designed for this purpose, juvenile periodicals and newspapers, and sometimes a second series of readers, have been introduced; and finally, biographies, histories, and works of fiction have been more or less used for supplementary reading.

“Some of the advocates of this plan have put forth most extravagant claims in its favor. Compilers and publishers naturally did what they could to sound its praises, as it could not fail to put money into their pockets.

“In a short time this supplementary reading business was in some quarters greatly overdone. Fortunately, a reaction has set in, and much of this supplementary rubbish is finding its way to the junk shop, while the regular readers are again coming to the front in the school room.”

“Supplementary reading” was reaching the market in quantity by 1885, the year when John Dudley Philbrick derided it. One example of such supplementary reading appeared in an advertisement in the back of James Johonnot’s The Sentence and Word Book, published by Appleton and Company, New York, in 1885. That page advertising “Readers and Reading Charts” included the six-book series, The Standard Supplementary Readers, edited by William Swinton and George R. Catcart:

“Comprising a Series of Carefully Graded Reading-Books designed to connect with any of the regular series of readers....”

Note the innocent reference to “any of the regular series of readers” in 1885, instead of to the presently-reputed monolithic McGuffey’s.
Leypoldt’s American Catalogue for 1876-1884 also listed a series of six books by Swinton and Cathcart published in 1881, but the publisher was Ivison and not Appleton. The titles and prices of the books suggest they were graduated from material for beginning readers to material for advanced readers, and they are very possibly the same series as that being published by Appleton by 1885. (A curious overlapping of publishers sometimes appeared in books of the period.)

G. R. Cathcart’s earlier Literary Reader had been published by Ivison in 1874, so Cathcart had possibly been commissioned by Ivison to write the 1881 supplementary reading series along with Swinton. Swinton’s own regular reading series was later published by the same company, Ivison, Blakeman, Taylor & Company in 1882-1883. It was in 1883 that Ivison copyrighted Swinton’s Primer and First Reader, a phony phonics text.

The publishing record shows other texts which were undoubtedly meant to be “supplementary” besides those by Swinton and Cathcart. Philbrick’s hostility to such “supplementary reading” was understandable. It was the invention of Colonel Parker, whose “improvements” were associated with Philbrick’s being fired. Parker used to go around in a wagon in Quincy to distribute such books to his schools.

It is Philbrick’s footnote which is of particular interest. That footnote quotes the St. Louis Superintendent who had replaced Harris in 1880:

“No additional reading matter has been introduced in the recitations, it being the theory in our schools that more real progress is made by thoroughly mastering a few lessons than by superficially reading many. - (St. Louis Report for 1880-1, by Mr. Edw. H. Long, Superintendent.)”

The St. Louis superintendent who replaced Harris not only kept the phonic Leigh print that had been rejected in Boston, but he rejected the idea originating with Parker at Quincy that the classrooms should have great amounts of “supplementary reading.” The hostility in St. Louis to “supplementary reading” and its simultaneous use of Leigh print in 1881 suggest that Harris may have been invited to leave in 1880. It was in the Midwest that the new, phonic editions of McGuffey’s which started to come out in 1879 were so successful. Educational winds were obviously blowing in a different direction in the Midwest by 1880 than in those areas which appear to have been influenced by Boston.

When Rice reported on the method used to teach beginning reading in St. Louis and the resultant excellent reading ability in 1892, which will be discussed later, he found that the use of “sound” in beginning reading was still producing success in 1892. Smart St. Louis may have never thrown out true phonics. What the record suggests is that instead they threw out Superintendent William Torrey Harris in 1880 and never used his 1878 Appleton readers.

Eventually, it was said that Harris:

“...labored especially to put education upon a psychological basis....”

That must have been after 1874, since, as has been mentioned, Colonel Parker wrote the School Journal on August 12, 1899 (page 118), concerning practices twenty-five years before (which would be in 1874):

“Psychology in education, especially in New England, was tabooed. It was called ‘splitting hairs.’”
Harris certainly must have known the trendiest philosophers of the period, though, the kind that were so disapproving of Leigh phonics, according to the Boston School Committee in its 1871 report. The Harris biographical entry that has been quoted stated:

“In 1867 [Harris] founded the Journal of Speculative Philosophy. ...in it such later writers as... Dewey and James made their debut....”

Hillard and Campbell’s Readers, Including the Franklin Series

The Primary Teacher of January, 1879, had recommended the Franklin First Reader. That was another highly successful reading book that appeared about this time, entitled in full The Franklin Primer or First Reader, by George S. Hillard and Loomis J. Campbell, which they personally copyrighted originally in 1873.

The Franklin series was the third reading series written by Hillard, his first coming out in the late 1850’s. The “Preface” to The Third Primary Reader by G. S. Hillard in Boston, May, 1858, said:

“This book is designed as an introduction to my Fourth Class Reader, and to be used by the highest classes in Primary or Intermediate Schools. It has been chiefly prepared by a gentleman long engaged in teaching, and of much practical experience in all that relates to education, but under my direct and careful supervision....”

Hillard did not name that 1850’s collaborator, but his co-author on his two later series was Loomis J. Campbell.

The earliest book in George S. Hillard’s first series, A First Class Reader meant for the highest, not the lowest, class, appeared in 1855. When Hillard revised the series, it became the Sixth Reader, with “An Introductory Treatise on Elocution” by Professor Mark Bailey of Yale, according to Nietz, page 92. The First Primary Reader appeared in 1859, but was meant for the lowest class. By 1864, Hillard and Campbell were publishing the second series. The lowest readers in the 1864 series were available in Leigh print. From the fact that the copies of the lower readers of the series in the Harvard library are apparently all in Leigh print except for one in 1859 and one in 1878, the 1864 Leigh-print editions must have been the norm, even though they were also advertised in ordinary print. The Library of Congress also has a Leigh-print second reader of the 1864 series, although I could find no first reader or any other second reader of that series. The fact that only a Leigh-print edition survived at the Library of Congress seems to suggest Leigh print on Hillard’s materials after 1864 were in wide use.

Then, in 1873, Hillard and Campbell copyrighted the Franklin Primer of the third series, the Franklin series. The Franklin Primer was essentially a sight-word book, suitable for teaching the sentence method, very like those of today. However, to unwary parents, it looked as if it taught phonics. It was also available in Leigh print, according to advertisements on the back of 1877 and later copies in the Harvard library. Yet no Leigh copies of the 1873 Franklin Primer are in the library that I could see, nor are there any Franklin Primer copies earlier than 1877. That is very strange, to say the least. Certainly the Boston schools would have been likely to use the newer Hillard materials of 1873, rather than the 1864 materials. Until Leigh-endorsing Superintendent Philbrick was fired on March 1, 1878, it seems probable that the Boston schools had Leigh editions of the 1873 Franklin Primer. As reported elsewhere, school property disappeared over the summer of 1878 a few months after Philbrick was fired. The property included primary school records and other unspecified materials. Possibly Leigh editions of the Franklin Primer disappeared at that time, which might account for none surviving to reach the Harvard library.
The Franklin Primer and Advanced First Reader of 1881, only by Loomis J. Campbell, was published by Taintor Brothers, Merrill, & Co., New York, and William Ware and Company, Boston, and a copy survives in the Harvard library.

However, since the later primer written by Loomis alone was printed in 1881 by Taintor Brothers, Merrill, & Co., the Syracuse copy of the original Franklin Primer which I saw with the change in the publisher's name to Taintor Brothers & Co., dropping Merrill, must have been printed after 1881. That Syracuse copy had written inside on the fly leaf in an adult’s flowing hand, “Josephine E. Lane, Syracuse, N. Y., Porter School, 10th Ward, Feb. 14th, 1888.” This copy apparently belonging to a teacher suggests the use of the Franklin Primer in Syracuse as late as 1888. The copy did not use Leigh print and was called the Webster-Franklin Primer because it used Webster spellings.

It appears likely that the Franklin Primer has dropped into education history’s black hole because of its possible ties to “movers and shakers” in Cambridge, Massachusetts, in 1877. The promoters are unknown who arranged to have the Franklin Primer printed by University Press, Cambridge, in 1877 in normal type when almost every school in Boston was using primers in Leigh type.

The press used on available copies of Hillard’s earlier series was not University Press, as it was on the non-Leigh-print Franklin readers, nor did University Press show on almost any other reading materials which I examined, except one with possible ties to the change-agents and one Code 1 earlier series which may possibly not have had change-agent ties.

The one with possible ties was the 1879 Our Baby’s Primer and Pretty Picture Book by Phillip Findlay, published in 1880 by Estes & Lauriat (Charles Francis Adams’ publisher on education topics) of Boston, and printed by University Press: John Wilson & Son, Cambridge. It was printed on peculiar, large-size paper and would have met Superintendent Eliot’s 1878 demand, referred to elsewhere, for story books for the Boston primary grades, just as the collection of old tales by Henry Cabot Lodge, also printed on peculiar paper, met that “need.” Lodge’s 1879 book carried the notation that it was prepared for the Boston schools.

The other material showing University Press as the printer was an 1865 edition of the 1860 Code 1 The Standard First Reader, Part Two, With Spelling and Defining Lessons - Sargent’s Standard Series, by Epes Sargent. A Harvard copy shows it was published in 1865 by John L. Shorey, Boston; J. B. Lippincott, Philadelphia, W. I. Pooley & Co., New York, and carried the notation “University Press, Cambridge: Printed by Welch, Bigelow and Company.” University Press, at that time, was a private press and so obviously might have been available to do such non-university printing, just as it might also have been available for influences from university members. However, University Press did not show, so far as I could see, on any other of the reading materials originating in Boston which I examined until the critical Franklin series appeared.

Whoever the activists were, they had an apparent interest in using sentences for beginners and a distaste for Leigh phonetic print (both of which certainly suggest influence from Professor William James of Harvard). The “Preface” to the Hillard and Campbell Franklin Primer (presumably written in 1873 when the material was copyrighted) shows the preference for sentences for beginners, although the phonics referred to is, of course, “phony phonics.”

“The lessons in this Primer have been constructed with especial reference to both the Phonic and the Word modes of teaching to read. They are also adapted to the Alphabetic mode.... The words in the reading-lessons are such as young children commonly use, and of which they know the meaning. The aim has been to form sentences which will interest the youngest learner, and, in each lesson, to have the sentences relate wholly to the picture. In this way the lessons take a more
connected form, and the pictures become a most important aid in showing the meaning of the words and sentences.”

G. S. Hillard who was the senior author on the 1873 Franklin Primer was a highly regarded literary man and anthologist. His very popular first reading series published starting in 1855 which did not use the name “Franklin” was revised in 1864 to became the second series, the “New Series,” under the names of G. S. Hillard and L. J. Campbell. As discussed, it was in 1873, that Hillard and Campbell copyrighted the brand-new The Franklin Primer, part of Hillard’s third series.

To judge from actual surviving texts of the Hillard and Campbell Franklin series described in Early American Textbooks, 1775-1900, published by the Office of Educational Research and Improvement, Washington, D. C., 1985, the first book in the Franklin series that was ever printed was the Franklin Fifth Reader. The Office of Educational Research and Improvement has an 1871 copy published by Brewer & Tileston, in Boston, and J. W. Schermerhorn & Co. in New York. Brewer & Tileston, and their predecessors with a slightly different name, who were the successors to the publishers of the 1826 Worcester Primer, had been the publishers for the two earlier series of Hillard readers. However, OERI also possess another copy of the Franklin Fifth Reader under the date of 1871, but this copy was published by Taintor Bros., Merrill & Co. in New York and William Ware & Co. in Boston. Although most of the copies of the Franklin series OERI possess were published by Brewer & Tileston and J. W. Schermerhorn & Co., OERI also have a fourth and an advanced fourth Franklin text published by the Taintor company and the Ware company dated 1873, as well as an advanced fourth dated 1874, and a sixth dated 1874. By 1877, the original publishers of the Franklin series, Brewer & Tileston and J. W. Schermerhorn & Co. had disappeared, and only Taintor Bros., Merrill & Co. and William Ware & Co. are shown, not just for the Hillard and Campbell Franklin series of 1871-1873, but for the 1864 Hillard and Campbell series.

Apparently the seeming conflict in publishers’ names and dates arises from the fact that the books showed the copyright date, not the publishing date. This is confirmed by copies of the Franklin Primer published by Taintor which show a copyright date of 1873 but which the knowledgeable Harvard librarians have clearly dated to 1877 and 1878. The 1876 American Catalogue shows the publishers of all of Hillard’s books as the Taintor group, but that catalogue was not printed until a year or two after 1876. It may very well reflect a change in the publisher’s names which dated to 1877, the date the Harvard librarians gave for the first Taintor copy of the Franklin Primer. That this is so seems to be confirmed further by the fact that the library has an 1876 second Hillard reader of the 1864 series in Leigh print still published by Brewer & Tileston, so Brewer & Tileston were still in business for at least part of 1876. The probability is that the switch in publisher’s names took place in 1877, when the first University Press copies were printed, which credited Taintor as the publisher of the Hillard materials. Such a change might have been possible because the materials were copyrighted, not by Brewer & Tileston, but by the authors themselves.

Copies of the Franklin Primer in the Harvard Library carry the 1873 copyright date, but the name of the publisher is shown as Taintor Brothers, Merrill, & Co. in New York and William Ware and Company (“Successors to Brewer and Tileston”) in Boston. The reference to “successor” proves the copies were printed after early 1876 because, as shown elsewhere, Brewer and Tileston and their associated New York company, J. W. Schermerhorn & Co., were still publishing in 1876. However, The American Catalogue, under the direction of F. Leyboldt, Subject Entries of Books in Print and for Sale (Including Reprints and Importations), July, 1876, “Compiled by Lynds E. Jones” seems to suggest that the Taintor company and the Ware company had taken over the Franklin series by the date of July, 1876, and Hillard’s other materials, as well. This is because the Catalogue shows no other publishers’ names for these texts as of July, 1876, but Taintor’s and Ware’s. Yet, as mentioned, the Catalogue was a year or two in preparation and might very probably reflect a publisher’s change in name that took place after 1876.
Taintor Brothers, Merrill & Co. were also the publishers of The Analytical Series of Readers, by R. Edwards and J. R. Webb, a classic sight-word series. It was still available in 1876 in Leigh or standard print, as many readers were at that time, although Harris’s Appleton series which came out in 1878 was not, according to any sources I have seen.

The switch in publishers’ names not only in Boston but in New York apparently came immediately before the critical school year for Boston school books of 1877-1878, as Harvard also has an 1876 copy from the earlier Hillard and Campbell series, Leigh’s Hillard’s Second Reader in Leigh’s type, which has on the title page “Boston: Brewer and Tileston, New York: J. W. Schermerhorn & Co. - 1876.” Concerning the actual printers of this 1876 earlier Hillard work, a note on the bottom of its third page states, “Electrotyped by Lovejoy & Son.”

An 1877 copy of the Franklin Primer (not in Leigh type) in the Harvard library showed that it had been copyrighted in 1873 by G. S. Hillard and L. J. Campbell and that it was printed by University Press: Welch, Bigelow & Co., Cambridge (and published by Taintor Brothers, Merrill, & Co., New York, and William Ware and Company, “Successors to Brewer and Tileston, Boston”). Harvard has another copy showing that it was printed by University Press: John Wilson & Son, Cambridge, and John Wilson & Son were the successors to the printers, Welch, Bigelow & Co. (However, the publishers were the same as on the 1877 copy.) That later copy most probably is an 1878 edition, because in 1878, Taintor Brothers copyrighted an altered “Webster” edition of the Franklin Primer, (using Webster’s instead of Worcester’s spellings) and the printer of their 1878 revision held by the Harvard library was also shown as University Press: John Wilson and Son, Cambridge, Massachusetts.

The obvious question arises: why, in 1877, was University Press used to set up the 1873 Franklin Primer in non-Leigh type when almost all sales in the Boston area were in Leigh type? (Buisson reproduced a non-Leigh type version he obtained at the 1876 Centennial published by Brewer & Tileston. Although Buisson did not name its printer, if it had been University Press, the same question remains.) Why did University Press continue to be used on non-Leigh editions in 1878? Although privately owned, University Press at the time was the press used by Harvard. The University Press was not used on the earlier 1876 text of the earlier Hillard and Campbell primer from Brewer and Tileston in Leigh type, which was mentioned above (which would suggest it had not been used either on the non-Leigh Franklin Primer which Buisson saw in 1876). Nor was University Press apparently used even on a later 1881 purely sight-word text for first grade by L. J. Campbell alone which instead shows only the name of William Ware and Company.

The cover of the 1877 Franklin Primer did mention Leigh versions were available from the publishers, but they must not have been in use in the Boston area after 1876, where Harvard has three non-Leigh copies, (one with Webster spellings) after that date, nor in the Syracuse area, where the public library has a non-Leigh copy (also with Webster orthography) after that date.

It appears obvious that the Franklin Primer printed in ordinary instead of Leigh type by the University Press is the watershed text which divided the success of Leigh in Boston before 1877 from the failure of Leigh in Boston after 1877, and that the change is somehow associated with University Press which set it up, probably in 1877, with the publishers shown as Taintor Brothers, Merrill & Co., New York, and William Ware and Company, “Successors to Brewer and Tileston, Boston.”

As previously discussed, a possible tie existed between some person or persons at Harvard when the radically different “meaning” Worcester beginning reader was introduced in 1826. The same kind of possible tie appeared some fifty years later in 1877 and 1878 when Welch, Bigelow and Co., and then
John Wilson and Son owned the University Press and printed the sight-word texts for beginning readers, The Franklin Primer and The Webster-Franklin Primer.

To summarize these complex changes, in 1877 University Press: Welch, Bigelow and Co., and in 1878 University Press: John Wilson and Son printed editions of a straight sight-word, non-Leigh-print, “meaning” text, The Franklin Primer. In 1878, University Press: John Wilson and Son published a different non-Leigh version with Webster orthography, The Webster-Franklin Primer. Those printings by University Press in 1877 and 1878 were for publishers who had taken over Brewer & Tileston, the Boston company which had been publishing both standard print and Leigh-print phonic “sound” versions of the earlier readers by George Hillard and L. J. Campbell as late as 1876 but who had not used University Press on any of those readers which I examined. (F. Buisson reproduced pages from a Franklin Primer in normal print which he saw in August or September of 1876 at the Philadelphia Exposition, as described elsewhere, and Buisson named Brewer & Tileston as the publisher of that copy but the printer is unknown. It could, of course, have been University Press, but that would still suggest a possible tie to someone at Harvard, although a far more open one.)

Hillard and Campbell’s earlier primer, Hillard’s Primer or First Reader, had been available in Leigh print. It had been published in 1864 in standard print and was available in Leigh print as well by 1866. It was still being printed in Leigh print as late as 1876 by the old publisher, Brewer & Tileston of Boston, which indicates Brewer & Tileston had been distributing Leigh editions for ten years before it apparently suddenly went out of business after 1876, apparently at the exact time that University Press began printing the Franklin Primer in non-Leigh type. That Brewer & Tileston went out of business after printing the 1876 book just mentioned is established by the fact that Brewer & Tileston were not listed as Hillard’s and Campbell’s publishers in the American Catalogue of 1876, which reported on books for sale in that year.

It is true that the cover of the newer Hillard’s and Campbell’s Franklin Primer advertised regular print and Leigh-print versions as available from the newer New York and Boston publishers, along with the 1864 Hillard’s Primer or First Reader in Leigh print or regular print. Yet the three copies of the Franklin Primer from 1877 and later which survive in the Harvard library and the one in the Syracuse library are not in Leigh print. Although Leigh-print primers had been taking over the American market before 1876, only non-Leigh print primers turned up from Boston and Syracuse after 1876. By contrast, the copies in the Harvard library of the 1866 edition of Hillard’s and Campbell’s 1864 Hillard’s Primer or First Reader are in Leigh print, except for a non-Leigh copy printed by the publishers which took over Brewer & Tileston after 1876. Harvard has that non-Leigh-print copy entered under a publishing date of 1878.

It is clear Leigh-print Hillard primers which apparently had been in almost exclusive use in the Boston area by 1876 went out of print in Boston by 1877, at the height of the success of Leigh print in the Boston schools. This is obvious since only Leigh-print Hillard/Campbell copies survive from between 1866 and 1876 in the Harvard library and only non-Leigh print copies of any Hillard/Campbell editions survive after that date. Could there be any clearer evidence of meddling by extremely nasty influence peddlers?

Is it the influence from the circle of Harvard “experts” that Nila Banton Smith was trying to hide when she left about fifty years out of American reading instruction history? That she did so can be demonstrated by arranging her 1932 (1965) bibliographical references in calendar order, instead of the order of the book’s chapters, as she listed them. A rough review of her bibliography (which review is not finalized) shows that for 1848 to 1894, a period of 46 years, she cited only 13 references, two of which were European, two were Webb readers, and one was McGuffey’s. That left a total of only 8 other citations for those 46 years. Yet, for only the following ten years from 1895 to 1905, she gave 20 citations. Specifically, between 1857 and the 1889 reference to Pollard, a period of 32 years, she cited
only THREE American references. Yet in the 32 years preceding 1857 she had cited 25 references and in the very next decade after 1889 cited 10, but, significantly, all but one were after 1894. However, her references between 1845 and 1853 were also scant. In effect, Nila Banton Smith cut the half century from 1845 to 1894 out of American reading instruction history.

Her gutted bibliography obviously had a purpose. It buried the reign of sight-words and “meaning,” their failure, the opposition to them, and the actions of the “experts” associated with Harvard in the 1870’s and again in the early 1890’s to see that sight-words and “meaning” remained in place in American schools. Also, in effect, Nila Banton Smith omitted not only James’ and Cattell’s influences, but G. S. Hall’s and Colonel Parker’s influences. She gave only two dates on Parker. One was on page 243 when she mentioned that 1901 was the date the new Francis W. Parker School opened in Chicago (but Parker died the following year!). The other was in her bibliography, not likely to be checked by a casual reader, when she gave 1894 as the date for Parker’s book, Talks on Pedagogics. To someone unfamiliar with reading instruction history, that pushed Parker’s influence beyond the date of 1894 and into the twentieth century, when the fact is that he died in 1902. Smith wrote her “history” at Columbia Teachers College, when Thorndike, William James’ close friend and ex-student, was still teaching there, and when William James’ close friend, James McKeen Cattell, was still a neighbor and close friend of Thorndike.

Superintendent Philbrick of the Boston schools was fired as of March 1, 1878, and the Leigh phonic texts Philbrick had introduced in the Boston schools had to be dropped in September, 1878 because of the adoption of a new curriculum which implicitly outlawed the teaching of letter sounds at beginning first grade. The Annual Report of the School Committee of the City of Boston - 1878 includes the September 2, 1878, report of the new Superintendent of Schools, Samuel Eliot, who replaced Philbrick. Eliot said, on page 12:

“The course of study in the Grammar and Primary Schools, laid out by the Board of Supervisors, was adopted by the School Committee at the close of the last school year. It now goes into operation.”

Therefore, the 1877 printing date for the non-Leigh Franklin primer for first grades by the company which replaced Brewer & Tileston, at the time when practically all Boston first grades were still using Leigh material, would indicate someone was aware of an impending need which would arise by September, 1878, for large numbers of first grade books NOT in Leigh print to replace those in Leigh print. The fact that University Press: Cambridge, was the printer for those materials which seemed to serve little purpose in the Boston area in 1877 when they were printed suggests the person with that peculiar foresight might well have been associated with Harvard, as the 1826 promoter of the Worcester book, the predecessor to the Hillard books, may have been fifty years earlier.

Concerning the 1888 Illustrated Primer by Sarah Fuller of the Boston School for the Deaf Which Had Been Founded by Philbrick, Which Deaf-Mute Primer Was Recommended by E. B. Huey in 1908

As mentioned, Samuel Eliot replaced the remarkable Philbrick as Boston Schools Superintendent when Philbrick was fired. In the 1878 Annual Report of the School Committee of the City of Boston, the new Superintendent Samuel Eliot stated on page 12 of the “Superintendent’s Report:”

“...Spelling-books, for instance, block the way they profess to open. Children should learn to spell partly from their reading-books, partly from the other books they use, and partly from oral and written exercises.... The work is to a large extent unconsciously done....”
Eliot thereby announced that he was the same kind of “new broom” as Colonel Parker in Quincy (where a later superintendent announced that throwing out the spelling book in Quincy after 1875 had been a failure). By contrast to Eliot, Philbrick had said (page 151 of the “Superintendent’s Report” portion of the 1871 Boston schools report):

“The spelling-book is the symbol of popular education, and justly so, for it is the first word-book....”

Philbrick was acknowledging with the description, “the first word-book,” that in 1871 the speller came after the primer.

“No school-book in these latter days has fared so hard as the dear old spelling-book.... But the great antagonist of the speller has been the modern educational maxim, ‘Ideas before words,’... But the spelling-book is probably destined to a great longevity....”

The spoiling of beginning reading instruction for hearing children after Eliot took over and threw out Leigh phonics, as well as throwing out the speller at upper grades, was apparently not enough for the change agents in their war against “sound” and in favor of “meaning.” Philbrick had installed Bell’s phonics for deaf children in the precedent-setting and extraordinarily successful municipal school for the deaf which Philbrick had founded. For obscure reasons, that school was named, apparently after Philbrick was fired, the Horace Mann School for the Deaf. It should more properly have been named the Philbrick School for the Deaf. A book which came out some years later revealed the meddling after Eliot had replaced Philbrick had affected the deaf children, too, and that some school personnel who had served under Philbrick changed their ways under Eliot. Apparently the maxim we know worked then, too: if you want to get along, you have to go along.

Eliot wrote a preface for a book published by Sarah Fuller, Principal of the Horace Mann School for the Deaf, Boston, who had worked there when Philbrick was Superintendent. Her book was entitled, An Illustrated Primer, copyrighted in 1888. It was, significantly, recommended for hearing children by Edmund Burke Huey in his 1908 book, The Psychology and Pedagogy of Reading. It can be taken as another maxim that any reading book praised by Huey had to have something very wrong with it. The copy of An Illustrated Primer which I saw was published in 1893 by D. C. Heath & Co., who were also publishing G. Stanley Hall’s text on the teaching of reading and works by other “scientists” of the period. This suggests a tie between the Boston school administration and those wonderful “scientific” people whose motto might well have been, “Science Is a Sacred Cow,” the title of a fine book by a true scientist some years ago. It might truly be said that in Jacques Barzun’s House of Intellect, “Science” belongs only in the kitchen and not the parlor. Eliot’s preface read in part:

“This primer is intended to help little children who are deaf, in their earliest language lessons. They are supposed to have learned to speak and to associate the words they utter with the objects represented in words. Here, in this volume, they find the printed forms of the words which they speak, and of the sentences which they have been taught gradually to construct. As they master the words and sentences of the primer, they gain the power to learn other words containing similar vowel and consonant elements, so that their vocabulary may easily grow beyond the limits of this little volume. In the same way, these sentences lead to the construction of others, and prepare the child for more advanced lessons in language.”

Note the analytic comparison phonics from memorized whole, meaning-bearing sight words, which the children were expected to use to work out unknown words. That was quite a contrast to Alexander Melville Bell’s synthetic phonics.
“The illustrations are simple but numerous, in order to facilitate the all-important association of words and phrases with the objects for which they stand.

“It need not be said that deaf children, especially the little ones, meet many difficulties unknown to those who hear. Because they do so, they need a different primer from any in use among the hearing, and it is out of the actual necessities encountered in teaching the deaf, and the actual means by which they have been met in the Horace Mann School, that this primer has grown.

“The hope is entertained that teachers of the deaf in other schools will find their labors assisted by the methods that have proved helpful in the school where they originated.

“Nor should our desire that this book may be serviceable confine itself to the teaching of the deaf. Hearing children, it is hoped, may be helped by it in their first lessons whenever the common primer may be found unsuited to them. Like all other text-books of any real value, its purpose is comprehensive.

“I have much pleasure in writing this preface at Miss Fuller’s request. Samuel Eliot, July 1888”

The table of contents of the book referred to the vowels being taught, but it revealed absolutely no discernible phonic pattern, though it may have matched the articulation lessons for the deaf children. The effect of the book, however, despite its puzzling phonic arrangement, tended strongly towards sight-reading. It was bluntly advertised on the back of an 1893 edition, which listed “Reading” books for D. C. Heath, with the statement, “This book presents the ‘Word Method’ in an attractive form for little children.” “Fuller’s Phonic Drill Charts” were also advertised, with the statement, “These charts have been prepared for the purpose of exercising pupils in making the elementary sounds and in combining these to form syllables and words.” They were meant to teach speech, and had nothing to do with teaching children how to decode print. The Horace Mann School for the Deaf obviously was the successor to Philbrick’s school. Yet, under Philbrick’s successor, Samuel Eliot, it was moving rapidly away from “sound” and towards “meaning.”

**Town and Holbrook’s Progressive Series**

The fact that the first of the three Hillard series (the Franklin series being the last) had been enormously successful is shown by a September 17, 1862, pamphlet in the Harvard library entitled, *Truth Vindicated: A Correction of Sundry Falsehoods and Misrepresentations in a Circular Signed by Oliver Ellsworth*” (Educ 2199.01 bx), by Brewer & Tileston (the obvious successors to Hickling, Swan & Brewer), and Brewer & Tileston’s pamphlet of January 19, 1863, To the Readers of the “Maine Teacher,” (Educ 2199.01 bx), in response to Ellsworth’s answer, which is not available. Ellsworth’s sales were obviously hurting from the Hillard competition, and, among other charges, he had (apparently very unfairly, if the Brewer & Tileston circular can be believed) claimed that some of the selections were unsuitable for young children. Ellsworth also claimed that Brewer & Tileston had tried to influence legislation in Maine that was intended to forbid changes in textbooks more frequently than every five years, which legislation had been passed elsewhere.

Brewer & Tileston denied all charges, convincingly at least in their brochure, and were considering a libel suit. Interestingly, Brewer & Tileston paralleled in their recourse to the courts the actions of their predecessors against the McGuffey readers, as discussed later. However, that legislatures should have concerned themselves with forbidding textbook changes less than every five years demonstrates how competitive the textbook market was by the 1860’s.
In 1857, Oliver Ellsworth’s company, Bazin and Ellsworth of Boston, had published the Progressive Series by Salem Town (the author of an earlier series) and Nelson M. Holbrook. The Descriptive Catalogue of Town and Holbrook’s Progressive Series of Text-books, 1860 (Harvard Educ 2199.02 bx) said the series used the “orthography of Webster” which was still controversial, some still preferring Worcester’s. The comment on page 7 said:

“We are aware that a few still oppose the Webster Orthography, but these individuals are principally confined to Boston and Cambridge.”

The series certainly had some impressive authors, even though Salem Town was probably functioning only as a well-known old authority. Concerning other authors:

“Thomas Bulfinch, of Boston, author of the ‘Age of Fable,’ a popular treatise on Mythology, has been engaged upon three of the books of this series....”

“D. B. Tower, author of Tower’s Series of Readers... has also been engaged in the compilation of two important books of this Series, the PRIMER and the SPEAKER” (page 9).

Tower had introduced phonics (for elocution, not decoding) into first grade in his own series. Yet the copy of The Progressive Pictorial Primer which I have seen was not a phonic primer. It was copyrighted in 1857 and printed in 1862. Though missing all pages up to 15, it is evident from what remained that it was in no sense a phonic primer, although a few words which rhymed were included in the short word lists that followed paragraphs. Neither was Hillard’s a phonic series. Though Hillard touched on elocution in his own series, neither was any real phonics to be found in his First Primary Reader, any more than it had been found in Worcester’s reader which had been its immediate predecessor.

The advertisement on the back cover of Town and Holbrook’s The Progressive Speller (1860) read:

“This popular series of Text-Books has already been wholly or partially introduced into a majority of the schools in New England, and also into the schools in many of the cities and large towns in the Middle, Western, and Southern States. It was the ONLY series of Readers ADOPTED by the New Hampshire Board of Education, in March, 1857; also the ONLY series ADOPTED by the Vermont Board of Education in December, 1958....”

The series was still being published in 1867, despite the conflict with Hillard’s, as an 1867 revised copy of The Progressive First Reader is in the Harvard library. It was apparently out of print by 1876 as it is not listed in the 1876 Leypoldt’s American Catalogue. The series was certainly popular when it came out. In the 1860 pamphlet, the publishers stated:

“New England towns alone have furnished us with over one thousand testimonials, to which we invite the attention of the public. These recommendations can be seen in bound volumes at our office.”

By the publication of their new Hillard series starting in 1855, the former publishers of the Worcester series were most likely trying to compete with the publishers of Salem Town’s 1844-1847 popular series, and the new Progressive Series by Salem Town and Nelson M. Holbrook which started to come out in 1856. Both the new Progressive series and the Hillard series reached the market about the same time, but in pieces. In the nineteenth century, such series were not issued as a finished whole, but in such pieces, as each book became available. As mentioned, the predecessor to the Progressive Series by Town and Holbrook had been Salem Town’s older series, and it continued in print while the new series was being
issued. Holbrook had previously written an arithmetic for Town’s publishers (although the names of the publishers were constantly changing and reforming, even more so with Town’s publishers than with the publishers of McGuffey’s.)

The new Hillard series was also fighting for the Cleveland market. The brochure on the Hillard readers quoted many testimonials from Ohio, saying the Hillard books had displaced other series. One specifically mentioned that the Hillard books had displaced McGuffey’s. It is obvious this Cleveland business was the result of work by Bragg after 1858, before he switched sides in the textbook war and joined McGuffey’s, as discussed elsewhere. (Concerning the “heat” of these textbook wars, an amusing narrative from the School Bulletin is in Appendix A.)

**Concerning the 1883 Royce Readers, and Their Use in California, St. Louis, and Indiana**

In 1883, at least briefly, the public schools in St. Louis, Missouri, may have used or have been unsuccessfully pressured to use a series of reading books with ties to the change-agents. That series was called the Standard Education Series and it was published in St. Louis.

The book, The Letters of Josiah Royce, “Edited with an Introduction by John Clendenning,” The University of Chicago Press, Chicago: 1970, contains two letters (pages 470-472) written by Josiah Royce (1855-1916) which have a bearing on that 1883 series of readers. The series was one of three almost identical series that were published in simultaneous but separate editions. One was published in California as the A. L. Bancroft Series, one was published in Indiana as The Indiana State Series, and the third was published in St. Louis, Missouri, as the Standard Education Series.

The first of those two letters by Royce (although it does not specifically mention the readers) is dated February 20, 1904, and it is addressed to James McKeen Cattell. Cattell at that time was both a publisher and a professor at Columbia University. Royce wrote that, in answer to a request from Cattell a few weeks earlier, Royce had the Harvard Library prepare, at Royce’s own expense, a bibliography of Royce’s writings, as least as far as was possible. However, Royce said that quite a few of the articles he had written as a young man were not included. Royce added that he could not understand why a bibliography of his articles should be of any interest to Cattell or to any of Cattell’s associates.

However, Clendenning thought that he had found an explanation for the request that Cattell had made about January, 1904, which request had so puzzled Royce. Clendenning wrote:

“Royce was elected to the National Academy of Sciences in 1906. The bibliography was evidently used by Cattell in presenting Royce’s nomination.”

The two-year lag between Cattell’s request and Royce’s election does seem unusually long, if Cattell’s circa January, 1904, request really did concern Royce’s election some time in 1906.

The second letter was written only four days later, on February 24, 1904, to George Brett Platt (1858-1936), president of Macmillan Company, and Royce’s publisher, in answer to a question that Platt had asked Royce. The timing suggests that Platt’s question had been sparked by the list of Royce’s writings that Royce had sent to Cattell, particularly since Platt’s company, Macmillan, published materials from Columbia, where Cattell was located. Royce wrote Platt that he intended very soon to announce publicly the background concerning his own association with The Indiana State Series of school readers. Royce had been surprised to learn that the current Indiana series, in its 1903 revision, showed Royce’s name on the title page. Royce assured Platt that he presently had no connection with those
Royce said that Bancroft, in the early 1880’s, wanted to prepare a reading series for use only locally. At the time, Royce was a young English Composition instructor in the University of California, and he was asked, with two others, to prepare the readers. Royce was paid for his work when it was done, and, as far as he knew, that ended the matter. Royce had heard that Bancroft had passed the copyright on the reading series to others, but until recently Royce did not know who had the copyright or even that Royce’s own name was still being used on the materials. Royce did not consider the work he had done on the readers in the early 1880’s to be any importance, and he thought it very inappropriate that his name should appear on a 1903 revision. Royce told Platt that he was free to repeat the contents of his letter to anyone who had any interest in textbooks, but that he felt it was wrong to have his name on the current, revised series.

Clendenning’s footnote reads:

“Bancroft’s First (-Fifth) Reader, ed. Charles H. Allen, John Swett, and Josiah Royce (San Francisco: A. L. Bancroft (1884). See Frank M. Oppenheim, S. J., ‘A Critical Annotated Bibliography of the Published Works of Josiah Royce,’ Modern Schoolman 41 (1964): 345, where this item is listed with the following note: ‘These readers were adopted at least by the Standard Education Series, St. Louis, and the Indiana State Series, and underwent repeated revisions. Royce’s contribution to the first edition remains to be clarified as does his connection with subsequent editions of these readers.’”

Clendenning’s 1970 publication of the above two letters certainly clarifies “Royce’s contribution” which was apparently minor in the 1883 edition and non-existent in its revisions, but it does raise other questions.

Therefore, Royce and two others about 1880 and 1881 were preparing what was at least the third edition of a Bancroft series. The preparation of such a new edition every few years was normal for reading series at that time (and still is). What is interesting is that Royce was obviously misled into thinking that the new series on which he was working would also be only for local use, as the earlier two series apparently had been, when the fact is that it was immediately published in three editions in three widely separated areas. That is apparent proof that the new edition, from its very beginning, was intended to be far more than a local edition.

That the earlier two series were only used in California is suggested by the fact that they were printed only in California, unlike the edition on which Royce worked. On page 75 of Early American Textbooks... appear the entries for the texts in the OERI library which were prepared by “Allen, Chas. H., John Swett, and Josiah Royce.” In contrast to the scanty entries for the two earlier Bancroft series, many copies were listed of the series that Royce said they finished about 1882, the earliest of which were published in 1883. However, these editions were published in 1883 not only in California but also in Indiana and Missouri. The intent, therefore, from the beginning of the 1880’s revision, had obviously
been to provide state editions not just for California but for Indiana and Missouri, but that intent had not even been announced to at least one of the authors of the revised readers, Royce!

Bancroft’s Second Reader and Third Reader appear in Early American Textbooks with publication dates of 1883. Indiana State Series, First Reader, published by Indiana School Book Co., Indianapolis, appears with publication dates of 1883 and 1894, as well as a revision “by Annie Klingensmith” of 1894. The Indiana Second Reader carries a publication date of 1889, their Third Reader of 1889 and 1895, their Fourth Reader of 1883, and their Fifth Reader of 1889. Early American Textbooks shows that the Standard School Book Co. of St. Louis published Standard Educational Series. Standard Second Reader, in 1883, Standard Third Reader in 1883, Standard Fourth Reader in 1883, and Standard Fifth Reader in 1883.

It should be emphasized that these are chance, surviving copies, but the recurring dates strongly indicate a publishing “push” in 1883 to get these materials into government schools in three widely separated states: California, Indiana, and Missouri. Considering that all the surviving copies from Missouri are dated 1883, the push there may have been intense, but largely unsuccessful, as appears to have been the case in California. It is possible, however, that the series was reprinted or revised by the state of California under another title, as the Harvard library has an 1886 copy of the California State Series of School Text-Books, First Reader, “Printed at the State Printing Office, Sacramento, California.” The Indiana copies, by contrast, appeared over a period of many years and so were in use over many years. Yet, obviously, some net of influence must have existed prior to 1883 or this simultaneous distribution of what were apparently intended to be “official” state texts in 1883 could not have occurred. It is in this distribution net that the change-agents may be looked for.

Royce’s sincerity need not be doubted. As a young man, he was given an assignment, for which he was paid, and about which he never thought again until someone called his attention to the use of his name on a 1903 revision, about which use he had then been taking advice from some friends. (William James was probably his closest friend.) Who called Royce’s attention to the continued use of his name? Even the President of Macmillan publishing, obviously shortly after Royce’s attention was called, asked Royce about the reading books, so someone must have told the Macmillan president. (Macmillan was the publisher of some Columbia University materials, such as Reeder’s 1900 history.)

It is unlikely that the bibliography that the Harvard library prepared for Royce and that Royce sent to Cattell would have contained the name of the 1883 Bancroft edition, since Royce said that someone had called his attention to the use of his name, not that he found it on the bibliography he paid the Harvard library to prepare. If the bibliography did not include the Bancroft readers, then someone, someplace, must have spent some time reading the title pages on school readers and have stumbled across Royce’s name. Royce’s name must have been familiar to that person and eventually resulted in Royce’s attention being called to the use of Royce’s name. Royce wanted the facts to be made clear to anyone interested in textbooks, and who might that have been? The request for Royce’s complete bibliography had originated with Cattell, so it is very likely that it was Cattell, himself, who found that Royce’s name was still being used. It may have been that which sparked Cattell’s request to Royce for a complete bibliography of Royce’s works. Royce’s letter to Cattell certainly indicates that Royce had been nonplused by Cattell’s request for such a bibliography.

However, the fact that the reading series finished about 1882 was obviously meant to be used at least by 1883 in three states simultaneously, apparently as state-adopted texts and not texts competing on the open market, certainly suggests the existence of a net of influence before 1883. That was before Cattell came on the scene and first started to wield his influence in the 1890’s. It is because of Royce’s apparently unknowing relationship to this early net of influence that Royce’s surviving letters are of interest. Royce’s letters showed that he had used the influence of powerful people to further his career.
Apparently, it never occurred to Royce that such “influence” might use him, but the following summary of his early letters certainly seems to suggest that was what happened.

John Clendenning edited The Letters of Josiah Royce, University of Chicago Press, Chicago, 1970. After his excellent “Introduction,” which was a brief biography of Royce, Clendenning divided his collection of Royce letters into five sections, the first of which, Part I, concerned the period from 1875 to 1882, when Royce would have been from nineteen to twenty-six years of age. It was about 1880 or 1881 that Royce was asked to become one of the editors on the revised Bancroft series. The list of letters shown below with the dates and names of those to whom Royce wrote contains almost all the surviving letters for the period leading up to the completion of that reading series about 1882, which was published in 1883. In an appendix, Clendenning listed other letters in existence which he had not reproduced, but they are very few for the period 1875-1882. Therefore, the summary below concerns almost all of the surviving Royce letters for that period.

Concerning the names shown in the following summary, Daniel Coit Gilman was the president of Johns Hopkins University, having come there from the University of California where he had been president and where Royce had been a student under him. Gilman promoted Royce’s career and raised money to send him to Germany for a year’s study, after which Royce was given a two-year fellowship at Johns Hopkins under Gilman. Gilman had been a Yale graduate whose biography and influence are discussed in America’s Secret Establishment, by Anthony C. Sutton, Liberty House Press, Billings, Montana, 1986. William James of Harvard had given lectures in 1878 at Johns Hopkins while Royce was a fellow there, and their sincere friendship dated from that period, although Royce was some thirteen years younger than James. As discussed earlier, Albert Torrey Harris, a Hegelian and a native of Connecticut, had become Superintendent of the St. Louis schools, and was also the editor of The Journal of Speculative Philosophy. Lanman had been a fellow at Johns Hopkins at the same time as Royce, and was his very close personal friend. The Coale family of Baltimore had also become Royce’s close friends.

A summary of Royce’s early letters, involving all of these names, follows:

To Daniel Coit Gilman, June 14, 1875
Acknowledges grant of funds arranged from sponsors by Gilman so that Royce could spend a year studying in Germany, under Lotze, Wundt and others.

To Daniel Coit Gilman; July 11, 1875
Announces his sailing to Hamburg on the following Thursday, and going on to Heidelberg from there.

To Daniel Coit Gilman, December 11, 1875
From Leipzig, where he said he had almost no money left.

To Daniel Coit Gilman, February 2, 1876
From Leipzig. He thanked Gilman for sending funds, and said he hoped to repay it all within a few years.

To Daniel Coit Gilman, July 17, 1876
From Gottingen, concerning returning to Baltimore by September.

To William Torrey Harris, January 4, 1878
On Gilman’s advice, Royce sent him a manuscript for possible use in Harris’s Journal of Speculative Philosophy.
To Charles Rockwell Lanman, June 6, 1878

A personal friend, who lent him some money. He said he did not want to borrow from William James, if it could be helped, although James was kind.

To William James, June 11, 1878
Declined James’ offer to visit him. Congratulates him on forthcoming marriage.

To Daniel Coit Gilman, July 1, 1878
As king his advice about accepting a job offer from the University of California.

To Daniel Coit Gilman, July 16, 1878
Royce wrote that he had accepted the offer of Dr. Stebbins of the University of California. He said that he wanted to travel through St. Louis on his way to California, and to meet Harris. He asked Gilman to give him a letter of introduction to Harris, and thanked him for Gilman’s offer of letters to New Haven. Royce said that he had already visited there, along with Dr. Lanman, and had been privileged to see President Porter of Yale briefly.

To William James, July 16, 1878
Royce said that, after asking Gilman’s advice, he had decided to accept the job at the University of California. He said that they would probably let him teach some philosophy, if it were not atheistic in front of Freshman classes.

To Daniel Coit Gilman, August 11, 1878
Concerned in part the future payment of his debt to Johns Hopkins University.

To Daniel Coit Gilman, September 16, 1878
Reported on his new job at the University of California. Thanked him for the introduction to Harris whom he had met in St. Louis.

To George Buchanan Coale, September 16, 1878

To Daniel Coit Gilman, November 27, 1878
Reported that he felt intellectually isolated in California.

To William James, January 14, 1879
Royce complained that there was no philosophy to be found in California. He said that from the Golden Gate to the top of the Sierra mountains there were not enough brains to form even one respectable thought. Royce also said that Harris wanted him to compose a short review.

To Daniel Coit Gilman, January 26, 1879
Royce wrote that Professor Sill gave him some time in his Junior literature class so that Royce could present to the Juniors a revision of the Romantic School course that Royce gave at Baltimore.

To Charles Rockwell Lanman, January 26, 1879

To Daniel Coit Gilman, March 26, 1879
Royce wrote that he was presently heavily at work on his proposed Romantic School Literature course. He thanked Gilman for a copy of the proposed program of the Summer School of Philosophy at Concord.

To Charles Rockwell Lanman, May 25, 1879

To William James, January 8, 1880
Royce wrote that, since it was useless to try to find a market for philosophy in California, he was thinking longingly of his friends in the East who were so interested in metaphysics.

To William James, June 7, 1880
Philosophical discussion: Shadworth Hodgson, consciousness, and “time-stream,” conceivably an influence on James’ “stream of consciousness” ideas.

To Daniel Coit Gilman, September 5, 1880
Royce said that William James, while in England in the summer, told Shadworth Hodgson of some comments Royce had written to James on some obscure items in the Philosophy of Reflection, which book was apparently written by Hodgson. Royce said that, as a result, Hodgson had sent Royce a nice letter.

To William James, September 19, 1880
Philosophical discussion. Announces marriage plans.

To George Buchanan Coale, September 23, 1880

To Charles Rockwell Lanman, January 3, 1881

To William James, April 3, 1881
Reports his sending his application to Harvard.

To Daniel Coit Gilman, April 3, 1881
Reports that James wrote Royce of an opening at Harvard and that James had promised to support Royce’s application. Royce asked Gilman to write a letter of recommendation to Harvard to support Royce’s application for that Harvard job.

To William Torrey Harris, August 23, 1881
Concerns the possible publishing of one of his essays.

To William James, August 28, 1881
Chatty. Royce wrote that a wealthy Californian had endowed a chair for ‘Moral and Intellectual Philosophy and Civil Polity.’ Royce doubted that he would be considered but that some old Methodist minister would be more acceptable than someone under forty and someone who might be suspected of heterodoxy. The candidate would have to satisfy the active orthodox enemies of State Universities. Royce also said that he hoped that someone would summarize Lotze’s work for Americans, and wondered if Hall might do so.

To Daniel Coit Gilman, August 28, 1881
Royce thanked Gilman for writing Harvard about his job application, although nothing had come of his application. Royce did think that his prospects in general had been improved by the kind letters from friends.
As Clendenning showed, Royce’s English-born parents had both been devout, his mother a Baptist. But, like John Dewey, whose own mother was devout, and G. Stanley Hall, who was himself a conservative Protestant until his trip to Germany, Royce lost his faith by trying to absorb the intellectually indigestible philosophies that were coming into America largely from Germany.

The roots of these lay in the mad statement of Rene Descartes in France in the seventeenth century, “I think, therefore I am.” Descartes had used the fact of his own thought to prove his own existence, even though, as has long been pointed out, it is logically evident his existence had to precede its thought just as the subject, “I” in English precedes the English predicate, “think.” By making his own thought the proof of reality, Descartes in effect denied the existence of objective truth. The grammatical structure of Descartes’ Latin statement, “Cogito, ergo sum,” lacked the clarity of English grammatical structure, “I think, therefore I am,” and came to be considered by most philosophers to be bedrock “truth.” With the acceptance of that statement, “truth” became not objective, but subjective.

Philosophy has progressed in a dream - or nightmare - state ever since. Royce’s pathetic confusions showed up in the following letter:

To George Buchanan Coale, December 5, 1881
Royce wrote that he remembered how his heart had seemed to fail when he rejected his own creed, and said that he therefore came to believe, for instance, that he must accept the theory of evolution as truth. For some reason, Royce thought that accepting the theory of evolution had to result in his also giving up his belief in immortality.

To William James, December 28, 1881
Refers to his having spent the summer at Cambridge, to philosophical articles he had written, and ends with a convoluted discussion of reality as subjective, not objective.

To William James, January 19, 1882
Thanks James for his offer to write to one of the trustees of the University of California about him. Ends with more philosophical discussion.

To William James, February 1, 1882
More philosophy.

To Daniel Coit Gilman, February 1, 1882
Royce asked Gilman if Gilman had recovered his health. Royce said he was just as anxious as before to get a good job in the East. He said Gilman’s friends in California were inquiring after Gilman.

To William James, May 2, 1882
Concerning Royce’s acting as replacement for James at Harvard while James was to be on a leave of absence for a year. Royce said that he had telegraphed his acceptance the night before, and was looking forward to official confirmation. Royce said that a Cambridge egg (obviously the temporary job at Harvard, which would be only during the sabbatical leave of James, and which had no offer of a firm job at the end of that year) would be more valuable than a whole collection of chickens in California (obviously, his future prospects in the California job).

To William Thomas Reid, June 2, 1882
Tendered his resignation as Instructor in the English Language and Literature because he said he had accepted a year’s appointment in the East.
To Daniel Coit Gilman, July 12, 1882

Royce wrote Gilman that he had finally obtained an Instuctor’s rank at Harvard to fill in for James for a year, although the job was only temporary and he had no promise of a future job there.

To Charles Rockwell Lanman, August 14, 1882

To William James, October 31, 1882

Reports on progress of his work at Harvard.

As the letters confirm, after his two-year fellowship at Johns Hopkins where Gilman was President, Royce was unable to get a position in the East, so went in 1878 to the University of California to work under Edward Rowland Sill, teaching elementary courses in composition and literature. Until his close friend, William James, personally arranged for Royce to act as his replacement in 1882, for four years Royce found it impossible to find the employment he yearned for in the East, despite Gilman’s “influence.”

Yet what Royce did not see was the correspondence between Gilman and Sill at the University of California, where Royce was serving so unwillingly and so unhappily. Clendenning recorded for 1878 (page 19):

“On September 4, Sill wrote to Gilman with the air of a man who had just purchased a product through a mailorder catalog: ‘Royce has been duly reed, & found to answer the description.’“

Royce thought he had been using influence, and he desperately did not want to go back to California. Yet, to Gilman, Royce had been just a chess-piece, so to California Royce went and in California Royce stayed for four long and miserable (to Royce) years, until someone other than Gilman finally found a position for Royce in the East.

Why would Gilman have gone to such trouble to train someone like Royce and then to install him in the University of California, obviously ignoring Royce’s intense desire to work in the East? By Royce’s admission, old-fashioned Methodist ministers were considerably more welcome there in 1878 than the quasi-atheistic Royce. But that, apparently, was just the point. Royce had been turned into a post-Christian, most probably by the combination of his training under Gilman, by his training in Germany, and by his training at Johns Hopkins University.

As Orestes Brownson pointed out, as referred to previously, one of the chief aims of the change agents in 1829 and 1830 had been to remove the influence of Christianity from the schools. Brownson indicated at the time he wrote his autobiography years later that he felt such change agents as he himself had been were probably still operating, and he drew attention to the changed content of school materials. Gilman was possibly such a change-agent as Brownson had been, and, if so, Royce would have provided a convenient post-Christian tool for whatever Gilman’s purposes were at the time. Of most importance, as a professor, Royce had become an unwitting anti-Christian and anti-Jewish influence on college students, in what Royce found to be at that time a philosophically conservative California.

Over the years, Royce ground out volumes of philosophy on semi-religious topics, but it was dreadful and loquacious pantheistic stuff, in the tradition of “Let the Force be with you.” However, it is also conceivable that Royce’s altered kind of thinking, as a result of his “education,” showed up not only in his philosophical writings and in his college lectures but in his choice of reading selections for the new
Bancroft series. If the last were true, that would have been in sharp contrast to the kind of traditional and often religious selections in older reading textbook series like McGuffey’s.

Obscure philosophical writings by “intellectuals” such as Royce have been around for a very, very long time, to judge from comments in The Catholic World Report, Ignatius Press, San Francisco, California, January, 1992, pages 32-33. An article quoting from the writings of St. Irenaeus of Lyons (c.120-c.202) was headed:

“The great aim of St. Irenaeus was to refute the adherents of Gnosticism, who flourished in the 100’s....”

An insert gave St. Irenaeus’ reaction to the obscure ideas which were coming from the Gnostics, demonstrating that such fuzzy obscurity as Royce’s is anything but new:

“The teachings Irenaeus fought are extremely difficult for modern readers to understand. The language is opaque, the doctrine like an onion with layers and layers of peels. Such terms as ‘Dyad,’ ‘Tetrad,’ ‘Ogdoad’ abound, each used to refer to one or another of the divine or semi-divine realities at the center of the cosmic drama. Irenaeus is often given to sarcasm in his description of these teachings, on one occasion renaming the Gnostic divinities ‘Utter-Emptiness,’ ‘Gourd,’ ‘Cucumber,’ and ‘Melon.’“

To return to the Bancroft series: Sill was head of the Literature department at the University of California. Someone asked three members of that department to write a reading series. That someone very probably was their superior, Sill. Upon its completion, the series was promoted immediately in three states, California, Missouri and Indiana. It is unlikely that Sill was an employee or part owner of the publisher, Bancroft, and equally unlikely that either Sill or Bancroft would have been able to arrange such an immediate and wide distribution.

Concerning Bancroft’s undoubtedly limited influence, the 1876 American Catalogue showed that in 1867 Bancroft had published an edition of Common School Reading by J. Swett for $1.50, simultaneously with A. S. Barnes of New York who published it for a price of $1.25. With Josiah Royce and C. H. Allen, J. Swett later was an editor on the Bancroft 1883 readers. Whether Swett was at the University of California in 1867 as in 1883 is unknown, but the publishing arrangement shown on the 1867 book listed in the 1876 American Catalogue suggests that Bancroft was only acting as a West Coast distributor for Barnes on that text, and not as its principal publisher, since Bancroft’s name was listed after Barnes in the 1876 American Catalogue. Yet Bancroft clearly was the principal publisher on the 1883 series.

Bancroft had apparently published its previous two reading-textbook series of 1873 and 1875 largely for the local market and so presumably lacked the necessary contacts for nation-wide distribution. However, it is highly likely that Gilman, with whom Sill obviously had a close relationship, and who had been Sill’s superior at the University of California before Gilman went to Johns Hopkins University in Baltimore, could have arranged for a wide distribution through his nation-wide contacts such as Harris in St. Louis.

Since the Indiana series, described later, was Code 1 to Code 3 material at its beginning, then the almost identical California and Missouri materials must also have been Code 1 to Code 3, or a “meaning” approach, at their beginnings. Harris had left St. Louis just before the academic year 1880-1881. It is a matter of record, as discussed elsewhere, that St. Louis continued using Leigh print after 1880. That meant that St. Louis could not have been using Harris’s 1878 Appleton readers at first grade, since the American Catalogues show no Leigh-print edition for the Appleton readers. Therefore, Harris’s 1878
Appleton readers with their “meaning” approach at first grade had not succeeded in displacing “sound”-approach Leigh print at first-grade in St. Louis after 1880.

Yet Royce’s series, which he said was finished in 1882, and which was published in 1883, must have been begun just about the time that Harris left (was fired from?) his job as Superintendent of Schools in St. Louis in 1880. Published in 1883 as a St. Louis series (as well as an Indiana and California series), and using a “meaning” approach at the beginning levels, those Bancroft materials which Royce helped to write were possibly planned as a second attempt (after Harris’s Appleton 1878 series had obviously been rejected) to displace “sound”-approach Leigh print in St. Louis.

The records show that St. Louis continued to use Leigh print after 1883, so that attempt (if there had been such a deliberate attempt) failed. However, it certainly would have been a strong attempt since so many 1883 copies of the St. Louis series survived to find their way into the publication, Early American Textbooks. The listings in Early American Textbooks also suggests that such a St. Louis attempt (if it did exist) must not just have failed, but must have failed resoundingly, since not even a single copy of the St. Louis series with a publishing date after 1883 survived to find its way into the listings.

Yet the size and efficiency of the net of influence on the Bancroft series in 1883 (involving California, Indiana and St. Louis) is certainly dwarfed by a comparison to the size and efficiency of the later 1930 nationwide net of influence on the William Scott Gray readers, which resulted in the total adoption of the deaf-mute reading method in American schools and the plunging of a once-literate America into a sea of functional illiteracy.

Unlike the apparently unsuccessful St. Louis version of the 1883 Bancroft series on which Royce worked, the Indiana version of the Bancroft series was very successful. Concerning that success, the Indiana School Journal in 1890 printed this advertisement from the Indiana School Book Co. of Indianapolis:

“To the School Officers of Indiana:

“The Several Complete Series of Readers, Geographies, and Arithmetics published by this company were adopted on July 10, 1889, by the State Board of Education for exclusive use in the common schools of Indiana for the next five years. This action was taken under the law of March 2d, 1889. The best evidence of the merits and value of these books is afforded by the resolutions of the Board of Education, taken from the official record....[quoted at length in the advertisement] The above resolutions were adopted by a practically unanimous vote....”

Listed as a member of that disgraceful board approving government textbook control was David S. Jordan, “President of Indiana University.” The reading series being mandated for use in all Indiana schools was the same California one of 1883 on which young Josiah Royce had worked, and which had been promoted, apparently unsuccessfully, in St. Louis in 1883. Possible ties to Gilman at Johns Hopkins have been discussed concerning both the initial writing of that series, which was done in part by Gilman’s protege, Royce, and concerning the subsequent unsuccessful promotion of that series in St. Louis as a substitute for Leigh print. As the above makes clear, that reading series which showed signs of change-agent activity in its preparation and in its St. Louis promotion continued to show such signs when it was used in Indiana. That is because it was actively promoted by Jordan, and Jordon’s tie to change-agent Agassiz is certain, as will be shown.

The mandatory use of the textbooks in Indiana was challenged in court. An editorial on page 37 of the Indiana School Journal, Volume XXXVI (apparently January, 1890) read:
“Testing the New School-Book Law.... Judge Frazier... agreed with the governor and attorney general that the law is constitutional and will stand but disagrees with them as to its being compulsory. He says: ‘It is not expressly required that these (Indiana) books shall be exclusively used in the schools, nor can that requirement be fairly implied. It is one thing to secure good books at a low price, and quite a different thing to compel their exclusive use in the schools.’"

On page 159 of the Indiana School Journal (apparently the March, 1890, issue), the Journal referred to the public reaction:

“...last August, before the law had taken effect, when there was great excitement and great difference of opinion as to whether the law was compulsory, and as to the merits of the books, etc....”

Of course, no “difference of opinion” would have existed if there had not been some highly visible and influential people who were interpreting the law as “compulsory.”

It is evident the law was a steamroller operation, in total disregard of the convictions of many people. Yet it is also interesting that David S. Jordan is shown plainly allied with those forces of coercion. David S. Jordan had been on the fast track by the time the Indiana textbook coercion took place, and was then, in 1889, President of Indiana University. By 1900, the apparent date of the article “Agassiz at Penikese” by Professor Burt G. Wilder, which bears Harvard College Library’s stamp of October 29, 1900, and which had appeared in the American Naturalist, Vol. XXXII, Jordan was President of the Leland Stanford Junior University in California. When the Anderson Summer School of Natural History had been held by Agassiz at Penikese Island in 1873, Jordan at that time had been simply Instructor in Botany at Appleton, Wisconsin. Yet young Jordan in 1873 was of enough importance for Agassiz to have included him on his short list of 44 adult pupils. In April, 1892, Jordan wrote an article, also called “Agassiz at Penikese” for the Popular Science Monthly, Volume XI, p. 721-729. The Penikese experience had obviously been important to him.

What is very curious about Agassiz’s 1873 Penikese school is the very peculiar financial support that it received. Agassiz had sketched the idea the previous December, according to the article in the Harvard College Library, and had initially intended to hold the school elsewhere. However:

“In the following spring, the munificent offer by an utter stranger, Mr. John Anderson of New York, of the island of Penikese in Buzzard Bay, together with a dwelling house and barn and an endowment of $50,000 not only led to the change of location but enabled Agassiz to carry out certain parts of his plan more fully.”

That was a very strange occurrence. Since Anderson was “an utter stranger,” who got Anderson involved in the project - and why? Agassiz had already decided where to hold his 1873 summer school and had apparently not canvassed for any such help. If Agassiz had openly done so, the above 1900 report by a probably knowledgeable near-contemporary of Agassiz would have been written very differently.

It is clear from portions of the Indiana series which were quoted and discussed in the Indiana School Journal that the “official” reading textbooks that Jordan approved as a member of the state board were a “meaning” series, Code 1 to Code 3. Whether the Indiana materials approved in 1889 were exactly like the original 1883 Indiana materials is not certain, but it is highly unlikely that they were very different. Therefore, sight unseen, it is fairly safe to conclude that the 1883 California and Missouri series would also have been Code 1 to Code 3.
The Indiana School Journal had articles on teaching beginning reading by Howard Sandison, Professor of Methods in the State Normal School. In January, 1890, Sandison said on page 12:

“In primary reading, the first phase is that which results in the mastery of a group of some forty or fifty words as letters, standing for meaning. This work is oral, and occupies perhaps, two or three months in time. In it, the sole purpose is to directly associate a printed word as a whole, with its meaning. In this work, the attention of the children is not called in any way to the letters or sounds. If the children learn anything in regard to these, such knowledge is incidental. The one aim of the work, is to impress the children with the idea that words stand for meaning; and to give them a basis for determining the meaning of new words in connected sentences, through the meaning of these familiar words that are also found in such sentences.

“Words signify, however, more than meaning. They signify sounds. Therefore, printed words must be taught as standing for sound. but this work is not to be taken in connection with the preceding phase, because it unduly and unnecessarily complicates the work in that phase, and also prevents the child from acquiring the idea that the main function of words is to express meaning....”

Sandison then endorsed at that point the use of a vague kind of phonics from whole words, and said,

“These two phases of work having been well done, the child is prepared to enter upon the definite use of a First Reader, and the study of simple thought in connected sentences.

“The nature of work with connected sentences is the question now to be considered. Take for example, Lesson XV, on page 23 of the First Reader of the Indiana Series:

“Come, mamma, do come!” says Dickie Rat. “See this little box. May I go in to play? It is a nice box to play in.”

“Oh no, Dickie! it is a trap. We will not use it.”

The content of Sandison’s article was unusually vague and confused, even for a “reading expert,” but he had nevertheless made it clear that systematic synthetic phonics was not recommended before starting a child on the Indiana Series first book, and that by an early lesson, Lesson 15, in that book, the children would be forced to read the irregularly spelled words as wholes by “meaning” and “context” instead of by “sound.” With his comments and his quoted section, Sandison had conveniently labeled the Indiana Series in use in 1890 as a Code I approach at its beginning, no matter what “phonics” may have been used in it later. (However, Rice’s 1892 contradictory comments, discussed later, indicated that he saw “supplemental phonics” in use in Indianapolis by that date.)

Sandison made his ideas on “phonics” very clear in a later 1890 article, appearing on page 143 of the magazine’s 1890 volume. Sandison was describing a lesson given five months into the first grade year, at which point most phonically trained first-graders can independently read aloud, very slowly but with fair success, almost anything in print. Sandison’s “lesson” lasted ten minutes and concerned reading the simple word, “red,” for its meaning and sound. He made the incredible statement that for his first graders, after five months of so-called “reading instruction,” “The next step was to awaken the idea that the oral word consists of separate sounds.” Sandison’s “phonics” was manifestly whole word, phony phonics.

Indiana in 1890 was obviously under the control of the “meaning” camp in reading, not only in its normal school where Sandison was employed but in its mandatory school books. (Yet, happily, Rice found in his 1892 visits to the Indianapolis schools, mentioned later, that “supplemental phonics” was
being used, very probably in connection with the “experience charts” which were also being used there.) Indiana was an important link in the whole “school improvement” crusade carried on by the activists. William Hailmann who was famous for his promotion of kindergartens became Superintendent of the La Porte schools, to judge from page 80 of the 1891 volume of the Indiana School Journal. That would have made the La Porte schools very prestigious as a later job reference for its primary school teachers.

It is therefore very interesting that a woman closely associated with the W. S. Gray’s Scott, Foresman “Dick and Jane” readers came from La Porte. Zerna Sharp died at 91 in 1981 (on a Wednesday which was apparently June 19) and had been a teacher and principal in the La Porte primary schools before joining Scott, Foresman. She headed an editorial staff and is said to have written much of the text for “Dick and Jane,” obviously under W. S. Gray. Her obituaries in the Chicago Tribune and New York Times said she had observed children repeating such words as, “Look, look!” and “Run, run!” when she sunned on the Chicago beach in the 1920’s and that this was the source for the “Dick and Jane” deathless prose. She was called the “Mother of ‘Dick and Jane’” The Times said she “often referred to Dick and Jane as ‘my children.’”

What the obituaries did not say, of course, was that the idea of constantly repeating words in print to fix them in memory came from the “meaning” method for teaching deaf-mutes to read and had been standard in most sight-word readers for close to a hundred years by the 1920’s. Its use in the “Dick and Jane” readers is more properly attributed to the reading theories of W. S. Gray than to Verna Sharp, no matter how convenient her observations on the Chicago beach may have been to support what he wanted to do anyway: to write deaf-mute “sight-word” readers with strictly controlled vocabulary for hearing children. Verna Sharp’s observations just made it easier: the necessary repetitions to fix the sight words in memory now did not have to be separated by any intervening words. After her contribution, the necessary repetitions could sometimes come in unbroken salvos!
Chapter 26
On the History of the McGuffey Readers, On the Origin of Their Last Publisher, American Book Company, and On Their Greatly Inflated Sales Estimates

In American Reading Instruction, widely accepted as a reliable source, Nila Banton Smith began a largely fictional history of the McGuffey Readers by repeating other fictions. She began by wrongly claiming that the New England Primer and, after it, Noah Webster’s speller had been almost universally used to teach beginning reading in America from early in the seventeenth century until about 1840. Smith then claimed these two had been replaced in turn by a third massively dominant material, the McGuffey Readers, which remained in heavy use until about the beginning of the twentieth century. The fictions made the blanketing of the United States in 1930 with the deaf-mute “meaning” method Dick-and-Jane readers seem to be a continuation of an American tradition.

Of course, these fictions have kernels of truth. Concerning McGuffey’s, it is true that the 1836-1842 “meaning” or sight-word McGuffey series was widely used in the Middle West, and also in parts of the South along the Mississippi where it could easily reach that market by riverboats. The even more popular 1879 “sound” or phonic-approach McGuffey series was very widely used in the Middle West. The reason for the heavy sales of McGuffey Readers in those areas in those years is that its publisher could supply readers in those areas more cheaply than most other publishers since it had lower transportation costs. Almost all the other schoolbook publishers were in New York, Philadelphia, or Boston, but McGuffey’s publisher in Cincinnati, Ohio, was far closer to those markets.

Concerning the New England Primer “enlarged”, the first historical reference to it was an advertisement in an almanac entitled News from the Stars, published in Boston in 1691. That advertisement was by the publisher, Benjamin Harris, while he was in Boston for a few years before he returned to England. Harris said his “enlarged” edition would include material that is known to have been in his earlier book, The Protestant Tutor. That earlier book has a surviving edition of 1685 now in the American Antiquarian Society library in Worcester, Massachusetts. Most of the remaining material in the “enlarged” edition was a catechism.

Yet it is the material by Harris, such as “Verses Made by Mr. Rogers, The Martyr,” taken from The Protestant Tutor, and the “Illustrated Alphabet,” probably also by Harris, which people today consider most meaningful when referring to the New England Primer. The New England Primer in the “enlarged” form known today most probably was put together by Harris after 1685, since that is the year he published The Protestant Tutor in Boston.

Boston imprints of other books published by Harris in America are dutifully reported in Evans’ American bibliography. Records survive of his publications after he returned to England, as reported by Alston. Yet no record exists of the presumed 1691 American edition by Harris of his advertised New England Primer “enlarged”. Thirty-six years after that 1691 advertisement of the “enlarged” edition “now in the press” (which may never actually have been finished since no other record of it survives), the second record of the New England Primer appeared, well into the eighteenth century. That second record is provided by the first surviving “enlarged” copy, printed in 1727, presently held by the New York Public Library.

The New England Primer “enlarged” manifestly was of little importance before 1727 since, unlike it, many other primary school texts published before 1727 (and even the 1685 Boston edition by Harris of
The Protestant Tutor) have surviving copies. Yet almost no one but historians have ever heard of these other surviving school texts, while almost everyone over fifty years of age has heard of the New England Primer. It is true that the New England Primer had vast sales after 1760 (but not before), as confirmed by Charles F. Heartman’s 1934 check-list of surviving copies. The New England Primer Issued Prior to 1830 [Bibliographical Check-list of the New England Primer], which he had also issued in less complete editions of 1916 and 1922. The New England Primer with the material by Harris was even printed in Great Britain after about 1770. Yet it was used as a catechism, not as a schoolbook. That is confirmed in part by Noah Webster’s own testimony quoted earlier concerning the schoolbooks that were in actual use in Connecticut in the 1760’s. It is also confirmed by the fact that Noah Webster himself prepared a version of the New England Primer after 1800 to make it suitable for school use, which is a clear admission that it had not been used in schools before that time! Heartman’s checklist of New England Primer editions lists Webster’s version.

Heartman also included the only surviving reference to the New England Primer in its unimproved, pre-Harris form. It seems to confirm that the earlier version was simply a catechism, and not a beginning reading book. Heartman wrote:

“...the first edition of this book was probably printed in England. In the Stationer’s Register in London under the date of October 5, 1683, a certain John Gaine entered a title in accordance with the statute requiring the registration of all books for sale. This entry reads:

“Mr. John Gaine
Eodem Die et Anno. Entred then for his Book or copy Entituled the New England Primer or Milk for Babes with Wm. Scoresby.
Jno. Gaine”

As discussed earlier, all that this establishes is that two men in England in 1683 were selling a book called “New England Primer or Milk for Babes.” There is no indication that they either wrote it or even that they printed it. Furthermore, it would have been very odd indeed for someone in England to put the title “New England” on his own work. The copies they were registering for sale in England might very well have come over by ship from Boston, since even copies of New England texts printed for American Indians in an Indian language are known to have done so earlier. Furthermore, “Milk for Babes” was a term for catechism - and so was “primer,” as shown by the bibliography of Evans. Of course, the two men may also have reprinted a New England original for the English market. Therefore, instead of this entry’s suggesting an English origin, it instead tends to confirm the American origin of the New England Primer and to suggest strongly that in its pre-Harris, pre-1691 form, it was only a simple catechism, which was thought of as providing spiritual “Milk for Babes,” not beginning reading instruction. A careful review of the historical record does demonstrate that the New England Primer was not a beginning reading text from 1691 into the late eighteenth century, as reported by Nila Banton Smith in her so-called “history,” American Reading Instruction.

Concerning Nila Banton Smith’s claims about the use of Webster’s “sound” or phonic-approach speller of 1783, it is true, of course, that Webster’s speller had been in enormous use as a schoolbook in America. It certainly was the most enormously used of the three major texts which Smith cited: the New England Primer, Webster’s speller, and the McGuffey Readers. Nevertheless, at all times it had heavy competition, unlike the later McGuffey Readers, the use of Webster’s speller was not largely limited to one part of the United States but covered almost the whole United States as early as the 1790’s, as shown by the “planter’s” anecdote quoted earlier. However, Webster’s “sound” or phonic-approach speller was usually not used at the critical beginning reading stage after 1826, in which year the activists began their successful drive to replace the “sound” spelling books for beginners with the “meaning” sight-word primers. The activists’ drive which took off in earnest in America in 1826 has been discussed at length in
this history, and was joined to their drive to replace private education with government-controlled education. The activists’ largely forgotten but successful drive to achieve both aims is confirmed by a great number of surviving documents, and it resulted in widespread reading disability, which fact is virtually unknown today.

Furthermore, Webster’s 1783 Code 10 “sound” or phonic speller had never been almost the sole speller in use. (To repeat, Code 10 represents a “sound” approach in teaching beginning reading, and Code 1 a “meaning” approach, with the numbers in between representing relative mixtures of the “sound” and “meaning” approaches.) Webster had fought for copyright laws in the early nineteenth century specifically to protect his speller from imitators. That fact alone is testimony to the existence of competition even long before 1826 when the use of a spelling book to teach beginning reading largely ceased.

Before stating the facts on the McGuffey Readers, a portion of Nila Banton Smith’s material on McGuffey’s should be quoted for comparison since that fiction has been so widely promoted that it is generally accepted as fact. The quoted material from her 1965 edition of American Reading Instruction published by the International Reading Association presumably is the same as the material in her 1934 edition published by Silver, Burdett and Company. The original edition had been prepared from Smith’s doctoral dissertation at Columbia Teachers College, apparently in 1932.

Since her original faulty “history” had been prepared at Columbia Teachers College about 1932, that obviously placed its author, Nila Banton Smith, in the circle of influence of the psychologists, John Dewey of Columbia University, and Edward L. Thorndike of Columbia Teachers College, and of the “reading expert,” Arthur Irving Gates of Columbia Teachers College. Also, through them, she very possibly could have been influenced by the psychologist, James McKeen Cattell, formerly of Columbia, who was Dewey and Thorndike’s close friend. She could also have been influenced through them by the psychologist, Charles H. Judd, and by the “reading expert,” William Scott Gray, both of the University of Chicago and both close associates of Thorndike. Judd and Gray were also associates of Cattell, as surviving letters testify which are in the Cattell manuscript files in the Library of Congress.

Nila Banton Smith also had a much earlier tie to the psychologist, Edward L. Thorndike, before taking her doctorate at Columbia Teachers College about 1932. In 1920, the Picture Story Reading Lessons by Nila Banton Smith and Stuart A. Courtis had been the first material to use Thorndike’s list of the commonest words, even before Thorndike published his list in 1921. Courtis also had ties to Columbia and Thorndike at least by 1919 when Courtis took an academic degree there in middle age and when he prepared a paper on arithmetic jointly with Thorndike. (Courtis probably had far earlier ties, since he had worked on the 1911-1913 New York City school survey carried out by Hanus of Harvard. That survey had a very murky history, Hanus having been very badly used, as his autobiography implied.)

Yet in her “history,” Smith did not mention Picture Story Reading Lessons, copyrighted in 1920, that she and Courtis had written. It had been a Detroit schools pilot program, teaching beginners to read by silent reading and pictures (a pure “meaning” approach), just as Gallaudet’s deaf-mutes had been taught. (Gallaudet had even published in 1830 a remarkably similar book, The Child’s Picture Defining and Reading Book. Although the 1830 book was not meant for beginners, as his 1835 Code 1 “meaning” method Mother’s Primer was, the 1830 book was intended to be used by both deaf and hearing children and contained pure Code 1 “meaning” philosophy.) The 1920 book by Smith and Courtis had revised editions in 1924 and 1926, and the 1928 United States Catalog showed it was still in print in 1928. The “Readers” section of the United States Catalog listed all readers in print in 1928, only a few of which had additional separate listings elsewhere in the catalog. Those with additional separate listings were obviously the best-sellers. Apparently Picture Story Reading Lessons was selling very well in 1928, only six years before Smith’s “history” was published commercially in which she omitted any mention of that
1920 book. That is because Picture Story Reading Lessons had its own special alphabetical entry elsewhere in the United States Catalog, besides being shown in the general section, “Readers,” and apparently only best-sellers rated such a separate listing.

Although Smith omitted any mention of the 1920 Picture Story Reading Lessons in her 1932-1934 “history,” even though Picture Story Reading Lessons had obviously been having large sales as late as 1928, she did mention other materials she had written. Smith also mentioned silent reading materials written by other people. Therefore, Smith’s omission of Courtis’s and her own highly successful 1920 silent reading program for beginners certainly suggests that Smith was attempting in 1932 and 1934 to suppress the facts about the origin of that widely sold 1920 program. Its origin was, of course, very unusual, because it had been the very first to make use of Thorndike’s list of the commonest words, and it did so to teach little beginners with normal hearing by the same Code 1 “meaning” approach that Gallaudet had used with deaf-mutes.

In pages 17, 210 and 211 (and possibly elsewhere) of his 1930 book, Interest and Ability in Reading, Arthur Irving Gates cited studies specifically carried out on deaf children just learning to read, the studies apparently being carried out under his direction at Columbia Teachers College. For the little deaf beginning readers, one new word was introduced for every 150 words of a story. Gates specifically noted on page 785 of the June, 1925, issue of The Elementary School Journal, concerning teaching deaf children under eight years old to read, “Incidentally, study of the deaf should throw light on the values of phonetic training, since they cannot, of course, utilize this device.” This comment of his and the study of beginning reading for the deaf clearly indicate that Gates understood the origin and nature of the inferior deaf-mute method he and William Scott Gray were to inflict on American children with their 1930 deaf-mute-method primers. Gates’ so-called “intrinsic phonics” method was simply that same deaf-mute sight-word “meaning” method in new dress, and it was used in Gates’ 1930 Macmillan series and in William Scott Gray’s far more widely sold 1930 Scott, Foresman “Dick and Jane” series.

Although those facts are never mentioned in the literature after 1930, both Gates by 1916 and Gray by 1913 had been Thorndike’s graduate students at Columbia Teachers College, and both had works published jointly with Thorndike, Gray in 1914 and Gates during the 1920’s. Also, Courtis and Smith, in writing the 1920 material, were clearly influenced by Thorndike. For Smith to have listed the 1920 Picture Story Reading Lessons in her 1934 commercially published book might have made unnecessarily obvious the clear influence of the psychologist, E. L. Thorndike, on Smith and Courtis, and perhaps even on Gates and Gray. It conceivably also might have put unwelcome light on the fact that all four people who had been influenced by Thorndike had later used the deaf-mute “meaning” method to teach beginning reading in their enormously sold materials (and the special listing of the Courtis/Smith material in the United States Catalog establishes that their material was being very widely sold by 1928). Smith’s and Courtis’s 1920 work had been the most blatant and the most obvious use of the deaf-mute method - perhaps far too obvious for the “experts”“ liking after 1930. It had lacked the armor against possible criticism which protected Gates and Gray by their use of the phrase, “intrinsic phonics.” (However, Courtis later wrote a widely used, and undoubtedly highly profitable, picture dictionary for primary grades, but that was a less obvious application of the deaf-mute “meaning” method.)

Any mention after 1930 of the connection of the psychologist, E. L. Thorndike, to the teaching of beginning reading disappeared totally from the literature. So did the connection of “intrinsic phonics” to the teaching of deaf-mutes. “Intrinsic phonics” is simply the deaf-mutes’ silent, visual comparison of the parts of whole, meaning-bearing sight-words to each other in order to tell the whole words apart (exactly like visually comparing the pieces of jigsaw puzzles). That comparison exercise is carried out with the “help” of the “meaning” context of a reading selection in which the words are embedded. Gallaudet had to use the context-guessing method to enable his deaf-mute students to distinguish the differences between the whole printed words his deaf-mutes were learning by their “meaning.” Yet it is certainly no
accident that it was only after the publication of the two massively-used 1930 deaf-mute “meaning” method series by Gates and Gray, Thorndike’s graduate students, which used Gates’ so-called “intrinsic phonics,” that America was flooded with functional illiteracy.

Excerpts concerning the McGuffey Readers from pages 103 to 109 of Nila Banton Smith’s so-called “history” follow:

“McGuffey Readers

“We have seen that The New England Primer was the favorite reader during the period of religious emphasis [Ed.: 1607 to 1776], and we have noted that Webster’s famous old Blue-back Speller held sway in the classrooms of the nationalistic-moralistic period [Ed.: 1776 to 1840]. Now we are about to consider the characteristics of the reading text which outstripped all others in sales and popularity during this new period [Ed.: “Education for Intelligent Citizenship,” 1840-1880?]. It was none other than the famous McGuffey series.

“McGuffey’s complete set of readers first appeared between the years 1836 and 1844. They came into immediate popularity and continued their strong hold on the American public for the next forty years, after which they were gradually replaced by the more attractive new books that came from the press. There has been a demand for these readers, however, until recent times. The last editions intended for general school use were printed by the American Book Company in 1896 and 1907. Still more interesting is the fact that Henry Ford had a private edition printed in 1925. In that year Mr. Ford opened a new experimental school on his estate at Dearborn, Michigan. Evidently his interest in restoring various features of the past led him to supply the school with McGuffey readers. In other respects the equipment of the school was ultra-modern, and it was staffed with a highly trained personnel, including a psychiatrist and a dietitian....

“McGuffey must be given the credit of being the first author to produce a clearly defined and carefully graded series consisting of one reader for each grade in the elementary school....

“...The [first reader] consists chiefly of sentences about children and animals. These sentences are usually subservient to the phonetic elements which McGuffey selected for drill purposes....

“In spite of this objection to the [dull] content, one feels a relief to find at last an author who recognized the necessity of repetition for fixing new words. McGuffey was the first who definitely provided for repetition. He also made an innovation in decreasing the number of new words introduced per page. In his lessons in the first reader the new words range in number from ten to twelve per page....

“His upper grade readers in general, however, were of a high literary standard. Mark Sullivan in his America Finding Herself (page 15) says that ‘to millions, to probably nine out of ten average Americans, what taste of literature they got from McGuffey’s was all they ever had; what literature the children brought into the home in McGuffey readers was all that ever came. Broad classical reading was not general. McGuffey, in short, because of the leverage of his readers, had a large part in forming the mind of America.’

On that final massive piece of fiction, Nila Banton Smith left the topic of the McGuffey Readers and went on to discuss Tower’s readers. The Tower series fitted in nicely with establishing her fiction that phonics had been in use in the mid-nineteenth century because the Tower series did teach phonics, but it was for elocution, not decoding.
Smith’s selection just quoted is bulging with falsehoods. Most prominent is her totally avoiding the critical fact that there was not just one long-lived series of the McGuffey Readers but three major and largely totally different series of the McGuffey Readers. Henry H. Vail’s A History of the McGuffey Readers, which was published by The Burrows Brothers Co., Cleveland, Ohio, in 1911, clearly provided the facts, so there is no excuse whatsoever for Nila Banton Smith’s glossing over any of those facts. The original sight-word series begun by William Holmes McGuffey in 1836 was replaced with a truly phonic series in 1879, on which Henry H. Vail himself had been the editor. That new series was almost totally different except for retaining many of the original selections from the highest readers. The 1879 series was replaced with the final series in 1901, which once again was a sight-word series and which once again was largely new. The higher readers in all three of the major editions did contain a considerable number of the original selections, but it was the lower readers which were most widely used, and the lower readers were almost totally different in each of the three major editions: 1836-38, 1879 and 1901. (There had also been minor editions at various times on the first series before it was replaced by the 1879 series.)

Rather than having sales “fall off” forty years after the first to fourth readers were published (1836 to 1838), the most massive sales did not even begin until forty years after the original series was on the market. (The fifth reader of the first edition, The Rhetorical Guide, was prepared by William H. McGuffey’s brother, Alexander H. McGuffey, in 1842 and was then revised with Dr. Timothy Stone Pinneo in 1844. The sixth reader of the first edition was prepared later, and partial revisions were made before 1879 in all levels of the first edition.) Furthermore, those massive sales were not of that original sight-word edition, but of the 1879 phonic edition. The massive sales of the almost completely different 1879 phonic series took place only over a period of about fifteen years, until about the mid-1890’s. Furthermore, it is absolutely false that McGuffey’s first sight-word series came into “immediate popularity” after 1836, because the series was largely unused outside the Middle West and the Southern states along the Mississippi until that 1879 phonic edition appeared, and even that was most widely sold only in the Middle West.

Whatever the meaning of Smith’s expression, “The last editions intended for general school use were printed... in 1896 and 1907,” the fact is that the 1836 series was not even listed as available in the 1912 United States Catalog of books in print, which showed only two McGuffey’s series, obviously the 1879 and 1901 editions. Furthermore, the American Catalogue for 1895-1900 of books published during those years does not list a re-issue of the 1836 series, which the catalog almost certainly would have done if a new edition had been printed in 1896. The edition dates of 1896 and 1907 must therefore refer to reissues of the enormously popular 1879 edition, which Vail said, as will be quoted, was still having good sales in 1911.

That the 1907 edition Smith mentioned must have been a re-issue of that 1879 series certainly seems to be confirmed by the fact that the first reader carries a 1907 renewed copyright by Vail himself instead of by American Book Company, who had owned the original Van Antwerp 1879 copyright. Vail had personally written the phonic 1879 book one of the McGuffey series and possibly had also written the supplementary phonic primer of 1881 (and possibly the Chart Primer of 1896). Since Vail is known to have obtained the copyrights on the 1879 McGuffey book one in 1907 and on the 1881 McGuffey primer in 1909, and since he renewed a copyright on book one as late as 1920, Vail possibly obtained the copyrights on all of that 1879 series in 1907 or shortly afterwards. Vail may very well have obtained some kind of agreement about the copyrights when he left the company in 1907. Vail implied in his 1911 history that at that time the 1901 edition apparently was outselling the 1879 edition. Therefore, American Book Company might very well have been willing to dispose of the copyrights on that very old, less profitable series in 1907 in some kind of termination agreement with Vail.
Although American Book Company was still publishing the 1879 series in 1928, American Book Company must have done so under some kind of contract with Vail (or his possible heirs) since Vail owned the copyrights, at least on the primer and book one. A very interesting and untold story apparently lies in the Vail/American Book Company relationships in 1907 and afterwards. Vail’s history praising the McGuffey Readers was printed only privately about 1910, and when it was finally published publicly in 1911, it was NOT published by American Book Company! That was despite the fact that Vail had left the company only in 1907, and despite the fact that American Book Company was still publishing the 1879 McGuffey Readers in 1911! Those circumstances are very, very strange. Since Vail implied no criticism of American Book Company in his 1911 history, despite the fact the evidence suggests he may have had conflict with them, it is possible Vail felt he had to protect his royalties by avoiding any direct conflict with the publishers of what had become his books.

Henry Ford’s curious involvement with the McGuffey Myth will be discussed later. As will be seen, it appears highly probable the involvement was only with his public relations staff, and not with old Henry Ford himself. However, Nila Banton Smith’s claim that 1925 was the year of Ford’s official involvement with McGuffey’s, by Ford’s republishing an old edition of McGuffey’s, should be taken with the gravest reservations, as well as her claim that Ford started his experimental school in 1925. The McGuffey Myth was really launched only in November, 1927, with the publication of the Saturday Evening Post article, “That Guy McGuffey.” That year, 1927, appears to be a far, far more probable date than 1925 for Ford’s McGuffey reissue and for the founding of Ford’s public-relations-serving school. If those two Ford events did actually take place in 1927, as I strongly suspect they did, then to move them back two years, to 1925, would provide a stronger foundation for the “experts” highly-publicized McGuffey-Myth.

To continue with demolishing Nila Banton Smith’s “unthink” in the above-quoted excerpt, McGuffey’s was not the first “clearly defined and carefully graded series consisting of one reader for each grade.” Even to think of writing a series for each grade would have been almost impossible in 1836, anyway, since such graded schools were virtually unknown in America for many years afterwards! Nor was McGuffey’s the first series to be graded simply in difficulty, as this history has demonstrated. Noah Webster, Lindley Murray, John Pierpont, Samuel Wood, Samuel Worcester and many others deserve credit for having produced series that were graded in difficulty. As Vail stated, Worcester sued McGuffey for plagiarizing material from Worcester’s own graded series, as will be discussed, so Worcester certainly preceded McGuffey in producing a series that was graded in difficulty!

The sentences in the first reader were not “subservient to the phonetic elements... for drill purposes.” The 1836 series had NOTHING to do with the teaching of phonics, and was purely sight-word material. The 1879 series which Smith never even mentioned was the phonic series.

Nor was McGuffey the first to provide for repetition of new words for hearing children, nor the first to decrease the number of new words for hearing children. Gallaudet certainly did both things in his 1835 Mother’s Primer which he wrote specifically for hearing children, using the deaf-mute-method he had used in his Hartford school for the deaf. So apparently did Oliver Angell and Lyman Cobb provide for repetition of new words and so did they apparently decrease the number of new words in their two reading series written in 1830. So apparently did other authors before McGuffey. Nila Banton Smith must have picked her statement about limiting the introduction of new words and about word repetition right out of the air. I did an informal study only on the introduction of new words in Gallaudet’s 1835 Mother’s Primer, and that informal study took a considerable time. To do such a study on the introduction of new words in many reading books, and then to add a study on the degree of repetition of those new words, would be a very formidable statistical task. Yet there is no indication that Nila Banton Smith ever did such a massive study on the great many reading materials which were published before McGuffey’s appeared, which such materials known to me are listed in Appendix B. To my knowledge, no study has
ever been done on word frequency or word repetition in the sight-word materials that were produced in such abundance after 1826, starting with the Franklin Primer.

The most outrageous misrepresentation, of course, was Smith’s quoting Sullivan’s fiction without comment, which implicitly supported that fiction. An enormous number of reading series were published in the nineteenth century, as can be seen from Appendix B and Appendix C. Yet we have been conditioned to believe Sullivan’s statement that the McGuffey Readers were being used by nine out of ten American children, which would mean all those other series had to divide only ten per cent of the market among themselves. That claim is perhaps the most ridiculous fiction which has ever been popularized, and deserves the title, the McGuffey Myth.

The best way to refute the McGuffey Myth, which Nila Banton Smith among others was promoting in 1932 and 1934 (and which first began to be promoted in 1927), is to cite testimony given by Henry H. Vail in A History of the McGuffey Readers. Vail had worked for the companies publishing the McGuffey Readers from the 1860’s into the 1900’s. Even though Vail gave very few figures on the numbers of copies printed, the figures he did give deflate the McGuffey Myth, and so does his general testimony, as will be seen.

On the Name Changes of the McGuffey Publishers, on Their Market Share, and on the Arrival of American Book Company in 1890

In his history, Vail told of the changing names and ownerships of publishing companies in the nineteenth century. Vail also outlined the many changes in the publishers and owners of the McGuffey Readers since their publication starting in 1836 by the Truman and Smith company of Cincinnati. Truman and Smith had commissioned William Holmes McGuffey to write the original series. The company name became just W. B. Smith in 1841, and W. B. Smith & Company in 1852. The company name became Sargent, Wilson & Hinkle in 1863, and Wilson, Hinkle & Co. in 1868. In 1877, the firm name became Van Antwerp, Bragg & Co. In 1890, the firm merged with three others, as equals, to form a new company, American Book Company. All of these changes were partial, with personnel from the previous companies remaining with each change in the company name. However, the books themselves were vastly changed from their original date of publication, so much so that on page 5 Vail said of the major revisions of 1879 and 1901:

“Each of these revisions has constituted practically a new series although the changes have never included the entire contents. In the higher readers will be found today many selections which appeared in the original books.”

Mott Media of Milford, Michigan, reissued in a most attractive edition the original McGuffey Readers which first appeared from 1836 through 1838. (Unfortunately, on the lowest copies, Mott Media omitted the hyphenation which had originally been shown on some multi-syllable words as an aid to beginners.) Reproduced on the back cover of the readers Mott reissued is the original advertisement for the series as it was planned in 1836, before all the levels had actually been published. The advertisement listed the primer, books one through four, and the speller. Books one and two in the Mott reissue carry copyright dates of 1836, their original date of issue. Books three and four carry copyright dates of 1837, the year they were published. The speller by Alexander H. McGuffey, William H. McGuffey’s brother, carries a copyright date of 1838, the year it was first published. The primer carries a publication date of 1836, but no original copyright date, apparently because the original publishers thought it unnecessary on such a flimsy little pamphlet which was obviously intended largely only to teach the alphabet.

Yet the revised primer first published thirteen years later in 1849 was another matter. It was a relatively long, straight Code I, sight-word text clearly meant to teach beginning reading by sight-words

662
and “meaning.” By contrast, the 1838 Code 7 “sound” speller written by Alexander H. McGuffey stated clearly, at its end, that learners were expected to complete the speller before beginning to read books one to four. If the practice of using the phonic speller first had been followed, the original McGuffey sight-word series would have been turned into a phonic “sound” approach, as the speller was Code 7 material. However, the publication of the Code 1 “meaning” primer in 1849 suggests that the McGuffey series had always been used, in actual practice, as a “meaning” approach to teach beginning reading.

Minor revisions in the original McGuffey series took place over the years such as in 1843, but the major revisions of the McGuffey Readers were in 1879 and in 1901. The major revision in 1879 was carried out when Vail, the author of the 1911 history of the McGuffey Readers, was one of the partners in its publishing company along with Caleb S. Bragg and others. Vail was the editor on that 1879 revision, even writing the phonic book one himself. The firm name was then Van Antwerp, Bragg & Co., which name had replaced that of Wilson, Hinkle & Co. on April 20, 1877. Then, in 1890, American Book Company was formed by a merger of four of the five leading grammar school textbook publishers in America, and one of the merging companies was Van Antwerp, Bragg & Co. Therefore, after 1890, the new American Book Company became the publisher of the McGuffey Readers.

Some texts of Appleton, Barnes, and Ivison have already been discussed. Acting as equal partners, those companies joined with Van Antwerp to form the new American Book Company in 1890. Before the year was out, the new company bought the textbook list of Harper’s. Harper’s was the remaining one of the five leading grammar school textbook publishers in the United States in 1890. The result was the American Book Company, which was obviously enormous.

These roots of American Book Company were explained, not by Vail, but by an “Announcement” which the new company put out as an advertisement. It was dated May 15, 1890, and the “Announcement” originated from “New York - Chicago - Cincinnati.” A copy of that advertisement appeared on the back cover of the August, 1890, issue of the Indiana School Journal, Indianapolis, Indiana, and stated in part:

A later advertisement added the school books of Harper & Bros. of New York to American Book Company’s list, although the Harper company remained independent while the other companies had merged to form the new American Book Company.

The officers of American Book Company listed in the “Announcement” had all been officers of the four merged companies. In the new company, Birdseye Blakeman was President and Alfred C. Barnes was Vice President, the former from Ivison, Blakeman & Co., and the latter from A. S. Barnes and Company. The chairman of the board was Caleb S. Bragg from Van Antwerp, Bragg & Co. (the publishers of McGuffey’s). Besides Bragg, the board included two others, Hinkle and Vail, from Van Antwerp, Bragg & Co.; three from Ivison, Blakeman & Co., namely, Blakeman, Ivison, and Cathcart; three Appletons from the Appleton company; and three Barneses from the Barnes company. American Book Company was therefore at its beginning an amalgamation of four equally powerful publishers: Appleton; Barnes; Ivison; and Van Antwerp, each with three members on the board of directors.

Yet American Book Company denied that they were a cartel, controlling the textbook market, even with the addition of Harper’s schoolbooks to their list. Two editorials in the Indiana School Journal of 1890 provided more information, the first on page 267, apparently in April, and the second on pages 327 and 328, apparently in May.
The first editorial read in part:

“Bradstreet estimates the wealth of the new firm at not less than $4,000,000, and says it may reach $5,000,000.

“It has been estimated that the four houses composing the firm (“The Big Four”) furnish not less than two-thirds of all the common school text-books in the United States.

“The promoters of the new enterprise deny specifically and vehemently that it is in the nature of a “trust,” or that it has any of the features of trust management, organization, or policy connected with it....

“The headquarters of the new firm is in New York, and it begins business May 1, 1890.

“Various reports in regard to the absorption of other book houses have been going the rounds of the press, but they are largely speculation.”

The second 1890 editorial on the American Book Company the following month, apparently in May, read in part:

“...A later phase of the matter is as follows: Harper & Brothers, whose school-book list was perhaps equal in size and merit to any one of the combined firms, refused to enter the co-partnership, but offered to sell out their school book interest to the new house. This sale has been made, and it gives to the great firm control of at least eighty percent of all the books used in the United States in the schools below the high school.

“Another thing this new company has done is of peculiar and special interest to Indiana. The Indiana School-Book Co., which supplies the Readers, Arithmetics, and Geographies, by contract under the new school-book law, does not own the copy-right or plates of the books it furnishes, but gets them ready for use from the publishers. Now, the new company has bought the plates and copy-rights of the Indiana books, so that hereafter the Indiana School-Book Co., will have to buy all its books from the American Book Co. This will not affect in any way the contract of the Indiana Company with the state. The books will be supplied at contract prices and of standard quality.

“The final effect of this deal on the school interests of Indiana can not now be told. Two things it is likely to bring about are these: 1. The Indiana Co. and its special friends will hardly feel at liberty to berate the old companies in their new form and new relations and apply to them all the hard epithets in the category of criminal literature.

“2. The old companies will hardly feel at liberty to describe as utterly and everlastingly worthless the Indiana books, which they now own. If this new arrangement shall have the effect to take this text-book question out of politics, so that the law and the books can be discussed and dealt with on their merits, it will certainly be a consummation devoutly to be wished.
“The effect upon prices of putting under one control four-fifths of all the school books of the country, the future will have to answer. The company itself claims that the union has been in the interest of economy and lower prices, and the Journal has no ground upon which to doubt the statement. (For a fuller statement of the company’s purposes, see its advertisement.)

“As an evidence that the American Company expects to treat all other companies in an honorable and fair way, it has entered into an agreement with many of them not to put out each other’s books by even exchange or cutting prices, etc.: the same arrangement that existed before between the old companies.”

The Indiana School Journal made it clear that something remarkable had happened in 1890 as a result of the merger of those four companies and the buy-out of the textbook division of a fifth company. With their combined grade-school textbook volume, they now controlled about eighty per cent of the American market.

Since each of the four merging companies had about the same influence in the new American Book Company, their approximate market shares must have been about equal. This appears to be confirmed by the statement in the Indiana School Journal that Harper’s market share was probably equal to any of the others. McGuffey’s publisher had been one of those five companies, and manifestly only an “equal” on general grade-school textbooks, to judge from the material just quoted. McGuffey’s publishers therefore would have held only 1/5 of eighty percent, or sixteen percent of the total American grade school textbook market in 1890, including readers. It is very, very hard to inflate that estimate, based on testimony by contemporaries in 1890, into the estimate made years later in 1927 and 1928 that eighty or ninety percent of ALL reading books in America before and well after 1890 had been the McGuffey’s series!

Such an inflated estimate for the whole period from 1836, when the readers first appeared, into the twentieth century is particularly ludicrous since, according to Vail’s testimony, it was only from 1879, after the new edition was on the market, that the McGuffey Readers had their best sales. Yet at that time their estimated total textbook share including readers, as shown above, would have been only about sixteen per cent of the total American market. Their market share had been even less, not more, before the best-selling 1879 edition, though at all times the McGuffey Readers sold very well in the more sparsely populated Midwest.

The belief that there had once been a monolithic reading series, the uniform McGuffey Readers, capable of shaping the mind of 19th century America, as the study of the Bible had shaped the minds of preceding generations, is truly a myth. Furthermore, probably more than half of American children in the nineteenth century did not stay in school long enough to get the revised fourth, fifth and sixth readers which contained most of the inspirational material. These upper level readers had not originally even been meant as fourth, fifth or sixth grade books, but only advanced level books, because most schools were not graded when the books were first published. In addition, the McGuffey Readers over the years were actually several different series of readers, with largely different owners and publishers. They evolved to meet competition, and it is obvious from consulting original sources that they always had plenty of competition.

Therefore, it is mind-boggling to read unsupported statements like the following concerning the publishers of the McGuffey Readers from page xiii of the “Introduction” that was contributed by a professor of the history of education to Early American Textbooks, 1775-1900, Office of Educational Research and Improvement, U. S. Department of Education, Washington, D. C., 1985:

“By the 1870’s, the company W. B. Smith had founded was the largest textbook company in the world.”
That statement is refuted, not just by the facts already cited on the relative importance of the major American textbook publishers in the 1890’s, but by remarks made in 1884 by a contemporary publisher concerning textbook market shares in 1884, six years before the American Book Company merger. The 1884 remarks were made by the New York publisher, Charles N. Taintor (the younger brother of the publisher Joseph Lord Taintor, who had died in 1881), in an interview published in the New York Tribune in 1884. Taintor’s remarks are reported in Volume II of A History of Book Publishing in the United States by John Tebbel, published by R. R. Bowker of New York in 1975.

Tebbel reported that Taintor wrote in 1884 that some 25 firms published only textbooks. Their sales constituted a business of approximately $8,000,000 a year, and they served about the same number of school children. Taintor had said that, of those 25 firms, only three were located in cities south or west of Philadelphia and Baltimore.

Obviously, two of those companies south or west of Philadelphia and Baltimore were John P. Morton & Co. of Louisville, Kentucky, and Van Antwerp, Bragg & Co. of Cincinnati. Possibly Taintor meant A. L. Bancroft & Co. of San Francisco as the third, but that company was very probably publishing other materials than textbooks. However, despite Taintor’s 1884 statement, there certainly were more than three publishers of school books in that vast southern and western area, although they obviously were not very large, and were probably publishing other materials as well.

Taintor reported that almost all the companies were in New York, except for one in Cincinnati. Taintor said that two-thirds of the textbook market was controlled by only five firms. Van Antwerp, Bragg & Company of Cincinnati, and Ivison, Blakeman, Taylor & Company of New York were the largest of those five. Each of those two did a yearly business of over $1,500,000. The third largest textbook firm was A. S. Barnes, with sales of $1,300,000. Taintor reported that most of the smaller companies publishing textbooks did not exceed sales of $50,000 a year.

The other two of the five largest firms in 1884 whose names Taintor omitted were obviously Harper and Appleton. Yet Taintor (and Tebbel) omitted any reference to the Appleton company. Nevertheless, Appleton was obviously one of the five firms doing two-thirds of the American textbook business in 1884. Perhaps Taintor omitted Appleton because it published more than textbooks, such as an encyclopedia. As has been shown, Appleton joined with three of the five (Van Antwerp, Ivison, and Barnes) in 1890 to form American Book Company. The last firm of the five which were handling two-thirds of the textbook business in 1884 was obviously Harper, not specifically mentioned by Taintor but mentioned by Tebbel. Harper may have been omitted because it also published other materials, such as the well-known journal. As discussed, Harper sold its textbook rights to the new American Book Company in 1890. That resulted in American Book Company’s control of 80% of the American textbook market in 1890, according to the 1890 article in the Indiana School Journal, referred to previously. The estimates of market shares do compare well: Taintor estimated that the five controlled two-thirds, or 67% of the market in 1884; the Indiana School Journal estimated that the five controlled 80% in 1890.

Tebbel added the names of six more leading textbook publishers in 1884, whose names had been omitted by Taintor. One in Philadelphia was Cowperthwait & Co. One in Boston was Ginn, Heath & Co., still only one firm instead of two in 1884. Apparently about 1885 it split to form two firms, since Ginn dropped “Heath” from its name and an independent firm called “Heath” appeared in Boston. The other four that he said were located in New York were Sheldon & Company, Clark and Maynard, Porter and Coates, and Harper.

Although Tebbel was right in locating the three firms of Sheldon & Company, Clark and Maynard, and Harper in New York in 1884, Tebbel was apparently wrong in placing the Porter and Coates company
in New York in 1884. As shown in Appendix C, Porter and Coates were definitely in Philadelphia at least as late as 1880, and most probably later.

However, just from Taintor’s 1884 testimony, it can be seen that it is obviously not true that Van Antwerp, the publishers of McGuffey’s, was the largest textbook company in the world in the 1870’s, as Early American Textbooks stated. The firm of Van Antwerp was not even the largest in America in 1884, being equaled at that time by Ivison. Furthermore, the period of the McGuffey publishers’ largest sales came immediately after the 1879 McGuffey’s revision appeared on the market, according to Vail. Therefore, Taintor’s 1884 report of their sales figures was during the period of their greatest sales, from 1879 to 1890. The McGuffey publishers obviously had been less successful before 1879, so the claim was even less true for the 1870’s than for 1884.

Other countries also published textbooks, such as Great Britain with its vast empire, to all of which it exported textbooks. By the 1870’s, the Nelson company in Great Britain had become a huge publisher and yet was still only one of many textbook publishers there such as Cassell’s and Macmillan’s. All three of those very large British companies were marketing their reading series in America, according to Leypoldt’s 1876 American Catalogue of books in print in America. Those British companies must have been very large if they went to the trouble to try to capture part of the American market.

Yet no claim is ever made that McGuffey’s publishers had a London, England, office, or a Sydney, Australia, office, or a Johannesburg, South Africa, office, or a Bombay, India, office, which would demonstrate that they had made similar efforts to those of the British companies. Instead, Vail said the McGuffey’s publisher even had to buy out what was apparently its only fully licensed publisher of the McGuffey Readers, a New York company, in 1862, because that company had been bankrupted by its inability to sell books in the South during the Civil War!

On what grounds are those British companies considered to have sold fewer textbooks than McGuffey’s publishers, which is implicit in the statement in the “Introduction” that was contributed by a professor of the history of education to Early American Textbooks? Furthermore, on what grounds were the vast numbers of other European publishers of schoolbooks presumed to have been smaller than McGuffey’s publishers? Where were the heavily researched and provable footnotes to support that all-inclusive statement? It is that kind of fake “scholarship” which has disgracefully been permitted to maintain the McGuffey Myth.

Concerning McGuffey’s competition in the 1870’s and later, the period in which the statement in Early American Textbooks claimed its publisher was the largest textbook publisher in the world, the Appleton company was one of the major American publishers of books on education in that period. By the admission of Vail who was a part owner of the company publishing McGuffey’s, the Appleton texts had fought the new McGuffey’s texts to a draw for control of the market in the 1880’s, starting some six years before Taintor’s 1884 comments. Yet Vail implied further that Appleton and Van Antwerp fought to a draw only in the Midwest area, where McGuffey’s later did greatly outsell Appleton’s. The Appleton/Van Antwerp textbook war is certainly testimony against the statement which implied that the McGuffey’s publishers dwarfed other textbook publishers.

Furthermore, Barnes was obviously an enormous American publisher of textbooks in the early 1870’s, as is evident from the book lists in the back of their contemporary editions, like Welch’s book on object lessons which has been referred to elsewhere. It is very probable, from the size of those book lists in the early 1870’s, that Barnes was a larger textbook publisher than the McGuffey’s publishers at that time. Yet they became equal by 1884, according to Taintor’s 1884 testimony, which was after the enormously successful phonic 1879 McGuffey edition appeared on the market.
In 1890, less than twenty years after the company W. B. Smith had founded was supposed to be the largest textbook company in the world according to the statement in Early American Textbooks, it was swallowed up as only one-fourth of the new American Book Company, formed by the merger of the textbook publishers, Ivison, Appleton, Barnes and Van Antwerp. That fact is certainly an apparent contradiction of the statement in Early American Textbooks.

Concerning the final “meaning”-approach revision of the McGuffey Readers when American Book Company was the publisher, Vail said, (page 58), “Dr. James Baldwin, who was the author of the Harper Readers and of Baldwin’s Readers” did the last revision of 1901.

The 1901 “meaning”-approach McGuffey’s edition was the only revision after the general phonic “sound”-approach revision of 1879, on which Vail had worked. That 1901 revision used the “word method” and phony phonics instead of the real phonics of the 1879 series. (It is discussed at length in Appendix C, under American Book Company.) A copy of book one of the 1901 series is in the Department of Education library in Washington, D. C., but it was not listed in the 1985 Early American Textbooks, which publication had been intended as a representative sampling of the library’s holdings. The compilers of Early American Textbooks either did not see that 1901 revision or did not realize its significance.

There was something different about the copy that I saw (possibly the only copy) of the 1901 sight-word McGuffey’s book one in the Department of Education library in Washington, D. C. Inside its cover was a half-inch- or inch-wide white paper strip around its contents, so that it was impossible to turn the pages without breaking that strip. I had to break the strip to read the book. I have never seen any other book with such a seal around it. If the book had been rebound (as it very well may have been), that could account for such a strip. However, the fact that the paper strip was still unbroken suggests that the copy had not been seen by the editors of Early American Textbooks, so that they obviously could not have included it in their listings.

Concerning the publication of Early American Textbooks, I was told by an employee of the Department of Education library that it was very difficult to get that material published, because its publication was greatly opposed by some people. Why should that have been the case? Such a catalog, on the face of it, certainly should be considered innocuous. Despite the fact it is sometimes inaccurate, I have found it enormously helpful in compiling this history, and must applaud its publication. If more editing and checking assistance had been made available when the volume was being prepared, its occasional inaccuracies could easily have been removed. It was obviously a huge job to compile, and sufficient assistance should have been given to its compilers.

As has been shown, the changes in company names for the publishers of McGuffey’s were in 1841, 1852, 1863, 1868, 1877, and 1890. In 1890, Caleb S. Bragg became the chairman of the board of the new American Book Company, formed from his company, Van Antwerp, Bragg & Co., and the three other companies, Ivison, Barnes and Appleton. Concerning Bragg’s originally joining McGuffey’s publishers, which had the name Wilson Hinkle & Co. at the time Bragg joined them in 1871, Vail said (page 54):

“Mr. Caleb S. Bragg had for years acted as the agent for a list of books selected by him from the publications of two or three publishers and was a partner in the firm of Ingham & Bragg, booksellers of Cleveland, Ohio. Mr. Bragg sold his interest in the business in Cleveland and became a partner in Wilson, Hinkle & Co., on April 10, 1871; and at the same time Henry H. Vail and Robert F. Leaman, who had for some years been employees, were each given an interest in the profits although not admitted as full partners until three years later.”
The name of Ingham and Bragg appears on the title page of a competitor to the McGuffey Readers, Hillard’s The Third Primary Reader, of 1858, part of the original Hillard reading series. Above “Cleveland: Ingham and Bragg” appears “Boston: Hickling, Swan & Brewer.” This title page on a Harvard library copy shows, therefore, that Bragg was tied in 1858 to a firm publishing a competitor to the McGuffey Readers.

Furthermore, the predecessor to the Boston firm publishing that competitive Hillard series in 1858 had published the Worcester Readers for many years, and they had been McGuffey’s first adversaries. Henry H. Vail wrote the following on pages 42-44:

“On October 1st [1838] Benjamin F. Copeland and Samuel Worcester brought suit in the court of the United States against Truman & Smith and William H. McGuffey for infringement of copyright, claiming that material had been copied from Worcester’s Second, Third, and Fourth Readers and that even the plan of the two latter readers had been pirated.... To place themselves entirely in the right and remove every cause for cavil or complaint, [McGuffey’s publishers]...expunged everything claimed as original, and substituted other matter.... The suit [was] settled by paying the plaintiffs two thousand dollars.... The Worcester Readers had a short and inconspicuous life. When this suit was brought, their publishers were Richardson, Lord and Holbrook of Boston. In 1836 Charles J. Hendee published them, and in 1854 they appeared with the name of Jenks, Hickling & Swan of Boston. These several publishers were probably gobbled up by some imaginary Book Trust sixty years ago.”

Jenks, Palmer & Co. of 1848 were obviously the predecessor to Jenks, Hickling & Swan who Vail said published the Worcester reading series in 1854. Therefore, the Hillard series published by Hickling, Swan and Brewer in 1858 on which Bragg was shown as the Cleveland agent was the direct successor to the Worcester series.

Yet, before 1862, the Worcester series was no longer listed among its former publishers’ current textbooks in pamphlets presently in the Harvard library. Instead, the Hillard reading series was listed. One of those pamphlets was dated September 17, 1862, entitled, Truth Vindicated: A Correction of Sundry Falsehoods and Misrepresentations in a Circular Signed by Oliver Ellsworth” (Educ 2199.01 bx), by Brewer & Tileston (the obvious successors to Hickling, Swan & Brewer). The other was Brewer & Tileston’s pamphlet of January 19, 1863, To the Readers of the “Maine Teacher,” (Educ 2199.01 bx), in response to Ellsworth’s answer.

Vail was certainly wrong that the Worcester readers “had a short and inconspicuous life” and that their “several publishers were probably gobbled up by some imaginary Book Trust sixty years ago,” which would have been about 1850, since Vail published his book in 1911. Instead, the Worcester readers had lasted from 1826 until some time after 1854, probably until after 1858, and it was their publishers who retired them for a newer series: the Hillard books, which must be considered as their immediate descendants. The publishers of the Worcester readers in 1854, Jenks, Hickling & Swan, under the new name of Hickling, Swan & Brewer, became the publishers of the enormously successful Hillard series in 1858. It was most probably shortly after 1858 that the publishers stopped selling the Worcester readers. (See Appendix C for the sequence of publishers of the Worcester and Hillard readers.)
Under that successful publisher’s name on the title page of The Third Primary Reader of Hillard’s appeared “Cleveland: Ingham and Bragg.” So Bragg had joined the competition to McGuffey’s by 1858, but when he became a partner in Wilson, Hinkle & Company he was changing sides in the textbook wars of the period.

Concerning McGuffey’s sales and competition before its most successful revision in 1879, Vail said (page 61-62):

“The Willson Readers, published by the Harper Brothers, were vigorously pushed into the schools of Ohio and Indiana about 1867.... In a few years the Willson Readers were out of the schools....

“The Goodrich Readers published by Morton & Griswold in Louisville, Ky., were perhaps the most constant competitors with the McGuffey Readers in the early years throughout the states of the Mississippi Valley.... They were first copyrighted in 1839 [sic] and were frequently revised. They finally became the property of the Louisville publisher. Mr. Smith and Mr. Morton kept up a most vigorous schoolbook war, especially in Ohio, Indiana and Kentucky in the years from 1845 to 1860.... From the location of Cincinnati on the Ohio River, then affording the cheapest means of distributing goods to all parts of the South, Mr. Smith had obtained, before 1860, a very considerable part of the schoolbook trade in the Southern states of the Mississippi Valley.”

Vail’s inference at the beginning of the above excerpt that McGuffey’s retained almost the entire Indiana market after 1867 is of interest in connection with the material quoted elsewhere concerning Indiana, and in connection with the Bancroft 1883 series also discussed elsewhere. The Bancroft sight-word “meaning” series first appeared in Indiana in 1883 under the title, Indiana State Series, published by Indiana School Book Co., Indianapolis. By 1889, it became the sole authorized series for government schools, obviously displacing earlier materials. From Vail’s comments, it seems probable that the 1879 phonic “sound” McGuffey’s series was the material which was displaced in Indiana by that government-authorized “meaning” series. If so, that was just one more instance when change-agents had used governmental control to displace “sound” for beginning readers with “meaning.” It was the Indiana State Series which was referred to in the editorial from the Indiana School Journal quoted previously.

Vail told on page 53 of the change on April 20, 1877, from the old firm name of Wilson, Hinkle & Co. to the new firm name of Van Antwerp, Bragg & Co., under which company name he eventually became a partner, Vail said (page 56):

“Van Antwerp, Bragg & Co. issued many new and successful books and remade many, including the McGuffey Readers and Speller, Ray’s Arithmetics and Harvey’s Grammars. Most of these met with acceptance and this was so full and universal throughout the central West as to give opportunity to the competing agents of other houses to honor Van Antwerp, Bragg & Co. with such titles as “Octopus” and “Monopoly,” names that were used before “Trusts” were invented....

Note he referred to “full and universal” acceptance of Van Antwerp, Bragg & Co.’s books (therefore after 1877) only through the “central West,” an area with a minority of the American population in the 1880’s. Vail said (page 58):

“The story of the revisions of 1843 and 1853 has been told. The books were apparently in satisfactory use in a large part of the West; but about 1874 the firm thought it wise to exploit a new series.”
“In satisfactory use in a large part of the West” obviously makes no claim that Van Antwerp, Bragg & Co.’s predecessors had almost monopolized the American market, even in the “West.” It also makes it clear that the use of McGuffey’s before 1877 was largely limited to what Vail called the “West” (actually the Midwest). Vail went on:

“At its request Mr. Thomas W. Harvey prepared a series consisting of five books. This series was published in 1875; but the experience of a few years with the Harvey Readers showed that the people still preferred the McGuffey Readers and after long discussion and hesitation it was agreed that these should again be revised. This determination was hastened by the publication of the Appleton Readers in 1877 [sic], and by the incoming of a number of skilled agents pushing these books in the field that had for many years been held so strongly for the McGuffey Readers as to baffle the best endeavors of two or three Eastern publishers who had tested the market. On April 9, 1878, the firm of Van Antwerp, Bragg & Co. determined upon making a new series of readers bearing the well-recognized title of McGuffey’s Eclectic Readers and distinguished as a ‘Revised Edition.’ ... The method of teaching in the first reader was to be adjusted to a phonic-word method, and the gradation was to be improved.... The first reader was entirely re-written by the editor.”

It is curious that Vail made no mention in his history of the fact that the primer of the earlier McGuffey’s edition had been available in Leigh phonic print since 1868. It must have been that “sound”-approach edition which the 1878 “meaning”-approach Appleton Readers were originally trying to displace in the Midwest before the 1879 phonic McGuffey’s edition came on the market. It must also have been largely that 1868 Leigh-print edition which the Harper “meaning” series had tried to displace for a few years after about 1867, which intense competition Vail also mentioned, as quoted previously. Yet Vail must certainly have approved of the use of such true phonics as Leigh print since Vail, himself, was the editor who produced the phonic McGuffey’s first reader of 1879. He had commissioned others to write it, but found their version unsatisfactory and so completely rewrote it himself.

Vail had said of the initial plans for the 1879 revision, “The method of teaching in the first reader was to be adjusted to a phonic-word method,” but the company had been selling phonic materials since the 1860’s. They had not only been printing McGuffey’s New Eclectic Primer, New Edition in Leigh’s phonic print since 1868, but had published The Phonic Reader No. 1 by A. Knell and J. H. Jones, listed as #1837 on page 90 of Early American Textbooks, 1775-1900, OERI, U. S. Department of Education, Washington, D. C., 1985. It is shown there as being 112 pages long, and published in 1868 at Cincinnati: Wilson, Hinkle & Co.; Philadelphia: Claxton, Remsen & Haffelfinger; and New York: Clark & Maynard (PE III7.A1K.K55). It was obviously their company’s response to the drive for more phonics that was characteristic of the 1860’s. Yet that book must not have been too successful. Vail never mentioned it in his history, but it is described on page 242 of Ferdinand Buisson’s 1876 report on his American visit, published later in French in Paris, which report is mentioned elsewhere in this history.

Vail said of the 1879 revision (page 60):

“...In this revision the three lower books were almost entirely new. The fourth was largely new matter, while in the Fifth and Sixth such matter as could not be improved from the entire field of literature, was retained.”

Vail said (page 60:
“As soon as these books were completed, large editions were printed and they were most vigorously exploited not only to take the place of the older edition of McGuffey Readers, but to supplant the newly introduced Appleton Readers.

“This book-fight was a long and bitter one. Every device known to the agency managers of the houses engaged was employed. Even exchanges of books became common. It was war; and like every war was carried on for victory and not for profit. It is perhaps fortunate that such contests cannot in the nature of things last long. In the long run business must show a profit or fail. Contrary to popular opinion, a book war is not profitable in itself; but is a form of petition that has existed for fully a century. It presents no novelties even now. The two chief combatants at length withdrew with one accord. Neither firm could claim entire victory; but the McGuffey readers came through with much the larger sales and these increased for years....”

Vail’s earlier comments make it clear that the “war” with Appleton’s was fought in the Midwest area, since he referred, as quoted previously, to the “incoming of a number of skilled [Appleton] agents pushing these books in the field that had for many years been held so strongly for the McGuffey Readers as to baffle the best endeavors of two or three Eastern publishers who had tested the market.” It was in the Midwest that McGuffey’s came through with “much the larger sales and these increased for years....” However, Indiana in that “field” was lost by 1889 or earlier to the Bancroft “meaning” series prepared as an Indiana state-mandated edition, as is discussed elsewhere.

Vail spoke of the last revision of 1901 by Dr. James Baldwin, and said (page 57):

“These books acquired at once a large sale, and the sales of the previous editions are still remunerative.”

Why would American Book Company, the owners by then of the 1879 McGuffey’s materials, have revised the series in 1901 if it had been holding ninety percent of the total American market? If the 1879 McGuffey’s (the one most people know today as McGuffey’s,) were so highly regarded, why then did Baldwin’s McGuffey’s revision obviously outsell it in 1901, which is implicit in Vail’s comments?

Concerning the McGuffey Myth

John H. Westerhoff III wrote the 1978 book, McGuffey and His Readers, which was republished by Mott Media, Inc., Milford, Michigan, in 1982. Westerhoff credited (page 16) Ralph Rusk, who wrote The Literature of the Middle Western Frontier, Columbia University, 1925, with having said on page 25 of Rusk’s book:

“Upon the generations immediately succeeding the pioneer period the influence of McGuffey may well have been greater than that of any other writer or statesman in the West. His name has become a tradition not yet extinct.”

That may well have been true in the “Middle Western Frontier.” The error is in applying the statement to the whole of America.

Westerhoff referred to an article by Hugh Fullerton in the Saturday Evening Post on November 16, 1927, “That Guy McGuffey.” The article’s title is repugnant. It was an attempt to be “folksy” by the public relations associates of the “experts” who were inventing the McGuffey Myth. (It is well to refer here to a remark made by James McKeen Cattell in 1929, quoted at length later: “It is the object of psychology to describe, to understand, and to control human conduct....” In being fed the McGuffey Myth, American thinking was apparently being “controlled.”) In his 1927 article, Fullerton said:
“For year’s McGuffey’s system and his books guided the minds of four-fifths of the school children of the nation in their taste for literature, in their morality, in their social development, and next to the Bible in their religion.”

Then, after quoting Rusk’s 1925 Columbia University book, as well as Fullerton’s 1927 remarks in the Saturday Evening Post, Westerhoff said (page 16):

“It was such convictions, repeated countless times, that prompted Mark Sullivan in 1929 to chastise historians and scholars for ignoring McGuffey, the ‘most popular, most affectionately remembered person in the nineteenth century, a national giant to be ranked with George Washington and Abraham Lincoln.’”

Dr. Cremin referred to the belief that the McGuffey Readers had shaped the mind of America, and referred to it as:

“...the so-called McGuffey myth, propagated above all by Mark Sullivan in the second volume of Our Times: the United States, 1900-1925....”

However, the McGuffey Myth should not be defined primarily as the belief that the series shaped the mind of America, but instead should be defined primarily as the delusion that McGuffey’s were the readers used by eighty or ninety percent of American children in the nineteenth century.

What Westerhoff did not realize was that Vail’s 1911 book in praise of the readers really made no such claims, and the “countless times” the “convictions” were repeated concerning McGuffey’s dated only from the 1925 book published by Columbia University.

A book which is reported to have been published about 1830 but which appears to be a figment of someone’s imagination is A Treatise on Methods of Reading, by William Holmes McGuffey (1800-1873). In McGuffey and His Readers by John H. Westerhoff III (Abington: 1978, Mott Media, Milford, Michigan: 1982), Westerhoff said (page 44):

“Previously, (McGuffey) is said to have published in London A Treatise on Methods of Reading.”

Westerhoff referred (page 72) to Harvey C. Minnich’s William Holmes McGuffey and His Readers, American Book Company, 1936, (page 32) as his source for the report on McGuffey’s treatise and added:

“Regretfully, the manuscript appears to be no longer in existence.”

It stretches credibility past the breaking point that a young frontier pioneer in Ohio about 1830 like McGuffey would choose to send all the way to London to have some company there publish his very first book when the United States at that time was awash with independently-owned printing companies, as the title pages on readers and spellers of the period demonstrate. Apart from the McGuffey Readers, that
mysterious text would have been almost the only book McGuffey ever wrote. (Westerhoff lists McGuffey’s known writings on pages 163 and 164. Except for an unpublished three-volume work on philosophy written late in life by the college-philosophy professor McGuffey, only a few articles and essays are shown.) Such a report is not believable, even without Westerhoff’s blunt admission quoted below that Minnich’s book was “undocumented.”

In a note on page 25, Westerhoff said,

“Now out of print, two of the most frequently quoted books written about McGuffey and his Readers are A History of the McGuffey Readers (Cleveland: Burrows Co., 1911) by Henry Vail, onetime editor of the McGuffey Readers, and William Holmes McGuffey and His Readers (New York: American Book Co., 1936) by Harvey C. Minnich, onetime professor of education, dean and curator of the McGuffey Museum at Miami University, Oxford, Ohio. For years these basically undocumented works were relied upon as authoritative sources for understanding McGuffey and his Readers....”

Unlike Minnich’s, Vail’s history cannot be considered to have been undocumented, even for the years before he joined the company. Furthermore, from the 1860’s onwards, as an employee of the publisher of the McGuffey books only some thirty years after McGuffey wrote his books, Vail was himself an unimpeachably authoritative source. It would be impossible to find anyone more authoritative. Yet Westerhoff admitted that “professor of education” Minnich did write an undocumented book.

However, the date of Minnich’s original text was not 1936, but 1928. At the end of the section, “Readers,” in the Cumulative Book Index, 1928-1932 appeared “About Readers.” It was apparently very unusual not just then but today to have such a section discussing readers, and it contained this entry:

Therefore, Minnich’s history first appeared in 1928. It joined the Saturday Evening Post article of 1927, and Mark Sullivan’s 1928 book, written in 1927, as being among the very first of the “references” on McGuffey’s that appeared during the years of the great McGuffey promotion, which dated from 1925 to about 1935. The full-blown McGuffey Myth was launched by the publication of the Saturday Evening Post article of November 16, 1927. In the 1920’s, the circulation of the Saturday Evening Post in America was enormous, very much like that of the Reader’s Digest in America today, and the Saturday Evening Post was equally respectable. It provided an ideal vehicle with which to influence American thinking. If, as this writer believes, the McGuffey Myth was the deliberate invention of “experts,” it must have been conceived and its promotion planned a considerable time before that first full-blown appearance on November 16, 1927, most probably about 1925. The launching of the complete, full-blown McGuffey Myth by November 16, 1927, was almost immediately followed up by references on page 15 of Mark Sullivan’s 1928 America Finding Herself (copyrighted in 1927), which was the second volume of Sullivan’s Our Times series, and by the 1928 publication of Minnich’s “history.” It also was referred to in the third volume in 1929 of Our Times (page 11), which was cited in Westerhoff’s footnote, as mentioned elsewhere.

As indicated elsewhere, Dr. Lawrence Cremin of Columbia Teachers College referred to Minnich’s history but dated it to 1929, probably the date of the copy Cremin saw. Furthermore, as already mentioned, Cremin specifically stated that McGuffey’s sales were largely confined to the Midwest, implicitly refuting Minnich, but Cremin’s statement had no effect on the McGuffey Myth which persists to this day. Minnich’s 1928 book became part of the supporting background for the massively publicized McGuffey Myth that about eighty or ninety percent of Americans in the nineteenth century had learned to
read with the McGuffey “phonie” readers. This made the take-over of almost one hundred percent of American schools by the deaf-mute-method “Dick and Jane” readers after 1930 seem only “natural” and in the American “tradition.”

Yet Vail’s historically acceptable account, which would have implicitly demolished the burgeoning McGuffey Myth, was NOT in print in 1928, according to the 1928 United States Catalog! It is still largely unavailable. The New York Public Library has only a microfilm copy available, made from a book missing pages five through sixteen out of the total seventy-two pages. One microfilm frame showed page four appearing on the left and page seventeen on the right, next to it. That means the intervening pages five through sixteen were already missing at the time the book was opened to those pages and the microfilm picture was taken. I had to send to a library in the West to obtain the missing pages, as so few libraries have copies of Vail’s work.

In his 1978 book, McGuffey and His Readers, John H. Westerhoff III said (page 15):

“McGuffey Readers sold over seven million copies before 1850 and by 1890 had become the basic school readers in thirty-seven states.”

Westerhoff’s source for that last shatteringly improbable “fact” was John L. Clifton’s Ten Famous American Educators (Columbus, Ga.: R. G. Adams & Co., 1933) p. 75. Note the 1933 publication date for this “historical fact.” It was during the height of the blitz to put Scott, Foresman “Dick and Jane” readers into all American schools. The blitz was so massively successful that the names, “Dick and Jane” became as much a part of the American vocabulary for most people over forty years of age as the name George Washington.

Yet almost all of the literature on the McGuffey Readers, such as Clifton’s, are dated from the 1925 Columbia University book onwards (except Vail’s credible 1911 text, Reeder’s passing reference in 1900, and a few casual mentions by Midwesterners who actually did use McGuffey’s in their schooldays). The exceedingly peculiar fact, apparently never before been publicly noted, is that almost all of the source materials on McGuffey’s date from 1925 and later, instead of the time frame in which references to McGuffey’s should have appeared in the literature, the period in which McGuffey’s was supposed to have been in massive use. The purported massive use of McGuffey’s was supposed to have been some twenty-five to one hundred years before 1925 when the flood of materials on McGuffey’s actually began.

Sometime during 1890, the states of Idaho and Wyoming were added to the Union. Therefore, depending on whether Clifton meant “by 1890” or “by the end of 1890,” the United States had either 42 or 44 states. To assert that only five (or seven) of those states by 1890 did not have McGuffey’s as “the basic school readers” appears to be the same kind of “reporting” as we see today in the “newspapers” sold at supermarket checkout counters, which contain questionable occurrences such as Egyptian mummies being resuscitated.

The “experts” in 1925 located at Columbia Teachers College in New York and the University of Chicago in Chicago obviously intended to blanket America in 1930 with the proposed deaf-mute-method “Dick and Jane” Scott, Foresman texts by William S. Gray of the University of Chicago, as well as the deaf-mute-method Macmillan series by Arthur I. Gates of Columbia Teachers College. (Of course, no open reference was to be made to the fact that the readers used an inferior method invented almost two centuries earlier for teaching deaf-mutes.) The blanketing effect would raise questions. That is the apparent reason that the whopping McGuffey Myth was fed by “experts” to the author, Mark Sullivan, of Volume II of Our Times, America Finding Herself, by 1927 or before. Sullivan apparently used the Myth in total innocence. As a review of some of his mutually contradictory “facts” demonstrates, Sullivan did
Sullivan’s book, copyrighted in 1927 but published in 1928, was the second volume of his entertaining and nostalgic series, Our Times, the first volume of which was published in 1926 and the last reportedly in 1935. In his second volume, Sullivan thanked “experts” for their “help” on historical details. Sullivan reported the Myth as quoted below on page 15 of his book published in 1928, and Nila Banton Smith quoted Sullivan on page 109 of her “history.” Her “history” was her doctoral dissertation at Columbia Teachers College about 1932, and was published in 1934 (and revised in 1965). Characteristically, no listing for Sullivan was given in Smith’s index or bibliography. Nila Banton Smith, or more likely those “experts” managing and promoting her work, just planted the Myth in her readers’ minds, as it had been planted in the minds of the readers of the Saturday Evening Post article of November 16, 1927, by Hugh Fullerton, which article had carried the repulsively folksy title, “That Guy McGuffey.” The 1927, 1928, 1932, 1933 and other “references” (and even the apparently valid reference in the 1925 text published by Columbia University, referred to earlier), could then pop up as “authentic” in future years. After planting the references, the “experts” could then recite to themselves what Shakespeare had Mark Antony say quietly to himself after his very public oration over the body of Julius Caesar: “Mischief, thou art afoot. Take thou what course thou wilt.”

As has already been mentioned, Nila Banton Smith’s “scholarly reference” about 1932 (commercially published in 1934 and 1965) quoted Sullivan’s 1928 “scholarly reference” as follows:

“...to millions, to probably nine out of ten average Americans, what taste of literature they got from McGuffey’s was all they ever had; what literature the children brought into the home in McGuffey Readers was all that ever came. Broad classical reading was not general. McGuffey, in short, because of the leverage of his readers, had a large part in forming the mind of America.”

So nine of ten Americans in the nineteenth century were supposed to have learned to read with the conservative, high-minded, religious, patriotic McGuffey Readers. The Myth ignored the fact that there were, in effect, two almost totally different series of the McGuffey Readers in the nineteenth century, the first coming out from 1836 to 1838 and the second in 1879. The two series were almost totally different up to Book Four, and largely different above that level. The Myth also ignored the fact that, until after about 1880, probably considerably more than one half of American children left school before they even reached Book Four, which was not meant as a fourth grade book, anyway, but just a higher level book. The “phonic” McGuffey Myth is even more ridiculous in view of the 1901 successful sight-word “meaning” edition of the McGuffey Readers, unknown today. After its appearance, the 1901 edition was marketed simultaneously with the 1879 edition. It is obvious from Vail’s 1911 comments that the 1901 “meaning” edition was considerably outselling the 1879 “phonic” edition in 1911.

It is astonishing how totally the McGuffey Myth has been swallowed by people over forty or fifty years of age, so it must have received an ENORMOUS public relations blitz in the general media starting in 1925, with the Henry Ford re-issue of the 1857 McGuffey Readers, referred to later. When that Myth had been absorbed, the blanketing of America after 1930 with the deaf-mute-method “Dick and Jane” reading series was presumed to be as American as saluting the flag when it goes by in a Fourth-of-July parade.

A curious thing about this intellectual error is that it is “known” most firmly by people who are among the most widely read. This can be taken as kind of direct ratio: the more widely read a person is, the more times he will have encountered this Myth which has been injected into the literature. I heard ex-Secretary of Education Bennett, a man who was trained in the classics and philosophy, repeat the Myth in a speech he gave. I am convinced he did so quite sincerely and innocently, when he said that the sales
of McGuffey’s in America were surpassed only by the sales of the Bible. Bennett would have come a lot closer to the mark if he had said that, if the statistics could be made available, and they are very curiously totally unavailable, the sales of the “Dick and Jane” deaf-mute-method series almost certainly tragically surpassed the sales of the Bible in America.

Concerning some of the obvious omissions in her “history” of the teaching of reading, Nila Banton Smith at Columbia Teachers College in 1932 totally omitted any reference to R. R. Reeder’s history of the teaching of reading, even though it had been written at Columbia only thirty-two years before. She also omitted any reference to G. Stanley Hall’s text, How to Teach Reading and What to Read in School, which apparently never mentioned McGuffey’s. Hall’s book was published by Heath in 1886, but its first edition probably dates to 1874, which is the date cited by E. B. Huey in his 1908 book, The Psychology and Pedagogy of Reading. Yet Hall’s book, despite the fact that Nila Banton Smith ignored it in 1932, was still in print in 1928, so it obviously had been well known for a great many years.

Rudolph R. Reeder’s 1900 The Historical Development of School Readers and of Method in Teaching Reading, The Macmillan Company, New York, was published while he was an instructor at Columbia Teachers College. Reeder’s book is the apparent original source of the fable that McGuffey’s was the dominant reading series in America, even though he acknowledged that it was only one of many series. That obviously reduced its market share from the ludicrous eighty per cent to perhaps twenty per cent or so, which is the probable reason his book written while he taught at Columbia Teachers College in 1900 was ignored by Nila Banton Smith at Columbia Teachers College in 1932. Yet, contrary to the fable which apparently had its roots in Reeder’s reading history, at no time was McGuffey’s the dominant series in America, even though in all its editions since the 1830’s it had been popular. As mentioned, the journal materials, institute reports and other sources I have seen indicate that Appleton’s was the dominant series in the 1880’s, and before then many series published by other Eastern publishers were very popular.

Even though Reeder’s history had commenced the McGuffey Myth, he only implied that McGuffey’s was the most used among other widely used series. That established a market proportion for McGuffey’s that was a little larger than perhaps one-out-of-five (perhaps 20%). That this contradicted the four-out-of-five (80%) or nine-out-of-ten (90%) McGuffey Myth appears to be the reason that Smith omitted Reeder in her “history.”

Reeder’s intent in limiting his post-1860 remarks largely to the McGuffey series was apparently to cover up the history of the 1870’s Franklin and and 1878 Appleton series, which he never mentioned. (He did mention the original series before 1860 by Hillard, who was the senior author on the Franklin series.) Nor did Reeder mention almost any series published after 1860, stating only that there were very many. Reeder made the astonishing remark on page 50 that between 1860 and 1880 there had been “little change” in school readers! Although he did mention elsewhere in his book that Leigh phonics had been used in that period, he did not state that most readers had a Leigh-print edition before the appearance of the dominant 1878 Appleton series which omitted a Leigh-print edition. It was the influence of the Appleton series which is probably most responsible for the demise of Leigh phonics, as has already been discussed. Nor did Reeder note the marked change that appeared in readers starting in 1860, largely as a result of the Leigh phonic influence. Between 1860 and 1880, some increase in phonics appeared in almost all readers. After 1880, Code 3 phony phonics became the norm, in sharp contrast to the pure sight-word materials that had dominated the market before 1860.

The Franklin and Appleton series were associated with the change-agents in Massachusetts who were opposing the return of phonics, or “sound,” in the 1870’s, of whom William James was probably one, and who were promoting the sentence method to teach beginning reading. As has been discussed, the teaching of silent reading to beginners (which is an obvious deaf-mute approach) originated in 1870 and apparently
grew out of James’ ideas on the nature of the sentence, which he considered had to be dealt with only as an unbroken whole. Silent reading was supposed to guarantee that a child would concentrate first on a whole thought (a “sentence”) instead of on its isolated words, as a child might do if a sentence were first read aloud. James considered the sentence to be the equivalent of his unbreakable basic unit (a “thought”) in his “stream of consciousness.” After Farnham introduced the sentence method in 1870, children were supposed to deal only with such whole “thoughts” or sentences. Isolated drill on sounds, or even separate words, apart from such whole sentences, was considered by well-informed “experts,” to interfere with “thought.”

Rudolph R. Reeder of Columbia University, in his 1900 reading history, wrongly stated that McGuffey’s came out in 1850, over a decade after it actually appeared! Reeder never mentioned the fact that there had been two totally different McGuffey’s series in the lower books, an 1836-1838 sight-word approach followed by an 1879 phonic approach in its beginning book one. (A phonic primer was added in 1881). Reeder then stated (page 51):

“McGuffey’s series has probably attained the largest sale and widest distribution of any series yet produced in America.”

They were two claims that even Vail did not make, despite his statement mentioned elsewhere concerning the total number of copies sold of the 1879 edition which had been on the market for so very many years. However, by comparing Vail’s 1911 statement, word for word, with Reeder’s 1900 statement, it is evident Vail accepted part of Reeder’s “expert” opinion, but interpreted it in his own frame of reference.

Vail was apparently a very reliable man and meant to inform and not to mislead, despite his obvious desire to honor the McGuffey Readers. He spoke plainly of that of which he had direct knowledge, such as the few specific sales figures for McGuffey’s quoted elsewhere, and the historical sequence in the company. In Vail’s 1911 statement about over-all sales for all publishers, however, he was apparently citing an earlier authority for information outside his own field of experience, instead of information based on his own direct knowledge. After all, there was no way Vail could have known the textbook sales figures of other book companies. So far as I know, no such figures have ever been published, except for Taintor’s estimates and those in the Indiana School Journal, both of which have been cited previously. Even the infamous “estimate” about 1927 by Dillman, the president of American Book Company, of sales of 122,000,000 McGuffey Readers up to 1920 implicitly admitted, with the use of the word “estimate,” that firm figures did not exist. Vail could only have gotten the information that McGuffey’s had outsold all others from an “expert.” The two statements, placed one after another, suggest the prestigious “expert” Vail was quoting by 1911 was Reeder in 1900, whom Vail was only too happy to believe. Some words in the two statements are identical or very similar:

Reeder in 1900: “McGuffey’s series has probably attained the largest sale and widest distribution of any series yet produced in America.”

Vail in 1911: “The revised edition of the McGuffey Readers... attained the largest sales that have as yet been accorded by the public to a single series of books.”

“Attained the largest sales” is not a common or high frequency phrase. Vail in 1911 was apparently drawing on Reeder in 1900 for this particular piece of “information” but it was just so much smoke. Furthermore, a great difference can exist between the words “series” and “editions.” Reeder meant “series” to cover all the McGuffey Readers, from 1836 on. Vail meant “single series” to refer to the 1879 edition only, as he specifically said, “The revised edition.”
In addition, it is apparent from checking published statements from the 1880’s that Appleton’s most probably briefly had the “widest distribution of any series yet produced in America,” with “distribution” meaning geographical coverage. Vail specifically omitted the word, “distribution,” from his apparent paraphrase of Reeder, because Vail knew very well that McGuffey’s was primarily a regional series. Vail could not accept that part of the “expert” statement. Nor did Lawrence A. Cremin of Columbia Teachers College, many years after Reeder, accept it, as Cremin specifically acknowledged that McGuffey’s was regional in distribution, as discussed previously. By doing so, Dr. Cremin deflated the McGuffey Myth, although almost no one seems to have noticed it.

But when Vail dropped the word, “probably,” from the statement, the harm had been done. Reeder’s use of the word, “probably” had acknowledged that sales had been fairly evenly split among perhaps four or five major series, which put McGuffey’s share in the neighborhood of twenty per cent or so. When the word, “probably,” was dropped, the statement could then be used to support the claim that McGuffey’s supplied not just twenty per cent or so of the reading books in America but as much as eighty to ninety per cent, or even more. Honest Vail had therefore unwittingly provided a handy 1911 statement that could be used in footnotes, ever afterwards, to support the McGuffey Myth.

It should be emphasized that Reeder totally omitted mentioning Appleton’s and the Franklin series. Reeder’s listing of major reading texts ended by 1860, FORTY YEARS before his “history” was written, which fact he excused because he said so many series had been issued in the interval. There had, in truth, been a great many series, which is further testimony against the McGuffey Myth.

Reeder listed the McGuffey Readers, but made no mention of the fact that their highly phonic 1881 primer and 1879 book one were sharp departures from their earlier sight-word primer, or that the company had found it necessary to publish the earlier McGuffey Readers in Leigh phonic print in the 1860’s because, without Leigh print, McGuffey’s was a sight-word series. By omitting those facts, Reeder laid the groundwork for the fable that “phonics” was the standard approach for teaching reading in the nineteenth century. Yet McGuffey’s 1879 revised edition was the only widely used phonic “sound” series in the following period when there were many widely sold “meaning” series on the market. (Rebecca Pollard’s synthetic phonic series did not become commercially available until 1887 but was apparently generally boycotted by the government schools. The government schools were following the advice of the “experts” who opposed Pollard, such as Reeder (implicitly), the writers in the Public School Journal (openly), and Colonel Parker, then in Chicago. As mentioned elsewhere, Parker referred to Pollard’s synthetic phonics method as the method “full of sin.”)

In his 1900 book, Reeder nevertheless described at great length and implicitly praised Charles Eliot Norton’s recently issued Heart of Oak series of 1893-95, which was a totally sight-word series currently on sale. Yet his Columbia Teachers College “descendant,” Nila Banton Smith, who obviously had access to Reeder’s work in the Columbia Teachers College library, totally omitted mentioning the Heart of Oak series in her 1932 book. (A copy of the Heart of Oak primer is in Harvard library which is stamped as having come from Columbia Teachers College, but at what point it was traded is unknown.) Smith’s failure to mention the Heart of Oak series was presumably because of its obvious ties to the activists in the 1890’s, and I believe Reeder’s failure to mention the 1878 Appleton or 1873 Franklin series was for the same reason.

Yet Reeder obviously had some second-hand knowledge of the Boston 1870’s conflict on reading methods in which the Franklin series was involved. That is because Reeder quoted a specific comment made by Superintendent John Dudley Philbrick in one of the Boston schools’ voluminous annual reports, which comment endorsed the use of spelling books. As discussed elsewhere, it is exceedingly unlikely that Reeder could have had first-hand knowledge of that passing comment of Philbrick’s which is buried deep in those enormous 1870’s annual reports of the Boston School Committee. Those reports today
occupy a large section of the Harvard library book shelves. Someone else in 1900 had told Reeder of that remark of Philbrick’s made almost thirty years previously, and it is obvious that person had considered Philbrick’s remark to be important or it would not have been remembered for all those years.

Rudolph Rex Reeder of Columbia named almost no reading texts published between 1860 and 1880, the years in which phonics was coming back into reading instruction texts, and the years during which Leigh-print editions were so prominent. Reeder did mention the popularity of Leigh’s method, without mentioning that almost every major series had a Leigh-print edition by 1878. However, Reeder did list one series which came out in that period: J. L. Reynolds’ Southern Grade Series of 1869. Yet he omitted all Northern series! Reeder covered the period from 1860 to 1880 by stating merely (page 51):

“From 1860 to 1880 but little change took place in the character of school readers.... It was a very active period, in the study of method, as I have elsewhere noted.... Several new series were compiled during this period, and the great series of the preceding decade largely extended their circulation.”

Reeder’s remark that there was “but little change... in the character of school readers” buried the evidence of the generalized move towards more phonics in the readers published between 1860 and 1880, including the 1879 phonic McGuffey’s edition, and the earlier phonic-oriented materials of its publishers like the Knell and Jones material and the Leigh-print edition of McGuffey’s, both in 1868. Reeder’s assurance that there had been “but little change... in the character of school readers” in the 1860 to 1880 period also buried the absolutely startling “change...in the character of school readers” that resulted when almost all the major series, not just McGuffey’s, put out first-reader editions in Leigh phonic print! Those editions came out sometime after 1864 but before 1878, right in the middle of that 1860-1880 period in which Reeder assured his audience there had been “but little change.” The fact that Reeder mentioned Leigh print elsewhere in his text does not, in any way, excuse his omission of the enormous impact that Leigh phonic print had on “the character of school readers” in the 1860-1880 period.

Even more than the move to Leigh-print editions, Reeder’s remark covered up most of all the existence of the change-agent Franklin and Appleton readers which had dispensed with real phonics and which used phony phonics. They had been used after 1877, with much publicity about Parker’s Quincy “achievements” in teaching beginning reading by “meaning,” to displace the 1873 Franklin Leigh-print edition in Boston. (As has been discussed, the Leigh-print Franklin editions were possibly among the primary school property, including record books, that mysteriously disappeared the summer of 1878, after the activists’ got control of the Boston schools in March, 1878, and fired Philbrick). The Franklin and Appleton series also displaced those non-Leigh-print series which had included more real phonics after about 1860.

The American Catalogue by Leypoldt for 1876-84, listed Appleton’s School Readers of 1878 by Harris, Rickoff and Bailey. Yet it said nothing about an edition in Leigh print. Leypoldt’s first American Catalogue in 1876 showed that the Hillard and Franklin series were both available in Leigh print. So were most other popular series by 1876. Therefore, it seems evident that Appleton’s omission of a Leigh edition when it was published only two years later was very deliberate.

By failing to mention the vastly-used “meaning”-approach Appleton texts, Reeder obviously avoided having to mention that the new Appleton series had chosen to omit a Leigh phonic edition, and that such an omission was a glaring one of historical importance in 1878. The major competitor to the Appleton series in the years immediately following its publication in 1878 was the McGuffey series of 1879. In sharp contrast to the 1878 Appleton “meaning” series, the McGuffey series carried its own variety of effective phonetic markings, not unlike Leigh’s, and was arranged for the teaching of phonics. The competition was so intense that there was an actual publisher’s war, as attested to by Vail, presumably
almost immediately after the publication of the new McGuffey series in 1879. The existence of that textbook war apparently in the early 1880's between two major publishers, and the vast differences between the non-phonic 1878 Appleton series and the phonic 1879 new McGuffey series, were facts that were strangely missing not only from Reeder’s “history,” but from Nila Banton Smith’s as well.

Ralph Rusk’s 1925 book, The Literature of the Middle Western Frontier, published by Columbia University, had described (correctly) the influence of McGuffey’s in the Midwest. It was that same year, 1925, that Henry Ford (spontaneously?) reissued the “historical” 1857 McGuffey’s series, thus reinforcing his newer public image as a devotee of “history,” in contrast to his highly publicized 1919 remark, “History is bunk.” The birth of the McGuffey Myth can be dated to 1925 with Henry Ford’s probably highly publicized re-issue of that 1857 McGuffey series. However, it was not until the end of 1927 that the change-agents injected the McGuffey Myth in its full-blown form into American culture. That injection can be dated to November 16, 1927, when the Saturday Evening Post published the article by Hugh Fullerton “That Guy McGuffey.”

That 1927 article contained the massive lie that for seventy-five years the McGuffey books had been used by four-fifths of American school children, which obviously would have had to have been from 1836, when they were first published, to 1911. Note the implicit crediting of Vail with that lie, since the seventy-five years terminated in 1911, the date Vail’s history was published. Yet Vail had made no such claim. The four-fifths figure was pulled straight out of the air. It is easy to suspect “controlling” psychologists behind that whopper. It is probably psychologically true that a very big lie is far more believable than a little one. As discussed, the change-agents had also made an even stronger version of the lie (nine-tenths, nor four-fifths) available in permanent book form with the publication of Mark Sullivan’s second volume of his Our Times series, America Finding Herself, which was copyrighted in 1927 but not published till 1928. Sullivan thanked “experts” for their help, and he undoubtedly got a lot of help concerning McGuffey’s. The full-blown McGuffey Myth continued to be promoted with Sullivan’s third volume in 1929, and with Minnich’s history starting in 1928.

Concerning Henry Ford and the McGuffey Readers

Henry Ford’s “1925” (probably 1927) first reissue of the “historical” 1857 McGuffey’s series was certainly a contrast to his highly publicized 1919 remark, “History is bunk.” It certainly reinforced his newer (expensive) public image as a devotee of “history.” The change-agents hit the jackpot with the Ford publicity on the McGuffey Readers in those most active years of the promotion of the McGuffey Myth, 1927 to 1935. This was particularly so since the Ford promotion did have some basis in fact, as did the highly publicized reminiscences by a few other people from the Middle West who had really used the McGuffey series. The McGuffey series did, after all, contain much fine material, as did so many other series of the nineteenth century.

According to page 15 of the 1978 book, McGuffey and His Readers, by John H. Westerhoff III, republished by Mott Media, Inc., Milford, Michigan, in 1928, Henry Ford (1863-1947) “personally issued a reprint of the six McGuffey Readers (the 1857 edition), which he nostalgically remembered as significant in his own education.” Yet, in his book copyrighted in 1927, Sullivan gave the date of Ford’s reissue as 1925. As discussed earlier, the reissue was probably first put out in 1927.

It is tempting to remark that someone about 1927 may have reminded Ford, who had publicly embarrassed himself in 1919 with that remark, “History is bunk,” of the fact that Ford had used the “historical” McGuffey Readers. Ford may have received some such influence before he conveniently reissued (or, probably more correctly, signed the checks that paid for the reissue) of that probably highly-publicized nostalgic edition in the McGuffey-conscious years that began in 1927. If Ford’s interest in the McGuffey Readers had been so long standing, why was it only in those critical years of 1927 to
1935 that it burst forth so publicly? Ford’s personal involvement could have been minimal, but to obtain the lending of Ford’s name to the publicity blitz at a time that Ford and his cars had become household names was magnificent public relations.

The 1928 United States Catalog was published during the period when the McGuffey Myth appeared in its full-blown form. It listed under “Readers” currently being sold by American Book Company only the 1879 Revised Edition of McGuffey’s, and the 1901 New McGuffey Readers. The 1912 United States Catalog had also listed under “Readers” only the 1879 and 1901 editions, and under “Readers, Supplementary,” the 1887-1888 W. H. McGuffey’s Alternate Readers, primer to sixth reader. They were all sold by American Book Company in 1912, but nothing earlier than the 1879 edition of readers was listed. Under “Primers,” the 1928 United States Catalog listed the 1881 McGuffey primer sold by American Book Company and also something called the McGuffey Chart Primer sold by the dozen and first printed in 1896. No information is available on that 1896 material. It was also listed in the 1912 United States Catalog as sold by American Book Company, along with an Alternate Primer and four unexplainable varieties of the “Eclectic Primer.”

Therefore, emphatically, with the possible exception of primers in 1912, those earlier editions of the McGuffey Readers before 1879 were NOT in print as early as 1912 and very possibly had been out of print for a great many years before that. It is obvious that Henry Ford’s (or his public relations staff’s?) deciding to reissue the 1857 “meaning” edition, probably in 1927, was very extraordinary. That was particularly true since the 1901 “meaning” edition and the 1879 phonic “sound” edition were both still being sold commercially, according to the 1928 United States Catalog.

In his 1927 book, Mark Sullivan dated the Ford re-issue of the 1857 McGuffey Readers to 1925, but, as discussed, it was probably 1927. Westerhoff dated the reissue to 1928, the issue he probably saw. Yet the First Eclectic Reader in the Syracuse public library, the “Gift of Henry Ford,” was published in 1932. The public library in Syracuse, New York, called the Onandago County Library, had McGuffey books 1, 2, 3 and 4 when I visited there on April 17, 1984. The first reader which I examined had been donated by Henry Ford and was in the 1857 “meaning” edition, and so, presumably, were the rest.

Now, that was a very interesting development: A press someplace, funded with Ford money, from probably 1927 to at least 1932, had been grinding out free copies of that long-expired “meaning” edition of the McGuffey series. Since the books in that 1857 edition were NOT listed among the books for sale in the 1928 United States Catalog or the Cumulative Book Index, 1928-1932, they must have been given out free of charge. That the books in the 1857 series were not for sale indicates that the interest in them was coming from someone other than the general public. It was reputed to come from Henry Ford, himself. When really considered, that reputed intensity of interest by Ford is seen as a very strange thing. (Was the Ford Foundation possibly involved instead?) Those Ford-funded editions can be dated probably to 1927, and definitely to 1928 and 1932 (and most probably were appearing in the intervening years, the greatest years of the promotion of the McGuffey Myth). There is no reason to think that the city of Syracuse would have been treated so very differently from other large American cities, being singled out for a “gift” if other cities were slighted. Those expired editions were probably being donated as prestigious “gifts” carrying Henry Ford’s prestigious name to libraries all over the United States in 1932.

Between about 1927 and 1932, and possibly later, Henry Ford’s name and money were being used to mass produce those “nostalgic” McGuffey Readers in support of the McGuffey Myth, and the evidence suggests the presses were turning out those “nostalgic” readers in numbers that may have rivaled the Detroit assembly lines turning out Ford’s cars. The edition dates of 1927 (probable) and 1928 and 1932 (confirmed), and the presence of Ford’s 1932 “gift” to the Syracuse public library, certainly seems to suggest that.
The Syracuse McGuffey’s First Eclectic Reader with the date of 1932 has a Syracuse public library bookplate which reads, “Gift of Mr. Henry Ford.” The copyright page shows that registrations were made in 1857 by W. B. Smith, in 1863 by Sargent, Wilson & Hinkle, and in 1885 by Van Antwerp, Bragg and Co. This 1857 edition is not the 1838 “sound”-approach spelling book that was meant to be used first, before the McGuffey reading series, when it was prepared by William H. McGuffey in 1838. Instead, the 1857 first book is a sight-word book, like the first book in the original 1836 edition that had been written by William H. McGuffey’s brother, the Reverend McGuffey.

The flyleaf on the 1857 copy showed, “Reprinted by Henry Ford from McGuffey First Eclectic Reader, 1932.” On the title page, a list was given in the “Publisher’s Notice” of the books in the Eclectic Educational Series, including titles on arithmetic, grammar, “etc.” Under the list appeared the company name, American Book Company, New York - Cincinnati - Chicago. However, it is doubtful, despite the 1885 copyright by Van Antwerp, that the revised 1857 edition had ever been published by American Book Company, since that company only came into existence in 1890 after the later 1879 series had already been in print for eleven years.

Henry Ford is reputed to have wanted the 1857 edition republished because it was the one he reportedly used as a child, but the record suggests that the title page may not have been a reprint of that original edition, but may have been set up in about 1927 or afterwards, since it showed the name of American Book Company.

In the 1928 United States Catalog section headed, “Readers,” most entries were listed with the full information available. However, some few only showed, “See author entry.” This obviously implied these few series were better-selling than the vast number of others listed as for sale in 1928. Appleton’s 1878 series still appeared as in print in the 1928 United States Catalog, and it was listed under “Readers” like the vast majority of other series, with no such notation as “See author entry.” Concerning the McGuffey series, only two editions appeared, those of 1901 and 1879:

McGuffey, W. H. New McGuffey readers;
  first-fifth readers, 5 v 1st 32c; 2d 40c; 3d 48c; 4th 56c; 5th 68c; ‘01 Am. bk.
  - Revised eclectic readers. See author entry.

Unlike the 1878 Appleton “meaning” series and the 1901 New McGuffey Readers, also a “meaning” series, the 1879 Revised Eclectic Readers, the one on which Vail had worked, was a phonic “sound” series and the above quotation shows that it had its own special entry in 1928. That confirms that the 1879 series was a best-selling series in 1928, as it had not been in 1911 when Vail’s comment clearly implied that the 1901 series was outselling the 1879 series.

Yet the re-issue of the McGuffey’s series carrying Henry Ford’s name and paid for with his money was the very outdated 1857 “meaning” edition, and it was obviously being widely promoted from about 1927 to at least after 1932. One of the unfortunate effects the Ford-supported 1857 reissue ultimately achieved, besides promoting the falsehood of the McGuffey Myth, was to confuse the public about the real identity of the McGuffey series. Sending out all over America free copies of the sight-word 1857 McGuffey re-issue submerged public awareness of Vail’s 1879 phonic edition, even though that 1879 edition had once again been a best-seller in 1928.

In recent years, the 1879 edition has been in print once again, and the assumption now is that McGuffey’s has always been a phonics series. That relatively recent reissue of Vail’s 1879 McGuffey’s series, republished by Van Nostrand Reinhold Company, Inc., of New York, Cincinnati, Toronto, London and Melbourne, very possibly had no connection with American Book Company, which was still
publishing the 1879 series in 1928. The original and renewed copyrights on the 1879 series must have all expired by the time of that Van Nostrand Reinhold reissue, and the material would have been in the public domain.

Von Nostrand Reinhold’s copyright page listing those original copyrights shows, on McGuffey’s Eclectic Spelling Book, only a copyright by Van Antwerp, Bragg & Co. in 1879. On McGuffey’s First Eclectic Reader, Revised Edition, the copyright dates shown on the reissue are 1879 by Van Antwerp, Bragg & Co., 1896 by American Book Company, and 1907 and 1920 by H. H. Vail. The cover on the first reader of the reissue does show the name of American Book Company, as the originals would have done after 1890 when American Book Company became its publisher. However, the spelling book republished by Von Nostrand Reinhold does not show the name of American Book Company on its cover or any indication that American Book Company ever copyrighted it. Yet, from Dillman’s statement referred to elsewhere on over-all McGuffey sales including the speller in 1888 and 1889, it is obvious the speller must have had very large sales in those years.

By 1896, seventeen years had elapsed since the 1879 McGuffey copyrights. In 1896, American Book Company went to the trouble to take out a new copyright on McGuffey’s first reader and presumably the rest of the readers, but did not bother to do so on the McGuffey speller. An excellent explanation exists for American Book Company’s disinterest in the McGuffey speller. In 1890, the same year that American Book Company acquired all the McGuffey titles from Van Antwerp, they acquired the Webster speller from Appleton. With ownership of the Webster best-seller of best-sellers, American Book Company may well have lost interest in McGuffey’s speller by 1896. It was in 1896 that American Book Company issued the Chart Primer (whatever that was) according to the 1928 United States Catalog. Therefore, in 1896, American Book Company were apparently updating their copyrights on most of the 1879 McGuffey series but apparently deliberately omitted copyrighting the McGuffey speller.

The public relations job linking Ford’s name to the 1857 edition of the McGuffey Readers obviously continued for many years. W. J. Cameron gave a talk on the McGuffey Readers on the Ford Sunday Evening Hour on March 27, 1935, which was a nation-wide radio broadcast on Columbia Broadcasting System in prime-time. Cameron’s talk was reproduced on pages 533 to 535 of Readings in American Educational History by Edgar W. Knight and Clifton L. Hall, first published by Appleton-Century-Crofts, Inc., in 1951, and by Greenwood Press, Publishers, New York, in 1970. As part of his remarks, Cameron said:

“Mr. Ford’s interest in McGuffey was revived by a simple incident. One afternoon as the school children danced and shouted past the Ford home, Mrs. Ford remembered some verses she had learned from McGuffey Readers in her school days -

“Hear the children gaily shout
‘Half past four and school is out!’“

“Search was made for her old schoolbooks, but the First Reader, in which the verses were, was not to be found. Mr. and Mrs. Ford telephoned their friends, but none had the book. For a long time after that Mr. Ford haunted the old bookshops of many cities in search of McGuffey Readers. The result was one of the finest collections of these Readers in the country..... And then one sunny afternoon last September on that farm [on which McGuffey was born] in the presence of 15,000 people and presidents and professors of universities and colleges with which McGuffey in his lifetime had been associated, Mr. Ford’s monument in honor of the author of the Readers was dedicated. It stands on the exact spot where the chimney of McGuffey’s childhood home reared its squat and sturdy mass. And Mr. Ford made a speech that day. True, it was a very short speech, but even that is extraordinary. He doesn’t believe that much is accomplished by talk. But
that McGuffey Day in Pennsylvania was an occasion! Mr. Ford is probably prouder of his knowledge of the six McGuffey Readers than of any other volumes in his extensive library.

“William Holmes McGuffey belongs in the calendar of our national prophets. He is honored at Dearborn because moral principles became educational essentials under his system. Many wish that our present public education might be made the means of character formation that it was in McGuffey’s day....”

These remarks badly need turning inside out, apart from their almost unbearable tone.

So Henry Ford, richer than Croesus, was supposed to be living in a house near a public school, where Mrs. Ford could watch the children run by on the way home. Since Ford had been a very rich man for very many years, that sounds more like my neighborhood than the neighborhood around the Ford mansion.

So Mrs. Ford was supposed to have large numbers of her old schoolbooks. That would have been highly unusual. A stray schoolbook, usually a grammar book because it is a kind of reference book, does turn up in houses that had family members who went to school in Mrs. Ford’s day and for a generation or so after. If the family had to buy the child’s books instead of the school’s buying them, the family usually bought used copies from neighbors and then sold them later to other neighbors, until the books finally fell apart. If the school bought the books, the books were left at the school when the child was finished with them, unless the child had to buy them because he had damaged them wilfully. It is very unlikely that many people in those days kept a collection of school books.

Further, Mr. Ford made a short speech because he reportedly did not think much was accomplished by talk. What, then, were the McGuffey Readers if they were not “talk”?

Finally, W. J. Cameron said:

“Mr. Ford is probably prouder of his knowledge of the six McGuffey Readers...” etc.

If Henry Ford had been so proud of his reputed knowledge of the McGuffey Readers, why didn’t he say so himself? Why did Cameron have to surmise Ford’s feelings and then have to put those words, so to speak, into famous Henry Ford’s mouth on a coast-to-coast, prime-time, radio program in 1935?

McGuffey’s books did, it is true, contain much inspirational material, but so did almost all the hosts of reading series in his day and for almost a century afterwards until about 1927! Why, then, did W. J. Cameron emote about the inspirational content of the McGuffey Readers on a coast-to-coast radio network in prime-time and promote the incredible fiction that McGuffey “belongs in the calendar of our national prophets”? Did Cameron mean perhaps, something like this: February 12 is Lincoln’s birthday, and February 22 is Washington’s birthday, so we can average the two and make February 17 McGuffey’s Day?

From any angle, W. J. Cameron was obviously doing a first-class public-relations job promoting the McGuffey Myth, which was that there had once been a series of readers that blanketed the whole United States, and he was not only using famous Henry Ford’s name to do so but had Henry Ford paying for it in 1935. That was in the period when the deaf-mute-method Dick-and-Jane readers that had arrived in 1930 actually were blanketing all of America, as no series of readers had ever done before, and as McGuffey’s most emphatically had not done. Yet it was the McGuffey Myth, being brought into the public’s attention presumably solely because of the books’ moral excellence, that made the blanketing seem only “natural.” The 1935 coast-to-coast radio broadcast gave the McGuffey Myth that had been fully launched in 1927,
and then widely promoted afterwards, what was probably a much-needed booster shot. It is very possible that the majority of American adults were tuned into that 1935 broadcast.

The power of public relations in shaping American opinions had been well established before 1927, the year the McGuffey Myth was fully launched. Some time ago, a television documentary was made on the biography of an early public relations and advertising man, who had worked in the Woodrow Wilson administration during World War I. His name is lost to me, but a little library work could turn it up, if needed. A very old man at the time of the television interview, he told with amusement of an early public relations stunt about 1922. To show the power of carefully tailored propaganda, his group had some young debutantes (and debutantes were celebrities in those days) smoke cigarettes while taking part in Fifth Avenue’s Easter Parade in New York City. Before that Easter Parade, the idea of American women smoking was almost totally rejected. Yet, after it, American women took up smoking in great numbers. The old man’s “amusing” demonstration established that all that was necessary to move much of the public to accept the change-agents’ will was properly tailored propaganda.

What is contemptible, of course, about such behavior is its deviousness, its trickery, and its disregard for obtaining the properly informed consent of others. However, it is obvious that it was well known by “experts” long before 1927 that public opinion could be shaped by such carefully tailored propaganda, and the existence of the McGuffey Myth appears to have been the result of just such propaganda.

The coast-to-coast radio broadcast in 1935, like the Saturday Evening Post article of November 16, 1927, and Ford’s undoubtedly highly publicized reprint of the McGuffey Readers probably in 1927, and then in 1928 and 1932, and undoubtedly in between, was magnificent public relations. Do I sense the involvement of the psychologist/publisher, J. McKeen Cattell, Thorndike’s and Gates’ close friend, in using famous Henry Ford’s name (and money) to promote the McGuffey Myth? Cattell was a kind of celebrity collector, as the Cattell manuscript files at the Library of Congress attest. Also, as documented elsewhere in this history, many years before, when foundation moneys had not been so readily available to people like Cattell to support their change-agent projects, Cattell had managed to wring money from famous Alexander Graham Bell for a presumed old but unknown publishing debt, and a very considerable amount of money from famous John D. Rockefeller, as discussed elsewhere in this history. Getting financial support from famous Henry Ford would only be a continuation of Cattell’s old practices. As shown elsewhere in this history, even John Dewey thought many years before that Cattell was very good at getting financial support from foundations and therefore asked for Cattell’s help in getting a grant! All that Henry Ford was actually required to do, of course, besides lending his name, was to sign the checks that paid for the 1927 (probable), 1928, 1932 and other McGuffey editions and that paid for the 1935 coast-to-coast radio program.

Concerning the Fictional Reports by Mark Sullivan, and in Particular the Fictional Reports of McGuffey Sales

In Volume 14 of the Encyclopedia Britannica (1963), pages 573 and 574, under “McGuffey, William Holmes (1800-1873),” the statement appeared that the McGuffey readers were almost universally used in the growing common schools of the Mississippi River and the South, going through many editions and selling 122,000,000 copies.

Although the article did to some extent limit the area for the use of the McGuffey readers, the article obviously drew on the ludicrous “estimate” made about 1927 by Dillman, president of American Book Company, which will be discussed. Nevertheless, while far better than Mark Sullivan’s statement to be quoted shortly, the encyclopedia’s comment is wrong concerning the area in which these readers were in dominant use. In his reliable history, Henry H. Vail made it clear that the readers had much competition from Morton’s books in the general area of the Mississippi River and parts of the South, at least until the
Civil War. That Morton’s books were influential in part of that area even longer is confirmed by the fact that they were still shown as in print in the 1928 United States Catalog. McGuffey’s area of greatest use after the Civil War was in the Midwest, as Vail indicated. In addition, the first appearance of the McGuffey speller is wrongly given in the encyclopedia article as 1846, not 1838 which Mott Media found to be the copyright date when reissuing the materials. Eventually a fifth reader was issued, which the Encyclopedia Britannica (1963) dated to 1844 (which was actually a revised version), and a sixth was dated to 1857.

As has been discussed, Mark Sullivan wrote Our Times 1900-1925, a series of nostalgic histories. Volume II, America Finding Herself, was copyrighted in 1927 and published in 1928 by Charles Scribner’s Sons, New York. On pages 17 and 18, Sullivan reported receiving a letter from Alexander H. McGuffey’s son, Reverend Edward M. McGuffey, Rector of St. James Church, Elmhurst, New York, which said the fourth reader was probably compiled by Alexander H. McGuffey and the fifth definitely was. Sullivan dated the fifth, McGuffey’s Rhetorical Guide, to 1841. Since Sullivan was in contact with Alexander H. McGuffey’s son, whose father wrote the fifth reader, the 1841 date is probably correct concerning the year it was written, although Vail dated its actual publication to 1842. (It should be mentioned, however, that Sullivan omitted the speller in his discussion of the McGuffey series.)

Sullivan depended on “experts” in writing his history, and the result was such material as this nonsense statement on page 8:

“It is possible to set down a rough statement of the order of succession in American school books. The New England Primer was the principal one, often the only one, until well toward the opening of the nineteenth century....”

This is, of course, flatly contradicted by Noah Webster’s comments on the books used in his own schooldays in the 1760’s, referred to elsewhere in this history. Webster completely omitted the New England Primer from the books used when he was a boy but included Dilworth’s speller, first published in England in 1740. The statement is also most significantly contradicted by the many American editions of school books in the Alston bibliography, and by the records which survive of schoolbooks imported to America and printed in America in the eighteenth century.

Sullivan made another outlandish statement on page 8:

“Then came a comparatively brief supremacy of “Spellers,” beginning with Noah Webster’s in 1782 [sic]. These were more than spellers....”

Alston’s bibliography of spelling books shows how wrong it is to date American spellers to a beginning period of 1782. Appendix B also demonstrates how wrong the statement was, and that spellers were in use in America from the 1600’s. (Sullivan did show the correct date of 1783 for Webster’s speller on page 126.)

Sullivan stated on page 8 and 9:

“About the 1820’s came the Readers, which, accepting the general conception that schools were places for moral teaching, included the same kind of stories and maxims as the New England Primer, and more of them. About that time education became more general; a conception of schools arose containing the seed of what we now know as common schools. With that, the readers were much expanded in size, and began to include material less strictly confined to ethical teaching. The beginning of the Readers was more or less simultaneous with the beginning of
public education at the expense of the State. The Readers reflected, as this conception of education did, a liberalizing spirit, a tendency to teach more than religion and ethics..."

As this history demonstrates, and as is shown in Appendix B, Sullivan’s remarks on readers which have just been quoted are almost pure nonsense. Yet it is this kind of nonsense which has been permitted to pass for a very long time as the history of American education. However, it is not fair to blame Sullivan alone for the nonsense “history.” He had, as he made clear, “expert” help in writing his book.

Sullivan did have a fascinating tidbit of information, if true. He said that John Pierpont, who wrote the vastly used and famous Pierpont readers, dating from the early 1820’s, had a famous grandson, John Pierpont Morgan, Senior (1837-1913), and a famous great-grandson. J. P. Morgan, Junior (1867?). The J. P. Morgans were, of course, the renowned financiers. John Pierpont Morgan, Senior, made the acid comment that was quoted earlier:

Morgan’s overly cynical remark is certainly not too cynical, however, when considering the “history” of the McGuffey Readers which has been fed into the literature ever since 1927.

However, Sullivan showed a footnote contradicting his statement that “about the 1820’s” marked the arrival of reading series. His footnote on page 10 said:

“The exact sequence of Readers was: Murray’s, 1799; Abner Allen’s, used about 1804-1810; Pierpont’s, about 1825; Samuel Wood’s, 1828, Warren Colburn’s, 1833. The Angell Readers were published in the early 1830’s, the Mount Vernon Readers in 1836, and “Peter Parley’s” in 1839. Then came McGuffey’s. (The information in this foot-note was given me by Albert Mordell, of Philadelphia, and George A. Plimpton, of the publishing firm of Ginn and Company, leading authority on American school books, and owner of a unique collection of them.)”

As Appendix B demonstrates, not only are most of the dates wrong, but those materials cited are only a very small portion of the number of American readers published before McGuffey’s appeared in 1836 (not after 1839, as he implied here, although he correctly gave the date as 1836 elsewhere). However, whatever the “Mount Vernon Readers” of 1836 were is unknown.

On page 10, Sullivan said:

“About this time [1839] the adoption, by the States, of the system of free and universal public schools, began to have momentum. With that came increased demand for Readers. To meet it came a new series, eclipsing all others, past or later - the Reader of Readers.”

Sullivan followed that ludicrous statement with more than fourteen pages eulogizing the McGuffey Readers.

Sullivan had obviously circularized well-known Midwesterners for their memories on the McGuffey Readers. He quoted the remarks of Governor Lowden of Illinois in 1927. In a footnote, he cited others who had responded to his apparent letter of request, saying “Among others who in letters to the author recalled McGuffey’s were....” They presumably all wrote about 1927, when he was writing Volume II, since one other letter besides Lowden’s did show a date, and it was 1927.
Sullivan cited a few locations for his correspondents: two were from Illinois, and one each were from Iowa, Nebraska, and Ohio. They were all from the Midwest that Vail had called the “West,” and McGuffey’s was the overwhelmingly dominant series in that section of the country for many years, as Vail made clear.

A footnote on page 14 said:

“The most tangible sign of the affection in which McGuffey’s was held came from Henry Ford, who, in 1925, had the entire series (the revised series used when Ford was a schoolboy) reproduced, and distributed them widely. It is an odd fact that Ford came into one kind of fame in 1919 by saying ‘history is bunk,’ meaning history as written; and a few years later became, in a true sense, the most authentic historian in America, and also the most effective. To this appellation he is entitled by his reproduction and circulation of McGuffey’s, his purchase and restoration of an old American inn, the ‘Wayside,’ made famous by Longfellow, and an old American one-room schoolhouse; his revival of old American dances and songs, and his effort to make them familiar to modern America, by dancing them himself and by giving painstaking public instruction in them through his weekly paper, the Dearborn Independent; his museum of old American implements of transportation and other utensils.....”

In 1919, Ford obviously must have been inundated with bad press (what Sullivan called “one kind of fame”) because of his remark, “History is bunk,” and it may well have resulted in some loss of confidence in the Ford company cars being so massively sold in those years. Sullivan confirmed that it was not until “a few years later” or well into the 1920’s that Ford became active in his “historical” activities. Ford was obviously well able to fund them because of his great wealth. However, there does seem to be a cause-effect relationship between Ford’s 1919 anti-“history” statement and Ford’s 1920’s pro-“history” activities. Whether Ford’s compensating activities in the 1920’s were all his own ideas or largely those of his advertising/public relations employees can only be surmised.

It is interesting that it was not until 1925 that Ford is claimed to have reissued the McGuffey Readers (but, as discussed, it was more probably 1927). In that same year of 1925, the Columbia University book appeared praising the readers. Almost every “footnote” on McGuffey’s since then has carried a date later than 1925. The few exceptions include Vail’s 1911 history and Reeder’s 1900 history, and some anecdotes from people who grew up on the Midwestern frontier, where the McGuikey Readers were in wide use in the late nineteenth century. However, it is abundantly clear that the McGuffey Myth began to sprout only in 1927, the Myth being ultimately defined as the delusion that the readers blanketed America in the nineteenth century. It is also abundantly clear that the Myth was a carefully planned public relations promotion, arriving in its ludicrous and full-blown form by late 1927 with the appearance of the infamous Saturday Evening Post article.

On page 15 of his book written in 1927 and published in 1928 came Sullivan’s most famous and most ludicrous quotation. It closely paralleled the 1927 Saturday Evening Post reference, but it increased the numbers of American children who were supposed to have used the McGuffey Readers from four-fifths to nine-tenths!

“To millions of others, to probably nine out of ten average Americans, what taste of literature they got from McGuffey’s was all they ever had; what literature the children brought into the home in McGuffey Readers was all that ever came. Broad classical reading was decidedly not general. McGuffey, in short, because of the leverage of his Readers, had a large part in forming the mind of America....”
Yet, elsewhere, Sullivan credited the McGuffey books with supplying only half of the children in America! Consistency was not the hallmark of Sullivan’s book.

Sullivan said the following on page 18, thoroughly trashing the true history:

“One finds in the text-books used by American public schools two springs of influence: In New England, Noah Webster wrote a Dictionary, a Speller, and a History [sic]; and S. G. Goodrich, “Peter Parley” (nephew [sic] of Chauncey A. Goodrich who was a son-in-law of Webster), wrote a Geography, a Primer, Histories, and text-books on other subjects. That composed a New England dynasty in American text-book history. More or less simultaneously, William and Alexander Hamilton McGuffey, brothers, wrote the series of Readers that became practically universal throughout America except New England* and part of the Pacific Coast. This distinction between the New England dynasty and the McGuffey one is more geographical than spiritual. Spiritually, the origins of the two were no more different, than Puritan England (which settled New England and founded Harvard and Yale) differed from Presbyterian Scotland (which was a main stream in the settlement of the rest of the country....”

“In a rather painstaking survey to determine the area of McGuffey’s influence, I found that apparently it had never reached any of New England except the one small southwestern corner close to New York City. Elsewhere, McGuffey’s was almost universal.”

Most of this is simply flatly wrong. It is unparalleled nonsense, as can be seen from even the most casual review of Appendix B, which concretely lists published materials of the period. What is extraordinary is that, among all the vast numbers of materials that have been pouring from American publishing houses ever since 1928, apparently none of them except Dr. Cremin’s of Columbia Teachers College has specifically and directly challenged this outrageous nonsense. Instead, Sullivan’s text is still used to support the McGuffey Myth.

Sullivan said on pages 20 and 21:

“One feels justified in estimating that, taking into account all the editions, as many as seventy or eighty millions* of McGuffey Readers must have been used by American school children. This should be qualified by remembering that some children used more than one Reader, depending on how long they remained at school. Taking everything into account, it would not be surprising if at least half the school children in America, from 1836, to 1900, drew inspiration from McGuffey Readers....”

Sullivan’s footnote referred to a letter he had just received from Louis M. Dillman, greatly increasing that estimate to 122,000,000, which letter is quoted and discussed later.

Whatever Sullivan meant by the statement, “…some children used more than one Reader, depending on how long they remained at school....” can only be surmised. Did he mean, as the statement seems to imply, that after they finished all six of the McGuffey texts, only then did they start on other texts? If so, the statement is silly. Nevertheless, he cut his 80 to 90% estimate for McGuffey use given in one of his statements to 50% in this statement!

Lawrence A. Cremin stated in a footnote on page 70 of his book, American Education, The National Experience, 1783-1876, Harper & Row, New York: 1980, that the large sales of 122,000,000 quoted for McGuffey’s to 1920 were estimates provided by Louis M. Dillman, president of American Book Company which had been publishing the McGuffey series since 1890. However, Cremin said that Dillman’s estimate came from Harvey C. Minnich’s book, William Holmes McGuffey and the Peerless
Pioneer McGuffey Readers published at Oxford, Ohio by Miami University. Cremin apparently did not know of Sullivan’s footnote concerning his letter from Dillman with the same figures, which footnote is quoted later.

Cremin gave the publishing date of Minnich’s book as 1929 when it actually was 1928, according to the Cumulative Book Index, 1928-1932. Yet Cremin’s report of a 1929 edition of Minnich’s book was seven years earlier than the edition reported by Westerhoff.

As previously mentioned, at the end of the section, “Readers,” in the Cumulative Book Index, 1928-1932 appeared “About Readers.” with this entry:

Most probably, Minnich got his estimate of McGuffey sales from Mark Sullivan’s 1927 book, published in 1928. As quoted below, Sullivan said he had received that estimate directly from Dillman.

John H. Westerhoff, III, wrote McGuffey and His Readers, (Abingdon: 1978, Mott Media: 1982). He took portions of his book from his dissertation at Columbia Teachers College in 1975. Westerhoff thanked professors there for their help, one of whom was Lawrence Cremin, who had stated correctly in his own writings that the McGuffey Readers were popular largely only in the Midwest. However and unfortunately, Westerhoff did not emphasise that fact which Cremin clearly acknowledged but instead quoted the outlandish claims that have been made for McGuffey’s. Westerhoff referred to Dillman’s unsubstantiated “estimate” on page 14:

“It is estimated that at least 120 million copies of McGuffey Readers were sold between 1836 and 1920, placing their sales in a class with the Bible and Webster’s Dictionary.”

It is absolutely incredible that the president of American Book Company, only “estimating” and not having firm figures like Vail’s, could have produced a figure of 122,000,000 McGuffey texts sold to 1920, when, as will be discussed, it is probable that the total to 1920 was, at most, less than half of that.

Westerhoff said (pages 23-24) that the original readers of 1836-1836 compiled by William Holmes McGuffey himself “sold only seven million copies in comparison to the more than sixty million sold of the 1879 edition.” On page 15, he said that the seven million figure covered the period from 1836 up to 1850. Westerhoff apparently did not specify his source for the sixty million figure which appears greatly inflated (at the very least, doubled) compared to Vail’s unquestionably reliable figures for the sales of book one and book six. As discussed elsewhere in this text, for the seven million figure, Westerhoff cited page 15 of a 1933 text by John L. Clifton, Ten Famous Americans, published by R. G. Adams and Company of Columbus, Georgia. Clifton’s 1933 book discussed ten educators, of whom McGuffey was one. Yet where did that Clifton dig up that elusive figure of seven million readers sold before 1850, which was mentioned, so far as I know, no where else?

Mark Sullivan had said in a footnote on page 20 of Our Times, 1900-1925, Volume II, America Finding Herself, copyrighted by Charles Scribner’s Sons in 1927, and apparently not published until 1928:

“After this was in type, a letter from Louis M. Dillman, President of the American Book Company, informed me the estimate (of seventy or eighty millions) is too low. Mr. Dillman estimates the combined sales of McGuffey Readers, Primers and Spelling-book, between 1836 and 1920, at 122,000,000. He has exact figures for two years in the late eighties:
Possibly the reason Dillman claimed to have “exact figures for two years in the late eighties” for the readers and the speller is that those two years were the ones immediately before American Book Company was formed from four companies in 1890, the Van Antwerp company, the publisher of the McGuffey Readers, being one of those companies.

These McGuffey sales figures for 1888 and 1889 which Dillman found so conveniently so many years later might very well be valid. These sales figures might very well have been prepared by the Van Antwerp company prior to the 1890 merger, covering that part of their materials carrying the McGuffey name: the 1879 series, the two supplementary series, and the speller.

Therefore, despite the obvious unreliability of Dillman’s estimate of 1927 or so, the 1888 and 1889 figures he cited for McGuffey texts may very well be reliable. However, they can only be understood in light of several facts:

1. In 1888 and 1889, schools used supplementary reading series besides the regular series because of Colonel Parker’s promotion of “supplementary reading” after 1875. The Van Antwerp company itself published two such “supplementary” McGuffey series in addition to its regular 1879 McGuffey series, and they are discussed below. Yet all three McGuffey series may have been used only as supplementary readers in schools which were using a competing series as the principal one. Allowing for classrooms having at least two series, a main one and a supplementary, means each series’ “influence” is cut in half. A series could have wide sales without, in any sense, dominating the market.

2. As shown below, Webster’s speller was selling well over a million copies in the mid-1880’s, in part probably as a result of the swing back to spellers after the failures that resulted from following Colonel Parker’s 1875 lead of throwing out the speller. Dillman said part of his figures were for sales of McGuffey’s speller. Those sales may well have been comparable to Webster’s in the spelling-conscious years of 1888 and 1889 and may well have approached a million a year.

3. Vail cited total sales to 1911 for book 1 of the 1879 edition of 8,000,000 and book 6 of 1,000,000. That breaks down to an average annual sale for book 1 of 250,000 and book 6 of 31,250. (As noted below, the 1881 primer was an afterthought and was not meant originally to be part of the series. It was only intended as a “supplementary” book itself.) Adding the annual average for book 1 and book 6 gives a total of 281,250. That figure is, beyond any reasonable doubt, a thoroughly and properly documented average annual sales figure for 1/3 of the 1879 six-book McGuffey series, from its appearance in 1879 until 1911. Excluding the “supplementary” non-essential 1881 primer, it is possible to get a rough estimate of the average annual sales for the entire six-book 1879 series. The annual average sales which are definitely known for two books may be multiplied by three to produce a rough estimate of 843,750 for the average annual sales of the whole six-book 1879 McGuffey series. That resultant figure very possibly truly approximates the six-book 1879 McGuffey series’ annual sales, except for the non-essential primer, in 1888 and 1889. Yet, in the 1880’s, a single volume, Webster’s speller, was selling well over a million copies a year, which makes the McGuffey series’ total considerably less impressive.

4. Adding the approximate annual sales of its 1879 series to the possible McGuffey speller sales in 1888 or 1889, which speller sales may have equaled the reader sales, produces about 1,600,000 copies. The 500,000 or so remainder might well have been accounted for by the primer and the two recently published and probably popular supplementary McGuffey series, one of which had six and the other two texts,
5. Using Klass’s figures, quoted later, on government school enrollment in 1890 of 12,700,000, excluding large numbers of students in private and Catholic schools, and recognizing the fact that a good proportion of the McGuffey sales were for supplementary and not primary use in classrooms, it is self-evident that an annual sale of 900,000 or so of the 1879 McGuffey’s series could not supply all 12,700,000 government school students, even if the books had a life of approximately five years.

No one has ever said that Webster’s monopolized the spelling book market in the late 1840’s even though it was selling about a million copies a year (if that publisher’s figures can be believed). In 1840, the American population was 17,069,453, and in 1850, it was 23,191,876. The claim for McGuffey’s reader and speller sales in 1888 and 1889 can be compared to the population in 1880 of 50,155,783, and in 1890 of 62,947,714. On the face of it, therefore, the market shares for Webster’s in 1847 and for McGuffey’s in 1888 and 1889 appear to be fairly comparable. Figures are also available for those parts of the population which were in public schools in the years 1880 and 1890, possibly from either census figures or the Federal Government’s education office. Lance Klass’s 1981 book, The Leipzig Connection, written with Paolo Lionni, and published by Heron Books, Portland, Oregon, reported the figures and said the numbers were “continuing to rise rapidly thereafter”:

<table>
<thead>
<tr>
<th>Year</th>
<th>Public School Students</th>
</tr>
</thead>
<tbody>
<tr>
<td>1880</td>
<td>9,900,000</td>
</tr>
<tr>
<td>1890</td>
<td>12,700,000</td>
</tr>
</tbody>
</table>

This total does not, of course, include the parochial or private school students, who must have been numerous in those years. Furthermore, perhaps as many as half of all children never went beyond the fourth grade in 1890.

Vail did make what seems like an impressive claim for the 1879 McGuffey edition, but it becomes less impressive when analyzed (page 61):

“The revised edition of the McGuffey Readers... attained the largest sales that have as yet been accorded by the public to a single series of books. Of the Sixth Reader, which must have the least sale, over a million copies have been distributed, as shown by the edition number. Of the First Reader more than eight million copies have been used.”

The 1879 edition was on the market, unrevised, for a period of twenty-two years. That 1879 edition was still on sale thirty-two years later at the time Vail wrote his 1911 book, even though the 1901 revision had come on the market and was obviously outselling the 1879 edition. Vail’s total sales figure for the 1879 revision was for the thirty-two years up to the date of his 1911 book. Other popular series during that time were frequently revised. Vail was therefore comparing sales for thirty-two years, to 1911, to other popular series which may have only been on sale for five or ten years before they were revised. Naturally, the totals for the 1879 McGuffey’s would be greater.

Note, however, the total sales for the first reader, which the McGuffey Myth claims was used by nine out of ten American children. Sales only totaled eight million copies for that thirty-two year period. It is ludicrous to claim that eight million copies over a thirty-two year period from 1879 to 1911, averaging 250,000 copies a year, could have supplied the reading books for 90% of American first-graders! Furthermore, that 1879 edition was the most successful of the McGuffey editions, so the earlier editions covered even a smaller proportion of the total American market!

The 1881 primer was not part of the original 1879 series, as can be seen from an old copy of McGuffey’s Revised Primer, carrying the copyright dates of 1881 by Van Antwerp, Bragg Co., 1896 by American Book Company, and 1909 by Henry H. Vail. Its “Preface” reads in part:
“The flattering success of McGuffey’s Revised Readers, and the inquiry for more primary reading matter to be used in the first year of school work have induced the publishers to prepare a REVISED PRIMER, which may be used to precede the First Reader of any well arranged series. The method pursued is the same as that in McGuffey’s Revised Readers, and the greatest possible care has been taken to insure a gradation suited to the youngest children. Only about six new words are to be mastered in each lesson. These new words and the new elementary sounds are always to be found in the vocabulary of the lesson in which they are first used.

“The plan of the book enables the teacher to pursue the Phonic Method, the Word Method, the Alphabet Method, or any combination of these methods....”

The “Preface” makes it clear that the primer was never intended as part of the 1879 series, and was meant primarily as an adjunct to competitors’ series, or for “supplementary” reading with McGuffey’s series. The probability, therefore, is that its sales never approached the sales of the 1879 first reader.

Vail never claimed a monopoly for McGuffey’s. He actually added this remark to his boast about the great sales of the 1879 series:

“...at no time in the history of these readers have they been without formidable competition....”

When considering sales about 1880 to the, 9,900,000 public school students, it should be remembered that Vail said McGuffey’s publishers and the publishers of Appleton’s had been engaged in a textbook war at that time, and each withdrew without claiming victory. Therefore, it is certain from Vail’s own testimony that McGuffey’s could not have dominated the market in 1880. Vail did say that McGuffey’s had far the larger sales at the end of the textbook war (though he probably meant only in the McGuffey home territory, the Midwest), and that its sales later increased, which increase would have been towards the end of the 1880’s. This is the grain of truth in the McGuffey Myth: McGuffey’s was, at all periods, the best seller in the Midwest.

Obviously schools were not buying new books each year for each child, so a multiple must be used to arrive at the number of children who eventually used the books which were sold. Heavily used reading books might last, on the average, perhaps about five years. Dillman had said the 1888 and 1889 sales figures he gave included the McGuffey speller, and those were the years when a frantic new interest arose in spelling. Sales of the McGuffey speller must have been very large. They were possibly comparable to Webster’s which was selling well over a million copies a year in the late 1880’s.

Nevertheless, as discussed, these two possibly reliable figures which are available on total McGuffey annual sales in 1888 and 1889 do not confirm a near monopoly for the McGuffey Readers even in 1888 and 1889, the probable years of their greatest use. However, any figures coming from Dillman must be suspect.

The 1880’s was the period of the supplementary reading craze that had originated in Quincy, and also the “natural history” reading craze from the same source, although “natural history” had originally been popularized by Agassiz. Many supplementary reading materials and “natural history” reading materials were published after 1880. The 1885-1890 American Catalogue reported the publication of the following under the “McGuffey” title:

6 v. Van Antwerp.
Cont. First Reader, 15c. - Second reader. 25c. - Third
reader. 35c. - Fourth reader. 40c. - Fifth reader. 50c. -
Sixth. reader. 60 c.
- Natural history readers. ‘87–‘88. 2 v. 58c; 50c.

Van Antwerp.

In 1888 and 1889, just preceding the sale of most of Van Antwerp’s assets to American Book Company, the McGuffey Readers had actually been not just one set of readers, but three sets, plus the speller. One reading series was the regular series, and two were meant to be used as supplementary series in the same classrooms as the regular series. Furthermore, the two supplementary series were very fresh, just-published materials and were likely to have been popular. Therefore, Dillman’s “firm” figure of about two million for McGuffey sales in those years may have been divided among three separate series of readers meant to be used simultaneously in the same classrooms, as well as including the speller. The share of the principal McGuffey series may possibly have been considerably reduced. However, even if the figures were solely for the regular McGuffey series and the speller, that series itself was undoubtedly being used as “supplementary” reading material in many schools which were buying multiple reading series after the arrival of the “supplementary” reading craze. If half of such sales had been for “supplementary” readers instead of for principal readers, it would have reduced McGuffey’s influence as the principal reading series by fifty per cent.

Yet, despite the highly impressive but questionable sales figures given by Dillman for the McGuffey Readers and spellers for 1888 and 1889, the total sales of book one and book six of the McGuffey Readers after 1879 prove that the series never could have had a monopoly of the American market. (Probably very few sales were made outside the United States.)

Vail’s authoritative 1911 history is almost certainly the only reliable source for figures on McGuffey sales, unless Vail wrote other materials which are never cited. Library sources show that his 1911 history was first printed privately in 1910, but it was two pages shorter, not longer. Vail’s history showed, internally on page 57, that he had left American Book Company in 1907, many years before Dillman’s estimate of McGuffey sales to 1920. In Vail’s book, he listed actual figures for sales in only two places. On page 45, he said:

“In a First Reader printed in the fall of 1841 there are two pages of advertising matter in which Truman & Smith claimed to have sold 700,000 of the Eclectic Series.”

Those sales, apparently for a series of six books, were over a period five years, from 1836 to 1841, averaging 140,000 a year for all six books together. Yet shortly after, in 1847, the publishers of Webster’s speller were claiming sales of 1,000,000 a year, more than five times as great, for only a single book.

The only other mention that Vail made of sales was on page 61. He said concerning the 1879 revised edition:

“Of the Sixth Reader, which must have the least sale, over a million copies have been distributed, as shown by the edition number. Of the First Reader more than eight million copies have been used.”

Vail is probably the only one who could have produced such firm figures on sales, since he had been editor on that series from 1879 to 1907. Yet he must have had very few firm figures, or he would have used more of them. His above figures, of course, are firm. They indicate that books one and six sold nine million copies from 1879 to 1911. Books one and six were one-third of the whole six-book McGuffey series of 1879, not counting the primer or the speller. It is fairly reasonable, therefore, to multiply that nine million by a factor of three to get an approximate total sale for the total six-book reading series from
1879 to 1911 of 27,000,000 in that period of 32 years, plus the primer. Even if another 8,000,000 were included for the primer, since book one sold 8,000,000 copies, the total would be only 35,000,000, or a little over a million a year in the period of greatest sales. The total, obviously, is probably inflated.

Only 700,000 copies had been sold of all texts from 1836 to 1841. After that, from 1841 to 1879 was a period of 38 years, in which sales were lower, since Vail said the 1879 series sold the best of all editions. Even if the admittedly weak assumption were made that half as many were sold in the 38 years between 1841 and 1879 as in the 32 years between 1879 and 1911, total sales would equal 700,000 from 1836 to 1841, plus 17,500,000 from 1841 to 1879, plus 35,000,000 from 1879 to 1911, or 53,200,000. Since relatively few were sold afterwards, the total might have been 55,000,000 by 1920, but that is almost certainly an inflated total. Yet Dillman of American Book “estimated” McGuffey sales to 1920 at 122,000,000, or well over twice as much!

Yet any total sales figures, obviously, are largely unfounded “guesstimates,” which makes the “firm” figures which constantly turn up in the literature concerning McGuffey sales very puzzling indeed.

Westerhoff’s book, McGuffey and His Readers, cited such a figure on page 14, saying that over seven million McGuffey readers had been sold before 1850. As mentioned, he said that by 1890 they had become the basic school readers in thirty-seven states and cited as a reference, “John L. Clifton, Ten Famous American Educators (Columbus, Ga.: R. G. Adams & Co., 1933), p. 75.” Where Clifton got his figures is unknown, but the “seven million” turned up again in Early American Textbooks, 1775-1900, published by the Department of Education in Washington in 1985. On page xiii of the introduction, this appeared:

“Between 1836 and 1850, Smith sold seven million copies of the McGuffey Readers. From 1850 to 1890, sales averaged ten million copies each decade. Another fifteen million were sold between 1890 and 1920. This wonder of the publishing world has sold well over 122,000,000 copies.”

The professor of the history of education at a large university who contributed the introduction to Early American Textbooks was apparently drawing on the same source as Westerhoff for the 7,000,000 figure, and that source must also have yielded the figures for the various years the author quoted, but not the total that he gave. The author obviously also had another source which gave a “total” of 122,000,000, but he did not know that it was the total only to 1920, which had originated with Dillman of American Book. The author of the introduction must therefore have assumed the total was for a far more recent date. That is because his figures to 1920 (7,000,000, 40,000,000 and 15,000,000) only add up to 62,000,000, not 122,000,000! The author’s total on this major reference work, Early American Textbooks, published in 1985 by the Department of Education with all the authority that suggests, is therefore WRONG by 60,000,000, which is demonstrated by simple addition! That it involves a simple addition error is obvious, since the author clearly did not mean to imply that 60,000,000 McGuffey Readers were published between 1920 and 1985, particularly since his figures showed only 62,000,00 had been published from the time the readers first appeared in 1836 until 1920, and 1920 was long after their popularity had declined.

Whatever his source for the unsubstantiated figures he quoted which added up to 62,000,000, even these were inflated, when compared to the size of the only reliable figures available, those from Vail. However, the inflation of these figures only serves to make Dillman’s further inflation to 122,000,000 just that much more outrageous.

Vail based his history on his having been a part of the companies publishing McGuffey’s since the 1860’s, and on his having been the company’s editor from 1877 until 1907 when he must have resigned or retired (judging from an oblique remark on the bottom of page 57). Vail gave firm sales figures, not
“estimates,” for the total sales of book one and book six from 1879 to 1911. That 1879 revision had been prepared under Vail’s personal direction as editor, and Vail’s knowledge of its subsequent success was direct and personal. Vail gave sales figures for a period of 32 years, from the time the most popular 1879 edition was issued. Those sales break down to 250,000 a year to 1911 for book one for a school population which was increasing enormously every year. It is evident that figure could never have sufficed to reach almost all first graders in America in those years. This is obvious, even if each copy survived to reach five children in five years and even if book one had been used as the principal book in classrooms in those years when classrooms had multiple reading series.

For book six, average annual sales to 1911 would be 31,250. Even though far fewer children stayed in school through the upper grades in those years, (the sales suggest a ratio of eight beginners to one sixth-grader or above), it is evident that book six’s share of the total market was very small. Book one and book six sold only 9,000,000 copies in the years of greatest use, from 1879 to 1911. Vail’s firm figures for the sales of book one and book six, even taken alone, confirm that there was something very, very wrong with Dillman’s total “estimate” of McGuffey sales of 122,000,000 from 1836 to 1920. Dillman’s estimate was far larger even than Sullivan’s original estimate of 70 or 80 million. Sullivan’s original estimate was very like the total of 62,000,000 from the undocumented figures quoted in the contributed introduction to Early American Textbooks, which were, themselves, almost certainly inflated. Vail’s figures, therefore, clearly establish that Dillman’s estimate was very peculiar.

On Possible Connections between the “Experts” and Dillman’s Greatly Inflated Estimate of 122,000,000 McGuffey Readers Sold by 1920

Sullivan’s book, published in 1928, was in type when Dillman, the President of American Book Company, wrote Sullivan, and Sullivan’s book was copyrighted in 1927. Dillman’s letter to which Sullivan referred in his book was therefore probably written in 1927.

Dillman’s 1927 letter more than doubled the previous and very generous estimated McGuffey sales figures (62 million as effectively reported recently in Early American Textbooks from statistics they cited, and 70 to 80 million cited previously by Sullivan). Dillman’s 1927 letter instead enormously increased the estimated McGuffey sales up to 1920, reporting that they had reached a total of 122 million copies.

At the time that Dillman wrote his letter to Sullivan with his enormously increased estimated sales figures for McGuffey’s, he most probably knew Henry Suzzallo personally. Suzzallo had studied at Columbia Teachers College under Thorndike shortly after the turn of the century, as Suzzallo recounted in the February, 1926, honorary issue of Teachers College Record dedicated to Thorndike. Suzzallo had later been a professor at Columbia until 1915, before going to the University of Washington. While Suzzallo was at Columbia, three of his fellow professors were Edward Lee Thorndike, James McKeen Cattell, and John Dewey. All three were friends, and Suzzallo was a friend, at the very least, of Thorndike, and probably of the others as well. As mentioned elsewhere in this history, Suzzallo referred in an anecdote in that 1926 article to having met Thorndike at Thorndike’s office in New York, apparently in the recent past.

Suzzallo had been President of the University of Washington until 1926, when he was fired by the Governor of the state of Washington for cryptically expressed reasons, according to Ohles’ biographical entry, quoted later. As mentioned elsewhere in this history, after being fired by the Governor of Washington, Suzzallo worked for the Carnegie group. (They are still extremely active today in trying to shape American education, even though as a non-Governmental group they have no authority from the
American public to do so.) Suzzallo then served as President of the Carnegie Foundation for the Advancement of Teaching from 1930 till his death in 1933.

As discussed elsewhere, Suzzallo’s speller published by American Book Company of which Dillman was President in 1927 had been involved in a textbook-bid scandal in Texas in December, 1925. That was only about a year before Dillman made his greatly inflated estimate of McGuffey sales. The Texas textbook scandal led to a call for the impeachment of the Governor of Texas, as reported in the New York Times on December 4, 1925. Therefore, by the beginning of 1926, an American Book Company text by Suzzallo, on which American Book Company had submitted bids to Texas and which it was still publishing, had created a major scandal for American Book Company. Under these circumstances, President Dillman of American Book Company may well have known Suzzallo personally. Suzzallo was a long-standing member of the “expert” group and a personal friend of Thorndike, at the same time that Dillman made that curiously inflated claim in 1927 concerning the sales of the McGuffey Readers.

It was the fiction on the McGuffey monopoly planted in American culture in 1927 through Sullivan’s book quoting Dillman (not published until 1928), and through the 1927 Saturday Evening Post article, “That Guy McGuffey,” that made the take-over of America by the Gates and Gray deaf-mute-method series after 1930 seem to be only a continuation of an American tradition. Gates and Gray, of course, had been graduate students who had worked intimately with Thorndike (Gray in 1913-1914, and Gates probably since 1915). They remained Thorndike’s friends, as Suzzallo also did. Gates had not only worked with Thorndike but with Cattell, Thorndike’s very close friend, in 1917 and had even lived in Cattell’s home at the time Cattell was fired from Columbia for opposing the draft in wartime. Gates temporarily lost his draft exemption, presumably because of the association with Cattell, but Thorndike had it reinstated, according to Geraldine Joncich’s biography of Thorndike.

Thorndike and Gates were both still at Columbia Teachers College in 1925. Gates wrote an article in 1925 introducing his idea of “intrinsic” phonics (the deaf-mute-method visual approach), and his article is discussed elsewhere. Also discussed elsewhere is the fact that Gates’ assistants at Columbia Teachers College worked with little deaf-mute children in the late 1920’s, teaching them sight-words and analyzing the results, in comparison to teaching sight-words to retarded children and to children of average and above average intelligence. Gates wrote one of the first two deaf-mute-method readers for hearing children, published by Macmillan in 1930. The other and far more successful deaf-mute-method series for hearing children was the 1930 Scott, Foresman series. Yet Gates’ and Gray’ series were NOT, of course, identified as using Gallaudet’s deaf-mute reading method! That Gates and Gray used Gallaudet’s method is made even worse by the fact that Gallaudet’s deaf-mute-method is an inferior method for teaching deaf children to read! The Scott, Foresman readers blanketed America in the 1930’s and plunged it into the sea of functional illiteracy in which we still flounder. William Scott Gray of the University of Chicago was the author of that 1930 “Dick and Jane” deaf-mute-method Scott, Foresman series.

Gray had studied and worked closely under Thorndike in 1913-1914 at Columbia Teachers College, where he received his master’s degree on oral reading tests prepared directly under Thorndike. Gray returned to get his doctorate in 1917 at the University of Chicago, where Charles Judd, Thorndike’s old friend from college days, was located. Gates was not only Thorndike’s ex-student but Thorndike’s associate at Columbia Teachers College all through the 1920’s. Both Gray and Gates, who had such long-standing and close ties to Thorndike of Columbia Teachers College, were highly active and highly visible in promoting the “meaning” method and downgrading phonics (the “sound” method) all through the 1920’s. In the 1965 revision of her so-called “history” written for her doctorate at Columbia Teachers College in 1932, Nila Banton Smith referred to Gates and Gray as “giants,” but made no mention of the fact that both had trained under Thorndike.
Thorndike himself had trained under the psychologists, Cattell and Cattell’s close personal friend, William James. William James wrote in his 1890 psychology book about a deaf-mute man who remembered thinking very deep thoughts as a boy, before he had acquired any language at all. That was undoubtedly true, considering the nature of the human soul. However, James had used the anecdote to downgrade the value of spoken language (“sound”). James’ ideas on the “stream of consciousness” apparently sparked the interest in the 1870’s in using what was really the deaf-mute sight-word method for teaching beginning reading, in order to protect “meaning” and downgrade “sound.” Cattell and Thorndike, at least initially, must have endorsed the deaf-mute-method approach. They most certainly knew of the deaf-mute-method approach to teaching beginning reading. After all, in his published work, Gates specifically referred to the deliberate use of it with unfortunate little deaf children in “reading research” in the 1920’s.

Suzzallo, who was also Thorndike’s friend at least as late as 1926 and who was also Thorndike’s former associate at Columbia until 1915, was involved in a very disturbed business relationship with American Book Company in 1926 and may well have known the president of American Book Company, Dillman, personally. That was within a year of the time that Dillman made the curiously inflated claim for McGuffey sales.

The record shows some very interesting interlocking relationships surrounding those enormously inflated sales figures for McGuffey’s which Dillman of American Book Company produced in 1927. Those inflated figures supported the fiction that a reading series, McGuffey’s, had once blanketed America, coast to coast. Such a fiction very conveniently served the purposes of the change-agents in 1927, since they were planning to blanket the entire country after 1930 with their deaf-mute-method readers on which they were working in 1927.

The “experts” did blanket all of America after 1930 with their deaf-mute-method readers, the Scott, Foresman series and the Macmillan series, which were the products of Nila Banton Smith’s “giants,” Gray and Gates. The blanketing of America with the Gray and Gates deaf-mute-method readers was in the fake, invented “tradition” of the McGuffey Readers. Those “meaning”-method abominations then efficiently produced their legions of functional illiterates from the Atlantic to the Pacific Oceans, thus most grievously and wrongfully wounding our country.

Additional information on the McGuffey series is given in the appendices.
Chapter 27
Sheldon’s 1875 Testimony, Contrasted to Nila Banton Smith’s “History”

Unimpeachable testimony on the practices in use in teaching beginning reading in 1875 came from E. A. Sheldon, Principal of Oswego State Normal and Training School at that time, who had previously been Superintendent of Schools in Oswego.

Yet Sheldon obviously had no knowledge of the fact that methods had been very different only fifty years earlier. In contrast to Sheldon’s remarks, the remarks of Boston Superintendent of Schools John Dudley Philbrick in the 1874 Boston Annual School Report showed that Philbrick had a partial understanding that a major change had taken place years before 1875 in the teaching of beginning reading, when the syllable method had been dropped. It can be seen from Sheldon’s remarks that he had no knowledge that the syllable method to teach beginning reading had been in use in schools before 1826.

The following are quotations from Sheldon’s manual to Sheldon’s Readers dated July, 1875:

“The Word method of teaching to read was exclusively employed in the public schools of the city of Oswego from the time of their first organization, in 1853, to the year 1860.

“Methods of Teaching Reading
Within the last twenty-five years, five methods of teaching reading have been prominent before the public, - the Alphabet, the Word, the Sentence, the Phonetic, and the Phonic methods.

“The Alphabet Method
By this method, the children are first taught the names of the letters, and they begin, at once, to spell all new words by these names.

“Until within a comparatively few years, this was the method universally employed, and it is still much used.

“It is very faulty, in that the names of the letters do not guide to the pronunciation of the word. As an illustration, take the word log. The name of the first letter is el; of the second, the long sound of o, as heard in home; of the third, je. Now if we employ these names in the pronunciation of the word, we have el-o-je - and this comes very near to el-o-gy - a significant word with a very different meaning from log.”

Concerning the spelling, Sheldon did not mention that two kinds existed then: “on the book,” which just meant reciting the letters while looking at the word, and “off the book,” which meant reciting the letters without looking at the word. “The Alphabet Method” usually only used spelling “on the book,” so did not even require memorizing letter sequences on sight words. Dictated, written spelling tests as we know them were not normally what was meant by “spelling” in 1875. Sheldon continued:

“The Word Method
In this method, we begin by teaching words, which the children learn to recognize as wholes, and as the representations of ideas. This method is now extensively used; and, when others are employed, they can be considered as only accessory to this. It has ever been by learning to recognize words as wholes that children who have been taught the names of the letters have learned to read; for, when a child has spelled a word by naming all the letters that enter into it, he knows no more about its pronunciation than if he had not spelled it; the teacher must give him the
word, and, if he forgets it, she must give it again and again, until he learns to recognize it; and this is the Word method, with the useless appendage of learning the names of the letters."

Note that Sheldon was saying, implicitly, that the child was only identifying letters in a “new” word by naming them, not memorizing the word’s spelling: “...when a child has spelled a word by naming all the letters that enter into it, he knows no more about its pronunciation than if he had not spelled it....”

“The Sentence Method
This consists simply in treating whole sentences as we treat words, in the Word method; the sentence bearing the same relation to the thought that the word does to the idea. The child being in possession of a thought, the sentence representing that thought is placed before him, and he learns to recognize it as a unit. It is claimed for this plan that it has decided advantages over any other, in teaching the children ease and naturalness of expression; and I think this much, at least, may be justly claimed for it.

“It is well to train the child to keep the eye in advance of the voice; and this method requires him to do this. I am satisfied, however, that after a few short simple sentences are taught in this way, the child begins to recognize the separate words in the sentence, and very soon comes to rely on his knowledge of words, rather than of sentences.”

Note that Sheldon in 1875 equated “word” with “idea,” and “sentence” with “thought,” the usage in Farnham’s 1873 paper. (As discussed elsewhere, that usage was later employed by Colonel Parker, by the Boston Schools in its reports, and by Johonnot, and that usage finally appeared in William James’ 1890 psychology text, after which it died out, except for a brief revival in Huey’s 1908 text). Sheldon obviously was acquainted in 1875 with Farnham’s 1873 arguments, and probably with Farnham’s 1873 paper.

Sheldon published his series in 1875, but the “sentence” method had apparently never been heard of until 1870 in Binghamton, only five years earlier. The sentence method had obviously been publicized with all the swift efficiency currently being used to publicize “whole language,” and it was akin to it in philosophy. It endorsed “meaning” for rank beginners and demoted “sound.” Both the sentence method and “whole language” when used to teach beginning reading produce permanently wrong conditioned reflexes in readers.

Sheldon went on to discuss “The Phonetic Method,” referring to the Pitman print and the Leigh print, and “The Phonic Method,” which he conceived of as phonics as used in his readers. Yet, despite his obvious good intentions, he used only partial and phony phonics, the sort of thing prevalent in England at that time, which is discussed in the section on English texts. Sheldon’s material was modeled on the word and phonic program that had been used in Oswego schools after their partial use of Pitman print. The phonics was initial consonants plus word endings and it was used along with sight words.

It should be emphasized, however, that Sheldon stated categorically that “Until within a comparatively few years, (the Alphabet Method) was the method universally employed...”, that it was truly a sight-word method, and that the pure sight-word method had been used in Oswego since the schools began in 1853. This is further proof that “phonics” was not the norm in the nineteenth century.

Sheldon had also unconsciously testified elsewhere concerning the enormous retardation in reading in 1875, although I cannot find the exact quotation in my photocopies. It was probably somewhere else in the preface to his readers than in the portion I photocopied. Sheldon said somewhere in his writings that he believed children could not really read until they reached fourth grade, and that is certainly testimony to an enormous degree of retardation.
It is certainly interesting that Sheldon had no knowledge of the fact that the alphabet “meaning” method he described (the spelling of words) was so vastly different from the pre-1826 “sound” method (the spelling of phonetically-read syllables in words), and that he did not even show any knowledge of the existence of that syllable method. The two approaches are as wide apart as are the Japanese Kanji characters and Japanese Kana characters which are dealt with by the brain in opposite ways. The evidence indicates that the spelling of meaning-bearing sight-words uses the “spatial” right side of the brain that processes pictures, but the spelling of meaningless syllable sounds uses the “sequential” left side of the brain that processes sound. The almost instant disabilities in reading which arrived in the English-speaking world after 1826 with the discarding of the “sound” syllable method and the arrival of the “meaning” word method can be explained by this organic difference. Yet the post-1826 “word” primers and the pre-1826 “syllable” spelling books may look very similar to the casual observer who does not know that “word” primers were taught by “meaning” but “syllable” spellers by “sound.”

What is clear from Sheldon’s comments, however, is that, although the activists of the 1826 period had succeeded in seriously damaging the teaching of reading, by the time Sheldon wrote in 1875 attempts were being made to repair the damage. Pitman phonetic print, of which he approved, had not been successful in America in the 1850’s, but the Leigh pronouncing print of 1864 and phonics in general were gaining ground in 1875 when Sheldon published his series. That was the same year that Colonel Parker arrived on the Quincy - and American - scene. It was the vast publicity all over America on Parker’s “meaning” approaches after 1875 which killed the 1860’s and 1870’s growing American revival of phonic “sound.”

Therefore, by the time of Nila Banton Smith’s quotation, given later, concerning the failure of primary grades (in 1889 or 1894), the situation had deteriorated again. It is obvious something had happened between 1875 and 1889. Is this why Nila Banton Smith only listed so few references in her bibliography for that period, as discussed elsewhere? Is this why she did not mention William James at all, or James McKeen Cattell, or G. Stanley Hall, or the Leigh print, or the once-famous Quincy, Massachusetts, teaching methods and experiments in her index? Is this why she only showed The Franklin Primer as being written by George Hillard in 1831, when it is clear he must not have written such a book in that year? She did not even mention The Franklin Primer, an edition of which was printed in Cambridge, Massachusetts, in 1877 and again in 1878, on which Hillard was the senior author. Yet The Franklin Primer, first published in 1873, was very widely used, as proven by a large advertisement in The School Bulletin in 1875:

“The Franklin Series of Readers. Though so recently issued, these books have already been introduced, wholly, or in part, into the Public Schools of the City of Washington, D. C., City of New York, City of Boston, City of Albany, City of Worcester, City of Newark, City of Lowell, City of Cambridge, City of Salem, City of Fall River, City of Manchester, (N.H.), City of Gloucester, City of Nashua, (N.H.), City of Newburyport, City of Dover, (N.H.), City of Somerville, City of Augusta, (Me.), City of Newton, and a very large number of important towns. Brewer & Tileston, Publishers, Boston.”

This 1875 advertisement listed Boston among those using the Franklin series. Yet Boston at that time was using Leigh-print beginning readers in almost all primary grades. Therefore, Boston must have had Leigh-print editions of the lower books of the Franklin series in 1875. Those Leigh-print Franklin readers possibly were part of the primary school properties that were anonymously removed along with the primary school record books the summer after Boston Superintendent of Schools John Dudley Philbrick was fired. The documentation for that exceedingly peculiar 1878 disappearance of school property has already been discussed.
It is curious that Smith did not even mention the anonymous Franklin Primer of 1826 attributed to Willard, but only an unlocatable Franklin Primer of 1831 by Hillard, who would then have been very young. She quoted as the content of this apparently imaginary 1831 primer by Hillard the content of Willard’s anonymous 1802 Franklin Primer which was not reprinted after 1812. Furthermore, she never mentioned at all Hillard’s non-Franklin but widely used series of the 1850’s and 1860’s, nor the obvious “sentence method” 1873 Franklin series with Hillard’s name and his co-author’s.

Farnham’s 1881 book on the sentence method does appear in Smith’s bibliography, but only with an 1895 publication date. In the body of her book, which is the only place a casual reader would consult, she dated Farnham’s work to an incredibly late 1905 on page 122, 24 years after his book was first published, and 35 years after his Binghamton “experiments”:

> “George L. Farnham, author of one of the first teachers’ manuals in reading (1905), expressed reading aims in this way:

> “Reading Consists: first, in gaining the thoughts of an author from written or printed language; second, in giving oral expression to these thoughts, in the language of the author, so that the same thoughts are conveyed to the hearer. (58:ll)”

The quotation she cited is actually on page 13 of the 1881 edition, not page 11. Smith’s bibliographical entry “58” showed the publication date of Farnham’s book as 1895, not the 1905 she indicated just before giving the above quotation, another curious “accident” that serves to move a reader’s attention away from the 1870-1880 period when the sentence method actually arrived. Its existence in that period is confirmed beyond any doubt by Sheldon’s 1875 comments which have been quoted.

Nila Banton Smith continued:

> “II. The New Reading Materials
Professional Books

“This is the period in which professional books in reading first came into prominence. With the issuance of new materials and the formulation of new methods, it was natural that entire treatises should appear, devoted to the discussion of reading instruction.

“One of the first books of the period to exert any particular influence on the teaching of reading was Scudder’s Literature in the Schools, published in 1888....

> “Sarah Louise Arnold’s Reading: How to Teach It (1899) was another important book of the period.... In 1899, Charles A. McMurry published his Special Method in the Reading of Complete English Classics.... It was during this period also that Edmund Burke Huey produced his famous book on The Psychology and Pedagogy of Reading. This book does not advocate any particular method or take sides on any issue.... This book was the first scientific contribution to reading instruction and is still considered a standard reference in this field.”

To state that Huey did not “take sides,” is mind-boggling!

What Nila Banton Smith omitted can be taken to be the kernel of the matter. She made no mention of the fact that Farnham had used the sentence method in 1870 and had written a book on it by 1881. Instead she claimed that an 1888 book was the first to exert any influence on teaching methods in reading. She made no mention of the critically important 1883 Boston schools guide on the teaching of reading. (Of
course, she had also completely left out of her history the change-agent writings concerning the teaching of reading which clustered around the other change-agent date of 1826.)

She continued the smokescreen on the bottom of page 123:

“Courses of Study

“Separate courses of study in reading appeared for the first time during this period. Until about 1890 the courses were but meager outlines in reports of a school board or a superintendent of schools.”

Yet the elaborate Boston schools’ guide to curriculum, including a section on reading, had appeared in 1878, and the elaborate Boston schools’ guide solely on the teaching of reading had appeared in 1883, and she never mentioned either of them! Furthermore, it should be remembered that at that time Boston was still the intellectual hub of America. Intellectually speaking, as Boston went, so went the nation.

On page 141, Smith quoted from Farnham’s book and said several reading systems appeared based on his sentence method. She mentioned two published in 1897 and 1899, and went on:

“It was not, however, until the years between 1909 and 1918 that the method enjoyed the height of its popularity.”

Smith omitted a very interesting sentence method reader which was published far earlier, in 1889. Early American Textbooks - 1775-1900, Office of Education Research and Improvement, U. S. Department of Education, Washington, D. C. 1885, shows the following on page 98:

It seems highly appropriate that “Geo. Sherwood & Co.” of Chicago should have published what was probably the first pupil’s reader with “sentence method” actually in its title. Of course, there had been two earlier teacher’s guides for the sentence method, Farnham’s of 1881 and Johonnot’s of 1885. The reason that it seems highly appropriate is the fact that the Sherwood company is associated with the name of J. Russell Webb, the man who popularized the term, the “word-method,” starting with his first book of 1846. Webb’s Normal series which he began in 1846 was listed by Nila Banton Smith as one of the earliest word-method series.

Since at least 1866, the Sherwood company had been one of the major publishers of Richard Edwards’ and J. Russell Webb’s Analytical series. In 1873-1876, according to the 1876 American Catalogue, Sherwood published J. Russell Webb’s newest series, the Model Readers in four volumes. According to the 1885-1890 American Catalogue, Sherwood published in 1888 the New Model First Reader by “Webb,” apparently a revision of his 1873-1876 series. According to Early American Textbooks, Edwards had another series, called the Student’s Series, published by Sherwood from about 1877 to about 1881. Also according to Early American Textbooks, by 1897, Edwards’ Student’s Series was being published by Scott, Foresman & Co. of Chicago, “Rev. by Florence Holbrook.” Scott, Foresman & Co. bought out Sherwood in 1894, who had not only handled sight-word readers by Webb for a long time but who were also perhaps the very first to produce a reader openly labeled “sentence method.” The Student’s Series, which does not appear in the 1912 United States Catalog (nor for some reason not even in the earlier American Catalogues) may have been the predecessor to Scott, Foresman’s 1909 series by Elson.
Because of Sherwood’s publishing Webb’s “meaning” word-method texts and a text using the “meaning” sentence method, it may be appropriate that Scott, Foresman who bought out Sherwood was the publisher of one of the two earliest “meaning” deaf-mute series, W. S. Gray’s 1930 “Dick and Jane” readers.

Sherwood’s name appeared in 1862, in A. S. Welch’s Object Lessons for Teachers, published by A. S. Barnes & Company, which book is discussed elsewhere in this history. On page 137, Welch referred to models in wood of solid geometrical shapes, and said, “A large assortment of such models can be obtained from Holbrook & Co., Hartford, Connecticut, or from Sherwood & Company, Chicago. These firms have agencies in all our large cities.”

The Holbrook company was apparently founded by Josiah Holbrook, who worked so hard from 1826 on to establish government schools - and to foster “science,” which object lessons and “solid geometrical shapes” obviously would do. The Holbrook firm and the Sherwood firm were in the same line of work in 1862, so it seems fitting and proper that there is possibly some kind of connection - however nebulous - between old Josiah Holbrook in 1826 and “Dick and Jane” of 1930. (The probability is that “Florence Holbrook” was no relative of old Josiah Holbrook.

She not only wrote the revision of Sherwood & Company’s readers for Scott, Foresman, but other highly popular beginning readers of the period such as the famous Hiawatha Primer.)

Moving the period of the emphasis on the sentence method away from the 1870’s was not all that Nila Banton Smith did in her “history.” The Boston change-agents had endorsed the use of real “literature” instead of “scraps,” as shown by Boston School Superintendent Eliot’s comments in 1878, and by Lodge’s folk-tale book compiled for the Boston schools about the same time. Yet Smith obscured the fact that the increased emphasis on “literature” in readers had begun in Boston in the 1870’s. On page 143, she said:

“There can be no doubt that the pioneers in literary readers were... Stepping Stones to Literature (1897) and... Graded Literature Readers (1899).”

Concerning such “pioneers,” Nila Banton Smith was wrong by at least twenty years, since at least two such “pioneers” in literary readers had appeared some twenty years earlier. One was Hurd and Houghton’s House That Jack Built, part of their “Riverside Juveniles,” published in 1876, according to Leypoldt’s American Catalog of July, 1876, and undoubtedly other “literary” selections were among the Riverside Juveniles. A second “pioneer” was Six Popular Tales, Authorized for Use in the Boston Public Schools, “Selected and Arranged by Henry Cabot Lodge,” August 12, 1879. (Lodge’s book showed no publisher, but was copyrighted by him in 1879 and printed by the “Press of Brockwell and Churchill, Boston.”) Change was brewing in Cambridge and Boston in 1876, and the change-agents had taken over the Boston schools by 1879, the date of Lodge’s text “Authorized for Use in the Boston Public Schools,” which fact is printed at the top of its title page.

In 1885, Ginn and Company of Boston published Classics for Children - A Primer, by Jennie H. Stickney, who had been the Principal in the Boston city normal school when John Dudley Philbrick was Superintendent. Stickney’s book had a picture of the “House that Jack built” on its cover, parroting Hurd and Houghton’s particular 1876 “literary” theme. By 1892, a new fifth reader in the Stickney series was published, according to the American Catalogue, and Early American Textbooks shows an 1892 Ginn copy of Classic Series. Fifth Reader, by R. I. Fulton and T. C. Trueblood, Eds. The Stickney series finished in 1892 and the “Classics” series published by Ginn by 1892 were possibly the same materials, sometimes called Stickney’s series and sometimes called the Classics series. Whatever the distinctions, however, it is very clear that Ginn had a “classics” primer published in 1885, and a “classics” book five in
1892. In the intervening years from 1885 to 1892, Ginn had probably put out the rest of its “classics” literary series. Therefore, for Nila Banton Smith to claim that the first “literary” series appeared in 1897 is wrong by about thirteen years or so.

By 1883, Houghton, Mifflin (presumably the successors to “Hurd and Houghton”) had in print the Riverside Literature series with works by authors such as Longfellow. It should be remembered to which river that name, Riverside, referred. It was to the Cambridge River that flows between Harvard’s Cambridge on one of its riversides and Boston on its other riverside. By 1891, Houghton, Mifflin and Company had published The Riverside Primer and Reader, a literary primer, certainly suggesting that its previous “Riverside” material may well have been intended for school use. The Riverside Primer and Reader was of obvious interest to those at Harvard since Harvard’s copy has “Pres. C. W. Eliot” written in ink under its stamp, presumably because Eliot had owned the copy and then donated it to the library. The Riverside materials appeared at least six years before Nila Banton Smith’s “pioneer” date of 1897.

According to the American Book Publishing Record, the first copy of The Heart of Oak Books published by Heath appeared in 1893. The Heart of Oak literature series was by Charles Eliot Norton, a cousin of Harvard President Eliot. Norton was a close friend for 30 years of Henry James, William James’ brother. William James’ house, after his marriage, was built on a tract that was part of Norton’s woods, near his parents’ home. The Heart of Oak Books, apparently well known at the time, preceded Nila Banton Smith’s “pioneer” date of 1897 by four years (if 1893 is correct) or two years (if the 1895 date is correct.)

All of these “literary” materials before 1897 came from Boston publishers, even though at that time most publishers were located in New York. That certainly suggests the idea of “literary” readers was being promoted in Boston by determined people, besides President Charles William Elliot of Harvard, long, long before the 1897 date Nila Banton Smith gave for publication of the “pioneer” literary reader.

Concerning moving other dates about in her “history,” the earliest date Smith gave for Colonel Parker was 1894, on a book of his which she listed in her bibliography. That date was nineteen years after Parker’s 1875 arrival in Quincy. In her text proper, the only date she gave for Parker was a reference to the school he opened in Chicago in 1901, the year before he died. That was twenty-six years after Parker arrived in Quincy. Nila Banton Smith made no mention at all of Quincy or of Parker’s once-famous work there.

Concerning meaningful dates omitted by Nila Banton Smith in her so-called “history,” Leigh print started in 1864 and was in wide use by 1875. One of the earliest books on teaching reading was by G. Stanley Hall in 1874 (if Huey’s bibliography is correct, instead of the 1884 date given elsewhere). Hillard and Campbell’s Franklin Primer was first published in 1873. The sentence method was introduced in Binghamton in 1870 and was in wide use by 1875. Colonel Parker’s triumphant years at Quincy began in 1875. After a period in Boston, Parker left Massachusetts in 1883 for another “triumph” in Chicago. The Appleton readers were published in 1878. The Heart of Oak readers were published in 1893. The period which Smith is obscuring, therefore, concerns all of these developments and runs from about 1864 to 1893. She obscures the influential names of Cattell, James, Hall, and Leigh, among others. One of the more surprising names she omitted, of course, was Alexander Graham Bell and she also omitted mention of his father’s phonic method. In contrast to Smith’s ignoring Bell’s phonics, the senior Bell’s work on phonics managed to find its way into My Fair Lady on Broadway and in the movies, where Eliza was drilled on “Bell’s” charts to acquire correct pronunciation.

As mentioned earlier, at the beginning of this time segment, in Cambridge in 1864, William James and his brother Henry were sitting out the Civil War as students in Harvard. The rest of the James’ immediate family moved to Cambridge permanently the next year, to a house right across the street from
the home of the president of Harvard, Charles William Eliot, and very near the estate of Charles Eliot
Norton, who was to become the close friend of Henry James, and on whose land William James was to
build his later home.

Was anything in particular happening in Cambridge in 1864 that concerned reading? The answer has
been shown to be a loud YES. The debate concerning the teaching of language to deaf-mutes surfaced
into the public news that year of 1864. By about 1870, Agassiz was giving public lectures opposing the
teaching of grammar and was acquiring a dedicated following of change-agents. The Quincy Adams
brothers were almost certainly among Agassiz’ followers. “Philosophers” were reported by Philbrick to
be adamently opposed to Leigh phonics by 1871, and William James was a contemporary “philosopher,”
as was William Torrey Harris in St. Louis. Yet by 1893, the immediate developments associated with the
change-agents ended with the publication of Norton’s Heart of Oak series teaching “literature” by pure
“meaning,” with no “sound” instruction at all, in which Norton thanked an anonymous someone for
invaluable help. It is these years, 1864 to 1893, which Nila Banton Smith has most thoroughly erased
from American reading instruction history, and, along with that erasure, the story concerning the
change-agents of the 1870’s who killed the burgeoning revival of “sound” in the teaching of beginning
reading in America.
Chapter 28
The Testimony of the First of Three Disinterested Observers from 1873 to 1893

Probably the best sources for information on any period are the disinterested ones. With Reeder’s probable ties to movers-and-shakers such as Cattell and Thorndike at Columbia, Reeder’s history cannot be considered disinterested. Even Sheldon, because of his authorship of a reading series, cannot be considered totally disinterested.

Yet three disinterested reports concerning actual readers and practices in American schools during the period from 1873 to 1893 are available. Ferdinand Buisson of France reported on actual American readers exhibited in Vienna in 1873 in Rapport sur L’Instruction Primaire a L’Exposition Universelle de Vienne en 1873. Again, in Rapport sur L’Instruction Primaire a L’Exposition Universelle de Philadelphie en 1876, (Paris, Imprimerie Nationale: 1878) he reported not only on readers he saw exhibited at Philadelphia in 1876 but on those he saw in use during his visits to American schools in August and September, 1876. Benjamin Buisson (probably a relative of Ferdinand Buisson) visited the World’s Fair in Chicago in 1893 and made far briefer but meaningful testimony on American practices at that time. The last essentially disinterested report, at least concerning readers in use in American schools, although not concerning methods, is that of Dr. Joseph Mayer Rice. Rice’s material on his visits to American schools in 1892 appeared in the magazine, The Forum, from October, 1892 to June, 1893, and in The Public School System of the United States, New York: Century Company, 1893. Rice listed current third-grade reading books he used in oral reading tests (on which he gave only generalized results, and no figures). Three years later, in 1895 and 1896, Rice gave widespread spelling tests which established that children could, indeed, once again spell well by the late 1890’s. Rice reported those tests in the magazine, The Forum, in 1897, and in his 1913 book, Scientific Management in Education, Publishers Printing Company, New York.

Almost all of the readers mentioned by Ferdinand Buisson and Dr. Rice are in the Harvard collection of textbooks, the most extensive in America. It is reasonable to assume that F. Buisson and Rice listed those readers which were among the most dominant readers in America in the periods in which they were reported. Many other readers not mentioned by Rice and F. Buisson were also published in both periods and were probably also very popular, some of which will be covered. However, those listed by Rice and Buisson should reflect the dominant methods in the teaching of beginning reading for 1873, 1876, and 1893.

At Vienna in 1873, F. Buisson said Leigh had received a medal for his work on pronouncing print. According to OERI’s Early American Textbooks, 1775-1900, Leigh-print editions were prepared of beginning readers by Sanders; Hillard and Campbell; Sargent; Monroe; and McGuffey, as well as (page 91) the Hillard and Campbell Franklin books and the Analytical series by J. Russell Webb and Richard Edwards. There were others not listed in the OERI report, one of which was Barnes’ National series of 1857-1866 by R. G. Parker and J. Madison Watson, which had a Leigh edition by the time the 1876 Leyboldt American Catalogue was published, as did Barnes’ Independent series. Two others were listed in the American Catalogue of 1876 as having Leigh editions in the first book or books, which were not listed in the OERI report. One was Ivison’s New Graded Readers of 1873, presumably the same as The American Educational Readers of Ivison, referred to later. Another was Little Teacher, First Book in Reading, On the Word Method, published in 1855 by Wilson, Hinkle and Company, the publishers of the McGuffey series. All of those listed were sight-word books, but in Leigh editions they were turned into
phonic texts. Nevertheless, F. Buisson said he sometimes saw books in Leigh print taught like sight-word texts, and even Edwin Leigh, in his 1873 NEA paper, thought that could be acceptable!

Two series produced new editions in Leigh print as well as standard print in 1873: the Franklin series, and the Ivison series. Shortly after that, Philbrick of Boston told of Leigh print almost taking over the Boston schools, where it was being adopted freely and almost unanimously by schools because of their satisfaction with it. Although most reading books in America in 1873 were still being sold in standard print and were sight-word readers, the spreading use of Leigh print in 1873 was on the way to changing this by becoming a landslide. Yet, when the Leypoldt American Catalogue was published for the years from 1876 to 1885 and told of six new major reading series starting in 1878, not a single one of those new series had an edition in Leigh print! The old series were still selling their Leigh editions after 1876, as shown by the covers of the Franklin texts which advertised their editions in Leigh print and also advertised Edwards and Webb’s readers in Leigh print. Yet, none of the later American Catalogues ever reported the appearance of a single new or additional edition in Leigh print! The odor of activists wafts up from such a development.

The six new series between 1876 and 1885 were Appleton’s in 1878, a phony phonics plus sight-words series; A. N. Raub’s Normal Readers by Porter and Company of 1878, presumably using a normal-word phonic approach, though I have not seen it; McGuffey’s Eclectic Readers, Revised Edition, of 1879, which was a truly phonic series but possibly not so effective as Leigh’s approach, Barnes’ New National Readers of 1882-1883, a sight-word approach, Butler’s Series of 1883, another phony phonics plus sight words approach, and Swinton’s Readers published by Ivison of 1882-1883, another phony phonics plus sight-words series. Swinton’s appears to have been very popular, as, of course, were Appleton’s and McGuffey’s. Barnes’ and Butler’s also appear to have been widely used. Raub’s appears to have been little used. However, Leigh HAD made a difference, just as Rudolf Flesch did later: the reading series now at least all pretended to be teaching phonics, even those which really rated Code I.

Despite the spreading use of Leigh print in 1873, most reading books still had editions published in standard print, and most of these standard print editions still used the word method. In 1873, Ferdinand Buisson referred to “…charming elementary books for the study of reading” published by companies such as Barnes and Harper, which, instead of:

“…leaving the child to wait in the study of mechanical combinations of letters and sounds, put the child in the presence of real words which he knows and which interest him. The ideal that is followed and attained in part by the Readers like those of Marcius Willson, Parker, Madison Wattson (sic), etc., is to lead the child to read almost as naturally as he began to talk, not by a long series of laborious efforts and of mechanical repetitions but by the attraction of curiosity, by the pleasure of discovery, and by the interest without end which is reborn in the spirit, found in the exercise at the same time spontaneous and methodical of his senses, of his imagination, of his memory and of his judgment.”

Buisson had apparently been reading the advertisements for these sight-word abominations. The National School Primer of Richard G. Parker and James Madison Watson, a sight-word book, was part of the series published between 1857 and 1866 by A. S. Barnes & Company, New York. The second edition of Marcius Willson’s sight-word The Primer came out in 1860, part of Willson’s School and Family Series published by Harper. Reading charts accompanied the series, written by both Willson and N. A. Calkins, who also wrote Calkins’s Primary Object Lessons published by Harper. Calkins was with the New York City schools and later endorsed the teaching of sight words in first grades but using Leigh print! Calkins did not believe in beginning with phonics, even when using Leigh print. If other American publishers besides Barnes and Harper exhibited at Vienna, Buisson did not mention them by name.
As is apparent, Leigh’s influence was great at the time and Barnes materials were also available in Leigh print, but whether the Harper sight-word materials were ever available in Leigh print is not known.

However, by 1875, A. S. Barnes and Company published an alternate first grade book for its Independent reading series by J. Madison Watson, which series had a Leigh edition. That alternate book, The Independent Primary Reader, was strongly phonic. The trend, therefore, before 1875 had been clearly away from “meaning” and towards “sound” for beginning readers, despite the awful comments by Ferdinand Buisson in 1873, which he was apparently just parroting. Yet, some eight years or so after publishing by 1875 a strongly phonic alternate for a first grade book, A. S. Barnes published its 1883 series, Barnes’s New National Readers, by Charles J. Barnes and J. Marshall Hawkes, and that series had gone all the way back to a totally non-phonic Code 1. The new 1883 readers of the Barnes company represented a complete about-face, apparently as a result of the fact that the “experts”-inspired emphasis in government schools had gone back to “meaning.” The new Harper’s Educational Series of 1888, on which Professor O. T. Bright, Superintendent of Schools, Englewood, Illinois, was the editor of the first book, and James Baldwin the principal editor, was a horrible, non-phonic Code 3. (Baldwin later wrote two series for American Book Company, The Baldwin Readers and the 1901 sight-word McGuffey revision.)

At Vienna in 1873, Buisson had reported on exhibits by many countries, and in many subjects besides reading. Yet when he came to America as the representative from France to the 1876 Centennial Exposition in Philadelphia, his concentration was solely on American textbooks, and he devoted a good deal of his Rapport sur L’Instruction Primaire a L’Exposition Universelle de Philadelphie en 1876, (Paris, Imprimerie Nationale: 1878) to describing the American reading books he saw at the Exposition and when visiting schools in August and September. His listing of textbooks, therefore, can be seen as a valid indication of the books which were most popular in the United States in 1876. He said (page 252):

“The works of which we come to speak are those that we have seen the most often in the hands of pupils or at the Exposition and which struck us in our school visits in August and September 1876.”

For beginning reading texts, he listed the following. I have added comments concerning the texts.

The Phonic Reader No. 1, by A. Knell & J. H. Jones, “Wilson Publishing Company” (actually, the publishers of McGuffey’s, Wilson, Hinkle & Co. of Cincinnati, for which the OERI text shows a publishing date of 1868). Buisson said the reading was always in complete sentences. I have not seen this book, but it can be presumed to have been truly phonic.

The American Educational Readers, First Reader, publishers: Ivison, Blakeman, Taylor & Co., New York and Chicago: 1873. (This company was the successor to the companies which had published Sanders’ readers since 1840.) Presumably this 1873 series was the New Graded Readers of Ivison reported in the 1876 American Catalogue of Leypoldt. Buisson said the beginning book taught 17 “normal” words as sight words, which contained all the letters of the alphabet. He called the series “eclectic.” I have not seen this book, but Buisson reproduced considerable portions. It was their Leigh edition which appeared in the 1876 American Catalogue. Yet, by 1882, Ivison, Blakeman, Taylor & Co. responded to the trend back toward “meaning” by putting out a new series by William Swinton which used phony phonics plus sight words, and which was not in Leigh print.

The Rational First Reader, by Dr. Adolf Douai, published by E. Steiger, New York: 1872. It used a “normal words” approach to teach the letters - and sounds. This was a phonic text and apparently died out about the same time as the Leigh texts.
The Independent Primary Reader, by James Madison Watson, published by A. S. Barnes & Co., New York, Chicago and New Orleans in 1875. An earlier Independent primary book had been published in Leigh print about 1872. This phonic book was possibly Code 7. Barnes’ Independent series was a companion series to their National series which Buisson saw in Vienna. As mentioned, the Barnes company replaced both the National and Independent series with a straight sight-word series in 1883.

The Primer and The First Reader of Lewis Baxter Monroe’s Series, first published by Cowperthwait & Co., Philadelphia in 1864, and, if not, in 1871. This was a very poor series, partly sight-word and partly phonic, but it did include some real phonics. According to the OERI text, The First Reader was available in Leigh print by 1873. However, the pages of the Monroe text that Buisson reproduced were in standard print. Monroe’s New Primer of 1882 by Monroe’s widow, Mrs. Lewis B. Monroe was far more phonic. Some mentions of Monroe’s material occur until about the 1890’s, but then apparently it died out.

The New American First Reader, by Epes Sargent & Amasa May, published by J. H. Butler & Co., Philadelphia: 1871. Sargent’s Standard School Primer of 1856, from his earlier series published by Shorey of Boston, had been straight Code l. Sargent’s 1871 series still emphasized sight words but, by including some effective phonic analysis, was a sharp change. The publisher of Sargent’s 1871 series, J. H. Butler, later put out an 1883 series, Butler’s Series. It included The Chart-Primer, which was Code 4 phony phonics. No author was listed but the Butler series of 1883 was apparently by S. Mecutchen.

The Franklin Primer by Hillard & Campbell, published by Brewer & Tileston of Boston, and Taintor Bros., Merrill & Co., New York and William Ware, Boston. It used 21 “normal” words to teach the alphabet. It was, in practice, a sight-word series. However, The Franklin Primer (which was book one) and The Franklin Second Reader were available in Leigh print probably by 1873. Buisson listed Brewer & Tileston as the publisher of the 1876 copy he used, and reproduced pages from it in standard print, not Leigh print. The Franklin Primer was apparently overshadowed by Appleton’s in the 1880’s.

Union Sunday School - primer. From Buisson’s description , it was a sight-word text. An 1853 edition of the Union Primer in the Harvard library, published by the American Sunday School Union at Philadelphia, may or may not have been the same book, and it was a sight-word text and obviously inexpensive. The materials of the American Sunday School Union are discussed in Appendix C.

McGuffey Readers, (Buisson presumably saw the primer), Wilson, Hinkle & Co. Cincinnati. The 1849 McGuffey’s Primer was a straight sight-word text. However, the OERI text shows in 1868 that Wilson, Hinkle & Co. of Cincinnati published Leigh’s McGuffey’s New Primary Reader, and this may have been what Buisson saw. They also published Leigh-print editions of McGuffey’s. By 1879, the truly phonic new McGuffey series was being published, but the primer did not come out until 1881. The primer was not meant originally as the beginning book, but was only an addition to the already existing series. The phonic book one had been the beginning book in the 1879 series.

The First Reader, Adapted to the Phonic, Word and Alphabet Modes of Teaching to Read, by E. A. Sheldon, New York: Scribner, Armstrong & Co., 1872. This was a sight-word series with analytic phonics, which its author wrongly considered phonic. Despite his obvious good intentions, it is best to describe it as phony phonics. The author was the famous E. A. Sheldon of
Oswego Normal School, who had done much to popularize object lessons in this country. Their failings are discussed elsewhere in this history.

“Webb” - Buisson said, “One should remark in the state of Michican is an apparatus for teaching reading by Webb. It is very much used, we have been told, in that state. The Reader which accompanies it appears very well conceived for the word method. This is the only important example of an apparatus for collective teaching of reading.” Presumably Buisson did not mean Webb’s straight sight-word Normal Reader No. 1 published in 1846 which was still being published by Taintor in 1876 according to the 1876 American Catalogue, nor the Edwards and Webb Analytical series still being published by Taintor and Sherwood, nor Webb’s newest Model series being published by Sherwood. Buisson probably saw what Early American Textbooks lists as Webb’s Word-Method, by John Russell Webb, “Rev. ed. Detroit: E. B. Smith Co.; Boston: Nichols & Hall, 1868.” The 1876 American Catalogue listed the following in print in that year, which was obviously a new edition of that 1868 material published in Detroit, Michigan, in 1875: “Webb, J. R. Word Method: New Method of Teaching Reading. New Ed., 1875. 30 cents. E. B. Smith.”

What Buisson’s testimony establishes is that the teaching of phonics, which started to influence reading instruction about 1860, had been increasing in a flood tide in many places before 1876. Yet, less than ten years later, real phonics was effectively dead, and only the most ineffective of phony phonics could be found in the widely-used beginning reading texts. The record shows that it was the change-agents who killed the teaching of real phonics. To do so, they used the publicity on Farnham’s paper on the sentence method at the 1873 NEA convention, and the publicity on Parker’s fake “achievements” in Quincy after 1875. They also used their control of normal schools and educational journals (and very probably, through market pressure, their control of most publishers, McGuffey’s excepted). In Boston, however, the change-agents did not have to bother with using propaganda. They just fired Boston Schools Superintendent Philbrick in March, 1878, and took over the Boston schools.

The prefaces to reading instruction primers can indicate the dominant reading instruction methods in any period. Such prefaces, and the content of the primers themselves, establish that phonics was NOT the method being used to teach beginning reading in America after 1878 to 1893. The sight-word method, or the sight-word method plus phony phonics, was the method being used, particularly after Leigh-print editions of sight-word primers went out of general use before 1880.

The fact that “reading instruction” in the primary grades was largely an exercise in futility is shown, in part, by this statement in the Primary Teacher, Boston, Massachusetts: January, 1878 (page 92):

“They soon learn their little readers by heart.”

“Phonics” in America after 1826 until the aborted phonics revival of the 1860’s and 1870’s had always meant “elocution,” not decoding. “Elocution” was used in those “oral” exercises which resulted in children memorizing their “little readers.” As has been discussed, true phonics for teaching children to read had not been used again until the period between about 1860 and 1880 when it was employed in some places. The massive effect that the stress on elocution had on schools by 1876 is shown in Ferdinand Buisson’s Rapport sur L’Instruction Primaire a L’Exposition Universelle de Philadelphie en 1876, Paris, Imprimerie Nationale: 1878 page 235. Buisson had toured many American schools while attending the Exposition in 1876:

“Nothing is neglected to obtain from the pupils a correct pronunciation, not only in the elementary classes, but also in the more advanced. In any class whatever, the teacher reads, aloud and in an intelligible voice, a passage of the Reader corresponding to the degree of instruction of
the pupils. The children repeat it next in the same tone and with the same inflections of the voice. This is one of the most animated and the most curious exercises of the American schools: we have been witness to it many times with a keen interest.”

As can be seen from the summary of reading texts in Britain elsewhere in this history, the same kind of “elocution” was in use there in the 1870’s. Children in “reading” classes were not reading by themselves but were just parroting words pronounced first by their teachers. Obviously, this “curious exercise” assured that children who were unable to read by themselves would nevertheless be able to recite the passages in their readers.

Even those who were presumably endorsers of Leigh phonics sometimes were so in name only. The opinion of N. A. Calkins, an administrator of New York City, was covered in an 1879 issue of Primary Teacher, page 14, concerning the “work of more than 2,000 teachers during the past sixteen years” (presumably since 1863) in the teaching of beginning reading. Leigh print was endorsed, but not for beginners. Beginners were to learn by sight words. The likelihood is minimal that children would be able to make effective use later of Leigh phonics on new words once they had formed sight-word reflexes on other sight words in Leigh print. Calkins again clearly endorsed whole words for beginners in the November, 1879, issue, page 65. As the 1879 comment from Primary Teacher quoted previously makes clear, such children were not really reading, but only reciting memorized texts. Those “2,000 teachers” had spent “sixteen years” wasting time and tax money. The comment by Leigh, quoted by Ferdinand Buisson, and discussed elsewhere concerning reading failure in New York and other large cities before 1876, is additional proof that children in New York City primary grades were not really learning to read during those years when they were being taught to read by sight-words.

After 1880, phonics was disreputable except in the independent-minded Middle West. Harris had been a co-author on the Appleton series that came out in 1878; but he “resigned” from St. Louis in 1880, while St. Louis kept on teaching Leigh print for some years after that. St. Louis could not therefore have been using Harris’s Appleton series because it was not published in Leigh print. St. Louis was STILL teaching real phonics when Rice visited there in 1892-1893, though no longer using Leigh print. (The old Leigh-print textbooks must have been worn out by then.) An untold story appears to lie in the Harris-Appleton vs. Leigh-St. Louis relationships. The phonic McGuffey’s of 1879 was published in Midwestern Cincinnati and McGuffey’s great popularity was in the Midwest. (The sales-minded publishers of McGuffey’s covered all bases, however, by stating their books could be used by the phonic method or the “word” method.)

With appalling new texts like Appleton’s and the widely-used and equally appalling Franklin materials, the sight-word method in the primary grades was not seriously challenged again until the advent of Rebecca Pollard’s phonic method in the late 1880’s. By the 1880’s, reading failures which had been briefly banished by Leigh’s method were back in force, as a quotation from, amazingly, Nila Banton Smith makes clear.

My familiarity with the “reading expert” Nila Banton Smith’s history of American Reading Instruction has convinced me that it is classic Unthink: disinformation with a purpose. On page 131, she tried to show that the “word method” arrived in the late nineteenth century, but failed because it lacked Gates’ “intrinsic phonics.” Her purpose, of course, was to endorse Gates’ “intrinsic phonics.” Yet, typically, Nila Banton Smith obscured the source of the following quotation. Her reference implies, however, it is either from Rebecca Pollard (1889) or Edward G. Ward (1894), both of whom wrote highly effective phonic texts. The content, however, is what matters, because it is powerful evidence on the practices of the period:
“There is quite a general complaint among teachers, principals, and superintendents that pupils in the higher grades are not able to read with ease and expression; they have so little mastery over words that an exercise in reading becomes a laborious effort at word-calling. Pupils read usually very well through the first three readers, according to our present standard of reading in these grades. But the trouble begins in the fourth reader, and by the time the class is in the fifth, the reading recitation is torture to the teacher and a hateful task to the pupil. There can be no good reading without the ability to call words readily, and it may be well to consider whether the methods of teaching primary reading, which seem productive of such good results in the primary grades, are not at fault in preparing the pupil for the advanced reading.

“We are inclined to think the inability of pupils in the higher grades to call words is the legitimate outgrowth of the teaching of the word method. By this method the word is presented to the child as a whole, and the teacher either tells the child the word, or by skillful questioning leads him to use the word. Later, when phonics have been introduced, the teacher writes the new and difficult words on the blackboard and marks them. The general results of these methods on the mind of the pupil are about the same. He soon learns to think he can do nothing with a new word without the help of the teacher in some way.”

The reason for the remarks, “Pupils read usually very well through the first three readers, according to our present standard of reading in these grades,” becomes clear when “the present standard of reading” is explained. That explanation, surprisingly, comes from a statement of Colonel Parker. In Parker’s article in the School Journal, April 28, 1900, he spoke of the reading in Quincy, Massachusetts, when he arrived in April, 1875:

“It was the custom for pupils to read thru in a year one little book that a bright, well-taught child can read from end to end in a few hours.... They learned the book, often by heart from their older brothers and sisters; they could say every word, chant it, sing it, repeat it in their sleep, behold it in nightmares....”

They “read very well” because they were not really reading, but only reciting texts from memory. (As the school inspector in Wales about that time said, who is quoted in the section on British textbooks, children could go on “reading” fluently even if their textbooks had fallen on the floor.) Their reading failure did not show up till fourth grade, when they were asked to read difficult texts. By today’s readability levels, nineteenth century fourth and fifth grade texts are about at our high school level. Our “problem,” of course, is supposed to “develop” at the high school level but our “problem” is the same as the nineteenth century problem: the children cannot really read unfamiliar words.
Chapter 29
Pollard’s Phonic Challenge, Its Failure to Effect a Change, and The Appalling Reading Texts Which Followed

Nila Banton Smith’s quotation on reading failure in the late nineteenth century came either from Rebecca Pollard or Edward Ward, although Smith does not clarify the source. It was the kind of failure in the quotation from Nila Banton Smith’s book which Rebecca Pollard was trying to wipe out, and it is very possible it was Pollard who made the remarks Smith quoted. Rebecca Pollard was an “elocutionist,” Elocutionists at that time were entertainers and gave dramatic “readings” in front of audiences, sometimes traveling widely to do so. Pollard’s interest in elocution obviously inspired her interest in phonics for beginning reading. She introduced a synthetic phonics system in her Synthetic Primer of 1887, based on her work started some time before 1885. Her results were as spectacular as Leigh’s had been twenty years before, but almost immediately ran up against the same stone wall of “expert” opposition to which he had been exposed. Old Colonel Parker, who had brought his education ideas to lucky Chicago, was one of Pollard’s opponents. If America had had private education instead of government education in the late 1880’s, teacher and parent choice would have given Pollard a clear field, because it was from teachers and parents that she received her enormous support. But, by 1887, America’s government schools and normal schools were all firmly under the centralizing influence of “experts,” just as today. Therefore, Pollard’s method never won over the city government schools as Leigh’s had done. Instead, Pollard’s “Synthetic Method” was belittled to death.

A long letter from O. E. Latham33 of Kalamazoo, Michigan, appeared in the Public School Journal in December, 1892. Latham was disgusted with what he saw as stupid opposition to Pollard’s highly successful phonic method. An excerpt from his letter follows:

“For some time THE PUBLIC-SCHOOL JOURNAL has been presenting thoughts on methods of teaching reading. The bone of contention seems to be the Synthetic Method. The last meeting of the Chicago Principal’s Association was largely taken up by thoughts on the Synthetic. Colonel Parker there defined the Synthetic Method as the method full of sin, and gave his unqualified endorsement to the THOUGHT METHOD, even after speaking of a man with a perfect method as a quack... There are now many schools and many manuals for teaching shorthand; all of these follow the Synthetic Method. No sane man would suggest the thought method of teaching children to read long hand is based on the assumption that children have no brains and by appealing as it does to mechanical memory it soon produces the condition assumed. The advocates of this method then point to this condition in justification of their method.”

Comments on the cover of Pollard’s 1887 text confirmed the enormous popularity of the method with parents and teachers, and, interestingly, that the Appleton series was a failure in comparison with Pollard’s material. Pollard-trained children read the Appleton third-grade materials with ease before the end of first grade, and could even read the Appleton fourth grade materials.

“Testimonials

33 William H. Latham wrote Primary Reader for Deaf Mutes, published by the McGuffey firm, Wilson, Hinkle & Co., in 1876, which is listed on page 90 of Early American Textbooks, by OERI, Washington, D. C., 1985. One wonders if O.E. Latham had some family connection with the meaning vs. sound controversy.
“Miss Fanny Wells, who learned of Mrs. Pollard the Synthetic Sound Method of teaching reading, has had under her instruction the young pupils of my school who were learning to read this last school year. Her success has been remarkable and has given greater satisfaction than I have ever heard expressed before for any system. The pupils began to read in the Fall, read easily and intelligently in Appleton’s Third Reader before the close of the year and they could read at sight anything else equally difficult. I take very great pleasure in recommending the method to parents and teachers. The children who have been taught by it have been exceedingly happy in their work - it has interested them at every step. They read with great distinctness and accuracy. Very respectfully, Rebecca S. Rice, Principal of ‘Girls Higher School,’ 487 and 489 La Salle Avenue, Chicago. July 6, 1885.

“It gives me pleasure to recommend the Synthetic Sound Method which Mrs. Pollard introduces in teaching children to read. Our daughter, six years of age, entered her class last Fall knowing but a few words, and now, at the close of the school year, has completed Appleton’s Fourth Reader, besides being able to read almost perfectly in any book. Words which she has never seen before and of whose meaning she is ignorant, she is able to pronounce correctly by following the rules which she seems to understand thoroughly. I feel that this training has given her a foundation for the study of other languages. Mrs. H. M. Scott, 520 West Adams Street, Chicago, June 13, 1885.

“I most cheerfully give this testimonial of my daughter Bessie’s progress in reading during the past year. She is only eight years old. Last September she could not read a word; since that time she has read through Appleton’s First, Second and Third Readers, and has no difficulty whatever in reading Appleton’s Fourth. I am thoroughly convinced from her unusual progress that the Synthetic Sound System as taught by Mrs. R. S. Pollard in Miss Waller’s school, is the only method by which children may be taught to read with accuracy and precision in the short period of one school year. M. E. Wood.

“Mrs. R. S. Pollard: - Dear Madam - I take pleasure in adding my testimony to that of many others in praise of your success in teaching the elementary branches of education. Your Synthetic Sound System is an improvement over any plan I have heretofore known of, and the progress made by my daughter Jessie, aged six years and five months, during a term of nine months, her first and only experience, is remarkable; and it seems a marvel that she should read so well and pronounce words of three and four syllables, considering she did not know the alphabet when she started to Miss Waller’s school. I cannot speak of your success in too high terms. Sincerely, Mrs. M. O. Brown, 567 Adams Street.”

So Rebecca Pollard in Chicago was a 19th century Marva Collins, teaching true phonics and achieving the success that Marva Collins does in Chicago with true phonics in the 20th century. Pollard’s reading program was also like that of the ancient Greeks and like Sue Dickson’s highly successful Sing, Spell, Read and Write program of today, since like them Pollard used a great deal of music in teaching beginners to read.

Pollard’s remarkably successful program hung on for years and was still published after the turn of the century, at some point being taken over by American Book Company, but it never made any impact on the government schools. Nor did it make any impact on most of the private schools. As is still the case today, those in charge of most private schools were ingenuous enough to believe in the expertise of the “education experts” who were endorsing “meaning” to teach beginning reading. Instead of using Pollard’s successful program, beginning reading programs which guaranteed high failure rates were used since they were approved by the “best” people in “education.”
A description of some of these other first grade texts used in the 1890's, following the great popularity of Appleton’s in the 1880’s, shows that they were, at the best, sight-word texts with phony phonics, and were sometimes straight sight-word texts, unalleviated by any kind of phonics.

That sight-words for beginners were the norm in 1891 is proven by a quotation from The New Script Primer by Caroline A. Faber. That Code I text was published by Potter and Putnam in New York in 1891. It stated, “...all the best first readers of the day” had a core high-frequency word list of about 170 words - SIGHT words. Practice was at the board and in script for the first 6 months.

Quincy methods had obviously triumphed by 1891, but Quincy appears to have been totally forgotten as the source, only ten years after its fame. Instead, authors spoke of their own inspirations. For instance, the use solely of script instead of print for beginners seems to have originated at Quincy, yet Caroline A. Faber made no reference to Quincy in the “Introduction” to The New Script Primer:

“Introduction. This book is not a sudden inspiration, nor is it a mere formulated theory. It is the sifting and fitting for general use, the actual school-room work of the author.

“Modern methods in teaching the first steps in reading have found their best results in the development of a script vocabulary, so that the child can read and write from one to two hundred words before the transition is made to print, and the regular book taken up. Heretofore this has been accomplished by the laborious efforts of the teacher from the board, the child copying the words and sentences on his slate or paper.

“It is believed that this little book will not only relieve the teacher of much mechanical labor in the development of the vocabulary but by presenting a perfect copy to the child, it will tend to secure for him a better handwriting.

“It supplants no reader in use; but is preliminary to such reader, laying a good foundation for rapid and effective progress in the same.

“It is a book of practice, not of methods. It should go into the hands of the child as soon as the first word or sentence is developed on the board. How long the child should retain it is left to the discretion of the teacher. It is suggested, however, that the daily use of the books be limited to regular periods, at the close of which they should be collected by the teacher.

“Attention is here called to the following features of the book:

“1. One Vocabulary at a time and the Script one first.
This is the prominent feature of the book; but, in this respect, it is only the embodiment in practical form, of the best methods now in use.

“2. An easy and logical development of the Vocabulary.
The vocabulary developed consists of about one hundred and seventy words carefully selected, so as to be common to all the best first readers of the day. Thus all the words here learned will be words used in the regular book.

“The sentences are short, expressed in child language and in good English.

The reviews of two full pages, facing, occur at short intervals for sight reading. In the latter part of the book, several little stories are given for sight reading and interesting language work....
“6. The transition to Print.
This is made in easy steps by the method here pursued. The script word and sentence are
associated with the corresponding print word and sentence. Several pages in pure print are given
so that when the child finishes the book, he can take up and continue in his regular reader with
ease and profit.”

Note the reference in 1891 to “all the best first readers of the day.” That reference certainly does not
support the McGuffey myth. What is abundantly evident is that this was a time when the sight-word
“meaning” method was triumphant and generally unquestioned, despite the availability of the McGuffey
and Pollard phonic “sound” materials.

The Children’s Primer, the first book of The Cyr Readers, by Miss Ellen M. Cyr was another Code 1
book. It was published by Ginn & Company of Boston in 1891, who noted on the copy that Cyr was the
“Author of The Interstate Primer, Etc.” Cyr wrote:

“To the Teachers of the Children.... I have made my lessons as simple as possible; the
average number of new words being about two and one-quarter to each page...

“The wise teacher will weave an interest about the earliest lessons, filling them with thought
and meaning of which the printed text shall be but a suggestion....

“In connection with this book I have prepared a complete set of Practice Sentences. These
consist of fifty envelopes, each containing twenty sentences, introducing and giving practice on
the new words in each lesson. After the new words have been developed and taught from the
blackboard, these sentences are distributed to the children, and are read in turn. Each child has his
attention fixed upon his own individual sentence, and his mind is more concentrated than in the
blackboard lessons. No time is lost in waiting, as the preparation can be made while the others are
reading, and the lesson in the book is kept fresh for the final reading. I have made and used a
similar set, during the past three years, and consider them almost indispensable.

“Oh! read! read! read! is the cry of the times, and this set will double the reading-matter without
increasing the vocabulary.”

The very first page of the primer had a picture of a mother rocking a baby, and, in print under the
picture, the word “ba by” with an accent on “ba,” a long sign over the “a” and a short sign over the “y.”
These elaborate, advanced, phonetic markings for total beginners in reading were continued on the second
word, “Mam ma,” which was printed in separated syllables, with one dot over the first “a” and two over
the second “a.” On these first two words, therefore, “baby” and “Mamma,” three separate sounds for “a”
had been given and phonically marked. This guaranteed phonic indigestion for every child if a teacher
sincerely tried to teach these phonic markings at the beginning along with the sight-words “baby” and
“mama.” An accent mark was placed over the “Mam.” “See” was printed with a long mark over the first
As late as page 33, the “interesting” and “meaningful” vocabulary had only increased to, “See my kitty. I
can see my kitty. Mamma can see my kitty. My kitty can see. My kitty can see baby.”

To introduce beginners on the very first three words, “Mamma, “baby,” and “see,” and on the very
first page, with such a mixed-up, phonically-marked mess of seven different phonic markings does not
even qualify as phony phonics, or Code 3. Cyr’s book was, in effect, a Code 1 book. Cyr produced this
monstrous mess at the same time that Rebecca Pollard was efficiently teaching first-graders to read with
ease with REAL synthetic-phonics teaching and marking. The heart of Pollard’s method was teaching
children how to mark words phonically by themselves so that they could sound out words by themselves. It is very hard to find any explanation for the insertion of such phony phonics as the Cyr primer used with its very first three words except that it was a deliberate attempt to placate ignorant textbook purchasers who had been gullible into believing a “little” phonics was a good thing and who already believed the avalanche of “expert” condemnations of Pollard’s methods. It should be noted that Cyr came from the Boston area, and may have had ties with “experts.” She had published The Interstate Primer by 1886, and, as noted on page 81 of Early American Textbooks..., “Literary selections in all Cyr’s readers were prominent.” Possibly The Interstate Primer of 1886 or earlier was included in that comment. Cyr’s “Preface” to her Interstate Primer was dated July, 1886, Cambridge, Massachusetts. Her emphasis on literature and sight words, together with her origin at Cambridge certainly suggest that, like Stickney, she had ties to movers-and-shakers.

Although it does not appear to have been too popular, another reader copyrighted in 1890 which endorsed the current phony phonics was The Continental First Reader by William A. Campbell, published by Mutual Book Co., New York, New York. It was a Code 3 text. Campbell said, in his:

“Suggestions to the Teacher”

“How do children learn to read? Is there any fixed, absolute way along which they must travel day after day to learn their mother-tongue?

“The capability of child-mind to receive impressions reduces any answer of the most experienced teacher to simply this: ‘I don’t know.’

“In this day, when the discussion of ‘Methods’ extends almost to a ‘craze,’ there is danger that the freedom, power, and tact of young teachers will be lessened as they cling to this or that particular ‘Method.’ Experience clearly demonstrates that a child does not learn to read by either the ‘Sentence,’ the ‘Word,’ or the ‘Phonic Method,’ alone. Any one method pursued by itself, retards the progress, and distorts the development, of the child. No method is complete that does not include both

“ANALYSIS AND SYNTHESIS

...Children must be trained to separate both the spoken-word, and the written-word into the sounds and letters of which they may be composed. But this alone is only half-teaching... for the process must be reversed to obtain the best results.... Though it is natural with young minds to proceed first from the whole to the parts, yet after a limited stock of words has been learned, the two methods should be used simultaneously.

“WORD METHOD

The first lessons in this book are presented according to the ‘Word Method,’ aided by pictures. The special reasons for adopting this method in the beginning, in preference to the others, are:

“1st. It is the natural method. Children use words in talking, not the individual sounds; hence, it is better to give the written-word as a picture of the sound-word.

“2nd. It enables the teacher to associate the names of objects, and their qualities, with the objects themselves, or their pictures.

“3d. It has more interest for the learner....
“4th. It furnishes the pupils a stock of words, by sound and form.

“PHONICS.

The diacritical marks are not used in marking the ‘New Words,’ for at this period the sound of each new word must be learned by imitation. The children must be made acquainted with the variety, form and use of this notation. To this end there are arranged=

“GROUPS OF WORDS FOR COMPARING SOUNDS.

These lists of words have been carefully selected from the number of words already learned. They will afford the pupil a key to the pronunciation of other words.”

Campbell’s “phonics” was the same as that on the Gates and Gray 1930 deaf-mute readers: comparison of memorized whole sight words to see like parts. His whole-word, two-step phony phonics rated Code 3 and was guaranteed to produce reading disabilities.

Harvard library has an 1893 copy of The Riverside Primer and Reader which was copyrighted in 1891 and published by Houghton, Mifflin and Company, The Riverside Press, Cambridge. Harvard’s 1893 copy was, interestingly, Harvard President C. S. Eliot’s own copy, and it was given to the Harvard library on March 26, 1910, by which time it may be presumed Eliot had no further use for it. That he had a use for it earlier is probable: he was campaigning in the 1890’s, and presumably before, for children’s readers which contained real literature. As the following indicates, the purpose of The Riverside Primer and Reader was to train children to read real literature.

The “Introduction” read:

“This Primer and Reader is designed to serve as the sole text-book in reading required by a pupil. When he has mastered it he is ready to make the acquaintance of the world’s literature in the English tongue.

“The methods which prevail in our primary schools for familiarizing beginners with their letters, with the forms of words and with the structure of sentences, suppose not books but the blackboard, the slate, pencil and paper. It is in the oral communication of teacher with pupil by these means that the first steps are taken, and while this process is going on the book is in the hands of the teacher only and is used by her chiefly as a course of suggestion. (Footnote l. There are several manuals designed to aid the teacher in this preliminary instruction: The Riverside Manual for Teachers, prepared by I. Freeman Hall, who has inspired and informed much of this book also, will be found especially serviceable by those who use this Primer and Reader. A further aid is offered by The Riverside Instruction Frame, which is equipped with twenty large outline pictures, twenty-five pictures of objects, and between one hundred and two hundred words and sentences in script and in print. For fuller notice see second and third over-pages of this book.) When the child thus has become able to combine letters into words and words into simple sentences, to read at sight these words and sentences as written or printed for him, and to express his ideas in fit language, he may, alone or in a class, begin the pleasant task of reading a book, and this Primer and Reader is planned so as to make the task a natural and progressive one.

“There are two principles which the compilers of this book have kept steadily in mind while preparing it, and they hold them to be fundamental in any well-considered system of teaching children to read. The first relates to the process of the child’s mind and may thus be formulated:-

“The child must think intelligently before he can read intelligibly.
“One of the most common difficulties to be overcome by the teacher is that which arises from a parrot-like repetition by the child of what it has been told, and by far the most important result to be attained is the habit of thinking accurately and clearly before answering a question or reading a sentence. This habit of thinking accurately and clearly is cultivated by the methods which now prevail in the preliminary work upon the blackboard and slate. It should continue to be cultivated when a book is placed in the hands of the child.

“The second lesson in this book illustrates one method by which the compilers have aimed to inculcate this habit, and the method employed is repeated with variations as long as it can well be pursued. The pupil is set at work reading to himself, a task which at once taxes his power of understanding more than the mere pronunciation of the words aloud. He cannot go through the sentence mechanically and repeat it by rote, for he is obliged to translate the thought of the sentence into action. If he reads to himself, I go to the door, the words cease to be a mere succession of sounds, for he suits the action to the word and shows that he reads both intelligently and attentively by going to the door.

“This exercise of Silent Reading is continued at intervals which grow somewhat less frequent as the exercise becomes familiar and loses some of its force, but the principle involved in it is (applied) by other means. Thus the old-fashioned rebus is used in Lesson 4 and elsewhere. A picture is intelligible to a child before a word is, and in writing out the word which stands for the picture he is following the logical order of proceeding from the known to the less known. Again, in Lesson 58 the exercise calls for a translation of the picture into a sentence, and here the child has to think, not only what the picture says but how he shall tell this story in his own language.

“Suggestions for carrying this process of thinking still farther lie in many of the lessons.... More than half the battle is won when the child’s interest is aroused, and formal difficulties disappear almost marvelously before the quick movement of the mind when its attention is concentrated by curiosity and a lively hunt for the end in view. The pupil, keenly alive to the matter in a story, his whole heart enlisted in it, will not need much formal instruction in emphasis, and words which by themselves might be stumbled over will often be taken easily when they lie in the direct course of an attractive narrative....”

This glorious enthusiasm remained unquenched by the hard reality that the method, for the great majority of children, the greatest part of the time, simply does not work. Its parallel to present-day “Whole Language” propaganda is also obvious. The “Introduction” continued:

“The end of learning to read is to read great books......the work done by the teacher, before she places a book in his hands, is to accustom him to identify the words he knows how to use with the symbols of those words on the blackboard and the slate. She seeks for familiar objects and expressions and tries thus to vary and enlarge his working vocabulary. When the printed page is placed before him this same process is continued for a brief space until the child has been accustomed to a new medium. The transition from blackboard to book should be so easy that the child is not made aware of any notable change....

“The attempt has been made in this Primer and Reader to select from existing literature of the classic order such examples as come within the range of the mind at the age when the book would naturally be used. The very earliest are taken, in verse from the storehouse, Mother Goose’s Melodies, in prose from the uncounted collection of popular sayings and proverbs. Later, recourse has been had to Tennyson, Blake, Wordsworth, Stevenson, and others in verse, to versions of tales and world-renowned stories in prose.”
So the children were to be saturated with literature, but no mention was made of any selections from the Bible, which had been the primary reading matter in American schools before 1826! Nor is the “end of learning to read” only “to read great books.” Its everyday and functionally important “end” is to read things like road signs, labels on bottles, income tax forms, directions for assembling items ordered by mail, notes from a child’s teacher, selections on a restaurant menu, traffic tickets, etc., etc., etc., etc.

The Riverside collection of famous children’s books published about this time was indeed excellent, and was presumably meant to follow this primer. However, if the children were “taught” as outlined above, by pure “meaning,” almost none of them would have been able to read the Riverside collection. Perhaps by 1910 Harvard President Eliot realized he had been chasing a will-of-the-wisp with his emphasis on giving real literature to children, if they were to be taught to read only by “meaning” as in the 1891 Riverside Primer. Perhaps that is why Eliot turned his 1893 copy of this book over to the Harvard library in 1910, many years later.

Dr. Leigh’s “sound” materials of 1864 had apparently sparked the writing of the “meaning” sentence-method Franklin Primer of 1873, and of the Appleton “meaning” series in 1878 (both of which, however, were chockful of phony phonicics). Pollard’s “sound” materials of 1887 apparently spurred the experts into similar efforts to produce something new and different, since a truly “expert” “meaning” series appeared in 1893, or possibly 1895. Assuming two or three years at least to write it, it must have been started about the time Latham wrote his letter in response to the editorial campaign against the Pollard method in the Public School Journal in 1892. That new series of reading books was the Heart of Oak books which began to come out in 1893 or 1895.

Its editor, Charles Eliot Norton, was a cousin of the president of Harvard, Charles W. Eliot, and a close friend of Henry James, Jr.

Norton had helped Henry James, Jr., get his fiction published at the beginning of James’ career in the 1860’s, according to Leon Edel’s multi-volumed biography of Henry James. Norton, who lived close to the James family home in Cambridge, was apparently also a longstanding friend of the whole James family. For instance, William’s mother casually mentioned in a letter to his brother Henry in the spring of 1873 (Leon Edel, Henry James - The Conquest of London: 1870-1881, page 141) that William James had been late for dinner because he had been strolling with Sara in the Norton woods. Sara was Charles Eliot Norton’s daughter. After 1889 and some eleven years or so after his marriage to Alice Gibbons, Professor William James’ home was built on a subdivision of the Norton woods (page 409 and footnote, The Letters of Josiah Royce, “Edited and with an Introduction by John Clendenning,” The University of Chicago Press, Chicago: 1970).

Yet the close association of William James and Henry James with Charles Eliot Norton went back far more years. In William James’ letter to Henry James of February 3, 1868(?), in the summary volume of James family correspondence in the Houghton Library at Harvard, it is recorded that William James wrote that he was enclosing a review on Darwin for Norton.

That shows a publishing tie between both of the James brothers, working together, and Norton about 1868. William James wrote at least one, and possibly more than one, article for Norton as early as about 1868 and and sent it to Norton by way of his brother, Henry, who had become the older Norton’s close friend, after Norton got Henry’s fictional material published. Since both brothers were apparently writing material for Norton to publish as early as about 1868, that supports the idea that either of them could have

34 American Book Publishing Record has Heart of Oak in 1893-4 by Norton with Kate Stephens, revised 1902-03. 1895-1900 American Catalogue has 1895. Harvard’s 1899 copy was copyrighted in 1895, without Stephens’ name. Possibly an 1893-1894 edition came out before the 1895 one.
been the person Norton was not permitted to name, as discussed below, who was primarily responsible for the Heart of Oak books. That seems particularly likely since Henry James was so queasy about publicity that he ultimately burned all his private papers, and by doing so demonstrated beyond any question his intense dislike for publicity. If the brothers were involved in preparing the Heart of Oak books for Charles Eliot Norton, any correspondence between Henry James and Norton on the books would probably have been after about 1889, and would have been among the personal papers of which Henry James later made a bonfire.

Therefore, both William and Henry James were closely associated with Norton, and, as will be shown, either one may have been the person referred to by Norton in his “Acknowledgments” to the Heart of Oak reading series which began to be published in 1893:

“I regret that I am not allowed to mention by name one without whose help the Books would not have been made, and to whose hand most of the Notes are due.”

The series totally omitted any phonics or any instruction whatsoever in reading. Children were to learn to read through interest, and, to some extent, through seeing memorized poetry in print. It was one of the first of the “literature” series of readers, despite the fact Nila Banton Smith’s history of American reading instruction totally omitted Norton’s books and said instead that two later series were the first literature series. The 1891 Riverside Primer and the Riverside literature books which predated the 1891 primer by well over ten years were not really a reading series, although they were probably meant to be used that way. However, the similarity of the approach of the Riverside materials to the Heart of Oak books is obvious and the Riverside texts may be considered their predecessor. Norton’s readers were obviously also “sentence method” readers. Norton said:

“‘Mother Goose’ is the best primer. No matter if the rhymes be nonsense verses;...the child in repeating them is acquiring the accent of emphasis and of rhythmical form. Moreover, the mere art of reading is the more readily learned, if the words first presented to the eye of the child are those which are already familiar to his ear.

“The next step is easy, to the short stories which have been told since the world was young; old fables in which the teachings of long experience are embodied.... To make good reading more attractive than bad,... the growing intelligence of the child should be nourished with selected portions of the best literature.... To provide this... is the chief end of the HEART OF OAK series of reading books.”

A comment stating that “nonsense,” obviously as in some of the Mother Goose rhymes, can mimic sentence structure “and the Unity of one Thought” occurs in James’ 1890 psychology text, page 171:

“To sum up, certain kinds of verbal associate, certain grammatical expectations fulfilled, stand for a good part of our impression that a sentence has a meaning and is dominated by the Unity of one Thought. Nonsense in grammatical form sounds half rational; sense with grammatical sequence upset sounds nonsensical; e.g., Elba the Napoleon English Faith had banished broken to he Saint because Helena at....”

“Mother Goose” was ideal to arouse the kind of “grammatical expectations” which would be fully met when children passed on to more meaningful sentences in the “short stories told since the world was young.” As discussed previously, an emphasis on “real” literature had been a prominent part of the program in Boston after Philbrick was fired, and Henry Cabot Lodge had compiled in 1879 a book of classic fairy tales for young children which were used in the Boston schools. Riverside began publishing their children’s collection of literature about that time. Probably next came J. H. Stickney’s Classics for
Children, A Primer, published in Boston in 1885 by Ginn & Co. On its cover was a picture of the house that was built by “Jack” of the nursery-rhyme. (Stickney later wrote a complete reading series for Ginn, which apparently was advertised as a “literary” series, as discussed elsewhere, and the materials by Cyr of Cambridge for Interstate and Ginn, mentioned previously, also had a “literary” emphasis.) The Heart of Oak readers were in a straight line of development from such “improvements” in the teaching of “real” literature which were instituted by the 1878 Boston change-agents.

Phonics had no place in Norton’s book, as the “Note to Book One” stated:

“A good teacher will point out to the child the fact that many a word which has a strange look to him on the page is not strange to him in his talk. He soon learns how it looks and how to spell it. With intelligent and constant assistance from the teacher the difficulties in learning to read will be much better mastered by this natural method than by the use of any artificial system.”

Norton, therefore, endorsed pure “look and say.”

It is worth while to quote at length from the “Note to Book One.” The Harvard 1899 copy of the First Book of the Heart of Oak Books, copyrighted in 1895 is stamped Experimental School of Teachers College, obviously a Columbia Teachers College copy which was traded to Harvard. That book was presumably a duplicate of one Columbia Teachers College should still have had when Nila Banton Smith wrote her “history” and omitted all mention of the Heart of Oak Books. The “Note to Book One” outlined the book’s purpose:

“....In schools this little book is to take the place of a primer, and it may be used with or without an independent spelling-book, according to the skill or the judgment of the teacher. The usual apparatus of a lesson-book has been discarded, and no attempt at what is technically known as ‘grading’ has been made. The system of grading adopted in most books for beginning in reading is largely artificial and mechanical, and is hurtful rather than helpful to progress. It does not conform to the natural method by which language is acquired, either by the ear or by the eye. The teaching of children to read by means of pieces which have been specially prepared for them, by the omission of all hard words and of all expressions supposed to be beyond their comprehension, is a thoroughly objectionable practice. Words of varying degrees of difficulty, as well in spelling as in meaning, are learned by the ear, and should be learned by the eye, at the same time. The talk of a child when he begins to learn to read does not consist of only words of one syllable. Many a hard word is familiar to him in use before he sees it in print. His ear may be made the helper of his eye. A good teacher will point out to the child the fact that many a word which has a strange look to him on the page is not strange to him in his talk. He soon learns how it looks and how to spell it. With intelligent and constant assistance from the teacher the difficulties in learning to read will be much better mastered by this natural method than by the use of any artificial system.

“Any child who can read the pieces in the First Book of the Heart of Oak series will find few difficulties in the Second....”

Who was the friend whom Norton was not permitted to mention by name in his “Acknowledgments”? Was it his close and highly literary friend for some thirty years, Henry James, or was it his thirty-year-long close neighbor and friend who was so enamoured of “grammatical expectations,” the psychologist William James? Or was it, to some degree, BOTH OF THEM? It should be mentioned that Norton was principally a magazine editor, so his concern with beginning reading and reading books was a new, rather surprising activity. The renewed push for literary readers at that time almost certainly came from his cousin, President Eliot of Harvard, who had been extremely interested in new, literary readers.
for children, and had spoken publicly requesting such books for some years. Therefore, Eliot certainly
would never have objected to the use of his name if he were the one “without whose help the Books
would not have been made, and to whose hand most of the Notes are due.” It seems likely that Eliot asked
his cousin, Norton, the editor, to publish such books and Eliot asked a nearby Mr. X to help Norton to
compile them, or to help get someone else to compile them. Since William James was on Eliot’s faculty at
Harvard, Eliot would not have had to look very far if he wanted to ask for help for Norton from William
James, or through William James from Norton’s old friend Henry James who was living in England, but
who was in Norton’s debt for old favors.

The natural history theme that had originated with Agassiz continued through the nineties. The back
cover of Sarah Fuller’s Illustrated Primer, mentioned previously, advertised Badlam’s primer, in her
series Stepping Stones to Reading, the derivation of which name is discussed elsewhere. Badlam’s
material was rather phonic in its approach, which is surprising considering it was published by D. C.
Heath which was publishing material such as Fuller’s primer and G. Stanley Hall’s book on the teaching
of reading. Yet also advertised on the back of the Illustrated Primer were Wright’s Nature Readers
Sea-Side and Way-side. The First Reader treated of crabs, wasps, spiders, bees and some mollusks. The
Second Reader treated of ants, flies, earth-worms, beetles, barnacles, star-fish and dragon-flies. The Third
Reader had lessons in plant life, grasshoppers, butterflies, and birds. The Fourth Reader treated of wildlife
in its different aspects:

“Designed for schools and families. Intended to awaken in children a taste for scientific
study, to develop their powers of attention, and to encourage observation, by directing their minds
to the living things that meet their eyes on the road-side, at the sea-shore, and about their homes.”

Obviously, Agassiz’s natural history was still being promoted by D. C. Heath with such material as
Wright’s Nature Readers. However, to expect that little first-grade children would be more interested in
the “natural history” of wasps, spiders, beetles and barnacles before covering the “natural history” of
birds and bunnies shows a curious misunderstanding of little children’s minds. Perhaps it was not a
misunderstanding, but a deliberate attempt to quell the natural sympathy little children feel for familiar
animals and to replace it with “scientific objectivity” (i. e., callousness).

In summary, the record indicates, not only that Pollard failed to effect any widespread change, but
that the readers published shortly after hers were, if anything, even worse than those that had been
published before.
Chapter 30
Observers’ Reports from the 1890’s

More visits of French emissaries to American schools were made during the 1893 Chicago Exposition. The reports made by Benjamin Buisson (presumably some relative of F. Buisson) did not match the extensive reporting by F. Buisson on his 1876 visits, but are still of interest. They appear in Reports of the Delegation sent to the Columbian Exposition of Chicago by the Minister of Public Instruction - 1893 Primary Instruction (Enseignement Primaire) by Benjamin Buisson, Paris: Librarie Hachette et Cie., 1896 (pages 208-209):

“Reading. We point out the American word method, and also the method of the charts of sentences, containing at once little sentences, methods less analytical than our system of alphabetic spelling, and supported by pretty illustrated wall charts where one meets only those words and ideas already within reach of early childhood.” (Ed.: he also mentioned many supplementary reading books in use.)

“Spelling.... Employed are booklets containing graduated lists of ordinary words that the pupils learn page by page, and on which they are asked orally for the sense and the spelling. These books or spellers, aided by reading, appear to suffice to learn English spelling - difficult only because of the difference between the pronunciation and the figuration of the words, - not from the grammatical point of view. Certain educators seem to envy us the exercise of dictating a complete piece, which they preferred to spelling lists of unconnected words. But the spellers are again in vogue, and the pupils put much effort to spell well orally, or at the blackboard the words that one asks them. This is often under the form of a spelling bee, and of a fashion very lively and zestful, that this exercise is conducted in class.”

So Benjamin Buisson confirmed, by inference, that spelling had previously been dropped in American schools, but openly confirmed that it was heavily taught in American schools in 1893 by the use of spelling books.

The last essentially disinterested contemporary report on the teaching of reading, which can be cited as evidence on reading books and methods in general use in the early 1890’s, was made by an American, Joseph Mayer Rice, M. D. Dr. Rice’s first published material appeared in the early 1890’s as a series of nine articles in the New York magazine, The Forum, from October, 1892, to June, 1893, reporting on his extensive visits to American schools in 1892, and another article in August of 1894. In 1893, he republished the 1892-1893 articles in book form under the title, The Public School System of the United States, Century Company, New York. Rice later wrote three more articles in The Forum, at least two and probably all three of which were on his later very extensive testing of school children. Rice’s testing of spelling and arithmetic had covered a period of 16 months from February, 1895. The initial Forum article on his testing appeared in April, 1897, and the second was in June, 1897, entitled “The Futility of the Spelling Grind, II,” Presumably his last article reported on his testing of arithmetic and it appeared presumably later in 1897. Rice later reported on his 1895 and 1896 extensive testing, based on his Forum articles, in a 1913 book, Scientific Management in Education. Publishers Printing Company, New York, in which he said he had written a total of twelve articles for Forum over the years. However, like so much of education “history,” almost all of Rice’s work has fallen into our education establishment’s black hole.

Dr. Joseph Mayer Rice’s 1893 book, based on his first nine Forum articles, The Public School System of the United States, reported on his visits from from January 7 to June 25, 1892, to the classrooms of 1,200 teachers in 36 American cities. Rice also visited 20 normal schools. For two years before that, Rice
had been visiting schools and studying in Europe. Rice was a devotee of the “new” education, and opposed children’s reciting lessons from text books. Rice was, for the most part, in agreement with the Quincy ideas. Yet the “born yesterday” syndrome in American education was working just fine back in the 1890’s, too. That is because, as far as I could see, Rice showed no sign of ever having heard of the Quincy movement, although he endorsed Parker’s Chicago school. Rice apparently also had no knowledge that “elocution” had been so important in American schools before 1878, as he was baffled by a ridiculous elocution exercise he witnessed, the purpose of which completely eluded him. Rice referred to the “laws of psychology” and endorsed instruction in accordance with the “nature of the mind.” “Experts” in their bustling materialistic ignorance were busy even then writing with assurance about the “nature of the mind,” even though it will forever defy any material explanation.

Four years later in 1895 and 1896, Rice again toured American schools, and gave extensive spelling and arithmetic tests, reported in three articles in The Forum, apparently all in 1897, and in his 1913 book mentioned above, Scientific Management in Education. As the title of two of his 1897 articles made clear, “The Futility of the Spelling Grind,” Rice complained about the great amount of time being spent on spelling in American schools in the 1890’s. After the catastrophic effects on spelling that had resulted when American schools aped Parker’s 1875 Quincy “methods” and threw out the speller, spelling failures had been enormous. Because of these spelling failures, a reaction had begun to set in by about 1885 and children were being given too much drill on spelling. Curiously, unlike Benjamin Buisson, Rice apparently did not know that spelling had been largely thrown out of American schools for a period of time, and that the spelling “grind” was the over-reaction to the spelling failures that had resulted. Rice published a short speller which he thought could provide all the practice that was needed. Rice was obviously operating in an information vacuum, since he had no knowledge of the massive spelling failures of the previous decade which had been the result of throwing out spellers from the schools. Furthermore, in analyzing his scores from fourth and fifth grades in comparison to eighth grades, Rice showed a misunderstanding on the effect of failure on school enrollment. In 1896, most children were finished with school after graduating from eighth grade, but many did not reach that far. Rice did acknowledge that fact when he referred on page 78 to “the case of pupils who were likely to complete the grammar school course” in comparison to “those who cannot attend school longer than four or five years....” Yet what he seemed to ignore was that it was not only the children who had to leave school to go to work who dropped out after fifth grade, but it was the failing students, as well. Only the successful ones could reach grade eight. Rice’s spelling scores at grade eight were truly magnificent, but that told very little about “average” spelling scores, because the eighth graders were the academic survivors, the failures having all washed out. Therefore, it is only Rice’s fourth and fifth grade scores which are significant. He admitted that there was some wide variation in them. A large part of that variation could be explained by the presence of the failures.

Nevertheless, on the whole, Rice’s fourth and fifth grade scores in 1895 and 1896 proved that the return to the teaching of spelling had been successful for the great majority of students. For the purposes of this history, that also means that the great majority of students could once again read well in 1895 and 1896, since spelling is the best single indicator of reading competency. Rice’s tables, giving his tests results in extreme detail, are contained in his 1913 book, available at the Library of Congress and presumably elsewhere. Some of Rice’s comments culled from pages 78 to 80, and 88, are given below, to indicate his general results. His reference to A and B classes are to half-year grades, schools at that time having both September and February enrollment periods:

“...we are confronted by a number of interesting phenomena.... The most striking of these are: First, that in the vast majority of instances, the results are very close when the averages for entire buildings are compared. In fifteen of the twenty-one schools... the averages on the second test as the table shows run from 73.3 to 77.9. Second, while the results in the lower grades of different
schools show considerable variation, those in the eighth-year classes, which represent the end of
the school course, are remarkably even. In twelve of the seventeen eighth-year grades, the
averages are from 84 to 88, the A and B classes being taken together. And in fifteen of a total of
twenty-one sets of eighth-grade compositions examined for spelling, the variations were only
three-tenths of one per cent, the results lying between 99.1 and 99.4, the A’s and B’s being taken
as one. These facts are doubly remarkable when we consider that the twenty-one schools not only
represent institutions in many sections of the country, but that they are samples of schools
conducted under all conceivable conditions. For example, No. 7 is a Western city of moderate
size, while No. 15 is a large city in the East. Again, most of the children attending School A, No.
7, are of American parentage, and their home surroundings are particularly favorable; while the
children attending School B, No. 7, represent the foreign laboring element. Further, from a
pedagogical standpoint, all varieties of schools are included; some of them belonging to the most
mechanical while others are among the most progressive in our country.

“...in a special test of twenty-five very simple words, I examined four eighth-year classes
representing three different cities. The extremes did not vary more than two points; the results
being respectively 92.0, 93.2, 93.6 and 94.4. In one school, the compositions were written from
the picture alone so that the pupils were absolutely free in the selection of the story and the choice
of words. The average was 99.3.

“...just as it is impossible by the results to distinguish the mechanical from the progressive
schools, it is impossible to distinguish the schools attended by the children of cultured parents
from those representing the foreign laboring element; the results from this standpoint also varying
equally. Consequently, so far as spelling is concerned, the influence of environment appears to be
insignificant.

“...the sight or flash method.... A word is written on the board... for a moment... then erased...
and the pupils are called upon to reproduce it on the board from memory.... the results were
particularly discouraging....

“...A very careful study was made as to whether there is any foundation for the theory that
when children learn to read by the phonic method they fall into the habit of spelling phonetically,
and therefore become poor spellers. The analysis showed that some of the best results had been
obtained where the phonic method had been employed; that, in fact, the phonic method had long
formed a feature in the cities where the highest averages were made. Another theory, that the best
spelling is produced in schools where the most general reading is done, was proved unfounded.
Nor did the schools where the most time was devoted to written language make the best
showing...."

Those last comments, based on hard test data, certainly contradict the claims of our current “Whole
Language” propagandists!

However, after producing his fascinating data, Rice then made the wrong conclusion on it, showing
his total ignorance of the spelling disaster of the early 1880’s, as well as his ignorance of the fact that
“meaning” trained children need heavy doses of “spelling,” while “sound” or phonically-trained children
usually need very, very little:

“Do not these results indicate that in learning to spell, maturity is the leading factor, while
method plays only a subordinate part? And, if the superiority of the... spelling grind cannot be
demonstrated, is it not our duty to save the child from the grind?”
The spelling failure had been acknowledged by J. H. Stickney in the “Preface” to her 1889 Word by Word, an Illustrated Primary Spelling Book, Ginn & Company:

“The action of the mind in learning to read and spell has been of late years a favorite study of educators. Theories have been advanced and experiments made which, though disastrous in certain lines, have been on the whole of great value.

“Reading had undoubtedly gained both fluency and expression; loss falling, if anywhere, on the strength of impression - a fault not wholly chargeable to the school. But in many quarters a generation of bad spellers are testifying to failure somewhere, and the most zealous advocates of incidental spelling recognize the need of specializing the work at that stage in a child’s life when forms and images are most readily fixed....

“Since the agitation of the subject came through educators from whom have been derived some of the best fruits of educational progress, it will be useful to look closely into the grounds upon which the work of the spelling-book was first banished and is now being restored to the schools.

“It may be too soon to formulate these, but it will appear that it is not in all respects the old-time books or methods that are restored to favor. Good has come from the agitation, and the long columns of meaningless combinations will no longer bar the child’s interest....”

J. H. Stickney’s “Preface” is an historical document which establishes beyond any reasonable doubt that spelling was thrown out of American schools on the advice of the best “educators” and that the results were disastrous. As a result, the spelling book had been returning before 1889. Yet J. H. Stickney, who had written a sight-word series as well as the 1885 literature primer referred to earlier, was not recommending the spelling book for first grade, but only for second and third grades.

More testimony to the spelling failure from the Quincy/Boston influence appeared in Silver Burdett’s 1894 The Normal Course in Spelling - Primary Book by Larkin Dunton, LL.D. Head Master of the Boston Normal School. It was a straight Code 10 speller. Dunton wrote in his “Preface”:

“The recent reaction in favor of the spelling book has been so great as to create a demand for a book especially adapted to the needs of children in primary schools. This work is the result of an attempt to meet that demand.... Spelling does not come naturally to children; neither do they acquire it by absorption. It must be studied.... The book is always available for this purpose, while lists on the blackboard must be reproduced whenever used again.... It allows both teacher and pupils to breathe air free from the irritating and poisoning effects of clouds of chalk dust.... Pupils are helped much, in learning to spell, by making a close association between the different elementary sounds which compose the words and the forms and names of the letters representing these sounds.... The pupil is then prepared to study the lesson; that is, to look at the letters in order, while thinking of their names and of the sounds of the different syllables composing the words.... In oral spelling it is best for young pupils to pronounce each syllable as it is spelled. Older pupils may simply pause between the syllables.”

It might be thought that Silver Burdett by publishing Dunton’s The Normal Course speller in 1894 seemed to be returning to Noah Webster’s 1783 approach. That illusion is shattered when their Normal Course reading series is examined, which is discussed elsewhere. It was generating the same “clouds of chalk dust” of which Dunton had disapproved.
After 1826, “reading” had been seen as something apart from “spelling.” (It is not. The most sensible description of what should be involved in learning to read is the title of the phonic Code 10 reading materials available today that were written by the first-grade teacher, Sue Dickson: Sing, Spell, Read and Write, International Learning Systems, St. Petersburg, Florida. Even the ancient Greeks used singing, spelling, and writing, to help children learn to read.) Yet “reading” books after 1826 confused beginners thoroughly about the nature of print, approaching it like Chinese meaning-bearing characters. The “spellers” then later tried to repair the damage that was caused by beginning by “meaning.” For instance, as late as 1894, although the “Normal” reading series published a speller with the phonic emphasis that had returned to spelling in the late 1880’s, the 1894 Normal Course in reading was still confusing beginners by giving them “meaning” at the very beginning instead of “sound.” (The Normal series will be discussed later.)

Accuracy in spelling had been exceedingly poor for those in America who had learned by the “meaning” method after 1826. The damage was controlled to some degree for those who remained in school long enough to have used a spelling book for many years, and who, in addition, had to spell the sight words in their beginning primers orally with the “ABC method.” Yet, starting in the early 1870’s, the ABC method for beginners, which was the oral spelling of the sight words the beginners were learning, was largely dropped, although the spelling book at upper grades continued to be used for a few more years until the Quincy approach largely banished it. When visiting America in 1876, F. Buisson found that the ABC method in reading for beginners was out of use except in some rural areas. (The use of Leigh print may have contributed to that change, since it was not necessary orally to spell words in Leigh print, but only to sound them out.) Therefore, the spelling damage that had resulted from teaching first graders solely by the “meaning” method without even the oral spelling of sight words was left completely unrepaired in most places after about 1878, since even the spelling book itself had been banished at upper grades because of the influence of Parker’s “Quincy methods.”

England had been teaching beginners by “meaning” since about 1830, and was producing its own crop of failures from “meaning.” Whether England also dropped the speller in the late 1870’s when America did so is unknown, but the spelling failures in England were also spectacular by the 1890’s, reported in the “Introduction” to The New-Method Speller, which was copyrighted in 1892 by Warren H. Sadler, and printed in Baltimore by the Sadler-Rowe Company in 1892.

“...In England it is reported that at a recent examination of candidates for Public Service, nineteen-twentieths of the class failed in spelling, and an Educational Report of that country says: ‘Spelling is not what it should be. What we want is to teach spelling, and not merely to practise spelling.’

“Civil Service examination papers in this country also show a remarkable deficiency in this important study.”

An important speller was by H. F. Harrington, who was a superintendent of schools in New Bedford, Massachusetts. Copyrighted in 1880, the Harrington speller emphasized “meaning” and the use of sentences for spelling, not “sound.” As late as about 1917 or 1918 (the date on my photocopy unfortunately being missing), Harrington’s 1880 Graded Spelling Book was praised in an article in the Elementary School Journal (pages 465 and following in the section, “Educational Writings,” under the heading, “Current Tendencies in the Construction of Spelling Books for Elementary Schools”). It was praised because it attempted to emphasize the most commonly used (higher frequency) words.

The years 1882 and 1883 appear to have been a low point for spellers of any kind, since the Leyboldt list showed no new spellers published then. Some of the few new titles immediately before and after those years appear to have been like Farnham’s 1881 approach: words being taught by meaningful sentence
dictation, not phonics, and Harrington’s was an extension of that idea. However, by 1889, as Stickney pointed out, a reaction had set in and spellers were in demand. It is most probable that Stickney’s 1889 largely phonic speller and Dunton’s 1894 highly phonic speller were only responding to a market demand for phonics in such spellers. As William Torrey Harris remarked in the late 1880’s, Webster’s speller by then was selling about a million and a half copies a year. Despite the fact that the last revision of Webster’s speller had made it unsuitable for teaching beginning reading phonically, it was still heavily phonic as a spelling book. (As discussed earlier, Webster’s was probably also coming back into schools at that time, besides maintaining its sales to the general public. The statement quoted previously by the Appleton company officer had made it clear that the major market for the Webster speller by 1880 had been the general public, not the schools.) Furthermore, the McGuffey spellers were also phonic spellers, so there was material already on the market to meet the increasing demand referred to by Stickney.

That it was a demand for phonics in spelling is implicitly admitted by the fact that both Stickney and Dunton wrote phonic spellers, obviously aimed at claiming a share of the increasing sales. If the demand in place before 1889 had not been for phonic spellers, it is highly unlikely that Stickney and Dunton would have written the phonic spellers that they did in 1889 and 1894, since their publishers were at that very time putting out straight sight-word primers for first grades (and Stickney, herself, had written a sight-word series).

As Rice’s 1895 and 1896 spelling tests showed, some ten years after spelling had returned to the schools, most American school children at fourth grade and above could once more spell correctly. Some - and possibly most - of the spelling books which came into American schools after 1884 in response to the catastrophic failures were phonic spelling books. The increase in achievement was directly attributable to the heavy teaching of spelling, and most probably it was phonic spelling.

During Rice’s earlier 1892 visits, he had tested oral reading in third grades, not spelling. His comments on reading achievement (which were only anecdotal, and not given as accuracy percentages) have to be considered in light of his opinions. Expressionless reading, to him, was bad reading, and “mechanical” schools did not encourage expressive reading as was done in the “broad” (progressive) schools he endorsed. Despite his inaccurate conception of reading ability (which is in reality the ability to decode, and not the ability to emote) Rice’s comments do tell a great deal about relative oral reading accuracy at third grade in American schools in 1892, before the renewed heavy emphasis on phonic spelling in the upper grades could repair much of the damage that was done by teaching beginning reading by “meaning.”

Rice tested the oral reading of third graders in many American cities with four reading texts. He reported on this work in his 1893 book, The Public School System of the United States, New York: Century Company. One of the texts he used was from Harper’s Educational Series, presumably their 1888 edition whose editor on the first grade portion was O. T. Bright, Superintendent of Schools, Englewood, Illinois. The editor on Harper’s higher levels was James Baldwin, who later wrote two series for American Book Company, the Baldwin series and the 1901 “meaning”-approach McGuffey revision. Another text was by Stickney, presumably J. H. Stickney, listed as (Mrs.) J(ennie) H. (Lansing) Stickney in OERI’s Early American Textbooks. J. H. Stickney wrote Stickney’s Reading Series published by Ginn & Company, Boston, from at least 1886, and also wrote the 1889 speller which has been discussed. The third was by Swinton, who would be William Swinton who wrote a reading series published by Ivison, Blakeman, Taylor & Co. from at least 1882. I have seen an 1890 copy of Swinton’s Primer and First Reader which was still being published by American Book Company in 1890. The fourth text was by Powell, presumably W. B. Powell who, with Emma J. Todd wrote the series called The Normal Course in Reading, published by Silver, Burdett & Co. of New York, Boston and Chicago starting from at least 1889. In his testing in schools, Rice said, if Harper’s were in use, he used one of the others, and vice versa.
That these four reading series were among the most popular in America about 1890 tends to be confirmed by an entry in the Lyndhurst, New Jersey, Board of Education Minutes for August 30, 1889 (when the town was still called Union Township). Unlike most entries which simply showed a total paid to various companies for textbooks, this listed the actual book adoptions for 1889-1890. The two reading series ordered for 1889-1890 were two of the four series that Rice later used in 1892: Swinton’s as the main series, and Harper’s as supplementary.

What is particularly noticeable about the texts Rice chose in 1892, which were obviously all popular, is that NONE of them are among those which Ferdinand Buisson saw in use in 1876 or saw exhibited at the Centennial Exhibition, only 17 years before! Obviously, an almost complete turn-over had occurred in reading instruction materials. It should also be specifically noted that Rice did not use McGuffey’s for his oral reading tests in the many cities in which he tested.

Nevertheless, some of the earlier series remained in print, presumably with small sales, for many years. American Book Company reprinted many such old series in the twentieth century, the copyrights of which they obviously had obtained, probably most through the 1890 merger.

Yet none of the reading series from which Rice used the third grade books (and some fourth grade books) to test oral reading had truly phonic books at first grade. Except for McGuffey’s and Rebecca Pollard’s, very few such first grade truly phonic texts were published in 1892. Nevertheless, according to Rice, phonics was taught in five of the eleven schools he described, as will be discussed. It obviously had to be supplemental phonics.

The third-grade Powell text Rice used was presumably The Normal Course material. Their first grade material was a ghastly Code 3 book, with partial phonics - phonograms and consonant substitution. It had been copyrighted in 1888 and 1890 and the text I saw was published in 1892 by Silver, Burdett & Co. of New York. It is obvious that by 1888 it was normal to teach words and sentences in script from the blackboard for “meaning,” often with objects and as drill before moving into the book with the same words in print some five months later. This overuse of the blackboard was the source of the clouds of chalk dust to which Dunton referred. This massive use of the blackboard is also the obvious root of the experience chart approach which was used in Colonel Parker’s Illinois school and which is STILL in use today. The Normal Course text also had a teacher’s guide. Such teacher’s guides were the norm by 1890, which fact has also fallen into education history’s black hole.

The Normal series of 1890 had books for all grades up to and including the fifth grade. The first book was titled, The Normal Course in Reading, First Reader, First Steps in Reading by Emma J. Todd, Training Teacher in the Public Schools of Aurora, Ill., and W. B. Powell, A. M., Superintendent of Public Schools, Washington, D. C., Silver, Burdett & Co., New York - Boston - Chicago. The first grade book also had reading charts to go along with it. The “Publishers’ Note” read:

“Probably no text-books in our schools both represent, on the whole, more effort and enterprise on the part of publisher and author than the school reading-books. This branch has constantly received the contributions of our most successful school-book makers - a fact which in itself abundantly attests the importance which attaches to the study in the public mind.”

That publisher in 1890 would have been astonished by the “known fact” of today that McGuffey’s was supposed to have supplied about ninety percent of the American reading textbook market in the nineteenth century, and that all the other publishers to whom he was referring, including himself, were supposed to have divided the remaining ten percent among themselves!
“That there yet remain possibilities for improvement in this direction cannot be doubted by those familiar with the progress recently made in the methods of teaching reading employed by our best educators. This progress has revealed and emphasized the need of improvements not hitherto attempted in the reading-books offered for school use, both in the plan of presentation and in the subject-matter presented.”

Note the reference in 1890 to “the progress recently made in the methods of teaching reading employed by our best educators.” As is obvious from the following, he was referring to the opponents of Leigh’s and Pollard’s “sound,” who had instead promoted the sentence method and concentration on “thought,” or “meaning.”

The section, “Suggestions to Teachers” also clearly showed the roots of the experience-chart “meaning” approach:

“First Step: Talking Lessons. The work given in this little book suggests the objects which may be used in the talking lessons.

“The purpose of the talking lessons is: -

“(a) To secure the child’s confidence and make him unconscious of his surroundings.

“(b) To train the child to see relations.

“(c) To train the child to express in definite, accurate language the relations which he sees.

“(d) To train him in the use of many idioms common to the English language.

“(e) To give him power to emphasize the word or words in a sentence necessary to express the meaning asked for....

“Actual training should result from this work. The child should acquire the habit of proceeding from the conscious thought to its exact expression.

“If the child holds the object as he talks, he becomes very familiar with the idioms This is, Is this, Here is, Here are, That is, There is, There are, O see, which you see, which is, by which, from which, etc. The power to emphasize any word in a given sentence is of value in expressing orally the thought given in a written or printed sentence....”

Do six-year-olds who are neither deaf nor retarded NEED to be taught how to say such phrases as “this is”? By contrast, no normal six-year-old uses - or should be forced to use - such complex syntax as the phrases, “by which” or “from which.”

The “Suggestions” then stated:

“Continue the work of training the child to see and to tell in good language what he sees, until his vocabulary is enriched by many common English idioms, and until he can use his vocabulary for a definite purpose.
“It may require a few days or a few weeks to accomplish this, but the time and effort will be repaid by the natural expression which the child will be able to give when reading.

“The learning of words and sentences by sight is made easy to the child in proportion to the care and system given to the ‘Talking Lessons.’

“The words and sentences to be learned by sight are but the symbols of what the child has said. The child learns them as such. He thus learns words rapidly and with little effort.”

Paper never refuses ink, as his last statement demonstrates. Yet the failure of first-grade children to learn such sight-words “rapidly and with little effort” is attested to in a December, 1892, advertisement for Miss Ellen M. Cyr’s first-year reading materials in The Public School Journal, “A Complete Series, prepared expressly for the First Year.” Her straight sight-word materials stressing “literature” have already been discussed. That advertisement for Cyr’s texts, which advertisement will be quoted later, stated flatly that first graders could only handle the beginnings of other sight-word primers. HER materials, of course, were supposed to be different.

The ludicrous “Suggestions to Teachers” continued and concerned a rigidly controlled vocabulary:

“A carefully selected vocabulary is given in this book. The words which are learned before taking books and those learned in connection with the first book should be a community of words, a symmetrical vocabulary in which the different parts of speech are found in proportion to their use in common speech. This vocabulary should consist of the words and the idioms which the child uses or may be trained to use in conversation about plants, animals, children’s toys, and other objects; in descriptions of familiar objects and of simple pictures, in comparing and contrasting simple objects, etc. The sentences which the child gives are those which he should be taught to recognize and read.”

The last sentence is a definition of experience charts. It is clear that experience charts, as they exist today, originated with “improvements” by Farnham. Farnham taught sight words silently in sentences which described objects the children had handled or motions the children had made. The children then silently “read” the sentences describing the activities that had been carried out, and then finally pronounced the sentences aloud. Such “improvements” found their way into the prefaces to later reading books such as this. The experience-chart approach was standard by 1890. The “Suggestions” continued:

“The child should learn to read as he has learned to talk. His attention should be given to the thought. Thought controls expression. He must be led to discover that oral reading is expressing thought. After learning three or four name-words the work may be almost wholly sentence work.”

Note the Agassiz influence in 1890: “led to discover...” Note the James influence in 1890: the concern with “thought” and the use almost solely of whole sentences.

The material continued:

“For example: the words my top, my cup, my mat, and my box have been taught. The pupils place the objects as directed, and give the following: ‘My top is on a box. My cup is on a mat. Is my mat on a box? Is my top on a box?’ etc. Each is written and read as it is given.
“After all are written, they are read and erased. The teacher may now write, ‘My mat is on the cup.’ A pupil places the mat on the cup and reads the sentence.

“Much good reading matter may be made with a few wisely selected words, by changing their positions in sentences....”

Phonic drill is falsely criticized as being boring to children. Was the foregoing sight-word sentence drill supposed to be INTERESTING? Notice the “improvement” in the above: little beginners were doing silent reading, by following the teacher’s silent, written instruction, placing the mat on the cup. Note also that the meaningful “thought” conveyed, the placing of the mat on the cup, is pointless and silly. That meaningless sentence forms quite a contrast to the meaningful first sentence in Noah Webster’s old speller on page 43, after his introductory word lists: “No man may put off the law of God,” or the first sentence in the old hornbooks, “Our Father, Who art in heaven, hallowed be Thy name.”

The “Suggestions” continued:

“Sentences written on slips of paper may be given him to read. The same sentences may be on the blackboard. He compares the sentences on paper with those on the blackboard. He discovers the sentence, points to it, and reads it. In this he compares and concludes.”

He “compares and concludes” in a “critical thinking” exercise worthy of the “critical thinking” curriculum which is inundating our ignorance factories today. (The term, “ignorance factories,” is someone else’s invention. I want to thank him/her for it.)

Of course, the ultimate purpose of today’s “critical thinking” curriculum is far weightier and might best have been described in the Pro Family Forum’s The Family Educator, P. O. Box 8907, Forth Worth, Texas 76124, for July/August, 1991, page 4, quoting from Lamplighter, June, 1991:

“Perhaps the most honest definition of ‘critical thinking’ or ‘Higher Order Thinking Skills’ to come from the social planners came from Professor Raymond English. At a meeting sponsored by the U. S. Department of Education, he exposed ‘critical thinking’ as code words for being critical of, or subverting, society’s and parental values.”

Todd’s and Powell’s suggestions continued:

“Third Step: From Script to Print.

“The Transition from script to print is easily made if it is not attempted too soon.”

The use of script for beginners, instead of print, made it extremely difficult for the children to distinguish separate letters. The children were not even taught the alphabet before being given these script words. Children were, indeed, dealing with whole words when the words were printed in script.

Phony phonics entered as the fourth step. The children were being taught enunciation, and consonant substitution on known sight-words, to work out new words. They were not being taught synthetic phonics, but its phony phonics brings this sight word book up from Code 1 to Code 3.

The “Suggestions” continued:

“Phonic drill or work in slow pronunciation should be given. But this is blackboard work. The work in slow pronunciation should be begun the first day of school. At first the teacher pronounces the word; as “Find a d-o-l” “Take a c-a-p.” “Show me a m-a-t.” This work is continued until the child detects any word pronounced by the teacher, if the word is in his vocabulary. Then the teacher may pronounce and write words, as, mat, man, milk, mill, men, mow, mew, etc., having the children discover the first sound made. The letter is placed on the blackboard for further reference. This plan is continued until all the consonants are given. Now the work of word-building may be begun.”

Phonics concerns syllables, and every syllable must have a vowel. Note that the children have been taught no vowels, despite the beginning step of separating spoken words into their sounds. In written words, only consonants were taught, to help children in guessing whole words in context by their resemblance to parts of other known whole sight words. This book was teaching the purest of phony phonics. It continued:

“If the child knows the word at, with this knowledge of the power of letters, he will make bat, cat, fat, hat, mat, nat, pat, vat, sat, and vat. If he knows the word and, he will also know ...hand, land, and sand, etc. The work of changing the final letters of words may follow this changing of letters within words. This work in phonics aids distinct articulation. It should have a place in the day’s programme, but should not be a part of the reading lesson.”

The primer mixed script and print from the beginning, but, as the teacher’s guide made clear, the children were not given the primer until long after they had learned to read script sight words on the blackboard as “wholes.”

Mentioned earlier was the advertisement from The Public School Journal of December, 1892, which is historical proof of the failure of first-grade reading instruction at that time. The advertisement was for Miss Ellen M. Cyr’s first-year reading materials, “A Complete Series, prepared expressly for the First Year.” Cyr had previously written the 1886 Interstate Primer, dated July, 1886, Cambridge, Massachusetts, which suggested she had possible ties to people at Harvard. Cyr’s first-year reading materials included The Children’s Primer, The Children’s First Reader, and Cyr’s Reading Slips, “forty-eight manilla [sic] packages, each containing twenty sentences.” The advertisement stated:

“Without any doubt, teachers and superintendents find more difficulty with the first year’s work in reading than anywhere else in the course. To begin with, the difficulties of the first steps are not sufficiently provided for. Cyr’s Children’s Primer seems to meet the requirements at this point. New words are introduced very gradually and with great care, and yet, though the vocabulary is limited, the reading matter will be found fresh and entertaining from the very start. The book is pervaded with the spirit of child-life, and all the best devices and methods are made use of to render these first steps easy, interesting, and judicious.

“The Reading Slips furnish a large amount of supplementary work in the most convenient and the cheapest form.

“In one way, the second half-year usually gives even more trouble than the first half-year. Less attention has been given to its special requirements in the preparation of primers and first readers. The last parts of these books are almost invariably too hard, and so a number of different books are required to provide reading matter. The children have to begin different books with the simple, uninteresting lessons, read to the hard places, and then lay these books aside on the shelves for (a fresh) start in new ones. Cyr’s Children’s First Reader is so made as to give practice on what has been learned, and to maintain the children’s interest. It is a simple but steady
growth in the same line, and will make possible a real advance, in place of constant stopping and
beginning over again.

“The Primer, Slips and First Reader make a complete course specially designed for the first
year’s work in reading.”

The publishers followed this with the statement, “Stickney’s Readers preserve the child’s natural
Ginn & Company were also apparently offering their Stickney sight-word series in 1892 to follow Cyr’s
first-grade sight-word material. By 1894, however, Cyr’s series included the primer, and first through fifth
readers.

This 1892 advertisement for sight-word “meaning” materials, which is actually an irrefutable
historical document, should be placed alongside the fable that McGuffey’s books were used by ninety
percent of American children in the nineteenth century, and that ninety percent of American children in
the nineteenth century therefore learned by “phonics.” It shows instead that many reading texts were used
in first grades, that they were sight-word texts, and that the failure rate from them was enormous.
However, because of massive spelling failures, by about 1885 Webster’s kind of phonetic spelling had
returned to most schools, but it was not taught until second grade. The failure at first grade from teaching
beginning reading by “meaning” was largely repaired at second grade and above by teaching for “sound.”
This is proven by the high scores Rice got in his 1896 spelling tests given to fourth through eighth grades,
mentioned previously.

Ginn & Company continued to publish other beginning sight-word materials besides Cyr’s and
Stickney’s. Ginn copyrighted in 1897 and published in 1897 The Finch Primer, the back cover of which
advertised Stickney’s Readers. The Finch Primer, mentioned approvingly by Edmund Burke Huey in his
1908 text, was a Code 1 book, but the publisher nevertheless claimed it could be used with any method. It
was written by Adelaide V. Finch. The title page referred to its “Three Hundred Words.” The author
signed her preface and followed it with “Lewiston, Maine, March 4, 1897.” The title page showed she
was “Principal of the Normal Training School, Lewiston, Maine, Formerly of the Minneapolis Public
Schools.” She was obviously reflecting “expert” methods. Her preface read:

“There is need of a systematically constructed, carefully graded primer, based upon sound
educational principles. Such a primer should consider the environment of the child at different
seasons of the year; it should inculcate a love of home, of country, of nature, and kindness to
animals; it should present simple lessons, which are outgrowths of conversational, objective,
language work, as such lessons from their very nature appeal strongly and directly to the child; it
should leave the teacher perfectly free to use her own method, or the best from all methods,
although our best educators believe that blackboard and book work should go hand in hand....”

The first page had the words, “leaf, maple, This, a, is.” Almost every one of these words would have
been introduced later in a true phonics program, but never at the very beginning. The isolated words were
followed by a picture of a leaf, and the whole sentences, “This is a leaf. This is a maple leaf.” The primer
went downhill from there. Script was used to page 87, and the book showed no phonic arrangement.

With the emphasis on blackboard work for beginners, however, it is obvious that some schools may
have taught real phonics before giving children the primers. Rice recorded that phonics was taught
effectively in five of the eleven cities and counties to which he specifically referred. The five he reported
to be teaching phonics in 1892 were St. Louis, Indianapolis, Minneapolis, Boston and Cook County, but
methods were mixed in Chicago in Cook County. Methods were also mixed in St. Paul. The word-method
or the word method with spelling (the ABC method) was used in Buffalo, Cincinnati, New York, and Baltimore.

Rice approved of Indianapolis schools in general, in addition to their teaching phonics, because they used a kind of open-classroom approach with interesting activities and an experience-chart approach in reading. However, concerning Rice’s report of their high achievement in reading in 1892, it should be noted Indianapolis ALSO gave phonics drill. This could, of course, have been in connection with the first-grade experience charts or in connection with spelling drill at second grade and above. Rice did not specifically say the phonics he observed being taught was always first-grade phonics. The state of Indiana had endorsed the state-approved “meaning” series, as has been discussed, but Indianapolis apparently preceded it with experience charts which may have used a phonic approach.

In Minneapolis, Rice said reading seminars were held and no single method was used by the teachers, who employed the “Science” method (whatever that was), the sentence method and the word method. However, Rice ALSO said that much attention was given to phonics. This was the only common thread in their methods that would account for their high achievement. Rice said of the Minneapolis schools that the reading was “especially good - no where better.”

Rice said, concerning both the Indianapolis and Minneapolis third-graders:

“All could read intelligently at sight in 3rd grade readers, some as well at 4th, the majority as fluently as might be expected anywhere.”

Since Rice was testing third graders, it is entirely possible that the successful results in Indianapolis and Minnesota came from heavy phonic emphasis in spelling at second grade, rather than from phonic emphasis in beginning reading in first grade.

Rice said that Boston schools were using phonic drill in 1892 (suggesting a return to pre-1878 practices). He found the St. Louis schools to be doing a good job teaching phonics, but he mightily disapproved of their rigid, non-progressive curriculum. Concerning the effect of the good teaching of phonics in St. Louis, however, he said:

“The children certainly read as well at the end of four or five months as those attending many of the schools where no phonics are taught read at the end of two years.”

That is the standard effect of teaching by phonics, as true today as when Leigh print had been used: children learn to read rapidly.

Rice found in Cook County that “in teaching children much attention is given to phonics.” (Whether Rice meant the county public schools or the practice school attached to Cook County Normal School, of which Parker had become the principal in 1883, I do not know. Unfortunately, I have no photocopies on Rice’s book, but only notes.) Concerning Rice’s oral testing of the third graders there, he said that they “stood the test admirably,”

Concerning Chicago, Rice did not specifically report on test results (or so I believe) but said:

“Methods employed in teaching reading vary in the different schools - some word method, others sentence method, (and in) others (a) variety of methods including phonics and word building”.

He said that in St. Paul there was a variation in methods, but in some instances the results were good.
Rice said that in Buffalo, which was not teaching phonics, classes were doing spelling exercises. Yet, one teacher said

“I do wish we would return to the alphabet method of teaching reading, because those children who know their alphabet progress most rapidly in spelling.”

To ask children to “spell” when they apparently did not fully know their alphabet was an extraordinarily stupid thing.

Some other schools he specifically mentioned visiting in 1893 did not teach phonics. Cincinnati was teaching spelling with reading, but not phonics. New York was using the word method, but without the sentence method, and Baltimore was using the word method. Presumably, from Rice’s remark contrasting the phonic St. Louis schools to non-phonic schools, these were among the non-phonic schools which were achieving poorly.

In summary, sources for the 1890’s demonstrate that first-grade reading in most places was not taught with true phonics. However, the emphasis in spelling with phonics at second grade and above repaired much of the first-grade damage. The enormous emphasis on spelling at second grade and above was the apparent cause of the very good spelling results Rice obtained at fourth grade and above when he carried out his testing in 1895 and 1896.
Chapter 31
The Turn of the Century Developments and The Beacon Phonic Series, One of the Few Really Successful Phonics Series

Most reading books produced about the turn of the century, except for Ward’s from 1894, continued with the phony phonics or no-phonics approach. Yet the harm they were doing was progressively less, as “supplementary phonics” in first grade and above, the kind Rice had seen, became more and more the norm. Nevertheless, the readers themselves repeated or increased the “meaning” themes that had been emphasized ever since the “sentence” method arrived. The sentence method had begun to infect the schools starting in 1870, but became pandemic after 1880 (despite Nila Banton Smith’s dating it primarily to the twentieth century).

One of these “meaning” texts at the turn of the century was Wheeler’s Graded Readers. A Primer, by Gail Calmerton and William H. Wheeler, published by Wheeler Publishing Company, Chicago. A later edition was published on which Guy Buswell of the University of Chicago was an author, entitled Happy Days, The Silent Reading Hour (1929). A Catholic schools edition was published in 1923. The authors of the first edition of 1900 believed in a strictly controlled vocabulary, obviously differing from the Heart of Oak approach of 1893 and 1895. A split in the “meaning” camp existed in the 1890’s between the promoters of the “natural” method and of “literature” and those who still used controlled vocabulary. Obviously, both methods were incompetent, but at least the latter could achieve some success by teaching high frequency sight words and context guessing, usually with phony phonics. Yet the “natural” method did not teach anything. The split exists today, between the “whole language” advocates which method teaches almost nothing, and the older sight-word basal readers which at least taught Code 3 phony phonics. The failures from the “whole language” method in comparison to the older sight-word basal readers are so pronounced they are producing parental rebellion, as shown in some fall, 1990, newspaper articles in the North Jersey Herald and News of Passaic, New Jersey.

Wheeler’s 1900 material was a Code 1, and not a Code 3 text. It is curious that the statement was made that they thanked “Francis A. March of Lafayette” for some help. What his help was is unknown.

“PREFACE

... It is of the utmost importance that a child’s first steps in reading should be taken in the right direction. A child does not learn to speak a word by hearing it once, and he will not learn to recognize the printed form of a word by seeing it once. He acquired his colloquial vocabulary slowly at first and by the aid of constant repetition. In this way, and in this way only, will he learn to recognize words in print. It should not be forgotten that in the early years of his training, the child is forming habits of reading and of thought by which he will be aided for the rest of his life, or of which he will by and by have to cure himself with painful effort.

“The end of learning to read is the ability to read great books, but what shall the child’s first reading book be? Some of our educational wise men say that it should be filled with classic literature, and that it should contain nothing which is not strictly classic. This sounds well, but these wise men have failed to produce the strictly classic Primer.

“...These literary selections should be graded in such a way as to bring those containing the fewest words outside of the colloquial vocabulary into the lower books of the series, the difficulties being gradually increased as the child grows towards maturity....
“...There are too many children who never form reading habits because they never really learn how to read. All through life they take no interest in reading and get no enjoyment from it because of the stress of attention and expense of energy necessary to get at the thought....”

This sounds suspiciously like Cattell’s influence: “the stress of attention to get at the thought...” The evidence indicates that, based on his experiments, Cattell’s followers believed that, for those who learned to read by phonics, a separate, conscious step had to be taken to turn meaningless sounds into a message. Yet children who learned by sight-words were presumed to go immediately from print to “meaning.” The article on reading in the 1913 Cyclopedia of Education by Henry Suzzalo provides background on this particular confusion of the early psychologists, which I have discussed at length in my earlier papers and books. The preface continued:

“This little book is the first of a series of ‘Graded Readers.’ It is to be read by the children and not to them by the teacher. The authors believe that a Primer should be very simple indeed; that the vocabulary should be small, that each word should be repeated often; that the words used should be largely those which are already familiar to the child in conversation; that it is unwise to require the child to learn many new words at the same time that he is learning to recognize the printed forms of the words which are already near and dear to him; that the sentences should be short; that there should generally be but one sentence to a line; that there should be frequent reviews; ....and that the very first ‘Stepping Stone to Literature’ is to acquire some skill in reading.

“Grateful acknowledgements are due to all the Primary Teachers who have given helpful suggestions; to the critic, the eminent philologist, Dr. Francis A. March of Lafayette College; to Ella Wheeler Wilcox for permission to use the little gem, ‘Five Little Brothers’; and to the Berlin Photographic Company for permission to use copyright pictures.”

The preface used the phrase, “Stepping Stone to Literature.” I first saw the phrase “stepping stone” in relation to reading in Mrs. A. C. Martin’s paper, “What Shall We Attempt in Elementary Schools?” which was read before the “Elementary Department of the National Educational (sic) Association” in Detroit, August 5, 1874, and printed in The Massachusetts Teacher, from which it was reprinted by Alfred Mudge & Son, Boston: 1874. Her paper was obviously getting a lot of mileage, suggesting that it was being promoted. Some of her ideas were good, but she was opposed to most memory work and to most examinations. She said, on page 23:

“Once more I plead for Reading as a ‘stepping stone,’ not as the pursuit of an art.”

The phrase appeared again in the title to an 1893 copy of an 1887 book, Stepping-Stones to Reading, A Primer and First Reader, by Anna B. Badlam. Badlam was shown on the 1893 copy as Principal of Lewiston, Maine, Practice School, formerly of Rice Training School, Boston. (The Primary School Teacher, Boston, in the early 1880’s had a considerable number of articles contributed by Badlam.) In her book, Badlam used some of Leigh’s notations, with his permission, on a mixed sight-word, phonic and sentence approach to beginning reading, which ended as heavily phonic, and which was published by D. C. Heath & Co. in 1893.

The phrase appeared again on the sight-word “literature” text, Stepping Stones to Literature, A First Reader, by Sarah Louis Arnold and Charles B. Gilbert, published by Silver, Burdett and Company, New York - Boston - Chicago, in 1897. The last book appears to have been very successful.
The first page of Wheeler’s primer had a picture of a mother with a baby, and the words, “baby,” “loves,” and “Mamma.” Then came the sentences, “Mamma loves Baby. Baby loves Mamma.” On later pages, the book was even worse as a beginning reading book. On page 23 appeared:

“Once more I plead for Reading as a “stepping stone,” not as the pursuit of an art. It is an old-fashioned notion in these times, but I hold to it still, that a child should learn to read as soon as possible. There must be many who hear me who cannot remember when they could not read. I am sure I cannot....”

Despite such uncontrolled vocabulary materials as The Heart of Oak series, which was apparently never popular, the controlled vocabulary approach was common and popular at the turn of the century. On March 10, 1983, a fellow teacher showed me a copy of a primer given her by a family member who said it had been used in Passaic, New Jersey, many years before. This book has penciled on its inside cover, “Sandie Henderson, Feb. 16, 1910.” It was entitled, The Sunbonnet Babies’ Primer and was copyrighted in 1902 by Eulalie Osgood Grover and published by Rand McNally & Company, Chicago, New York, and London and illustrated with pastel-colored illustrations by Bertha L. Corbett, “The Mother of the Sunbonnet Babies.” Excerpts are given below. Page 5 was the first page of text.

Page 5: “Who we are.” (Three pictures of a Sunbonnet Baby, two pictures of a dog and a picture of a cat.)

Page 7: “I see a baby. The baby is May. I am the baby. I am May. See May’s Sunbonnet. It is my sunbonnet. Do you see May? Do you see the Sunbonnet Baby?” (Picture of baby at a dressing table mirror) “I see a baby.”

Page 107: A Word List. “This list includes all the words used in The Sunbonnet Babies Primer. In order to make the list of greater value to the teacher, the words are arranged not alphabetically, but by pages in the order of their appearance.” (329 different words averaging 3 new words to a page.)

The preface was signed Chicago, November, 1901. In it, Eulalie Osgood Grover thanked Miss Elizabeth Hall, who was then Principal of the Normal Training School, Lewiston, Maine for help. As previously mentioned, the Finch Primer of 1897, published by Ginn, had been written by Adelaide V. Finch, Principal of the Lewiston, Maine, Training School, who had formerly been with the Minneapolis schools. The pro-phonics Anna C. Badlam who had been the principal of the Lewiston school had been replaced by the pro-“meaning” Finch some time after the publication of the 1893 copy of Badlam’s book carrying the notation that she was Principal of the Lewiston school. Then Finch was apparently replaced by Elizabeth Hall. Obviously, the make-up of Finch’s 1897 book reflected “respectable” reading theory, and Grover’s 1901 book, written with the “help” of Elizabeth Hall, also was “respectable.” It is therefore of interest that these two women endorsing “meaning” were chosen to replace the pro-phonics Badlam.

“Molly and May” were the Sunbonnet Babies. The publisher also advertised classics like Alice in Wonderland and Treasure Island “edited by” so and so, so they were also obviously watered-down books with controlled vocabulary. The publisher also advertised:

“New Supplementary Readers... and The Holton Primer Lights to Literature Series by M. Adelaide Holton, Supervisor of Primary Schools, Minn. The Sunbonnet Babies Primer, 110 pages
86 illustrations in color, Norse Stories, Eskimo stories, Viking Tales, King Arthur and His Knights, Japanese Fairy Tales.”

Early American Textbooks lists The Outdoor Primer which was also written by Eulalie Osgood Grover, Rand, McNally Company - Chicago, New York, London, and copyrighted in 1904 by The Rand-McNally Press, Chicago. I have photocopies of portions. The beginning of this material is as follows:

Page 1: A picture of a field and brook and in adult sized print under it, “The wonderful out-of-doors.”

Page 2: A boy and girl at a split log fence and under it were these isolated words in larger print suitable for a child: this is the bird a bird (printed as phrases). Under that, these sentences, each on a line: “This is a bird. Can the bird see you? The bird can see you. Can Baby see the bird? Baby can see the bird.”

Page 3: Nest and eggs in hollow of trunk. Under that picture, but not in phrases: “four in nest blue eggs.” Under that appeared, “See this nest! See four eggs in this nest! Is the bird in this nest? Baby can see the nest. You can see four blue eggs.”

The approach from the outset obviously was strictly controlled vocabulary, used in “meaningful” sentences, with heavy repetition of the sight words. That was the norm for most series published about 1900.

Although the approaches of most of these first-grade books were manifestly based on sight-words and controlled vocabulary, phonics was well on its way back to first-grades through “supplementary phonics” by 1900. The Public School Journal editorials about 1892 opposing Rebecca Pollard’s synthetic phonics at first grade had given their blessing at least to the supplementary phonics that had been growing over the years since Leigh’s day. It did not take too long after the endorsement by the “experts” of supplementary phonics at first grade in the early 1890’s for a series to arrive using heavy amounts of such “respectable” phonics at first grade. Dr. Edward G. Ward’s very heavily phonic “sound” material for first graders of 1894 was probably the first to be widely used after Leigh’s defeat, but Ward’s material nevertheless began with all the mandatory ritualistic bows to “meaning.” However, it did incorporate phonics into the reading books themselves after beginning the first book only with sight-words.

Ward was Associate Superintendent of Public Instruction in Brooklyn, New York. In his “Preface” to The Rational Method in Reading - Manual of Instruction (Silver, Burdett & Company, New York - Boston - Chicago, 1894, 1895, 1896), Ward recorded his thoughts:

“The method of teaching reading embodied in this book is an outgrowth of the author’s profound dissatisfaction with the results of the word method.

“The latter method, while it possesses the undisputed merit of leading to facility in thought gathering during the first stage of the work, proves slow and cumbrous afterward, fails to excite the child to effort, furnishes him with but a scanty vocabulary, and finally sends him out of school unprovided with a key by means of which, without further assistance, he may gain access to the treasures of the language.”

Note Ward’s flat admission of 1894 that the New York City schools had not been teaching children really to read. When Dr. Rice visited New York City schools in his tour of American schools in 1892, he had been appalled at the results from New York City’s use of the word method. It should be remembered
that only some fifteen or so years before, New York City administrators like Kiddle and Calkins had been endorsing the word method for beginners, even though, as shown by Ferdinand Buisson’s remarks quoted elsewhere in this text, Kiddle had also admitted children were leaving school after three years or so, unable really to read. Ward continued:

“The RATIONAL METHOD is a peculiar combination of the word and phonetic methods. It utilizes each for that part of the work to which it is especially adapted. The word method is used, first as principal, because of its value in developing a habit of reading thoughtfully, and afterward as auxiliary, to remedy the short-comings of the phonetic method, and increase the stock of word phonograms. The phonetic method, which is introduced by easy stages during the ascendency of the word method, finally becomes the principal means of growth and progress. It imparts power, while it supplies the key which the word method is inadequate to give.”

In the Ward program, the first eight weeks were devoted to sight reading, after which phonics work began, with the use of diacritically marked letters, very like Leigh’s. By beginning with an emphasis on “meaning,” it seemed to meet the “experts”’ formula, now that they had let the nose of the phonics camel into their tent. Despite the use of “word phonograms,” the approach was not ultimately two-step phony phonics but became one-step synthetic phonics with its emphasis on diacritically marked letters.

By 1905, where Ward had first led in 1894, others followed. By 1905, the phonics camel was well inside the tent, with only his tail outside. The School Bulletin, Syracuse, New York, began a series of articles in its December, 1905, issue (page 61), entitled “Suggestions on the Elementary Syllabus. I. Reading.” The articles are unsigned, but The School Bulletin was highly regarded, having won the prize for educational publications at the 1893 Chicago World’s Fair, so the 1905-1906 articles can be assumed to be “respectable.” According to the United States Catalog for 1912, Bardeen of Syracuse who published The School Bulletin also published a book in 1906 entitled Reading for Training Classes by R. M. Libby. The probability is that the book is a collection of the articles, and, if so, the author of the articles would have been R. M. Libby, whoever R. M. Libby was. The first article in December, 1905, stated:

“...The Education Department of New York has in its course of study and syllabus for elementary schools outlined a course in reading and offered valuable suggestions to teachers. Beginning on page four of the syllabus, they say first year, words, short sentences, simple paragraphs read from the blackboard, charts and readers, phonic exercises, etc.

“It is our purpose in this series of articles to expand the ideas here so briefly stated by showing how these topics should be presented to the class....

“FIRST GRADE, SYLLABUS

“The first work of the teacher with a class of beginners is to become acquainted with the pupils and make them feel that the school is not so radically different from the home life. To this end, the first lessons should be conversation lessons...In this manner, after a day or two the teacher selects the first sentence to be placed upon the board, using a large round hand with script letters. The teacher may say while writing ‘I am making the crayon say just what you said.’ This would be an introduction to the sentence method. Some may prefer to teach several words as wholes before making a sentence..... And now comes our first caution, do not allow the pupil to read the sentence one word at a time....

“The teacher should select seventy-five to one hundred words from the first pages of the primer or reader to be used by the class later. No book to be in the hands of the pupils until this
number of words is taught and can be recognized in all possible combinations of sentences, which
can be done in four to six weeks....

“After a week have a separate period, or use the first part of the reading period, for a word
drill.... Remember the reading period is for getting and expressing thought and should not be
devoted to learning words.... Never allow any guessing, or a second’s hesitation on old words;
prompt, vigorous, snappy work in this, the same as in number combinations, should be the
watchwords. Drill daily upon the list of old words written in different orders. Scatter them over
two or three boards, partly hide them in the corners and turn the whole class loose hunting for a
certain word the teacher names. Put the words upon pieces of paper three or four inches long cut
in the shape of fish. Put these in a box and with closed eyes have pupils draw a word and tell what
fish they have caught. Daily arrange new sentences using new combinations of the old words
introducing the new words after they are learned.

“Never allow a child to attempt to read a sentence until you are sure he knows all the
words.... This leads us to the much mooted question how shall we teach new words? When shall
we begin phones (sic)? We believe the first sixty or seventy words should be taught as wholes to
be recognized at sight, the same as a child knows a dog or a horse. Of course, teachers trained in a
definite system or using a series of readers like the Pollard, Ward, Gordon, or New Education or
Blodgett will get good results by following these books without assistance, but for others the
following suggestions are offered.”

According to the 1912 United States Catalog, the Blodgett readers by F. E. and A. B. Blodgett, primer
to fifth, were published by Ginn in 1904, but I have not seen a copy. The New Education Readers, “A
Synthetic and Phonic Word Method,” were written by A. J. Demarest and William M. Van Sickle.
Harvard library has a copy of their Book One published by American Book Company with a 1900 date,
but it is a meaning-method with only phony phonics. The Gordon Readers by Emma Gordon were
published by Heath, and Harvard has Gordon’s First Book with dates of 1902 and 1910. Gordon’s was a
phonics series with a beginning bow to “meaning.” The Harvard library also has Gordon’s A Manual for
Teachers of Primary Reading, Revised, 1918, showing the date of the original version as 1910.

All these materials except Ward’s of 1894 which purported to promote or actually did promote heavy
phonics dated from 1900 or after. Nevertheless, the flood of sight-word books for first grades also
continued after 1900. Appendix C listing readers published after 1880 will make that clear. Ward’s
appeared in 1894 and was apparently the first and one of the most successful of the relatively few heavily
phonics series which made ritualistic bows to “meaning” at their beginnings. Fassett’s highly successful
Beacon series of 1912 published by Ginn, discussed later, was another such phonic series, although
Fassett continued to introduce some sight words all through first grade. As will become apparent, a
heavily phonic method using supplemental phonics drill, preceded by a bow to “meaning,” was exactly
the method being recommended by the author of the 1905-1906 series of articles in The School Bulletin.
Yet her recommendations could have been used with any of the reading series then in print, even the ones
most endorsing “meaning” for beginners. The 1905 article continued:

“At the end of six or eight weeks at most, sentences containing the seventy-five or one
hundred words selected by the teacher from the reader should be read at sight. And now comes an
important transition from the board to the reader. If the teacher can make the printed form of
letters with ease and rapidity it is well for a few lessons to write sentences on the board in both
forms, showing the children that there is not much difference between the script and the printed
forms. Up to this time nothing has been said about letters.”
It is significant that the suggested method, as late as 1905, was to try to teach children to read seventy-five to one hundred words before they knew a single letter of the alphabet.

In her article, “Learning to Read,” in the Elementary School Teacher for September, 1911, Josephine Horton Bowden told of her experimental work with several first graders with pure sight words. She said the sight-word vocabulary load being given to first graders at the time was far too heavy since she found children could learn very few words when no attention was drawn to letters. She also demonstrated that the few words the children did manage to learn were perceived as wholes, since three of the five children did not notice anything strange when she showed them the words upside down! Although she typed the words and did not use script, children at that time were generally given their first words in script, which means there was no separation between the letters. Children therefore perceived them as wholes since they had no knowledge of the alphabet. Yet, as Bowden demonstrated some time before 1911, without any knowledge of the letters, even with print instead of script, children could remember very few words as “wholes.”

The article in the School Bulletin continued:

“Place along the top of the board the alphabet, the capitals above and the corresponding small letters below, written in a large round hand. Before the first grade is complete pupils should be able to recite the alphabet consecutively beginning with A, as this knowledge will aid them in the use of the dictionary later.

“First teach the long and short sounds of the vowels, making much use of the different families. Call one the ‘at’ family, marking the a short, prefix c, r, b, s, m, p, etc. Write these words in a column. Then the “ate” family, “ite” family, etc.”

Note that though this resembles two-step phony phonics, it is critically different. The children have not learned whole meaning-bearing words in context and afterwards been taught to compare their parts to unknown whole words - the “meaning” approach. Instead, the children were learning isolated, meaningless printed sounds composed of single or multiple letters, and then were taught to use these meaningless letters to build words. That is one-step phonics, and the “sound” approach, very like some of the old, pre-1826, spellers. The article continued:

“Have daily drills upon the sounds of the consonants. After the long and short sounds of the vowels are mastered take up the two dots above, the one dot above and all others except the equivalents. Teach combinations like sh, ch, ou, ow. Call sh the sound mamma makes to quiet the baby, ch the engine sound, ou the sound the boy makes when he hurts his finger; use many other comparisons which will suggest themselves to the thoughtful and resourceful teacher. Use phonic charts or cards for drill. Too much cannot be made of this pedagogical aphorism, attach the unknown to the nearest relative known. Write “a” for example, several times on the board, then the teacher gives the different sounds and ask pupil to mark the letters. Continue these daily drills of phonics and building up families of words, together with lists of phonograms like ing, ble, and eight.

“Soon you can use this knowledge in teaching new words, instead of teaching them as wholes. For example, suppose the new word is batting, cross off one t, mark the a short, what does the b say? Pupil gives the sound of b. He knows the “at” and the “ing” if properly taught previously. In most new words, a pupil will recognize one or more parts.

“Cover the unknown part and have him give the known. By following this plan in its expanded form, after one year the child should pronounce any common word placed upon the
board with the silent letters crossed off and the letters properly marked. You need not call it
accent but if he places accent on the wrong syllable, say make this part stronger; at the same time
place the accent over the right syllable; thus the pupils will soon learn what the accent mark
means.

“Never tell pupils how to pronounce a word but always place the word on the board properly
divided into syllables with diacritical marks. Ask what does the first syllable say, the second, etc.
This work presupposes a knowledge of the sounds of the consonants as well as the different
sounds of the vowels indicated. Do not have pupils spell the words, calling the letters by their
alphabet names, in their endeavor to pronounce them, because this method is often a positive
hindrance in pronunciation.... First grade pupils should read four times per day... but no period
should be longer than fifteen minutes.

“After the book is used continue the practice of reading each sentence silently, then looking
off the book and telling someone the thought....”

So after fooling around with seventy-five or a hundred sight-words for six or eight weeks, they finally
taught the class just like Rebecca Pollard. Of course, they got results.

The same approach appears in many European programs today, with teachers spending a month on a
short list of sight words and then eventually teaching true phonics. One French teacher told me, when I
visited their schools in 1977, that sometimes the children at fourth grade did not know some of the fifty
words or so they began with as sight words in first grade, but they learned how to read afterwards. Very
probably the first month or so of “meaning” instruction had blocked their ability ever to recognize these
words correctly, but fifty words or so that might cause trouble occasionally do not spell real difficulty.
The diluted phonics method at first grade in America after about 1900 worked, and was usually taught
“supplementally.” America received real - even if diluted - phonics in its first grades until about 1930,
when the baleful deaf-mute method descended on the schools again, and almost overnight wiped out the
success that phonics had finally achieved.

The Famous Beacon “Phonic” Series

Among the diluted phonics programs available after 1900 was the famous 1912 Beacon series. The
first book was The Beacon Primer, by James Hiram Fassett, Ginn and Company, Boston, New York (etc.)
The following comment is from its revised 1921 edition:

“Preface... The teaching of words by sight as well as by sound is made necessary by the fact
that nearly fourteen per cent of the child’s vocabulary is unphonetic and must be taught through
visual memory.”

The number of unphonetic English words is far fewer than fourteen percent, although different figures
are usually given. Even so, normally only one letter on such words is non-phonetic, the rest of the letters
in the word being phonically perfectly regular. Even irregular spellings usually occur in easily taught
groups, such as in find, mind, kind, wind, bind, where the “i” which should give a short sound as in “bit”
instead gives a long sound as in “bite.” The child’s attention should be focused on the sounds of the
regular letters, and then his attention should be drawn to the fact that one of the letters is irregular in
sound. Therefore, it is staggering to hear that the author of the famous phonic Beacon readers thought that
“nearly fourteen percent of a child’s vocabulary... must be taught through visual memory” or as pure sight
words without the use of sound, and even thought this as late as 1921. Both editions of the Beacon
Primer, the 1912 and 1921, make heavy (and inexcusable) use of sight words. That is only one more
confirmation of the fact that the phonics teaching of the early twentieth century was defective, but at least it was heavily phonic so that the great majority of children learned to spell and read by “sound.”

Fassett’s faulty ideas about “reading instruction history” are evident in his first comment below from the 1921 edition. His following remarks are also of interest.

“The power derived from a knowledge of phonics has always been admitted by educators, but the stilted and mechanical readers of the past did much to throw discredit upon any strictly phonetic system. The author of the ‘New Beacon Primer’ has avoided expressions that are obviously dragged in for their phonetic value, and while he has provided constant opportunities for practice in the text, there is no sacrifice of unity or of dramatic interest. This is made possible by his method of organization....The Beacon system follows the deductions of those who have made a special study of the science of speech and the practice of our great English dictionaries.... in a comparatively short time... the pupil should become independent and able to interpret any printed page through his grasp of phonetic principles....”

The New Beacon Primer began with a sight word selection on the first few pages for what Fassett called “dramatic interest,” which read:

“See me, mamma. Can you see me? I can see you. I can see kitty. Can you see Rover? Can you see Rover’s cap? Can kitty see me? Can kitty see Rover? Can Kitty see Rover’s cap?”

It passes understanding that anyone could think that children could read these skinny sentences and sight words over and over and find them dramatically interesting. Fassett added this note concerning the first sixteen sight-word pages in the 1921 edition:

“Note: while the class are reading pp. 1-16 they should have a daily drill on pp. 128-131. This phonetic work must be completed before going on with p. 17. The use of the charts will greatly simplify these first lessons in reading. If fourteen pages of the Reading Charts are studied before the Primer is taken up, only nine sight words need to be taught in the first nine lessons, - an average of one new word a day.”

Concerning these sight words, page 2 had the sight-words “baby” and “says” on the top of the page. No sight-words were on top of page 3, but the text on both pages included the sight-words “ball,” “play,” “the,” “likes,” and “little.” Yet pages 128-131 and the first fourteen pages of the phonic charts which Fassett recommended teaching first could not have covered the phonic irregularities in these few words which were not even marked as sight-words on the top of the page.

On page 121-122 were “Directions to Teachers,” with the footnote, “See also directions found on the first page of each Chart.”

“It should be clearly understood that at first there must be two distinct lines of teaching carried on side by side: (l) the drill upon phonetic lists for the purpose of developing phonetic power in the child; (2) the reading of simple lessons, mainly by the word-and-sentence method, until the child’s power in phonetics is far enough advanced to enable him to apply it in his reading. The application of this phonetic power to reading will vary with the class.

“Before the teacher can use any system of phonetics she must have a clear conception of the sounds of the individual letters. This can best be obtained by selecting a few simple words and slowly speaking them aloud, carefully analyzing the sound of each letter as it issues from the mouth. Note accurately the position of tongue, lips, and teeth. Take, for instance, the word fan: by
dwelling on the first letter f, it will be noticed that the underlip is brought back until it comes in contact with the upper teeth, thus producing the correct sound of the letter f. Then the lower jaw is dropped slightly, and the short sound of a follows. Finally, to produce the n the tip of the tongue is brought to the roof of the mouth just behind the upper teeth.... (the teacher) can indicate to her pupils the correct position of the lips, tongue, and teeth in forming all letters.

“1. For the first few weeks keep the drill upon the Letter Cards and the phonetic tables of the Chart and of the Primer entirely distinct from the reading lesson.

“2. The use of the Letter Cards and the Phonetic Chart may be supplemented by blackboard exercises.

“3. Insist on the proper position of lips, tongue, and teeth in sounding the letters.

“4. Work for rapidity, and review frequently.

“5. Work for the individual; concert work is of secondary value.

“6. Do not dwell too long upon the first list of letters, for the drill is reviewed on succeeding pages.

“7. Work for recognition of words as wholes. It will be readily seen that until this point is reached, the phonetic knowledge of the child is practically useless in reading; hence the desirability of keeping the drill and the reading separate until some degree of phonetic power has been acquired.”

Note that Fassett’s insistence on reading whole words for “meaning” at the beginning was because he was totally unaware of the existence of the syllable as the proper reading unit, instead of the “whole word.” This mindlessness was, of course, fostered by the fact that in Germanic languages such as English closed syllables commonly are also meaning-bearing words (dog, hund, etc.)

Note also the probably harmful discussion with little children of mouth positions in uttering sounds. Such positioning is normally done automatically. Focusing conscious attention on such positions should probably be done only as necessary by a properly trained speech therapist.

“8. Before beginning the reading lessons in the Primer make sure that the pupil can recognize at once any word in the tables on pages 123-127 inclusive. The preliminary training may be given on the blackboard, but the Charts will make the work easier for both teacher and pupil.

“9. It is important that the work in phonics keep pace with the reading. This means that for the first few weeks, at least, twice as much time should be devoted to the phonetic tables as to the reading. The daily drill should be given in several short periods.”

Page 123 carried these notes:

“Phonetic Tables This book is planned to be used in connection with the Phonetic Chart. The following tables and exercises should not be taught until the Phonetic Chart is completed.”

Fassett gave a footnote at this point:

“If it is impossible to use the Phonetic Chart, teach the sounds of letters found above (s f h t b r n m c g d l p a) also ba ha la ma na pa sa ra ta ca ga fa.”
Fassett did not mean that these should be taught as classic open syllables with long vowels, but as short vowels, as is obvious from the rest of the footnote. “When the child has mastered these, build groups upon the blackboard as follows: ra-n, ra-p, ra-t, ha-d, ha-m, ha-t, la-d, la-g, la-p.”

Continuing after the footnote, Fassett said:

“After finishing the tables found in the chart, the child should come to this work with considerable phonetic power. The following words should be given at the rate of thirty a minute. Before beginning the reading lessons in this book, study pp. 123-127, and review the Reading Chart. For application of these tables see pp. 1-16.”

Page 123 had three letter words with the short “a” vowel: “ma-d, ma-n, ma-t, ta-g, ta-n, ta-p, ga-p, na-g, ga-g....”

On page 124, Fassett said:

“The following tables have been planned to supplement the Phonetic Chart, which should be studied before these exercises are begun.”

“Footnote l: If it is impossible to use the Phonetic Chart, teach the sounds of k, w, j, and c, short i. Also develop bi di fi, etc., and form groups wi - 11, wi -g, ro - b, ro - d:, ro - t, etc.”

This page had short “i” words of three or four letters, some with double terminal consonants.

This note was on page 125:

“There are many difficulties which the teacher will encounter in teaching phonetics, such as the confusion of b, d, and p, the rapid blending of letters, etc. These are all carefully met on the Phonetic Chart.”

The top of page 125 had three-letter short “o” words except for “doll.” The group of words in the middle contained the short vowels “a,” “i,” and “o.”

On the bottom third of page 125 this appeared:

“If it is impossible to use the phonetic Chart, teach the short sound of u and form groups as before: ru-n, ru-b, ru-g, etc.”

This was followed by a group of three-letter short “u” words.

Fassett was certainly not teaching syllables, but words, as shown by the following note on page 128 concerning the way in which he taught children to work out words of more than three letters. The initial consonant and vowel were called “the helper”:

“The children should recognize the helper, then the first three letters, and finally the entire word, as mi s t. for application, see pp. 18 ff. mist, milk etc.”

On page 129, he said:

“Develop the consonant digraphs sh, nk, ng, ck, ch, and tch, ...for application see pp. 20 ff.”
On page 130, he said:

"...in the following words, a blend of two consonants precedes the following. Always sound the vowel with these two consonants, thus sta-b, pla-n, sla-p."

That is not using Pascal sounding-and-blending phonics, nor was his “helper” the use of sounding-and-blending phonics.

On page 131, Fassett covered “wh” and “th,” to be taught as “helpers.” On page 132, he covered long vowels, but only as formed by a silent “e” at the end of the word (as in “cane,”) and then five or six letter words with short and long vowels (only the silent “e” form). At the bottom of page 134, he covered long vowels from digraphs (as in meat) and said:

“The following arrangement will be of assistance in teaching the equivalents of the long sounds of the vowels. Notice that the sound of the first vowel usually governs. The same table will be found on page 19 of the Phonetic Chart. Do not use this table from the book, but print the digraphs on the blackboard. Teach all ten, and review daily. Use flash cards and keep well ahead of the phonetic tables found on pages 136-140.”

The vowels he gave were: ee (meet), ea (meat), ai (pain), ay (pay) oa (road), oe (hoe) ie (tied), y (by), ue (cue), ew (new). His was an exceedingly awkward and messy approach for the teaching of long vowels. These tables were to be covered immediately before stories containing practice words on these phonic elements. For instance, on the vowel digraphs ai and ay, he said, “for application see pp. 53 ff.”

He followed this with teaching “oo,” long, “a” and “o” modified by “r,” “er ir ur,” and two syllable words divided between syllables: such as “bet ter,” “hunt ing,” and “run ner.” Obviously, he was not teaching syllabication. He then covered a terminal “le” as in table, the diphthongs “au aw ou ow oi oy,” and the endings “ce” and “dge.”

Fassett said he had patterned his phonic readers on Webster’s speller, although it is clear he did not effectively do so. Fassett’s 1921 material was anything but ideal but it nevertheless contained much real phonics. However, his original 1912 Beacon materials, although they were also weak, were superior to and more strongly phonic than his 1921 materials (both published by Ginn). That deterioration suggests someone gave Fassett “help,” the same kind of help Dr. Charles C. Walcutt received as his and Glenn McCracken’s 1963 Lippincott series deteriorated with each revision after its original publication. (Apparently, only Walcutt was the author of the subsequent Lippincott revisions.) The revised editions by the new publisher, Scribner’s, after Walcutt’s death no longer qualify as truly phonic materials but are meaning-oriented. It should be noted however, that part of the defects in Fassett’s original material, like the defects in Walcutt’s material, came from the fact that the series was written by someone who could only deal with theory and not practice, since Fassett, like Walcutt, was not a teacher of beginning readers or of adult illiterates as Noah Webster, Rebecca Pollard, Rudolph Flesch, Sue Dickson, Sister Monica Folzer and Samuel Blumenfeld had been. Instead, Fassett was a superintendent of schools and his failings came because he wrote his material in the rarified atmosphere of theory, not practice.

Fassett’s “Preface” to his 1912 edition read:

“The object of this primer is to offer a set of easy reading lessons worked out in connection with a series of graded exercises in phonetic drill for the purpose of assisting the child in the easiest and most direct way to acquire the power of word getting, of word mastery, and of reading.
“The idea of the author can best be explained by stating that he has endeavored to carry out in this phonetic primer the exact principles which Noah Webster embodied in his so-called Spelling Book, a book which in reality was not a speller, but a primer, or a first book for teaching reading.

“If the reader will carefully examine a copy of Noah Webster’s Spelling Book, he will become convinced that Webster’s idea of teaching reading consisted of two distinct parts, namely: (1) tables of words carefully arranged according to their difficulty; (2) reading exercises based upon the words found in these tables. Thus Webster developed a method which long usage proved logical and sound.

“Besides the consonants and the short sounds of the vowels, there are but few phonetic rules which the pupil needs to learn before recognizing the majority of English words. These rules, when brought to his understanding through practice on long lists of selected words where only one difficulty is presented at a time, quickly and surely develop the reading power.

“It is found in practice that with proper development of the principles underlying the phonetic part of the English language, the use of diacritical marks is unnecessary; in fact they are worse than useless, for they present to the eye not the true form of the letter or word, but an artificial and arbitrary form which the child must soon learn to discard.

“In preparing the phonetic tables, only those words have been used which are easily within the comprehension of the child, except in those cases where not enough common words could be found for the necessary drill.

“The short sounds of the vowels are presented first because the words containing short vowels are far in excess of those containing long vowels; moreover, from the very structure of the English language, vowels are short unless modified by position, or by the addition of final e.”

Fassett was wrong on several statements: Emphatically, Webster had relied on phonetic marks and they emphatically did work, and Fassett was misleading about short vowels and structure, because he apparently had no knowledge of open and closed syllables. He said further:

“Directions to Teachers - General Plan. Do not confuse the directions found on this and on the following pages, which relate entirely to the development of the phonetic power, with the directions which relate solely to the development of the reading lessons by the word and sentence method. It should be clearly understood that at first there must be two distinct lines of teaching carried on side by side, namely: (1) the drill upon phonetic lists for the purpose of developing phonetic power in the child; (2) the reading of simple stories by the word and sentence method until the child’s power in phonetics is far enough advanced to enable him to apply it in his reading lessons.”

On page vi, Fassett used as “Aids to Memory” stories about each letter for the teacher to tell to the students. That approach was stolen from Rebecca Pollard with no credit given her:

“Here is a picture of what the watch said - t t t t. (Give the sound, not the alphabet name.)”

Yet Fassett did not even teach the letters “x,” “y,” “z,” and “q” until the end of Part I.

In the 1912 version, the phonic tables preceded the text, obviously giving phonics primary importance. It does not seem accidental that in the 1921 version the tables were inserted at the end of the
book, even though they were intended to be used at the beginning. That placement downgraded their importance and increased the importance of the half-witted sight-word “stories” with which the book began. Furthermore, the lists of words in the tables for phonic practice were markedly shorter in the 1921 version.

The child’s personal sounding out of lists of words which contain particular phonic elements is the necessary practice with which the child forms firm conditioned reflexes on those elements. The sounding-out of unknown words is precisely analogous to typing practice or to piano keyboard practice. Yet the shortening and almost removing of these lists of words for phonic practice has been characteristic of “revised” and “improved” editions of phonic programs for many years. Despite the shortening of phonic practice lessons, however, Fassett’s general approach in 1912 and 1921 was the same.

The “script” approach for teaching beginning reading in which letters are joined and not separated seems to have originated in 1875 in Parker’s Quincy, apparently so that words would be perceived more readily by beginners as wholes instead of as composed of separate letters. Script for beginners was apparently still lingering in 1912, though it is doubtful that anyone knew the Quincy source by 1912 or suspected what was probably its real purpose: the perception of all words as “wholes.” Fassett wrote the following:

“The Reading Chart. The Reading Chart, with its accompanying Perception Cards, will be found an invaluable aid in the development of this part of the Primer. Through their application the teacher may avoid entirely the use of script forms upon the blackboard, which, if introduced at this point, tend to confuse the mind of the child. The desirability of having the child master the Roman forms before learning their script equivalents is perfectly apparent to the skilled teacher.

“If, however, The Reading Chart and the Perception Cards can not be used, the teacher will find herself well repaid if she will take time to print the stories upon the blackboard; she will thus obtain much better results. Script forms of course may be used in the development of the word-and-sentence part of this Primer as they have been used in the development of other Primers based upon the word-and-sentence method.”

A startling and unmentioned difference appeared in the handling of sight-words in the 1912 and 1921 primers. In the 1912 version, a total of nine words were shown on the first three pages at the head of the stories, which sight-words were obviously taught in order to read the stories. In contrast, only two sight words were shown at the top of the first three pages in the 1921 version, but 26 DIFFERENT words were used on those first three pages! In no way had enough phonics been taught so that beginning children could have sounded out the remaining 24 words!

The following appeared on page 34, Part I, of the 1912 version:

“Suggestions to Teachers. The stories immediately following introduce a very important step in the teaching of phonetics. Up to this point the child, in all probability, has not applied his phonetic power in the slightest degree to his reading, but, from now on, a number of easy phonetic words will be interwoven with the words which he has been taught as sight words.

“This step is a difficult one for the child. The teacher will be surprised and disappointed at the pupil’s lack of power in sounding in his reading lesson the same words which he can give without hesitation from the tables. Care, time, and patience will be necessary to assist the child over this difficulty.”

753
Fassett had created an enormous problem by teaching beginners to read by “meaning” with
sight-words in their so-called “stories,” at the same time that he had drilled them to read simple word lists
for “sound.” On the first, the children had developed a Kanji-type reflex, and on the other a Kana-type
reflex. Now Fassett was counseling teachers to try to undo the damage he had caused, by coaxing children
to read “stories” with a Kana-type reflex. I have worked with little beginning readers and have marveled
at the intensity of these reflexes, once formed, and how difficult and sometimes impossible it is to try to
reverse them, even with beginners. Yet, having created an enormous problem with his teaching of
sight-words, Fassett continued to introduce pure sight-words all through his books, so that no matter what
the teachers did, the children would probably end up with mixed reflexes. The Beacon readers, which
have been praised for years by phonics advocates, when examined closely turn out to have been very poor
phonic books indeed, but at least they did teach real phonics eventually.

Fassett wrote at the beginning of Part II, page 47:

“Part II is intended to be read by the child after he has finished the phonetic work on the
Phonetic Chart and has reviewed for quick recognition the phonetic lists on pages 1 to 15 of this
Primer.

“The following reading exercises are so arranged as to call still further upon the child’s power
of sounding. Throughout the remainder of the book, only such words as the child is unable to
sound will be found at the head of the lesson.

“One of the great obstacles encountered in teaching phonetics is to find reading matter which
does not present too many phonetic difficulties at one time. In the following exercises the
phonetic facts are introduced into the reading only after they have been taught in table form and
thoroughly developed. For instance, no story is given with a word containing the sound of oa or
oe until the table containing these sounds (see p. 66) has been mastered by the child.”

In the 1912 version, “oa” and “oe” were taught on page 66, and the “r” controlled vowels on page 48:

“The following table contains words with the vowels e i and u when modified by r - er ir ur
like sound of ur in urn.”

On page 49:

“The following table contains common two syllable words. Teach sound of y when like short
i.”

The two-syllable words were separated in this material. With the stories on the page 56, these
sight-words were used: “eyes,” “pulls,” “blind.” Page 57 used the sight-words “would” and “ears,” even
though page 58 introduced the sound of “ee” and “ea,” so that “ears” could have been taught phonetically
on the very next page!

Page 61 had these five sight words over a story: “two other they grandpa are.” The next page had
these sight words over a story: “cents money next page walk try house.” Page 64 had as a sight-word the
word “pony,” which is a ridiculous thing to do in a program which is supposed to be teaching phonics,
just as with so many of the previous so-called sight words like “try, cents, next, page,” and “ears,” all of
which are phonically perfectly regular. Page 65 had “one old very.” Page 68 taught the “le” ending on
such words as table as a phonic element. Incredibly, page 69 had a story with perfectly phonetic
“bow-wow” as a sight-word! Many sight-words were presented all through the stories, often several for
each story, and a great many of them were perfectly regular phonically.
Overall, the 1912 Beacon might rate a Code 6 and the 1921 a weak code 6. Beacon had a controlled vocabulary, controlled by sight in part I, and by BOTH sight and sound in Part II. Because of its heavy “emphasis” on meaning, it undoubtedly created some severe reading problems with those children who could not switch gears from reading Kanji-style to Kana-style.

Why did the 1921 Beacon primer water down some of the phonic emphasis, listing, for instance, fewer words for the absolutely essential phonic practice? This paralleled the watering down of the heavily phonic Alpha One Letter People material about 1980 which watering-down was, however, far worse. The lengthy word lists for practice in reading newly taught phonemes in the Alpha One Chatterbook workbook were enormously shortened in the revised workbook, and “meaning” reading practice was greatly increased. I did not distribute the worthless revised workbooks to my first grade class. (Their use was optional. I was required, however, to give the children the far worse Houghton, Mifflin workbooks and readers, and the time-consuming “tests” accompanying them geared to so-called “skills” in the workbooks. The tests had to be filed in the school’s office.)

Dr. Walcutt’s Lippincott series, first published in 1963 with Glenn McCracken, met the same watering-down fate as the Alpha One program. About 1984, I purchased Lippincott duplicating “dittos” for supplemental phonic practice with my first grade to replace school-purchased 1963 Lippincott “dittos” bought many years before which had worn out. Those I bought about 1984 were from the last Lippincott revision and overwhelmingly emphasized “meaning,” not “sound.” I was told by someone who had spoken with Dr. Walcutt about that time that he was a very saddened man, as, I assume, had been Fassett in 1921.

If Dr. Walcutt had still been living, he would have been considerably more saddened at the revision made to his series after it was bought by Scribner’s. One of the principal authors on the 1987 and 1989 revisions was Dr. Jack Cassidy, a former president of the International Reading Association, who gave a talk at the New Jersey Education Association Convention in Atlantic City in 1979 in which he belittled Dr. Rudolf Flesch’s opinions. (By contrast and not surprisingly, Dr. Walcutt was apparently a friend of Dr. Flesch.) The emphasis in the Scribner’s 1989 and later series at first grade is overwhelmingly on meaning, not phonics. Despite copious window dressing, the “phonics” when analysed is two-step phony phonics, and there is a great increase in “necessary” sight words. For instance, “it” is presented as a “sight word” in the fall of first grade, not phonically! That is despite the fact that the short vowels had been taught in kindergarten.

Fassett’s phonic program in its highly popular (and obviously highly profitable) 1912 and 1921 versions was not even in print by Ginn by 1928, according to the 1928 United States Catalog. Yet Ginn continued to print in 1928 old sight-word (and undoubtedly far less profitable) materials that had been in print from as long ago as the 1890’s!

From long, long before 1921 when Fassett’s 1912 material was weakened in its revised edition, which weak edition was not even in print by 1928, the history demonstrates the effective squelching of such phonics programs as Fassett’s by wielders of influence. It is those same wielders of influence who have shaped and continue to shape the “educational environment” of most school administrators. Most school administrators took and continue to take their cues from such people, who are embedded as recognized “experts” at the “best” universities, foundations, and the like. Almost nothing ever gets published in educational journals which contradicts the official “wisdom” of such “establishment experts.” A researcher will look almost in vain for writings supporting phonics in education journals since about 1892 (and there were precious few even then). In English-speaking North America, Great Britain, South Africa, Australia and New Zealand, “meaning” programs have consistently produced terrible failures for many, many years, starting in the 1820’s. They have remained in place despite the fact that “meaning” programs
required an inordinate amount of time to “teach” and money to fund. They eventually even had to resort to phony “silent” tests instead of oral tests so that they could cover up the damage they were causing.

Schools in English-speaking countries are at present being afflicted with academic rubbish called “whole language,” which proposes that phonics be taught only incidentally - if at all. In order to sell any kind of propaganda, the propaganda should be inserted in a package which is 98% truth. The unwary see only the 98% of “truth” in the so-called “whole language” method. Who can object to giving children attractive stories to read, and who can object to encouraging their writing of stories themselves, as the “whole language” method proposes? However, here is the 2% propaganda inserted in the so-called “whole language” package. It states that to attempt to teach children systematically the phonemic structure of alphabetic print is futile because it is BORING. (It is not boring. When children are first being taught to read, they love good, thorough, sequentially structured phonics programs. They particularly delight in the power it gives them. However, those children who have already learned to read by using a “meaning” reflex, do find it very difficult to learn and to use the opposite method, phonics.) Since children might not LIKE being taught phonics, they might not read or write stories. Instead, have children read and write stories FIRST and THEN teach them phonics, but only if and when they need it. (However, when phonics is finally introduced to children who have already been taught to read by sight word “meaning,” the “sound” usually IS boring to them because of the conflict in the approaches.)

Because only 300 words cover three-quarters of simple compositions, the brighter children by second grade, who were taught by the “meaning” method in first grade, learn these high-frequency words. That is because their teachers write these words for the children as the children ask for them while composing their “whole language” stories all through first grade. Once the children have learned the high-frequency words by what amounts to heavy drill in writing their whole-language compositions, and once the children have gained some vague ideas on consonant sounds (the kind of phonics they are taught “if and when they need it,”) the children can give the illusion that they know how to read by stumbling and guessing their way through the little stories that they are handed, which usually have constantly repeated phrases and lots of pictures to assist in guessing. Their brain-washed teachers then think the children do not “need” phonics. By third grade, such children have joined the armies of functional illiterates that “meaning” has been turning out in the English language since the early nineteenth century.

The story of “whole language” is presumed to have begun in New Zealand. A cloying movie which appeared in theaters about ten years ago told of a soulful, poetic teacher who understood the emotional needs of her Maori students and so began teaching reading with REAL stories that the students wrote themselves.

Now, it is remarkable how the world does beat its way to the manufacturers of better mousetraps. Sure enough, this obscure teacher from out in the countryside swayed the whole education department of New Zealand to her “new” way of teaching reading simply by going to the city to tell them about it. Of course, the government education department of New Zealand must have been open to other thoughtful input besides hers, like that of Frank Smith and Kenneth Goodman, whose “theories” supported her “discovery.” Her child-loving improvement, “whole language,” soon flowered also in the understanding soils of Australia, Canada, England and the United States, where it tied right in with the language theories of “experts” like Kenneth Goodman and Frank Smith. Whole-language “story-books” were published instead of reading series, in which the child is supposed to be able to read for “interest.”

In essence, the elaborately illustrated little “whole-language” books are like the Heart of Oak book one of 1893 and 1895, which had nursery rhymes or fairy tales with constantly repeated phrases and sentences. They are also like The Passaic Primer of 1903 which had sentences built from the same constantly repeated sight words. The authors of The Passaic Primer, Spaulding and Bryce, produced in 1907 the Aldine readers which used the approach of their 1903 Passaic Primer. The Aldine series was
massively successful (undoubtedly because the series must have been massively promoted, just as “whole language” has been). The Aldine readers were only displaced by the arrival of the also-massively-promoted “Dick-and-Jane” and Macmillan deaf-mute-method readers after 1930.

Yet all of those materials, just like the so-called “new” “whole language” method, provided drill on the reading of whole sight words by presenting those sight-words only in “meaningful” sentences. The sight words are obviously guessed by their “meaning” through the massive use of context guessing. The true nature of the so-called “whole language” method is very simple. It is nothing more nor less than the use of context guessing to read whole sight words. That is the same pedagogically-bad approach for teaching the deaf that the Abbe de l’Epee’s used with his unfortunate students back in the eighteenth century.

At a workshop in Lyndhurst, New Jersey, in 1990, I was presented with a folder of material, much of which had originated in New Zealand, and listened to a first-grade teacher from Maine explaining how HAPPY her children were with the approach. The Lyndhurst grade-school teachers took great exception to the Maine first-grade teacher’s downgrading of phonics, but the Lyndhurst High School woman administrator who had arranged the workshop (and who had apparently never taught first grade) found the Maine first-grade teacher’s lecture VERY convincing.

What is noticeable about the “whole language” promotion elsewhere, however, is that, instead of being promoted by the major publishers, it is commonly being promoted by “mom-and-pop” types in workshops. These “mom-and-pop” operations have “spontaneously” arisen like the spring grass all over America.

Beacon was an example of the two-headed reading programs like Ward’s in use from about 1900 to about 1925, one part teaching students to read by sound and the other part teaching students to read by meaning. Such programs must have caused great difficulties initially for most children and ultimately produced many of the few “reading disability” cases that Gates and others worked with in the 1920’s. However, as Arthur I. Gates stated in March, 1925, in his article, “Problems in Beginning Reading - An Analysis of 21 Courses” in the Teachers College Record, virtually all programs by 1925, including the “meaning” programs like Aldine, made heavy use of supplemental phonics, so most American children did learn to read.
Chapter 32
Anti-Phonic Activists Return As the “Meaning” Aldine Readers Spread Across America, Their Effect Minimized by the Almost Universal Use After 1900 of Supplemental Phonics.

The Elson Readers of Scott, Foresman, in the Preface to the 1915 second edition, made a long complaint about the heavy use of phonics in beginning reading in 1915. The Preface included the following remark:

“The stress is placed upon mechanical memory, to the neglect of the development of thought power....”

Yet the opposition to the rapidly developing phonics emphasis in some reading programs after 1900 and in teachers’ heavy use of “supplemental phonics” was apparent long before that 1915 arrival of the second edition of the Elson readers, published by Scott, Foresman Company of Chicago and New York, the first edition of which had been in 1909.

The opposition had been evident in the Aldine readers of 1907 that had preceded even the 1909 edition of the Elson readers, and in the Horace Mann readers, among others. A copy of the Primer of The Horace Mann Readers which had been copyrighted in 1908 and 1912 showed its authors as Walter L. Hervey, Ph. D., “Member of the Board of Examiners, Department of Education, New York City, Formerly President of Teachers College,” and Melvin Hix, B. S., “Principal of Public School No. 9, Astoria, New York City.” The edition is marked, “Revised,” and was published by Longmans, Green, and Co., New York. In its “Foreword,” it said:

“The Horace Mann Primer is intended as a basal first book in reading. It has been subjected to the test of actual use in the schoolroom.... Some of the distinctive features of (its) method, particularly as applied to the Primer, are briefly as follows:

1. “Let thought lead,” a basal principle of very wide application, is held to be particularly important at the beginning... The sentences in the Primer lessons form a thought sequence...the Primer as a whole is definitely designed to promote constructive thinking, and the interest, attention, and growth in power that always accompany such thinking.

2. A method of teaching beginners to read may fairly be judged by its treatment of the vital question of phonics. If it neglects phonics, it fails to develop independence in reading; if it abuses phonics, - e. g. if it lets phonics lead, - it results in word calling; if it wisely uses phonics, while letting thought lead, it will result in independent and thoughtful reading....”

This 1908 or 1912 comment from the ex-president of Teachers College, Columbia, (and presumably from his co-author Hix) can be stripped to its essential thought. In essence, it said that children should learn to read by “meaning.” That meant that children should first learn a small collection of whole words from “meaningful” stories, and then use only two-step phony phonics, which is the jigsaw-puzzle approach of pulling apart and then putting together pieces of those whole words that the children had learned by their “meaning.” Children were not supposed to learn to read by pure “sound,” using Blaise Pascal’s one-step synthetic phonics method of reading unknown words, which is simply to pronounce sequentially the sounds (not names) of the letters, which isolated sounds then suggest the words.
Harvard has a 1914 copy of the Primer, The Horace Mann Readers. I made the following note concerning it on my photocopy of the back cover on July 14, 1986. That photocopy shows that most of the center, which was presumably the printed portion, of the back cover had been cut away, apparently with a razor, leaving a margin of fabric of about an inch on the top and bottom and a half inch on each side. My 1996 notes read:

“Guttman Library, Harvard, Cambridge, Massachusetts. This hard-bound copy, covered in a coated fabric had this much of the back cover fabric cut out, showing underneath cardboard, which was apparently done with a razor. Note two deliberate cuts - top part and then a lower second part. Underneath cardboard looks somewhat soiled and worn, so this was apparently done many years ago, considering the low usage of such primers in the stacks. This is a September, 1914, reprint.”

I had marked with an arrow where the first razor line ended, far down on the cover, and where the second razor line was, an inch below it, although both lines are very visible on the photocopy. Other Horace Mann readers of earlier dates were in the Harvard library, but I saw no others with such razor work.

The intriguing questions, of course, are, “What was on that razor-removed section? Why did the wielder of the razor then have second thoughts and decide to extend the cut an inch further? What was on that bottom part?” It is possible the Horace Mann Primer was a state-adopted copy, like the Suzzallo speller involved in the Texas, 1925, textbook scandal. If it were a state adopted copy, what might the removed portion have said concerning that adoption or the copy’s state-mandated use?

The razor work on that Harvard copy, leaving curious margins all around the razor-removed section instead of removing all the fabric on the back cover, which would have been a more natural thing to do, may well have been done by the same person who removed parts of pages 10-11 and 13-14 in the 1870-1871 Quincy annual school report in the Harvard library, leaving part of the margin and part of the rest of the pages. (It is unfortunate that the Harvard library lacks the whole 1874-1875 Quincy annual report, covering the year Quincy hired Colonel Parker.) I contacted the Boston library for copies of the mutilated pages from the 1870-1871 Quincy annual report, but the photocopied pages they sent me did not match the mutilated pages from the Harvard library of which I had photocopies, even though they were supposed to be the same pages from the 1870-1871 Quincy annual report.

Both the 1914 book cover and the 1870-1871 Quincy annual report show razor-removal of only printed parts, leaving the blank margins on the book cover and parts of the printed pages and the inside margin in the Quincy report. That curious and unnatural pattern of removing “middles” instead of whole sheets might be seen as a kind of personal signature. If so, that suggests that the same person may have made both deletions.

These deletions may be considered when remembering the theft of some unidentifiable and therefore irreplaceable portion of William James’ personal collection of his own writings in the early 1930’s, which collection had been donated to Harvard and kept in a faculty room there. That theft has been discussed elsewhere, as well as Heartman’s reference to the crime wave that had broken out in American libraries in the early 1930’s. (Also as cited elsewhere, Bride of the Revolution, the biography of Krupskaya, Lenin’s widow, by Robert H. McNeal (1972) refers to the systematic “sweeps” of libraries in the Soviet Union in the 1920’s which were carried out at Krupskaya’s behest to remove “objectionable” books. Such activities were not considered a crime in the Soviet Union.)

Since the curious theft of an unknown portion of William James’ personal collection of his own writings took place in late 1930 or very early January, 1931, it is not altogether unreasonable to speculate
that both the theft of James’ books at Harvard and the mutilations of these two Harvard library texts (and possibly the Harvard library’s loss of the 1874-1875 Quincy report) may have been the work of the same person. It is probably significant that Nila Banton Smith’s 1934 “history” totally omitted any reference to the once-nation-wide famous Quincy history. That strongly suggests that at least the importance of the once-famous Quincy movement to reading instruction history was being buried by Nila Banton Smith. Correspondingly, the theft of some unknown part of William James’ writings from a private faculty room (possibly over the 1930 Christmas holidays?) at Harvard suggests that someone was very possibly trying to bury whatever the content was in those writings of William James. That person would probably not have bothered to steal those writings unless their content was generally unknown but also for some reason important. After all, by 1930, copies of William James’ formally published work should have been neatly filed and readily available to anyone, and probably in multiple copies, not only in the Harvard libraries but in the Boston libraries and in any other large libraries in the United States.

If an unmutilated copy of that 1914 reprint of the Horace Mann readers could be found (and it was very possibly a state-adopted reprint), it would be interesting to see what was on that missing portion. Very possibly it had something to do with the conflict on the teaching of beginning reading which was so pronounced in the beginning decades of this century.

The Elson readers published by Scott, Foresman of Chicago in 1909 and 1915 were the immediate forerunners of William Scott Gray’s “Dick and Jane” deaf-mute-method series in 1930 published by the same company. (As discussed elsewhere, Scott, Foresman bought out the Sherwood Company of Chicago which had published J. Russell Webb’s sight-word materials since the 1860’s.) The 1915 Manual for the Elson-Runkel Primer was written by William H. Elson (1856-1935), “Author Elson Readers” and Lura E. Runkel, “Principal Howe School, Superior, Wisconsin.” Yet the fourth grade level of the 1915 Elson readers showed only William H. Elson as author. Lura Runkel apparently did the hard work at the lowest levels on vocabulary control and phony phonics so that all Elson had to do at the higher levels was to collect an anthology of attractive stories.

Lura Runkel was apparently one of the many female drudges who “assisted” such “experts” any time any real work was involved. Yet an actual copy of the earlier Elson Grammar School Reader, Book Four, copyrighted in 1909 does not show Elson as the sole author of the 1909 series, as had been implied on the title page of the 1915 series. The 1909 title page read, “By William H. Elson, Superintendent of Schools, Cleveland, Ohio, and Christine Keck, Principal of Sigsbee School, Grand Rapids, Michigan.” Apparently by the time the 1915 series arrived, Elson could afford to resign as Superintendent of Schools in Cleveland and live off the royalties from the two series. Christine Keck, his 1909 drudge, faded into oblivion by 1915 so was presumably still working away in Grand Rapids instead of living off royalties.

The “Preface” to the 1915 Primer read in part:

“...In recent years, however, experimental psychology has been throwing new light on the reading process. After a careful study of public school practice, Dr. Edmund Burke Huey, Dr. John Dewey, Dr. G. Stanley Hall, and other scientific investigators have pointed out vital defects in the prevailing systems, and have urged a reconstruction of teaching methods, in harmony with the new psychology of reading. They call attention to two special faults in present-day methods:

“(1) The stress is placed upon mechanical memory, to the neglect of the development of thought power. In the words of Dr. Huey, ‘The actual aim that has guided in the selection and arrangement of most of the early reading-matter has been the development of the power to recognize and call words, making reading a matter of word-pronouncing, mainly.’ Indeed, by making word-mastery the end, these methods produce readers of words rather than of thoughts.
“(2) The child’s interest - his only motive for learning - is ignored, since no vital content is provided for him. Dr. Dewey, in speaking of what he terms the ‘utter triviality of the contents of our school primers and first readers,’ says they ‘lack the essential of any well-grounded method, viz.: relevancy to the child’s mental needs.’ It is to be remembered that a method which ignores interest is extremely wasteful of energy. For interest is the most powerful impelling force; when it is lacking, its place must be taken by external compulsion, resulting in laborious drill.

“The Natural Method of Teaching Reading

“In the light of the new psychology of reading, it would appear that the natural method of teaching the child to read provides him with material (stories) of such nature as will grip his interest and constantly develop his power for connected thinking, by means of incident and plot structure. Through the use of this vital content, the natural method develops the various phonetic elements of our language, one by one, as they are encountered in the story. A content of simple but vivid stories, expressed in a typical child vocabulary, will inevitably contain these phonetic elements, and will bring them to the child in the course of his reading needs quite as rapidly as he is capable of mastering them. Moreover, the type words selected from such material for drill purposes will come to him in interesting associations, as integral parts of real stories. Contrast the type words found in many primers, doled out to the child in stiff, unnatural sentences, built up merely because some particular page is designed to exhibit, let us say the ‘in’ family and therefore weaves an inane sentence to contain the word ‘pin.’”

Jean Chall very nicely handled this kind of objection to real phonics at the beginning of reading instruction, in her book, Learning to Read: The Great Debate (1967). W. S. Gray had paraphrased the ideas just given, and complained that phonic materials would sound just as effective if they were read from the bottom of the page to the top, and gave a page from the Beacon 1912 primer to make his point. Dr. Chall reproduced a page from Gray’s 1956 primer and placed it right next to a reproduction of the page Gray cited from the 1912 phonic primer. She said both sounded better when read from the bottom to the top, but added that a considerable argument could be carried on concerning which was more boring.

If the Scottish Schoolmaster from 1829 read those 1915 comments, he might well say again that it was a great deal of fuss over the ABC’s since reading can be taught so quickly if only it is taught properly. In phonically “sound”trained classes like those using Sue Dickson’s Sing, Spell, Read and Write, children can pick up and read any book with fair success, by themselves, by spring of first grade (including the whole-language story-books currently being churned out). Yet children taught the Elson “meaning” way could read only the Elson first grade material. Furthermore, concerning “interest,” the children using Sing, Spell Read and Write take a great deal of pleasure in learning how to read, as any visitor to first grades using Sue Dickson’s material can see for himself. The same child-delight was found in Pollard phonic classrooms about 1890, and in Leigh phonic classrooms about 1870, as previous quotations have shown, and is found today in any classroom teaching phonics competently by any good “sound” method such as Sister Monica Folzer’s, Sam Blumenfeld’s, Open Court and a very few others.

The opposition to true synthetic phonics was apparent but veiled in the 1921 revision of the 1916 Aldine speller, which was a “meaning” speller masquerading as a “sound” speller. The speller accompanied the strongly “meaning” 1907 Aldine reading series using the sentence method. The Aldine reading series, written by Catherine Turner Bryce and Frank E. Spaulding (1866-1960) was enormously popular until 1930. However, Spaulding did not work on the Aldine speller of 1916-1921, which was written by Catherine Turner Bryce, who was by then Assistant Professor of Elementary Education at Yale University, and by Frank J. Sherman.
As discussed later in this history and in Appendix C, Spaulding was a dollar-a-year man in connection with foundation work for the Government dating from 1914. The influence of foundations on education aroused powerful opposition in the United States Senate in the spring of 1917, but the investigation foundered because of the advent of World War I.

According to Samuel Blumenfeld in The Blumenfeld Education Letter, February, 1994, Spaulding was:

"...a Wundtian PhD who organized Yale’s department of education and wrote numerous textbooks, was a member of the Rockefeller funded General Education Board from 1917 to 1920."

Bryce’s later position at Yale, mentioned again below, was presumably because of her connection with Spaulding of Yale.

Bryce had written the sentence-method Passaic Primer with F. E. Spaulding in 1903, which suggests they must both have been in Passaic, New Jersey, in 1903. From Passaic, it was only about a twenty-five minute train-ride on the Delaware, Lackawanna and Western Railroad to the railroad’s terminal in Hoboken, New Jersey, which had ferries available to go over the Hudson River to Christopher Street or, possibly as early as 1903, a tube train to go under the Hudson River to 33rd Street in Manhattan. Columbia Teachers College was conveniently located towards the upper end of Manhattan about 120th Street, so it is not unlikely that Spaulding and Bryce may have had some contact with “experts” there.

What Spaulding’s and Bryce’s actual positions were in Passaic is unknown, but presumably they were employed by the Passaic school system. The School Journal of May 13, 1899, reproduced an address by Frank E. Spaulding, Ph. D., given before the New Jersey Childhood Association, so Spaulding was well established by 1899. The Passaic Primer was published by A. L. Freeman Printing Co., Passaic, and it used the sentence-method approach. So did the Aldine readers that Bryce and Spaulding wrote in 1907, and so did the speller written by Bryce and Sherman in 1916 which was revised in 1921, all of which were published by Newson and Company of New York.

The Passaic Primer of 1903 was a terrible thing. Beginning sections were to be memorized. It began with these “meaningful” sentences, which had the same unnatural repetition as the famous prose that starts “Look, Spot, look.” In no sense can such rubbish be compared to poetically repetitive material like the Mother Goose rhymes:
“Fly, little bird, to the tall tree.
Fly to your nest.
Fly, little birds.
Fly to your nest.
Fly to the tall tree, little birds.
Fly to your little birds.
Fly to your three little birds.”

The repetitive sight words in The Passaic Primer were also printed separately: “little fly the your tall tree next” (etc.) On page 3, two-step, whole-word, jigsaw-puzzle phony phonics began, with a word repeated but separated into two parts: “t - all.” By page 23 words were printed which used the same word parts, obviously meant as material for future use in two-step whole-word phony phonics: “tall” was followed by “called,” and also shown were “last fast past,” etc.

The source for the title, Aldine, on the 1907 reading series written by Bryce and Spaulding was pretentious. It had been the name of a famous Italian press which printed classical works in the sixteenth century. It had been used earlier on the Riverside Aldine Series, according to the American Catalogue of 1885-1890. The Riverside Press of Cambridge, Massachusetts, was owned by Houghton, Mifflin Company, but whether there was any connection between them and Newson and Company of New York who published the Aldine readers is not known.

Frank E. Spaulding became Superintendent of Schools in Newton, Massachusetts, and Catherine T. Bryce became Supervisor of Primary Schools in Newton before she moved on to Yale, presumably with Spaulding. Nila Banton Smith said the 1927 Newson Readers were written by Catherine T. Bryce and Rose L. Hardy, and they were presumably meant to replace the 1907 Aldine readers published by Newson which had been written by Bryce and Spaulding. Bryce also wrote Playtime Primer in 1915, published by Newson, and other material. After she wrote the enormously successful sentence-method Aldine readers with Spaulding in 1907, Bryce had obviously prospered, ending up at Yale. Yet the 1927 Newson Readers showed on its title page the information that Catherine T. Bryce was by 1927 “formerly Assistant Professor of Elementary Education” at Yale. Their other author, Rose Lees Hardy, was Assistant Superintendent of Schools, Washington, D. C., and the second year level of Newson Readers (of which I have a copy) carefully explained how its vocabulary compared to Thorndike’s and Gates’ high frequency word lists (and so presumably did the first-year texts).

As mentioned, Spaulding was not the other author with Bryce on the 1916-1921 spellers, as he had been on the readers. That other author on the speller was Frank J. Sherman, formerly superintendent of schools in Danvers, Massachusetts. An associate in the 1921 revision of the speller was Arthur W. Kallom, Assistant Director of Educational Investigation and Measurements, Boston, Massachusetts. As will be evident from quoted portions, the 1921 speller is very like the 1903 Passaic Primer.

The following comments were at the beginning of the 1921 speller. When reading them, the scientifically obtained scores on the 1915 Ayres’ spelling scale should be kept in mind. The Ayres’ scale showed almost unbelievably high spelling scores for American elementary school children in 1914 and 1915, enormously higher than those recorded by the Iowa spelling scale of the 1950’s. Therefore, in reading the following, it should be remembered that a favorite ploy of change-agents is to invent fake crises, and then to offer to “solve” the “problems” themselves, resulting in the “fox in the henhouse” syndrome.

“To teachers and the public alike, probably no subject taught in the public schools has been more disappointing than spelling.... (A speller) must contain an adequate and simple system of phonics in the primary grades, since a large percentage of the words in common use are purely
Yet the material itself was rank fakery. It used the sentence method and phony phonics while pretending to teach phonically, so it certainly was not “fixing” a “practical phonetic foundation.” It was published in two parts, and Part One was for grades one and two. It taught high frequency words, as it said its choice of words was:

“...thought to represent the real writing vocabulary of the average child of the grade in which it is taught....as every error creates a tendency, and if repeated quickly establishes a habit, it is important that the correct spelling of words be taught before children have occasion to write them....”

Page 7 was the first page for the children’s use, and it had the alphabet in small letters. The very next page had whole rhyming words, sight words, and “meaningful” material.

```
1. sun fun bun gun nun
2. be he we see she
3. run to me tree the
4. Run to me. Run to the tree.
```

Even the quality of Newson’s publication, as well as its content, left something to be desired. A picture appeared underneath the meaningful sentence, “Run to the tree,” but the picture had no tree.

Concerning the “practical phonetic foundation” which the speller was “fixing,” note that on the very first page for first-graders, in the first phonetic material under “1.” and “2.” a group of short “u” words was followed by a group of long “e” words. This obviously has nothing to do with teaching long and short vowels sequentially, but has everything to do with whole-word, two-step phony phonics using word parts to build new words, the sort of thing Suzzallo endorsed in spelling, as discussed later. This speller would presumably have met with Suzzallo’s approval.

Note also the use of capital letters on “run,” although the alphabet of capital letters has not been given, but only lower case letters. Note the consonant digraph “tr” before even single consonant sounds have been covered. Note the use of “th” and “sh” on the first page, in the first fifteen words. These difficult paired letters do not represent blends of letter sounds, as “tr” does, but stand for the sounds of letters which are missing in our alphabet. They can therefore give beginning readers who are learning phonically a great deal of trouble, and have to be taught with care, not bundled in with other sounds in the very first lesson and with no comment at all on their peculiar use.

The Icelandic expanded alphabet has two separate letters for the two different sounds of “th” as in “then” and “thin.” Long ago, English used one of these Icelandic-style letters, but then attempted for a while to show the first “th” sound with the letter “y” as in “ye olde inne” before switching to “th” to show both sounds Obviously, the correct sounds for “t” and “h” when said sequentially have nothing at all to do with the sounds represented by “th,” and neither do “s” and “h” have anything to do with the sound represented by “sh.”

The make-shift replacements for letters missing in our alphabet (th, sh, ch) are not taught in phonic programs until all regular consonants have been taught, but, in the Aldine speller, “th” and “sh” were introduced with the first fifteen words!
Note also the phonically irregular sight word “to” on the very first page of words. If it were phonetic, it would rhyme with “so” and “go.” Truly, the Aldine speller was a prize example of the fake, “But-We-Do-Teach Phonics” syndrome.

That the intent was clearly not to teach long and short vowels in a logical fashion was confirmed by the third instructional page (page 9), when a variant spelling for long “a” appeared with short “a”:

```
5 ....hay may say
6 band hand land sand stand
7 play and with girls
```

This was followed by pictures, and then:

```
8 Run and play. Play with me.
```

Note the two-step, whole-word phony phonics on this page (and all pages). The “meaningful” sentence included the sight words “and” and “play.” Two words from that sentence were used to construct the “phonie” word lists on the page, with phony, whole-word, substitution “phonics”: -and, b-and, h-and, etc., and pl-ay, h-ay, m-ay, etc.

The sentence and picture “meaning” approach was carried throughout the book. The words on the following pages are good examples of two-step whole-word phony phonics, but the pages also included plain sight-words, as well as “meaning-bearing” sentences and illustrative pictures. Following are some excerpts:

```
Page 10  “by my try cry dry sky why
bold cold gold sold told hold fold
fly birds lit tle old
(picture of birds)
The little birds fly. Fly to the old tree.”
```

```
Page 11  (On bottom by picture of nest in tree)
“best rest west vest chest pest
all ball call fall hall wall small
pin spin tin chin win skin thin
nest is in on top of each other tall”
```

```
Page 12  (On bottom)
“ear dear fear year near tear
low row grow show low snow
it bit hit sit fit wit
Fly to the nest. The nest is in the tall tree.
Review:
run me play fly and bold
all best in dear snow hit”
```

This 1921 speller’s debt to The Passaic Primer of 1903 is obvious!

```
Page 13  “hear wind blow trees on
(Picture next to it of girl and blowing branch)
Hear the wind blow. It blows the tall trees.
```
Page 22 completed the first grade material, with a review of the presumably “phonetic” words covered, all of which had been taught as rhyming whole words (which emphasizes parts of whole words), and page 23 reviewed the sight words. The numbers of sight words were approximately the same as the number of phonetic words in this “phonetic” speller! Furthermore, being taught as sight words were such phonetically regular words as “dog,” “yes,” “six,” “on,” and “from!” Since these words (except for dog) produce few rhyming common words, they were apparently not suitable to teach two-step phony phonics in rhyming lists of whole meaning-bearing words. The Aldine speller’s phonics which taught such phonics words as “sight words” calls to mind the Scribner’s “phonie” reading series, which are the rewritten Walcutt-Lippincott materials. Scribner’s series teaches “it” as a sight word in the first half of first grade!

The Aldine speller material for second grade was more of the same kind of thing. In no sense could this Aldine speller be called a phonic spelling book, but it certainly used “phony phonics.” So, presumably, did the Aldine readers. Yet Gates stated, as cited elsewhere, that a great amount of class time was spent until 1930 on supplementary phonics drill, so the effect of the phony phonics in the Aldine materials was undoubtedly largely cushioned.
Chapter 33
The Howell “Sound” Material, and its Possible Relationships

Like the Beacon series, the Howell material was an example of the two-headed reading programs after 1900, one part of which emphasized phonics and the other part of which emphasized sight-words. The Howell program, however, did not introduce numbers of pure sight words but instead drilled on phonically taught words for instant recognition, just as if they had been learned as sight words. That approach is very faulty. As Quintilian correctly said almost two thousand years ago, reading speed should come only after and as a result of slow and careful reading.

The superintendent of schools in Raleigh, North Carolina, Logan Douglass Howell, wrote the Howell reading series which began publication in 1910 and which was revised in 1917. It bears an uncanny resemblance to the original Basic Reading series of 1963, the J. B. Lippincott Co. readers by Dr. Charles C. Walcutt and Glenn McCracken (which were revised by Scribner’s in 1987, after several revisions by Lippincott). The resemblance of the 1963 Walcutt/McCracken materials to the Howell materials even concerns the kind of type employed. The Howell series may possibly have provided the model on which Walcutt and McCracken wrote the Lippincott readers.

The Walcutt/McCracken materials also drilled on phonically taught words for instant recognition. However, while the Walcutt/McCracken series introduced only one vowel and two or three consonants on its first pages, immediately using them in words, Howell’s primer taught twelve letters before beginning words, but then followed the Walcutt/McCracken pattern of introducing phonic elements only when they were going to be immediately used in words. The whole words were then practiced to build up speed of word recognition. Such an approach, despite its initial use of phonics, is word “meaning”-oriented, not “sound”-oriented.

Despite the late Dr. Walcutt’s devotion to phonics, he specifically rejected sounding-and-blending phonics. I heard him do so in a lecture at the Reading Reform Foundation meeting in Princeton in 1979. The Walcutt/McCracken analytic phonics series taught sounds only in whole words, never in isolation. It took longer to teach and it produced inferior results compared to synthetic phonics programs such as Sue Dickson’s Sing, Spell, Read and Write, Samuel Blumenfeld’s, Sister Monica Folzer’s, Char Lockhart’s, Phyllis Schlafly’s, Mona McNee’s in England, and the very few others like them on the market today.

The reason that Howell and Walcutt produced inferior phonic materials is not difficult to fathom. Neither Howell nor Walcutt, despite their good intentions, were teachers of beginning readers or of functional illiterates. (McCracken, who wrote other books on the reading problem, was apparently a co-author with Walcutt only on the original 1963 Lippincott reading series and possibly on its early revisions up to at least 1974. When Macmillan published Teaching Reading, a Phonics/Linguistic Approach to Developmental Reading in 1974, showing Walcutt, Joan Lamport, and McCracken as its authors, the title page listed McCracken only as “Reading Consultant, New Castle, Pennsylvania. In all probability, therefore, McCracken had never taught first grade, either.) Yet the other authors mentioned above, all of whom produced superior phonics materials, had all been, at some time, either teachers of beginning readers or of functional illiterates.

Excerpts from Howell’s 1910 materials follow.

“Announcement. The other books of the Howell Series of Readers are in preparation. These books will consist of literary selections suitable to the age of the children, arranged on the same phonic principle as this Primer. The grading, therefore, will be the same as in the first book; and the step from one book to another will be no greater than from one lesson to the following lesson of THE HOWELL PRIMER.

“A Note to the Teacher (page 3) A child’s book is not the place for a pedagogical treatise on the teaching of reading. The author would only say that this primer may be used by the followers of any method.

“The book is constructed on a phonic principle, which makes it particularly easy for that method or for the alphabetic method. At first only one sound of any letter is used, and sufficient drill is given for the pupil to learn that sound before any other is taken. After the first twelve letters only one new thing is taught at a time; this makes the grading of the book uniform and easy.

“The word lists are intended to be read, not to be memorized for spelling lessons - at least not when they are first reached, though they will serve that purpose excellently well as a review.

“Teachers who prefer the word method or the sentence method will find this book, from the interest and action in its stories, equally well adapted to their wants. Such teachers may omit the first pages and begin with the reading lesson on page 14.

“Whatever method a teacher may begin with, phonics must be taught sooner or later, if the child is to become an independent reader. Therefore, whatever method the teacher uses, a primer presenting words spelled regularly, and easily graded, will be easier to teach than a book that makes no pretension to order or system in introducing new words.

“The alphabet of animals, beginning on page 113, is designed to teach the names of the letters, and the song on page 127, to teach their order in the alphabet. These pages give also a review of the whole book; they contain no new sounds.”

The alphabet was not learned as a whole, therefore, until the end of the primer on page 127, by the use of a song attributed to Mozart.

“The method of teaching that the author would recommend is the phonic. A manual on the teaching of phonics, with special application to THE HOWELL PRIMER is in preparation.”

The 1910 Howell primer, taken as a whole, was poor, but its 1917 revision was considerably better. The publisher’s name was dropped which suggests Howell may have published it himself in 1917. On the revision, however, he had the help of a primary teacher, which probably accounted for its improved quality, though it remained a word- and not sound- oriented work, despite its phonics.

(Back of title page) “The Howell Readers Primer, First Reader, Second Reader, Other volumes in Preparation.”
“Helps for Teachers and Pupils

“How to Teach Reading, a Manual for Teachers.

“Howell Illustrated Perception Phonic Cards - for teacher’s use in rapid phonic drills, 72 cards.

“Howell Perception Word Cards. 54 cards containing 109 words, including all in the first eleven stories in The New Howell Primer.

“Seat Work Letter Cards. 480 cards about one inch square, each containing one letter for use of pupils at their desks.

“Seat Work Word Cards. 9 cards, containing all the words in the first ten stories in the New Howell Primer, each card containing all the words for one story to be cut out and given pupils.

(Page 3) “A note to the teacher. The purpose of this book is to teach children to read by acquainting them with the elements of written English, and the method is by presenting only one new element at a time, and giving sufficient drill in it for the pupil to learn it.

“The Logical Steps in Teaching Reading

“The letters of our alphabet stand for elementary sounds of speech, and they should be taught as such. It is irrational to teach the sign of a thing before teaching the thing itself. Therefore, before teaching single letters or entire written or printed words, teach the things that letters stand for. Begin with spoken words; separate these words into their elementary sounds. Train the child to recognize these elements, and when that is done, teach him the letters that represent the elementary sounds. Then by combining letters, teach him to recognize written and printed words. These are the logical and correct steps in teaching beginners in reading.

“The Book Itself Provides The Method

“It would take too much space to go here into the details of teaching reading. Suffice it to say that any one, by merely following the steps as presented in this primer, can teach children to read in a few months, by any method he pleases; for the grading of the book provides that beginners shall acquire the phonic values of the letters, no matter what the teacher’s method.”

To believe that children could learn phonics simply by exposure to regularly spelled words and that they could do so in a few months was a major error, and showed Howell’s reliance on teaching whole words in 1917 instead of teaching isolated phonic elements. This is what the various linguistic series attempted to do in the 1960’s, and it is no accident that Dr. Walcutt used the word, “linguistic,” on his series which appeared in 1963. When the USOE first-grade studies were done in 1967, the scores for the purely linguistic programs, with their heavy emphasis on meaning, were about as poor as for the basal reader sight-word programs with phony phonics. Dr. Walcutt’s program, however, scored very well on the USOE first-grade studies, probably because of the use by classroom teachers of something of which he disapproved. In the workshop at which Walcutt spoke at the 1979 Reading Reform Foundation meeting at Princeton University, the first-grade teachers who were using his program openly disagreed with him. They stated they used sounding-and-blending phonics with his materials. This is a very easy thing to do because of his program’s arrangement and presumably would not have been so easy on purely linguistic programs. Therefore, these teachers of Dr. Walcutt’s program, and probably many like them in
the USOE studies with Walcutt’s program, were focusing the attention of their beginning readers on separate sounds, not whole words. Such classes produced better results.

Howell wrote in 1917:

(Page 4) “The use of the word lists. Pupils should be able to read readily each page of word drills before proceeding to the following story or verses. And not only this; the word drills should be frequently reviewed; the mastery of them will give pupils power to read not only this book, but any other book of similar grade, and hundreds of other words not herein given....”

As mentioned, Walcutt’s Lippincott reade also had such word drills. The emphasis is again on whole words, and reading them rapidly, rather than on drill in applying phonemes to work out unfamiliar words. Howell and Walcutt were therefore clearly disagreeing with Quintilian, who had said that reading must first be slow at the syllable (which means “sound”) stage.

Howell continued:

“Where a new element is introduced, a diacritical mark is used to indicate the sound for the teacher’s guidance....Diacritical marks (are) a hindrance... (and) would only add to the difficulty of teaching....”

In Howell’s rejection of the utility of diacritical marks, he showed a complete ignorance of the successful work of Pollard and Leigh, not to mention Webster! Of course, this is implicitly a rejection of sounding-and-blending phonics, which sequentially recites the parts of a word to discover the whole, and an endorsement of analytic phonics, which works instead only with the word as a whole, analyzing the sounds of its parts. But, unlike Pollard and Webster, Howell had been a superintendent of schools and not a teacher of beginners.

Howell wrote:

“The manual - Teachers are referred to the manual, How to Teach Reading, for fuller suggestions for teaching the mechanics and the thought side of reading, including oral expression, language training, acting the stories, songs, games, story telling, writing, the use of the illustrations, and seat work.”

As the above shows, the supplemental activities in the sight-word manuals after 1930 were anything but new.

The 1910 Howell edition had given only twelve letters at its beginning (and so apparently had the 1917 edition). Dr. Walcutt’s gave even fewer letters at its beginning and the letters were used immediately in words. The difference in the initial number of letters used is the major difference between poorer phonic programs like Howell’s and Walcutt’s, and better phonic programs. In better phonic programs, all the letters and almost all their phonic powers are taught first. It is only afterwards that words are given in which to sound out these letters. Clearly, better phonic programs promote more synthetic phonics, and poorer phonic programs promote analytic phonics.

Children should be taught almost all the sounds of the letters first before they are given any “stories” to read. Otherwise, children who are weak on letter sounds will fall back on context-guessing to “read,” instead of reading by sound. It is very worth while to play classroom games such as Bingo to practice the sounds. When a child is finally given “stories” to read, the stories should at first be rigidly controlled by phonic elements, from the simplest phonic elements first to the next simplest, and so on to the most
difficult. The 17 little phonic story books of the Sing, Spell, Read and Write program by Sue Dickson, St. Petersburg, Florida, are almost ideal for this purpose (although Book 7 does introduce a few too many irregular sight words). Sight words (except for a very gradually introduced very few, such as the and you) should be totally avoided until children are reading well by “sound.” Children should be given almost all the phonic keys to reading before about Christmas of first grade. In the remainder of the year, the children should practice using these phonic keys, one after the other, from the simplest to the most difficult, in little readers which gradually introduce practice on these phonic elements in a carefully planned order. Slower students need a heavy phonics review at second grade, but it is only a review - not new teaching. After about Christmas of first grade, children properly trained in phonics will almost never again meet a word in which the letter sounds are totally unfamiliar, even though they may not yet have achieved any speed in decoding. The purpose of little sequential phonic story books like Sue Dickson’s seventeen little story books is only to bring the children’s slow phonic recognition to the level of automaticity. The use of phonic readers exactly parallels sheet music practice on the piano for children who have already learned where all the notes are.

Yet, in the 1917 Howell primer, the fact that “c” has an alternate sound to “k”, that of “s,” was not taught until page 93 toward the end of the primer, which would be about half way through first grade. Nor was the “ow” sound in owl taught until page 100 of the primer. The fact that “g” has an alternate sound of “j” was not taught until the First Reader, which would not be covered until the spring term of first grade. Therefore, children would meet many new words after Christmas of first grade outside their school readers and even in other school textbooks containing phonemes they had not yet been taught. They would be forced to decode these new words by context and guessing.

In the second book of the series, The New Howell First Reader, Howell and Company, New York, copyright 1910 and 1917, the following appeared on page 3:

“A Note to the Teacher. The main purpose of the Howell elementary series is to teach children to read by acquainting them with the elements of written English.

“How to Teach New Elements. The method of this book is the same as that of the Howell Primer, and it should be taught after the same manner; the only difference being that by now pupils will learn more rapidly. Since the book is based on the sounds of speech, the teaching should be based on sounds of speech. Each new element, when it is first presented, is printed in small Italics. Before teaching the new written element give the class a phonic drill on words containing the new element. This is ear training entirely without reading either in the book or on the blackboard. For example, the first element taught in this book is g for the sound of j when it comes before e or i. Have the pupils ‘sound’ the words in that drill, gin, gill, etc., the teacher giving out the words to the pupils, with their books closed. Then tell them that in these words the j sound is written with g not j. Write a few words on the board; call attention to the fact that g here stands for the sound j, not for the sound g, and have the class read the words. Then let the pupils open their books and read all the words in the list.”

Shown on page 17 at the bottom in italics was “g = j ge = j.” Yet no mention was made that it is the presence of “e” or “i” following “g” which usually produces the “j” sound. On page 19 were the words, “feather” and “weathercock,” which have the letters “ea” producing an irregular short “e” sound instead of the normal long “e” sound. (When two vowels are together as in “ea,” the first is usually long and the second is usually silent.) The fact that “ea” in some words like “feather” is a short “e” and therefore an exception to the phonic rule just cited is taught in good phonic programs.

This program apparently did not teach such phonic rules, but simply word patterns (“linguistically”). It simply presented such variant spelling patterns for absorption, without explanation. The word,
“weathercock,” also contained “ck,” a special spelling. Short vowels in English such as the “o” in “cock” are always followed by “ck,” not just “c” or “k” (cock, duck, pick, etc.). This fact is taught in thorough phonic programs. The Howell material obviously did not teach any such phonic rules as the fact that short vowels are followed by “ck” and not just “c” or “k,” and that “g” followed by “e” or “i” usually takes the sound of “j.”

Despite the fact that most American adults are not consciously aware of such rules and only learned them through years of exposure to print (“linguistically”), such phonic rules are very few and are easily covered in first grade. The Alpha One “Letter People” series of cartoon filmstrips manages to cover every important rule in the reading of English in a delightful, playful, story-book fashion, easily understood by little six-year-olds.

Concerning one of the more obscure rules, most adults are not consciously aware that English words never end with “v” but with “ve.” Omitting the “e” on words like “love” simply looks wrong to most adults. Yet my first-graders knew better. The Letter People consonants were “boys” and the vowels were “girls.” One of the filmstrip stories concerned the fact that Mr. Velvet Vest (V) had his vest torn on the left, so Miss E now always standing next to him to cover up the rips whenever “v” ends a word (“love,” “strive,” “glove,” etc.). The first-graders knew better than to leave the “e” off words ending with “v,” and they found that “rule” not at all difficult. These excellent Alpha One “Letter People” filmstrips can be used in tandem with any good phonic program to reinforce the teaching of rules.

In addition to the fact that there are relatively few rules that it is necessary to teach in beginning reading, there are very few special vowel sounds that it is necessary to teach apart from the long and short vowels. The short vowel sounds are those vowels heard in the sentence, “Nat gets his hot bun,” and the long vowels are the names of the vowels themselves: a, e, i, o, and u. The few special vowel sounds it is necessary to learn are au-aw as in “law,” ou-ow as in “now,” oi-oay as in “boy,” eu-ew as in “few” (sometimes as in “blew”) and the two sounds of oo as in “moon” or “book.” (For the record, the first part of the paired vowels, au, ou, oi, and eu, is used in closed syllables which end in consonants: “haul,” “loud,” “soil,” and “feud”; the second part is used in open syllables which end in vowels: “law,” “now,” “boy,” “few.”)

However, to teach such material, Howell’s book covered only spelling patterns, the “linguistic” approach. It was not until page 29 of this second book that the second sound of double oo in “book hook foot” was introduced. To wait until the spring of first grade to teach the second sound of the double “o” diphthong is incompetent phonics, at best. (The first sound is that of “moon,” and competent phonic programs teach the “moon” sound and the “book” sound together so that children can easily distinguish them.) That kind of foot-dragging delay in teaching phonics was true also of Walcutt’s Lippincott series.

Howell, superintendent of schools in Raleigh sometime before 1917, wrote the phonic texts just described between 1910 and 1917. Although they were not ideal, they were still heavily phonic, and children using them would eventually have learned to read largely by “sound” and not largely by “meaning.” (Code 7 or 8). The 1910, 1917 Howell books were used for years and were still in print when the 1928 United States Catalog was published. Yet when Donald C. Agnew tested oral reading in Raleigh in 1935 or shortly before, where Howell had once been superintendent of schools, he found appalling disabilities because a sight-word series had been in use there. The sight-word “improvement” probably came down the controlling pipeline from the state department of education in North Carolina for use in Raleigh.

Nila Banton Smith listed (pages 206-207) “Courses of Study” in various cities and states which makes it obvious that change was forced in the 1920’s and after through these state departments of education and through the influence of large city school systems. Both were frequently staffed with the
high-powered graduates of “expert”-ridden places like Columbia Teachers College. For instance, Smith showed that Raleigh, North Carolina, in 1930 had an official city course of study in elementary reading, which presumably would have endorsed sight-word materials instead of phonic materials like those of Howell, who had once been superintendent in Raleigh.

Agnew compared third-grade children in Raleigh, North Carolina, which had a sight-word program with intrinsic phonics, to third-grade children in Durham, North Carolina, which had a systematic phonics program.

Dr. Flesch said Dr. Agnew gave the Gray Oral Reading Check Test, Set II and III. On Set II, Durham’s phonic group had an averaged score of 2.35 errors while Raleigh’s sight-word group had an averaged score of 8.79. On Set III, Durham had 7.02 average errors and Raleigh 17.50. Concerning speed, the Durham group took a little over a minute for each set but the Raleigh group considerably less than a minute. As Dr. Flesch put it:

“...the little Raleigh word guessers took considerably less than one minute to make two to four times as many errors.”

Agnew was apparently using Gray’s Oral Reading Check Test of 1923, which I have not seen, not Gray’s Standardized Oral Reading Paragraphs in their commercially published version dated to 1915. However, the paragraphs in Gray’s 1923 test were probably modeled on those oral reading test paragraphs in Gray’s three finished versions of 1914, 1915 and 1917. Gray had orally tested an enormous number of children from 1913 to 1918 with versions of these paragraphs, which versions were essentially the same except for refinements in some paragraphs and substitution of a few different paragraphs. The 1917 version which I have seen differed very little from the 1914 version which I have seen, and presumably the original 1915 version, which I have not seen, also differed very little. It was the preparation and testing of these paragraphs, begun in 1913 under E. L. Thorndike, which was the basis for Gray’s 1914 master’s degree at Columbia Teachers College and his 1917 doctorate at the University of Chicago. Therefore, it may be useful to refer to those earlier paragraphs from 1914 to 1917 as they are probably suggestive of Gray’s 1923 material which Agnew used for his tests.

In Judd’s 1918 Studies of Elementary School Reading, on page 65, William Scott Gray gave the paragraphs on his oral reading test, as revised in 1917. As mentioned, earlier versions of these paragraphs had been those of 1914 prepared directly under E. L. Thorndike and those of 1915. The 1915 paragraphs were apparently the finalized version of his Standardized Oral Reading Paragraphs, as that date was given for them in Buros’ 1975 reference work on tests in print at that date. Therefore, the 1915 version apparently became the basis for the final version which was sold nationwide, rather than the 1917 one. (However, I do not believe the version I saw in 1976, presumably that listed by Buros with the 1915 date, could have been that original 1915 version, as it was so markedly different from those of 1914 and 1917.) However, the approximately 60-word length of the paragraphs for all these versions suggest that they are probably not too much shorter than Gray’s later Oral Reading Check Test of 1923.

Yet, according to the 1928 United States Catalog, Gray’s Standardized Oral Reading Paragraphs were not in print in 1928, in the original 1915 version or in any other one. They came back in print sometime before the publication of Buros’ 1975 volume which listed all tests in print in 1975. The version I was
given in a teacher’s graduate course in 1976 of Gray’s Standardized Oral Reading Paragraphs (which
must have been the paragraphs dated to 1915 by Buros) was not exactly the same as the 1914 or 1917
material. (I saw the 1914 version on a photocopy of Gray’s master’s thesis which I obtained from
Columbia Teachers College Library, and I saw the 1917 version reproduced in Judd’s 1918 report.)

Although the version I was given in 1976 had far fewer total paragraphs than the 1914 and 1917
versions, the original first paragraph had nevertheless been replaced by three far simpler paragraphs,
which greatly expanded the beginning portion and made it much easier. As a result, much less was being
asked of beginners in that newer material than in earlier material. The original second paragraph became
the fourth paragraph in the newer material. In addition, the syntax and vocabulary had been simplified
somewhat in some paragraphs.

What was most noticeable about the material I was given in 1976, however, was that the method for
scoring which had been very clear in 1914, and which had been very clear in the original, but not refined,
method in 1917, had been made impossibly complicated and obscure and was almost meaningless. It
would have produced little usable data on a child’s actual standing on oral reading accuracy.

Reading Tests and Reviews, II, 1975, published by The Institute of Mental Measurements, edited by
Oscar Krisen Buros, has a section, “TIP II Tests: Reading - Readiness (Tests in Print).” One of two W. S.
Gray oral tests in print in 1975 was item 1689:

“Standardized Reading Check Tests - Grades 1-2, 2-4, 4-6, 6-8, 1923-55, two scores - rate,
accuracy, William S. Gray, Bobbs Merrill, Co., Inc.”

The other was item 1690:

“Standardized Reading Paragraphs. Grades 1-8, 1915, William S. Gray, Bobbs Merrill
Company, Inc.”

Yet neither of Gray’s tests were in print in the far-earlier United States Catalog of 1928 or The
Cumulative Catalog, 1928-1932. Therefore, they did not come back in print until some time after the
1930 switch to the deaf-mute-method readers. When they finally did come back in print, the 1915
material had been simplified, and so, in all probability, had the 1923 material. Yet these oral tests had
obviously been buried during the critical period of change: from 1928 to some time after 1932.

The only other oral tests Buros showed as in print in 1975 besides Gray’s (and Gates’ word lists
which were only a small part of the Gates-McKillop individual tests) were an Australian one from 1969,
an American one from 1961, Helen M. Robinson’s American one of 1963-67, the American Gilmore’s of
1951, and the revised forms of Burt’s test in England from 1921 to 1967.

No information is available on the Australian test of 1969 or the American one of 1961.

Helen M. Robinson, the author of the 1963-67 test, was an author on editions of the Scott, Foresman
readers, the first edition of which in 1930 was the original deaf-mute-method reading series of W. S.
Gray.

Gilmore’s oral reading test is very worthwhile, and was used in the USOE 1967 first-grade studies.
However, Gilmore’s norming scores for all his grade levels from his 1951 test population produced bell
curves when graphed, instead of skewed curves. Those bell curves on oral reading are very interesting
artifacts concerning the way American children could read in 1951: Bell curves are the result of testing
inborn abilities in a population. By contrast, skewed curves, piling up at either end of a graph, are
produced when learned skills are graphed. Therefore, Gilmore’s bell curves proved that our betrayed American children were not able to read by the use of automatic skills in 1951, but instead had been forced to use their intelligence to guess their stumbling way through the forest of print.

The author of the English oral reading test was Sir Cyril Burt, the English psychologist who falsified vast amounts of research data in other areas. His fraudulent work was uncovered by 1978, but that was only after Burt’s work had been accepted for about fifty years as the most highly respected research.

An article describing Burt as a fraud, “Further Proof that I.Q. Data Were Fraudulent” appeared in the New York Times on January 30, 1979. Fred Hechinger, who wrote the article, said that when Burt died in 1971 at 88 years of age, The Times of London eulogized Burt as:

“the leading figure in Britain in the application of psychology to education and the development of children and the assessment of mental qualities.”

Hechinger said that the fact that Burt’s work was fraudulent had originally been uncovered because of two Americans who doubted Burt’s conclusions, Prof. D. D. Dorfman of the University of Iowa and Prof. Leon Kamin of Princeton. More recent proof had been given by Oliver Gillie in The New Statesman, reprinted in Atlas World Press Review.

Burt’s life was called a “case study of a social science charlatan,” apparently by Gillie. Burt pretended to have proven that heredity always triumphed over environment, but, to do so, among other things, he invented 53 pairs of identical twins, most of whom he reported had been raised separately. Yet the “twins” were pure fiction, and so was most of the rest of Burt’s “research” which presumed to show that it was heredity, not environment, which shaped children.

Sir Cyril Burt’s oral test which had appeared as early as 1921 remained in print at least to 1967, and almost certainly for some time afterwards. However, since the psychologist, Burt, is known to have falsified so much of his data, then his oral test norms which were in use over all those years very possibly were also pure fiction.

Therefore, of the very, very few oral tests that Buros reported to be in print in 1975, most showed ties to the early psychologists: Gray’s and Gates’, because of their ties to Thorndike and Judd, Helen M. Robinson’s (because of her ties to Gray’s reading series), and the revised forms of the psychologist Burt’s test in England from 1921 to 1967. Concerning the Australian test from 1969 and the American test from 1961, I have no information, and they may or may not have shown ties to the early psychologists or to their proteges, who were the early promoters of the deaf-mute “meaning” reading method.

However, in contrast, the Gilmore oral test is very worthwhile (although implicitly accepting the vocabulary control of the basal readers as a fact of life). The size of Buros’ book on mental tests in print rivals the size of an unabridged dictionary. Yet only one test of oral reading was available in 1975, Gilmore’s (and possibly the unknown 1961 and 1969 ones above) that did not have clear ties to the early psychologists or to their proteges.

The paucity of worthwhile oral reading tests and of valid oral accuracy testing statistics on American children are silent scandals.

Since Agnew tested with “Set II” and “Set III,” he was apparently using the tests for Grades 2-4 and Grades 4-6, which seems a reasonable thing to do to test third-grade abilities. Gray had published these Check Tests in 1923 when almost all children learned with phonics. As a result of validating his tests which he had to do before publishing them, Gray obviously found average third graders in 1923 who had
been taught with phonics could score well on Set II for grades 2-4, but scored less well on Set III aimed at grades 4-6.

Concerning Agnew’s results in North Carolina on these oral reading paragraphs, it is not surprising that the phonics-trained readers read more slowly than the sight-word trained readers, because children reading phonically slow down to work out difficult words. Sight-word guessers who had been drilled in guessing for three years scored higher on speed because they did not pause to work out difficult words but just guessed or skipped them.

Gray’s 1923 paragraphs are not available to me. Yet, before 1935, Agnew undoubtedly used the original 1923 paragraphs. Presumably, the 1923 material now on sale has been simplified just as Gray’s 1915 material now on sale has been. However, to show the effect on oral accuracy of material which is phonically difficult for learners, it is worthwhile to compare Gray’s paragraph 2 to his paragraph 3 from his 1917 tests. Both of these paragraphs would presumably be at the Set I level, since the 1917 paragraphs totaled 20 and there were four “Sets” in 1923, suggesting each “Set” might match five paragraphs from 1917. Note that, at the concept level, paragraph two is not much more difficult than paragraph 3.

“2.
Once there lived a king and queen in a large palace. But the king and queen were not happy. There were no little children in the house or garden. One day they found a poor little boy and girl at their door. They took them into the palace and made them their own. The king and queen were then happy.”

“3.
Once a green little leaf was heard to sigh and cry, as leaves often do when a gentle wind blows. ‘What is the matter, Little Leaf?’ said the twig. The little leaf replied, ‘The wind just told me that one day it would pull me off and throw me down to the ground to die. That is why I am so sad.’”

This last paragraph appeared only in the 1917 Gray list and is ugly in its content from the point of view of a child. Such material does unnecessarily upset little children. Why should such dreary material ever be given to children? Thornton Burgess, the author of the delightful (and highly scientific!) nature stories for children, said he avoided all such ugly elements. Burgess had a far clearer understanding of children’s minds than the authors of such material as Paragraph 3.

Paragraph 3 shows obvious tampering with phonic elements because of its unnatural piling up of certain irregular phonic types which in natural prose occur with far less frequency. It is sharply more difficult phonically than paragraph 2, even though it would not appear so to most adults. Yet Gray’s scores showed it was so for sixth graders in 1917, and it is not surprising that it was apparently omitted from the final published form of the test, which carried the 1915 date, and not the 1917 date.

Using his Standard I of scoring, which was his most lenient and which was apparently simple oral accuracy, Gray reported that 100% of sixth graders could read paragraphs 1 and 2 at a passing level. Apparently in order to pass, they had to read it at 90% accuracy or better, the Standard I method Gray had used on his 1914 paragraphs, but the probability is that the vast majority read these first two paragraphs with 100% accuracy. Yet a relatively sharp drop appeared on paragraph 3. The probability is still, of course, that most read even paragraph 3 with no errors at all, but 1.4% did fail to read it even at the 90% accuracy level. (Below 90% accuracy is usually the “frustration” level even today on oral accuracy tests). Those who scored with more than six errors of some kind would have failed, dropping below the 90% passing score, since paragraph 3 had 62 words.
The reason the short 62-word Paragraph 3 was more difficult can be seen by its exceedingly complex phonetic content in comparison to the 60-word Paragraph 2. Here is a list of the extraordinarily irregular phonetic elements it used: Paragraph 3 contains one of the more difficult phonetic elements: a terminal long “i” sound on some words: “sigh, cry, why, die, replied.” Children would be more likely to read the “ied” ending from “replied” not with a long “i” but as pronounced in most two-syllable words such as “carried.” The paragraph also included the difficult spelling “ow,” which can sound like long “o” as in “crow” or “ou” as in “crown.” It mixed this with a variant spelling for long “o” : “told,” and then mixed it with the “ou” diphthong spellings: “down, ground.” Besides this, it included “ea” as short “e” : “heard,” short “u” as short “oo” : “pull,” and “g” pronounced as “j”: “gentle” It included “wind,” which has two pronunciations: “wind the clock,” or “blowing wind.” The phonogram “ind” should be a short sound from its spelling but more commonly rhymes with “mind, find, bind, blind, kind,” etc. That one paragraph should be so chock-full of phonetic anomalies was no accident.

Neither was it any accident that sixth-grade children in the early twentieth century when Gray tested them should have had some slight difficulty with such irregular spellings. When children were taught phonics as in the Beacon and Howell readers, it was usually done too slowly, too late, and mixed in with heavy helpings of sight-words. The thoroughness of the purely “sound” Webster speller, and the early exposure and drill on irregular spellings which it gave to beginning readers, was just a memory by the early twentieth century. Leigh’s and Pollard’s programs which had brought such thoroughness back to the first grades in schools in the nineteenth century had been quickly drummed out of them by the pestilential “experts.”

Happily, that thoroughness has returned in the 1990’s in the few first-grade programs containing such thorough teaching, such as Sue Dickson’s Sing, Spell, Read and Write, Samuel Blumenfeld’s, Sister Monica Folzer’s, and a few others. Yet our tax dollars in America’s government schools are almost never spent today for such worthwhile programs but only for “expert” trash. Nevertheless, in comparison to the inexcusably bad programs for which our tax money is being spent, the defective Beacon and Howell readers which dragged out phonetic teaching too long would appear to be almost perfect.

It is possible, even probable, that the phonetic program used in North Carolina by the group tested by Agnew was by Howell of North Carolina. Like all phonetic programs of the early twentieth century, it gave too little drill, too late, and mixed it with sight words.

As shown, the Howell phonetic reading series did not teach “g” as “j” until the beginning of the second book, the first reader, and did not teach short “oo” until far later. It did not teach “ea” as short “e” until well into the second book, nor “ow” as long “o.” At what point it taught terminal “y” as long “i” as in “cry” instead of long “e” (or short “i”) as in “funny,” I do not know. However, Howell’s program was not providing that early and thorough practice on such elements, and neither were the other phonetic programs of the period.

To cram eleven phonetically difficult words into one 62 word paragraph as Gray did on his 1917 paragraph 3 was certain to cause problems in the early twentieth century, even with children who were presumed (wrongly) to have been taught thorough phonics. That accounts for lowering the score Gray recorded at sixth grade from 100% passing on Paragraph 2 to 98.6 percent passing on Paragraph 3. The drop in scores such material would cause at third grade, where Agnew tested with children three years younger, would be even greater, and so would the resultant reduction of speed. It was the Set III material which caused a drop in scores for the phonically trained third graders, and that had been aimed at grades 4 to 6 and would have contained more phonetically difficult material, like Paragraph 3 of the 1917 test.

However, on Agnew’s test on word accuracy, the huge difference between the phonically trained and the non-phonically trained is astonishing. The 1923 paragraphs were certainly longer than the 1917
paragraphs of about sixty words as shown by the time it took to read them (about a minute). All the phonically-trained third graders passed Set II above the frustration cut-off point of 90% since they had an average score of only 2.35 errors. Most of them passed Set III too at or above the frustration rate of 90% since they had an average score of 7.01 errors. Six errors on a short, 60-word paragraph would be a passing score. Set III was undoubtedly longer than 60 words.

Unfortunately, such scores showing an averaged number of errors hide individual achievement which ranked scores do not. Ranked scores tell instead the percentage of children who actually pass a test, instead of the averaged score for a group. The two results can be startlingly different.

However, with the sight-word score on Set III of 17.50 average errors, if the paragraphs had been about sixty words in length (although they were certainly considerably longer), the sight-word trained children would have averaged only a miserable 70 percent passing, not 89% like the phonically trained children. If the paragraphs were longer than sixty words, as seems certain, all scores would have been higher, which would mean ALL the phonically trained third graders had passed, at scores over 90 per cent accuracy! Yet the paragraphs would have had to average over 175 words in length instead of 60 words for all the sight-word trained children to have passed at 90% accuracy!
Chapter 34
The Activists By the Turn of the Century Worked to Promote the Teaching of Spelling By “Meaning” Instead of By “Sound,” Reversing the Move Back to Phonic Spellers Like Webster’s and McGuffey’s in the Late 1880’s.

While beginning reading had been moving toward “sound” after 1900, primarily by the use of supplemental phonics, spelling had been moving away from “sound.” In that move away from “sound” in spelling is another story.

As has been discussed, terrible spelling failures in the 1880’s had brought phonic spelling into the second grade and grades above it by the late 1880’s, so that, by the time Dr. Joseph M. Rice gave his massive spelling tests in 1895 and 1896, upper grade children could spell (and therefore read) very well indeed. However, as has been demonstrated by the texts which have been described, first grade reading generally remained a wasteland full of “teaching for meaning” without teaching how to read, until about the turn of the century when supplemental phonics charts became the norm to teach beginners to read.

Also as discussed, this was through the influence of such people as Edward G. Ward who wrote The Rational Method in Reading in 1894 and who gave at least lip-service to all of the “meaning” ideas which had plagued American reading since 1826. By sounding psychologically orthodox, such methods finally managed to bring phonics back to first-grade classrooms, most commonly as supplemental phonics. The Ward (1894), Beacon (1912) and Howell (1910, 1917) readers and some others like them introduced real phonics in the reading books themselves, not just the supplemental charts used with most other reading series. Yet even the Ward and Beacon series began the teaching of reading with sight words, and the famous Beacon phonic series continued to introduce some sight words all through first grade. The Howell materials gave massive sight-word drill on words that had been introduced phonically.

Nevertheless, by 1911, when the psychologists resumed their heavy meddling in primary reading, true literacy had been restored to almost all grades in American schools except perhaps in the unfortunate laboratory schools attached to those universities which contained “experts.” Myrtle Sholty’s work with three second graders at the University of Chicago laboratory school about 1911, discussed later, certainly showed that those poor little girls had reading disabilities because of inadequate phonic training.

The movement back to phonics in reading at the turn of the century, primarily by the route of supplemental phonics charts, apparently occurred without too much opposition from the “experts” because during that time the “experts” had been preoccupied in meddling with spelling instruction instead of reading instruction. Although “sound” had returned to spelling by the late 1880’s, hard work by the “experts” had finally succeeded in replacing “sound” in spelling with “meaning” not long after the turn of the century. Professor Henry Suzzallo of Columbia Teachers College, Thorndike’s student in 1902, made a very illuminating comment in his 1911 article in the Columbia Teachers College Record. It confirmed that the “experts” had been successful in spoiling spelling instruction by 1911. Suzzallo’s reference to the “phonogram” meant a visual portion of a whole sight-word, not a sound-unit. Note his reference to its “sudden and large growth” in spelling instruction, which growth was obviously not accidental:

“A detailed analysis of the claims made for the superiority of the phonogram as a mechanical unit in phonetic translations explains its sudden and large growth in educational practice.... it is far superior to alphabetic and phonetic letter (study)...”
That Suzzallo meant parts of whole sight words when he used the term, “phonograms,” is made clear in his article, “Spelling, Teaching of” in the 1913 Cyclopaedia of Education. That article further described the take-over of spelling by whole-word “meaning” methods:

“Now spelling words are drawn from a context and spelled in a context, paragraph and sentence dictation sharing the spelling period with word lists. Even the word lists are based upon a careful classification which focuses attention on the meaning of words....”

Note the focusing of “attention on the meaning of words” instead of on “sound” when learning to spell. Benjamin Buisson’s 1893 comment, when he came from France to visit the Chicago Exposition, showed that even by that date American “experts” wanted children to take dictation of whole sentences instead of spelling lists of words, which change would obviously emphasis “meaning” and demote “sound” in learning to spell. The “experts” obviously largely succeeded before 1911 in promoting that change.

Suzzallo continued:

“...under such a changed status, it is to be expected that the present-day methods and devices for teaching spelling would be different from those that were traditional with the nineteenth century. Such is the case. The methods of the best current practice are more diversified and refined.... Growth toward naturalism is clearly indicated by the growth in favor of the phonogrammic method over all other means of phonetic translation. The advantages claimed for the phonogram in teaching pronunciation and spelling are: (1) It provides larger units for the subdivision and recognition of new words, thus reducing the quantity of artificial handling of a word. This method may divide words of one syllable (r-un, fun, h-ide, side) but practically everywhere else it suggests larger sound units than the method of syllabication (dem-o-cracy; aut-o-cracy)....

“The memorization of long authoritative lists of prefixes, stems, suffixes, derivatives, and definitions, which might or might not be applied to real words, has passed.... The same thing may be said with reference to learning and applying spelling rules. Only a very small number of spelling rules of greatest utility are now taught. These also are presented in the inductive spirit.”

By the “inductive spirit,” Suzzallo meant comparing sight-words to one another to demonstrate a few “rules,” which, if the child did not discover for himself, he might never know. I speak from experience, having had to use such spelling workbooks in my classroom in the 1960’s and 1970’s which used the “inductive” approach, not spelling out the rules the spelling workbooks were presumably leading the children to see. Most children rarely saw the point of these exercises and were simply confused unless the teacher taught the rule directly from the blackboard. However, Suzzallo’s “inductive spirit” was obviously also the whole-word, “meaning” approach.

The enormous emphasis on the teaching of spelling which took up a large amount of school time had come back into American schools after the mid-1880’s as a result of massive spelling failures from the sight-word method. That this failure existed, and that its cause was the sight-word method, is flatly
admitted in the 1889 phonic speller for second and third grade, Word by Word, by J. H. Stickney, the author of a well-known sight-word series. Spelling failure is also alluded to elsewhere and is very evident when reading handwritten school board reports before 1900. (Sometimes the bad spelling is downright spectacular!)

Yet Joseph Meyer Rice (1857-1934), who visited American schools in the 1890’s after the teaching of spelling had returned, obviously had no knowledge of the recent and massive spelling problems. Instead, in his comments in 1897 in Forum magazine, he objected mightily to what he considered the unnecessary spelling “grind,” because by that time children had scored very well indeed all over America in the spelling tests which he had given them. The indications are that the spelling lessons to which he objected in the 1890’s (which were almost certainly the cause for the high scores on his tests) stressed “sound” more than “meaning.” Yet hard data on this fact is lacking, except for some available spelling texts from the late 1880’s and early 1890’s which stress phonics very heavily, as well as the very large sales in that period of the strongly phonic Webster speller, and probably very large sales of the phonic McGuffey speller.

Rice wrote Scientific Management in Education in 1913, repeating his test data from Forum in 1897. His 1913 book endorsed rigid control from the top by “experts,” bypassing curriculum control by local boards of education, which he called “scientific management.” As we all know too well, such “scientific management” in American education has been increasing ever since 1913 and American academic achievement has been plummeting ever since 1913, in an almost mathematically pure inverse ratio. (Concerning the “inverse ratio” mathematics of failure in education, Charles M. Richardson, the Long Island engineer/educator of The Literacy Council, Huntington Station, New York, constructed a highly illuminating graph which demonstrated the inverse relationship over a period of years between tax money spent on education and academic achievement.) Achievement has been continuing to drop further every time we permit more “scientific” controls from the top, particularly when they are Federally-funded ones.

However, the fact that spelling drill must have stressed “sound” more than “meaning” by the late 1880’s is shown most clearly by the fact that by the turn of the century the “experts” had become so concerned about spelling that they were trying to reform it. Thorndike wrote on the subject very early, in his article, “Spelling,” in Teachers College Record, about 1901. Referring to Rice’s work, which was presumed to have showed that accuracy in spelling was not related to the amount of time spent in teaching spelling, Thorndike said, “Miss E. K. Carmen, at my suggestion,” tested the hypothesis that:

“...bad spelling was due to comparative failure to observe and attend to the spelling of words, to the habit of reading without really seeing words in detail. From the report of her study, I will quote a part. It appeared in the Journal of Pedagogy for October, 1900.”

The article by E. Kate Carmen had been titled, “The Cause of Chronic Bad Spelling,” and had been published in the Journal of Pedagogy of Ypsilanti in 1900, Volume 13, pages 86-91. It establishes that the “experts” had started to work on spelling by 1900, since Miss E. K. Carmen, at Thorndike’s “suggestion,” had done that “study” on spelling which was published by October, 1900. (Note the “experts” use of female drudges, who were probably satisfyingly cheap. Gates used them in quantity.)

Thorndike also quoted from an article by Miss A. E. Wyckoff, Pedagogical Seminary, Vol. II, page 450 (1893, according to Jean Chall’s bibliography in Learning to Read). Pedagogical Seminary was published at Clark University where G. Stanley Hall was President. Thorndike quoted Miss Wyckoff and then commented on her remarks:

“Constitutional bad spelling may, in part be the result of a strong natural bent toward selective attention.’ Her data were observations of two bad spellers, of whom she said,
‘Conspicuous as thinkers, they were comparatively slow readers, having the habit of reading one word at a time. Almost all their mistakes in spelling occurred in the latter half of the words.... Further tests made it clear that attention was habitually directed to the beginning of the words....’

What “Miss Wyckoff” actually turned up in testing adults before 1893 were subjective readers who read meaning-bearing words with the right half of their brains and therefore had to read such whole words “all at once.” When these adults had first learned to read as children before the 1890’s, they could only see half a word at a time (as shown by eye-span research on beginning readers quoted elsewhere in this history.) As a result, they formed the lifelong habit of reading with only the first half of words. Furthermore, the fact that they read “one word at a time,” showed they were hung up on reading “meaningful words,” instead of syllable sounds. Thorndike, of course, interpreted the results differently. They were presumed to have paid insufficient attention to whole words.

As previously discussed, Suzzallo wrote an article, “Spelling, Teaching of,” in the 1913 volume of A Cyclopedia of Education. The bibliography Suzzallo gave at the end outlined some of the hard work of the “experts” after 1900. Although J. M. Rice was in sympathy with the “experts,” he was not one of them, but his data was very useful to the “experts” who were infesting the universities. Burnham was at Clark University, where G. Stanley Hall was president.

“O. P. Cornman, Spelling in the Elementary School, Boston, 1902.

Both Suzzallo and Pearson were working hard to displace “sound” in spelling with “meaning” by 1911, the year that Suzzallo’s first article referred to here was published, and they jointly wrote a spelling series.

Henry Suzzallo (1875-1933) received an A. B. in 1899 and an A. M. in 1902 from Stanford in California and then worked there from 1902 until 1903, after which he became a lecturer at Columbia, earning his Ph. D. at Columbia in 1905. Suzzallo then went back to Stanford in 1905 as an assistant professor of education. John F. Ohles’ entry for Suzzallo in his Biographical Dictionary of American Educators, Greenwood Press, Westport, Connecticut, 1978, stated that Suzzallo then became adjunct professor of elementary education from 1907 to 1909 and was a professor of the philosophy of education from 1909 to 1915. Curiously, the entry did not say where Suzzallo taught during the years from 1907 to 1915 but implied it was at Stanford where he had been a lecturer since 1905. Yet the listing of departmental editors’ credits in the 1913 volume of A Cyclopedia of Education showed that Suzzallo was a professor at Columbia by 1913. Therefore, it appears reasonably certain that Suzzallo was teaching at Columbia at least from 1909 and possibly from 1907.

The Cyclopedia (1911-1913) was edited by Paul Monroe (1869-?) of Columbia and had articles by about 1,000 contributors. Its departmental editors were almost all “experts” in good standing, like Suzzallo himself. They included, among others:

1. William H. Burnham of Clark University.
2. E. P. Cubberley, the “historian” of education from Stanford.
3. John Dewey of Columbia who needs no comment.
4. Charles H. Judd of the University of Chicago who was Thorndike’s and Cattell’s close friend.
5. Arthur F. Leach, the English historian of education who, despite enormous amounts of excellent original research, was wildly bigoted, and, in addition, was given to other distortions.

6. David Snedden who was still one of the “Education Mafia” as late as the 1930’s, as shown by the letter quoted later which was written in opposition to Frank Vizetelly.

7. Elmer E. Brown, the U. S. Commissioner of Education.

8. Foster Watson of England who was truly an excellent historian of education.

9. Gabriel Compayre of France, who had received a denunciation from Brother Azarius in 1896\textsuperscript{35} for his historical distortions.

Those two promoters of “meaning” in spelling, Suzzallo and Pearson, jointly wrote spellers which had, to say the least, an unusual history as demonstrated by an article in the New York Times, on December 4, 1925. So far as I know, however, Suzzallo and Pearson were not personally involved in the scandal.

The front page article was headed, “Fergusons Accused in Textbook Deal.” Continued on the second page, the article told of the possible impeachment of Governor Miriam A. Ferguson, because of her conduct as Chairman of the State Textbook Commission. She had signed a contract for almost all elementary spelling books in the Texas schools for six years, beginning September 1, 1926, awarding the business to American Book Company, even though it had been the highest bidder of fifty or twenty publishers who had given bids. The spelling books were the two-book series by Pearson and Suzzallo, Essentials of Spelling. Her husband, James E. Ferguson, had been impeached as Governor eight years before, and yet he was the clerk of the textbook commission, opening bids and sitting with the commission when it discussed the awarding of contracts. Mrs. Ferguson had actually signed the contract awarding the business to American Book Company after the Attorney General Dan Moody had already ruled that the contract was invalid.

As has been commented even today, as Texas (and California) textbook adoptions go, so, very often, goes the nation. Once the Pearson-Suzzallo spellers were adopted in Texas, they would be assured of an excellent sale in the rest of the United States. (These statewide textbook adoptions are, of course, an unconscionable abomination.)

Pearson and Suzzallo were very “scientific” and according to Rice’s theory should have been well qualified to “manage” education. Suzzallo had excellent credentials. As he commented in the article he contributed to the 1926 honorary issue of Teachers College Record devoted to Thorndike on his 25th anniversary at Teachers College, Suzzallo had been E. L. Thorndike’s graduate student about 1902. Suzzallo was later a Professor of Education at Columbia Teachers College from about 1909 to 1915, his name being listed in the credits in the Cyclopedia of Education of 1913. He then became President of the University of Washington until he was fired by the Governor of Washington in 1926, reportedly for too

\textsuperscript{35} Essays Educational, by Brother Azarius (P. J. Mullany), D. H. McBride & Co., Chicago: 1896, p. 263 to 277, “M. Gabriel Compayre as an Historian of Pedagogy.” Brother Azarius, an historian of pedagogy, faulted Compayre on many points in a 20-page chapter, and gave an amusing response to Compayre’s disapproval of the silence and order in Christian Brothers’ schools. Brother Azarius said, “Suppose for an instant, that, instead of the order and silence now maintained in the Brothers’ schools, there were disorder in every class, no regular plan of studies, no text-books; that the Brother spoke loud and indistinctly, and did not wait for an answer; that he boxed the boys’ ears right and left; that he ran about the class like a madman, with no necktie, without a coat, and his long shirtsleeves hanging down over his loosely waving arms and hands. Suppose this picture given of La Salle or any of his disciples, would M. Compayre find in it aught to admire? Would he have words of commendation for the Brothers? Well, the picture we have drawn is no caricature; it is the faithful description of a loving disciple. It is the portrait that Ramsauer has left of his master, Pestalozzi.# And yet M. Compayre finds in Pestalozzi the alpha and omega of educational perfection.” The footnote read, “#See Oscar Browning, “Educational Theories,” pp. 156, 157”.

783
aggressive fund-raising activities (an enigmatic charge). Ohles’ biographical entry concerning his firing is cryptic:

“The aggressive efforts to improve financial support led to the dismissal by the Governor of Washington in 1926.”

The entry continued:

“Suzzallo lectured in Europe on American education for the Carnegie Foundation for the Advancement of Teaching (1927-29). He was a specialist in higher education for the Foundation (1927-29), Director of the National Advisory Committee on Education (1929-30) and President of the Carnegie Foundation for the Advancement of Teaching from 1930 to his death.... He was a trustee of the Carnegie Foundation for the Advancement of Teaching 1919, the National Council of Education 1926-33....”

If the “National Council of Education” had elected positions, and if the people of the United States had been familiar with Suzzallo’s educational theories in 1926, including his ideas on spelling, would they have elected him to such a position of probably heavy influence?

Concerning Suzzallo’s long-standing association with the Carnegie foundation, we are very familiar today with the private, non-governmental Carnegie foundation because of its work on national teacher tests and other activities concerning the standardization of American public education. This private, non-governmental, unelected body is doing much at present to shape the future of American education without having received any authority whatsoever from the American voting public to do so. Neither did Suzzallo ever receive any such authority from the parents of the American children with whose education he meddled for so very many years. Yet it was Suzzallo’s and Pearson’s expensive American Book Company “meaning” speller which was being foisted on Texas in 1925 by Governor “Ma” Ferguson and her entourage.
Chapter 35
Who Was Truly “Expert,” Vizetelly of Funk & Wagnall’s or His Opponents, Who Were, Unasked, “Scientifically” Managing Education?

Suzzallo obviously kept in contact with Thorndike before 1926, judging from a comment in the article he contributed to the Thorndike honorary issue of Teachers College Record in February, 1926. Suzzallo spoke of the accidental eavesdropper, waiting his turn outside Thorndike’s office, who might be annoyed or amused by the conversations he overheard. He said Thorndike was always patient with such callers, whether it was the silly questions of a beginning student or the twisted convictions of a rigid mind. Suzzallo spoke of the sick nature of set ideas saturated with emotion. But he said Thorndike was always sympathetic with all men, as they were “respected embodiments of experience.” That anyone could speak of other human beings as “respected embodiments of experience” makes it questionable who it was who had the twisted convictions. It is also abundantly clear that Thorndike’s ideas were enormously offensive to some of his fellow men, those with the “rigid” minds, since very few visitors outside very few offices ever hear conversations which are “saturated with emotion.” (I worked as a secretary outside oil company executive offices for 18 years and never heard a single such conversation.)

A letter of August 4, 1931, to the New York Times, published on August 7, by William V. Saunders, New York, responded to a letter by Frank Vizetelly. It sounded as though Vizetelly might have qualified as one of those “rigid” minds “saturated with emotion,” to Vizetelly’s credit:

“Educators and Publicity. Vizetelly Comment Evokes Observation on Educational Methods.

“To the Editor of The New York Times.

I read with some dismay Frank Vizetelly’s defense of radio announcers which appeared in THE NEW YORK TIMES, as a part of which he included an unfair attack on teachers. I’ll grant Mr. Vizetelly accord with his words on English pronunciation, because he has established his authority, as he says, by devoting “four years to compiling a book on words that are frequently mispronounced.” May I request the honor of authority in my special interest likewise - viz., education? I have had the privilege of spending five years under the direct guidance of such men as Kilpatrick, Thorndike, Bagley and Snedden, and of coming to primary acquaintance with the principles and philosophies of Butler, Dewey, Strayer and Cubberley.

“I am not going to present an attack on several different institutions of our life, as Mr. Vizetelly has done. I am only going to attack his advertising of his interpretation of the propaganda which our leading (sometimes misleading, too, I must admit) educators must get published continually to force change which is essential to growth, which in turn is often used as a definition of life itself....”

The “leading educators” were primarily at Columbia University and Columbia Teachers College in New York and the University of Chicago, and they had philosophies which were alien to the vast majority of Americans. Who elected them as “leading educators” of other Americans’ children? Almost none of them had ever taught below the college level and had absolutely no experience teaching children, so their presumption that they knew how to teach children is intolerable. At the very best, their pronouncements were only the opinions of busybodies.

These “leading educators” did have regiments of “graduate students” at their disposal to do academic chores for them, such as counting the number of different words in reading texts, and these “graduate
students” often were also teachers of children. Yet, if such graduate students who were also teachers wished to earn degrees, it would have been unwise to argue with the “leading educators” about anything.

The “leading educators” have been called the “Education Mafia” for very good reason. For instance, Mae Carden argued with the “leading educators” about the teaching of beginning reading in the early 1930’s and found it necessary to leave Columbia Teachers College without taking her doctorate. Miss Carden founded a highly successful phonic system for the teaching of reading which the “leading educators” have opposed ever since. Where was it written that the judgment of such men on the subject of education was to be held in respect by the vast majority of Americans?

Furthermore, where was it written that, in education, “change... is essential to growth”? Why should change be necessary in education any more than in religion? Both deal with truth, and truth is unchanging. Saunders was preaching the “progress” fallacy in its most virulent form.

Saunders’ next comment was about “democracy” - but the experts’ version, in which the public is misled into doing the propagandists’ will:

“We are a democracy, and a democracy means that more than one person must believe in a thing in order that it may be made a part of the lives of all. Thus it is that Congress makes our laws and not the President.

“Thus it is that educators, who must depend upon public opinion for the financial strength necessary to make any change, or in other words, for progress, must first convince groups of people of the need and benefit of such change....”

Of course, Saunders thought Vizetelly had no right to object to what the “experts” were up to, because Vizetelly was not an “educational expert,” but only a brilliant and public-spirited citizen who had not docilely submitted to brain-washing in an “expert”-ridden teachers’ college. Vizetelly, unfortunately, was right to object to the “experts” in education in 1931. The educational shambles we have in America in today amply justifies his opposition, and it exists because the recipes of the “experts” have been followed slavishly in the government schools since the 1920’s. “Experts’ recipes are still being slavishly followed in the 1990’s as the government schools sink America ever deeper into a cultural twilight. When large numbers of our enormously expensively educated high school students do not even know when the Civil War took place, cannot spell properly, have almost no knowledge of geography, literature, or grammar, and cannot do simple arithmetic, and when half of them are borderline or outright functional illiterates as well, we are most certainly in a cultural twilight.

Saunders spoke of “educators” obtaining “the financial strength necessary to make vital changes” “by drawing the attention of the public to essential public benefits, and what better way is there to get this attention than by glaring headlines such as will be given educators whenever they attack educational methods and procedures?....”

Most of these advanced thinkers like Dewey and Cattell were socialists, which makes it very amusing that they were truly “expert” at one thing: gaining what Saunders called “financial strength” or the piling up of money capital for their projects. The “leading educators” had taken over the vast financial resources of many foundations long before 1931. (See Lance J. Klass’s The Leipzig Connection, written with Paolo Lionni.) By 1931, the “leading educators” were aiming at tax money as well, and it certainly must be admitted that they have done very well at legally raiding the government coffers ever since. Even the U. S. Department of Education which they fought so hard but unsuccessfully to found in the 1920’s finally became a reality under President Carter in the 1970’s. It has served as a very fine money cow ever since for “experts” to milk, to say nothing of its harmful intrusion into local control.
It is abundantly clear that such “leading educators” were simply unelected, unasked for, and usually unsuspected change-agents. The major “educational method” they were attacking in 1931 was the teaching of reading by “sound.”

Dr. Francis (Frank) Horace Vizetelly (1864-1938) was by 1921 or before “Managing Editor of The Funk & Wagnall New Standard Dictionary and its Abridgments,” according to the title page of Punctuation & Capitalization - How to Make Use of Them, a book he wrote which was published by Funk & Wagnall in 1921. In his “Introduction,” he said:

“The subject of punctuation is sadly neglected in colleges and schools...”

Vizetelly referred to the fact that fifty years previously the United States Treasury Department lost tariff due it for one year on two million dollars worth of fruit that were admitted free of duty because of a misplaced comma in a tariff bill. An advertisement in the back of the book concerned A Desk-Book of 25,000 Words Frequently Mispronounced by Vizetelly, and said:

“...the volume, containing the recommendations of the leading lexicographers of three centuries, presents the most complete consensus of English pronunciation that has ever been compiled....”

According to the American Book Publishing Record, R. Bowker Co., 1980, Vizetelly also wrote How to Speak English Effectively. Guide to the Art of Correct Enunciation, Funk & Wagnall’s Company, New York and London: 1933. Among the books Vizetelly wrote was one entitled Words We Misspell in Business, 10,000 Terms, a curious kind of parallel to Thorndike’s book listing the 10,000 commonest words in reading.

So Vizetelly joined Thomas Sheridan and Noah Webster in promoting proper pronunciation, and his interest in pronunciation was the apparent reason for his remarks on radio announcers in his letter to the New York Times, although I have not seen that letter which prompted Saunders’ 1931 letter. It is curious that some of the most noted defenders of “sound” have been those who were most intimately concerned with REAL “meaning,” the writers of our dictionaries. Not only did Thomas Sheridan introduce Pascal’s synthetic phonics in the eighteenth century, but Webster improved on Sheridan’s notation in 1783. In 1866, Reverend J. C. Zachos’ phonic method was used by William A. Wheeler and Richard Soule, who were editors of Webster’s and Worcester’s dictionaries. Wheeler and Soule wrote a primer, First Lessons in Reading: A New Method, which was published in 1866 by Lee & Shepard of Boston, who were the publishers of the highly successful Oliver Optic novels for children. Like Sheridan, Webster, Soule, Wheeler, and Vizetelly, Mitford Mathews was also a philologist, and he vehemently promoted “sound” in his book, Teaching to Read, Historically Considered. These men, whose lives were spent refining the meanings of words but who nevertheless promoted “sound,” were all real scholars.

Not surprisingly, one such scholarly philologist promoting an emphasis on “sound” was the partner in Funk & Wagnall, Isaac Kaufman Funk, who died in 1912. (My notes are not clear but his birth date was apparently 1830.) Funk was Editor in Chief on the 1910 and 1912 revised editions of Funk & Wagnall’s Standard Dictionary of the English Language, and the philologist F. A. March was a consulting editor. (According to Sokal, March was Cattell’s favorite professor at Lafayette College before Cattell’s graduation in 1880.) One of many associate editors at the company (apparently since at least 1904) was Frank H. Vizetelly. At that time, Funk & Wagnall employed some 200 specialists.

Isaac Kaufman Funk and Moses J. Montrose wrote the Standard Reading Series which used the “Scientific Alphabet,” a kind of pronouncing print, which was presumably their own invention. Nila
Banton Smith referred to its First Reader as having been published in 1902 (pages 127 and 429 of her “history.”). The First Reader was still in print when the United States Catalog was published in 1912. The series consisted of a first and second reader and a teacher’s manual. Smith also referred to the fact that the Funk & Wagnall Company, New York, printed a revised edition using the “Scientific Alphabet” in the 1960’s, presumably at the height of the enthusiasm over the English Pitman Company’s ITA (Initial Teaching Alphabet) print used by Downing of England and Mazurkiewicz of the United States. The Funk & Wagnall material was apparently largely unsuccessful both about 1902 and in the 1960’s. However, that dictionary-maker Isaac Kaufman Funk should have gone to such trouble to teach beginners to read phonically was in a straight line of development from dictionary-maker Noah Webster in the eighteenth century.

The scholar Vizetelly had been among the staff of scholars who had worked on the Funk & Wagnall dictionaries, including their New Standard Edition with 450,000 entries, published after Funk’s death. Another one of the Funk & Wagnall publications was an abridged edition of that newer dictionary, The Concise Standard Dictionary with 38,000 entries. The Concise Standard Dictionary “had been widely adopted for use in schools,” according to its advertisement in the back of A Dictionary of Simplified Spelling of 1921 by Frank H. Vizetelly. That publication gave the spellings which had been adopted by the group working for simplified spelling which included F. A. March but the work was almost completely unsuccessful, even by 1921. However, the school dictionary in regular spellings being advertised must have been a very worthwhile book, since it was compiled by such a group of scholars from their newer unabridged dictionary. According to another advertisement in A Dictionary of Simplified Spelling, Funk & Wagnall’s unabridged New Standard Dictionary of 1915 had been completed “after nearly four years of time and more than a million and a half of dollars had been spent in its production. The work of over 380 Editors and Specialists....” The staff had almost doubled since the days of the earlier editions. The new dictionary was revised in 1919.

Yet the dictionaries used in elementary school classrooms when I taught from 1963 until 1986 were not updated versions of the scholarly works of Funk & Wagnall. They instead carried Thorndike’s name as one of the two main editors. How could Thorndike really compete in writing a dictionary with the staff of Funk & Wagnall which had personnel like Vizetelly? Should any dictionary written in part by Thorndike, whose expertise was at best only the ten thousand highest frequency words, or any dictionary written in part by other “leading educators,” have been permitted to replace school dictionaries written by expert philologists like Vizetelly? What effect did the probable drop in the academic quality of an important reference book like the dictionary have on American students?

It has become very clear to me that those who promoted “meaning” but downgraded “sound” in education in general over the past 170 years (in the manner of Agassiz, and, earlier, John Wood, et al) have usually not only been lacking in scholarship but have had limited intelligence. Yet they could exert massive influence because they acted in organized phalanxes. The arrival of government schools in the nineteenth century created a power vacuum which was just waiting to be filled by such organized activists with agendas.

These activists have always robed themselves with “scientific” mantles, even as long ago as the 1820’s. It was just such “scientific” people engaged in grinding out propaganda whom Rice endorsed to “manage” education. They did, indeed, manage it. It is generally acknowledged that education in America after the 1920’s was shaped by such men as those Saunders mentioned in his 1931 letter to the New York Times which complained about Vizetelly. Saunders stated, from his own personal knowledge, that the men whose names he listed found it necessary and acceptable to publish “misleading” propaganda to force their wills on their fellow citizens. Many saw their fellow human beings only as “embodiments of experience,” purely material objects. Yet these materialists were permitted, using their “scientific
management,” to shape the education of America’s children who were, overwhelmingly, from religious families.

Vizetelly was in apparent opposition to Rice’s 1913 endorsement of education’s being “scientifically controlled” from the top, which the “experts” like those at Columbia Teachers College were doing by 1931.

What is fundamentally wrong with Rice’s idea of “scientific management,” of course, is that it ignores the fact that the “management” of the education of children is their parents’ responsibility. No one, neither a “scientist” nor anyone else, has any moral authority to interfere between parents and children unless the parents specifically authorize it (“in loco parentis”), or unless the parents can be proven to be incompetent. Therefore, the ultimate “experts” on the education of children are the children’s own parents.
PART 6
The Close Parallels to American Developments in the History of Beginning Reading Instruction in Great Britain
Chapter 36
The Deterioration of Beginning Reading Instruction In Great Britain: From “Sound” to “Meaning”

In the English-speaking world of the British Isles, North America, South Africa, Australia and New Zealand, “meaning” programs in the teaching of beginning reading have consistently produced terrible failures for many, many years, starting in the 1820’s. They have remained in place despite the fact that “meaning” programs required an inordinate amount of time to “teach” and money to fund. Their greatest protection has always been the ignorance of the public concerning their nature. It is the purpose of this section concerning Great Britain, as it is the purpose of the other sections of this history of beginning reading instruction, to shed historical light on the “meaning” method in the teaching of beginning reading. It is hoped that will lead to its eradication and therefore to the eradication of its cruel and vicious effects.

In the eighteenth century, spellers were used to teach beginning reading by the “sound” approach in America, Great Britain and elsewhere in the English-speaking world, sometimes after and sometimes instead of the “sound” approach horn book. American and British spelling texts were very similar, and the hornbooks in both places were usually virtually identical. Yet, in the early part of the first quarter of the nineteenth century, a move from “sound” closer to “meaning” appeared in a few texts in the United States, and the same thing happened in Great Britain.

In Great Britain, Mavor’s 1802 speller published by Longwood achieved a large success in the first quarter of the nineteenth century, although it was only one of many spellers in print which were also successful. Yet it was sharply less phonic in its 1823 edition (the earliest one I have been able to find) than eighteenth century spellers, and than other contemporary English spellers such as Lindley Murray’s or even Dorothy Kilner’s. However, Kilner’s also veered closer to “meaning.” Whether Mavor’s was the same in its original 1802 edition as its weak 1823 edition is unknown. It should be noted, however, that a move somewhat closer to “meaning” first showed up in America in 1802 with the publications of Kneeland, Willard, and the anonymous author of The Child’s First Book, Being an Easy Introduction to Spelling and Reading. Both Murray’s and Kilner’s spellers were reprinted in the United States, as Mavor’s does not appear to have been. Mavor’s speller also included a great many more little reading selections than earlier spellers did, which obviously was a greater emphasis on “meaning.”

In the previous century, Newbery had been perhaps the first to introduce reading books in English tailored for little children which were not spellers and which were not meant to teach beginning reading, but which used unnaturally simple vocabulary and syntax. This was shortly before Diderot’s Encyclopedie article, “Syllabaire,” recommended that such simple little books be prepared for little children. (Contrary to the general impression, Mother Goose is not composed of such simple syntax and vocabulary, and, emphatically, neither are fairy tales.)

In 1744, John Newbery printed A Little Pretty Pocket-book, a pleasant little work meant for little children, in very simple vocabulary. He was also printing his “battledore,” a pictured version of the hornbook, about the same time which was meant as the first step in reading instruction, and The Royal Primer for the second step. Therefore, it was certainly not Newbery’s intent that A Little Pretty Pocket-book was to be used as a beginning sight-word reader, moving from “sound” to “meaning” for rank beginners. Yet, by using an unnaturally sparse vocabulary and too-simple syntax (as certainly is not done, for instance, in Winnie the Pooh, in fairy tales, or in Mother Goose), Newbery was laying the groundwork for what followed.
It was Anna Laetitia (Aikin) Barbauld who followed through on Newbery’s approach of impoverished vocabulary and syntax, in 1778-1779, with her book, “Lessons for children, in four parts.” Part 1 was “For children from two to three years old.” Parts 2 and 3 were “For children of three years old.” Part 4 was “For children from three to four years old.” Little two- and three-year old children at the time were being given the horn-book, (a “sound” approach), and pestered to learn to read, three and four years too soon. Mrs. Barbauld tried to write reading materials to match that presumed stage of development, even though it is probable that most children at those very young ages could not really read. As Mary F. Thwaite pointed out in From Primer to Pleasure, (page 189), Mrs. Barbauld’s probable intent was to have an adult read the stories to a child. Nevertheless, it is evident Mrs. Barbauld wanted the child at least to notice some of the simple words in large print as they were read.

Mrs. Barbauld’s work produced a rash of books written for such toddlers. Yet none of them appeared to be meant as sight-word “meaning” readers for beginners, but only to follow a little child’s too-early introduction to the “sound”-approach horn book and speller. In addition, probably all were meant to be read aloud by an adult.

Mary F. Thwaite wrote (page 71):

“Another active publisher of moral tales was John Marshall, of Aldermary Churchyard, who issued most of the works of Lady Eleanor Fenn and Dorothy and Mary Kilner, all popular authors of their time... Lady Fenn, who specialized in simple works to lighten the path to reading, wrote as ‘Mrs. Teachwell,’ ‘Mrs. Lovechild,’ or ‘Solomon Lovechild.’ She invented many of her little aids for her nieces and nephews. One of the most well-known was a two-volume composition with the inviting title - Cobwebs to catch Flies (1783). A system of graded reading ‘in short sentences adapted to children from three to eight years’, it offers advice about behavior as it progresses....

(Page 190): “The first volume consisted of ‘easy lessons in words of three letters up to six letters’ for children of three to five years old.... Mrs. Barbauld had used no pictures in her little book, only large type, but Lady Fenn’s had the attraction of cuts... William Godwin and his wife brought out several books of easy stories for infants, including his own Fables, ancient and modern (1805) intended for children from three to eight years. Other examples of the Godwin firm’s productions for this age are Six Stories for the Nursery in Words of one or two Syllables (1824)... and Stories for little Boys and Girls in Words of one Syllable (ca. 1820)....”

All of this represents a move from “sound” towards “meaning” for rank beginners, even though the “sound-approach” horn book and speller were not dropped. Children had previously been exposed to complex syntax and vocabulary in the stories read aloud to them. By “teething” on such stories, part of the meaning of which they undoubtedly missed, they nevertheless expanded their growth in syntax and vocabulary, just as they did by listening to adult conversations which they did not completely understand. Exposure to this natural language complexity is the means by which children’s language can grow. Yet natural language complexity was being removed from children’s literature by the end of the eighteenth century so that the children would get more of a story’s “meaning.”

Alexander Graham Bell may never have heard of Mrs. Barbauld, but he opposed her methods. He said in his paper, “On Reading, As a Means of Teaching Language to the Deaf,” an address at the Gallaudet Meeting at Jackson, Mississippi April 14-17, 1888 (pages 5 and 6):

“If the (deaf) pupil is to make progress in his knowledge of ordinary language, the language must be above him, and not degraded to an unnatural level. Teachers may say, Why use idiomatic phrases that cannot possibly be explained to the deaf child? But he never can come to understand
them until he has seen them, any more than the hearing child can understand them until he has heard them. The hearing child learns to understand by hearing, and the deaf child will come to know by seeing. Frequency of repetition will impress the idiomatic phrases on his mind, and much reading will bring about this frequent repetition in ever-varying contexts.... I would have a deaf child read books in order to learn the language, instead of learning the language in order to read books....”

Bell believed syntax and vocabulary were best learned by immersion in a language, not only for deaf children but for hearing children, as well. Yet the Barbauld degraded-language approach is one that arrests language development.

Spellers for many years had been arranged in tables first of one-syllable words, then two-syllable words, and so forth. Yet the idea of breaking the one-syllable word tables down into separate categories based on the number of letters in the words had come from Thomas Dilworth’s 1740 speller. Dilworth invented the approach of breaking down the beginning tables of one-syllable words in spellers into lists of words of two letters, three letters, four letters, etc. Yet nothing could be more unnatural and alien to real language learning for a child than this choppy kind of speech based on limiting speech to one syllable words, and to the numbers of letters in those one-syllable words.

However, the “sound-approach” spelling books were not dispensed with by authors of children’s literature before the nineteenth century, even though widely known authors limited the words used in their stories, based on the number of letters in the words. Dorothy Kilner (1755-1836), mentioned above, wrote a speller which was in use for many years, not just in England but in America. The rare-books room of the New York Public Library has Dorothy Kilner’s speller in American editions of 1823 and 1830. Her speller rates a Code 7 because of its heavy analytic phonics, despite its somewhat abbreviated syllabary. The 1823 copy is entitled, The Primer: or Mother’s Spelling Book for Children at a very early Age. “By M. Pelham” (“pseud. of D. Kilner”), “Author of the Mother’s First Catechism. Second American Edition from the Ninety Seventh London Edition. New York. Published by G. C. Morgan, Pearl Street, Franklin Square, Gray and Bunce, Printers, 1823.” Pearl Street was obviously the publishing heart of New York, where Samuel Wood at that time and Coolidge by 1839 were also located.

The Kilner speller was not a simple chapbook, and the advertisement at the end showed its publisher was handling a far more elegant line of texts than chapbooks. Its back cover read:

“A General Assortment of Books in Every Department of reading for sale by George C. Morgan, 353 Pearl Street, Franklin Square.

Just published.

“Picket’s Grammar of the English language, comprising its Principles and Rules; adapted to the business of instruction in primary schools. Price 37 1/2 cents.

“A Beautiful edition of Robinson Crusoe embellished with 18 drawings, price 75 cents.

“Watts’s Divine Songs - with Cuts.

“The Ploughboy, an interesting tale - this tract is well calculated for Sunday School rewards, both from its cheapness and the interesting matter it contains.

“Sunday Scholars Magazine - Popular Monthly. This little Magazine has been seven months before the public, and from the reception it has met with, the editor is flattered with the hope that
it will be useful.... The price for any number less than six is one cent and a half.... making it at the end of a year a volume of 192 pages for the small price of 15 cents.”

The Picket who wrote the grammar which Morgan listed is probably the same Picket who wrote the spellers and readers discussed elsewhere in this history.

Since the 1823 New York second edition of Kilner’s speller by George C. Morgan said that there had been ninety-seven editions in London before that date, Kilner’s speller must have been extremely popular in England. With its abbreviated syllabary, it did represent a move away from the ancient approach. Her speller is not on Alston’s list of spellers published before 1800, which does include The Infant’s Friend. Part I. A Spelling Book of 1797 by Mrs. Lovechild (Lady Eleanor Fenn) and a 1798 fourth edition of Sarah Trimmer’s The Charity School Spelling Book, Part II. Kilner’s popular speller therefore most probably was first published after 1800.

Dorothy Kilner’s move away from the syllabary may have been influenced by the famous and influential 1798 Essays on Practical Education by Richard and Maria Edgeworth, discussed elsewhere, in which Richard Edgeworth claimed that the syllabary was of little value in learning to read English.

Sarah Trimmer, mentioned above, was another of the late-18th-century British authors for children. Mary F. Thwaite said (page 59):

“One of the earliest and most notable writers of children’s books to be inspired by the needs of the newer Sunday Schools, was Mrs. Trimmer. Sarah Trimmer, born Kirby (1741-1810) began her writings with An Easy Introduction to the Knowledge of Nature (1780) prompted by Mrs. Barbauld’s Lessons for Children (1778-1779), and the needs of her own children. In it she had outlined a slight sketch of Scripture history...

“Her publications for Christian education and Sunday Schools were soon to be taken up by the Society for Promoting Christian Knowledge, an Anglican institution founded in 1699 to promote the Charity Schools, and now to be revivified to help Sunday Schools....

(Page 60): “On their approved list of publications published at the end of Some Account of the Life and Writings of Mrs. Trimmer (1814) were included the author’s manual of Sunday School organization and management, The Oeconomy of Charity (1786),... spelling books and other works helpful to the Sunday school teacher or scholar.

“A firm supporter of the Church of England, she was a stalwart opponent of Rousseauist ideas, and she became increasingly alarmed about the rising number of ‘unsound books’ being published for children about the turn of the century. It was to counteract this mischief that she founded her second periodical, The Guardian of Education (1802-6). She firmly set before her public orthodox judgments on contemporary books intended for children and young people.... Mrs. Trimmer is best remarked, however,, for The Fabulous Histories, (1786) later known.. as The History of the Robins.”

Hannah More (1743-1833) was another highly successful writer of the period. On page 61, Thwaite said Hannah More wrote to Zachary Macaulay in 1796, saying:

“‘Vulgar and indecent penny books were always common, but speculative infidelity, brought down to the pockets and capacities of the poor, forms a new era in our history’.... it was chiefly due to her that the series of Cheap Repository Tracts was launched. These productions imitated the chapbooks in appearance and price (necessary features if they were to rival them on the
market).... The project, launched in March 1795, was amazingly successful, 300 000 copies of the tracts being sold within the first six weeks, and two million within a year.... over a hundred were published by 1798, when the series came to an end. But the venture had paved the way for the formation of the Religious Tract Society in 1799, and henceforth a steady supply of suitable and cheap little books... was assured.

“The ‘Cheap Repository Tracts,’ especially the more popular titles, were reprinted many times in the nineteenth century. They were not addressed to children, but to the poorer classes generally... Hannah More (who wrote many of the tracts herself under the pseudonym ‘Z’) and her collaborators did something to expose to the world the misery of the labouring classes... One of the earliest and most famous of the tracts, The Shepherd of Salisbury Plain (1795) page 61 depicts the efforts of an honest labourer to maintain his family on a wage of ten shillings a week... There was no intention of educating poor people or their children beyond their station.”

Extraordinary information is contained in this excerpt. Certainly, not all the lower classes and poor for whom the government schools were founded in the next century were literate in Great Britain in the eighteenth century. Yet such large numbers of the lower classes and the poor were literate in the eighteenth century that they comprised a vast market for chapbooks. The Cheap Repository Tracts, only meant to “rival” the chapbooks on the market, sold two million between 1795 and 1797, when the population was far smaller than the next century and when the chapbooks were still holding a good part of the market. Even allowing for the fact that Alice in Wonderland was a hard-cover book and not a chapbook, it sold only 180,000 copies between its publication date by Macmillan in 1865 and the author’s death in 1898. (That number is cited by Alec Ellis in A History of Children's Reading and Literature, Pergamon Press, Oxford: 1968. page 66.) How can 180,000 sold over 33 years even be compared to 2,000,000 sold over two years? Yet the fable has it that literacy “increased” in the next century, because of the spread of government schools.

As mentioned elsewhere, in his book, American Education - The National Experience - 1783 - 1876, Harper & Row, Publishers, New York: 1980, Dr. Lawrence A. Cremin showed that a vast market existed for printed materials on the other side of the Atlantic as well before “meaning” took over beginning reading instruction. Cremin stated that in 1817 the American Sunday-School Union put out its first book, Mary Butt Sherwood’s Little Henry and His Bearer. That was a sad story about an English orphan who taught the Bible to another child in India, which story had originally been published in England. An astonishing total of over 6 million copies of similar stories had been printed for American Sunday school students by 1830. Cremin said that another organization which had been founded in 1825, the American Tract Society, put out 3 million such works in the following five years, and by 1865 had published 20 million bound books, each of which included 12 or more such tracts, and it also had put out about 250 million single pamphlets.

Cheap chapbooks had been enormously successful in the eighteenth century. More expensive literature meant for children also came out at the same time. Ellis said (page 5):

“Newbery’s did not maintain their supremacy in children’s book publishing but were superseded by John Marshall of Aldermany Churchyard, who had on his list approximately 70 children’s books between 1780 and 1790. Marshall was antagonistic to books of fantasy, and among his authors were Dorothy and Mary Jane Kilner and Lady Eleanor Fenn. ...In the years between 1780 and 1800 an increasing number of publishers interested themselves in books for the young.”

The sequence of some major authors and one publisher who reduced vocabulary and syntax in materials for children was: Thomas Dilworth, 1740; John Newbery, 1744; Anna Laetitia (Aikin)
Barbauld, 1778; Sarah Trimmer, c. 1780; Lady Eleanor Fenn, c. 1783; Hannah More, c. 1795; and Mary Kilner, c. 1800. Yet there were others who did not, such as Oliver Goldsmith who wrote Goody Two-Shoes for the London publisher, John Newbery, in 1765, and William Roscoe, a member of Parliament and Liverpool banker, who wrote The Butterfly’s Ball and the Grasshopper’s Feast for his little son, first published in 1807, with delightful engravings by William Mulready (1786-1863). These last two books, true classics, would promote a child’s mental growth.

Note, however, that the first two of those listed, the author Dilworth and the publisher Newbery, sharply reduced vocabulary before the publication of Diderot’s Encyclopedie article, “Syllabaire,” which suggested such vocabulary simplification for children. Therefore, it is probable that the idea of vocabulary simplification for children had originated in Dilworth’s and Newbery’s England, before 1740, and not in Diderot’s France around the 1760’s. Yet, in contrast, as discussed in the section of this history on developments in France, the invention of two-step, whole-word phony phonics can be traced to France, where it first appeared in a recognizable form after some years of development as Abbe Bertaud’s Quadrille Des Enfants, 1744.

Therefore, before 1744, the foundations for the harmful “meaning” beginning reading approaches of the nineteenth and twentieth centuries were already in place: two-step, whole-word phony phonics (from France), and strictly controlled, over-simplified vocabulary (from England). Both were totally alien to normal language development, and both were unprecedented in history. It should be mentioned again that even the Abbe de l’Epee’s Code 1 sight-word method for the deaf after about 1760 was very probably inspired by Abbe Bertaud’s 1744 (possibly Code 3) Quadrille Des Enfants which taught whole sight words to illustrate letter sounds.

Eighteenth-century children’s books were being published for children who had learned how to read with the horn book and/or the spelling book and so had learned to read by “sound.” However, the impoverished vocabulary of many of those books after 1740 was undoubtedly stunting the children’s intellectual growth.

As mentioned, a move towards “meaning” for beginners began to show up in a few spelling books after the turn of the nineteenth century, not just in the reading books for children past the beginning stage. Mavor’s 1823 speller was one of those spellers moving towards “meaning.” An 1826 edition is in the British Library (Call number 12982 aa59), and its full title is The English Spelling-Book, Accompanied by a Progressive Series of Easy and Familiar Lessons and Intended as an Introduction to the Reading and Spelling of the English Language, by “William Mavor, LL. D., Lecturer of Woodstock, &c, &c., 322nd edition, Revised and Improved. London: Printed for Longman, Rees, Orme, Brown, and Green, Paternoster Row, and To Be Had of all Booksellers in Town and Country, with a Full and Liberal Allowance to Schools. Price, 18 Pence... 1826.”

That Mavor’s speller, originally published in 1802, had a revised edition in 1823 is shown by the date on the preface Mavor wrote, which reads:

“Preface - Notwithstanding the vast number of initiatory books for young children which have been written within these few years by persons of distinguished ability and sanctioned with their names, it must still be allowed that there has not appeared a single Introduction to reading for the general use of Schools, that rises above the level of the vulgar, though popular, compilations of Dyche, Dilworth, and Fenning. For the neglect of what we have alluded to, it would be impossible to produce any consistent reason. Perhaps the writers of acknowledged literature could not stoop to an occupation reputed so mean, as that of compiling a SPELLING BOOK. Yet to lay the stone of a noble edifice has ever been a task delegated to honorable hands;
and to sow the first seeds of useful learning in the nascent mind, is an employment that can reflect no discredit on the most illustrious talents.”

With these comments, Mavor confirmed that in 1823 the speller was normally the first book English children used in learning to read.

“...The Appendix may be learned, in part or wholly, at the discretion of the master.”

The content of that appendix on page 142 was similar to the beginning material in Noah Webster’s speller, much of which was routinely memorized by older students in American schools in the early nineteenth century. However, the Mavor material was not so good as Webster’s parallel material. Mavor’s appendix included:

“Section 1 - Of letters and syllables.
Section 2 - General rules for spelling.
Section 3 - Parts of speech.
Section 4 - Syntax” (etc.)

This note appeared at the bottom of Mavor’s preface:

“Advertisement - The sale of two millions of copies within the last 21 years is the most flattering proof of the (approval) of the public....”

To sell two million copies in 21 years was “flattering,” but it should be remembered, as mentioned earlier, that two million of the Cheap Repository tracts had been sold in ONE YEAR, between 1795 and 1796.

Reverend Mavor showed, at the end of his preface, his address and date:

“Rectory, Woodstock, August, 1823”

His 1823 version began with a picture alphabet followed with letter alphabets and a complete syllabary. This, however, was followed by short two letter sentences. Spelling lists after this included some spelling by analogy, which is, of course, a kind of analytic phonics, but there were too many reading inserts, and far too soon. Although the 1823 Mavor speller overall rates a Code 6, it was nevertheless a pronounced shift away from “sound” and toward “meaning.” Whether the earlier editions being published ever since 1802 had also rated only a Code 6 is unknown.

“The following is a list of Foreign Spelling Books before the Committee:

“Mavor’s Spelling Book
Carpenter’s Spelling Book
Fenning’s Spelling Book
Vyse’s Spelling Book
Cobbins Spelling Book
Williams’ Spelling Book
Porney’s French Spelling Book.
“The first of these (Mavor’s) in 1835, had passed through 420 editions in England, and it has been stated, that for many years, the profits on the publication were sufficient to meet all the expenses of the publishing house of Longman & Co., Paternoster Row.”

Fenning’s had been in print since 1756 and Dyche’s, mentioned by Mavor, had been in print since 1707. However, the sales of such spellers as beginning reading books had sharply declined long before 1843. By 1843, they were usually meant only for older students.

The first deliberate and announced change in beginning reading methods that had produced the high literacy of the eighteenth century showed up in Andrew Bell’s monitorial schools. These schools had been founded both in Great Britain and America by the early nineteenth century. Initially, Bell threw out the ancient procedure for spelling multi-syllable words, which will be discussed. More importantly, although Bell had been using Mrs. Trimmer’s little spellers in 1808, as shown by one of his published works, he inexplicably threw out spellers for beginning readers some time before 1823. That a seventh edition appeared in 1823 of his newer approach of dropping spelling books for beginners suggests his first edition appeared considerably earlier than 1823 and possibly not too long after 1808.

A folktale from the state of Maryland in the United States, in which a magical goose comes alive again after being shot and cooked, includes a magical chant which sounds suspiciously as though it were derived from the initial step of Andrew Bell’s newer version of the syllabary, given in the 1823 text, which began, “La, le, li, lo, lu.” Andrew Bell’s version of the monitorial schools, in which older children drilled younger children in the lessons to be memorized, was used by the Society for the Diffusion of Christian Knowledge. That was a Church of England organization, and the Anglican church was prominent in the Maryland area, from which area the folktale came. Also, a Bell monitorial school is recorded elsewhere in this paper as in operation in Philadelphia, close to Maryland, before 1817. (However, that one did not use Bell’s beginning reading materials.) The story, “The Singing Geese,” is from Folklore from Maryland, collected by Annie Weston Whitney and Caroline Canfield Bullock, copyrighted in 1929 by the American Folklore Society, and reproduced in More Stories, James Moffett, Senior Editor, Houghton Mifflin Company, Boston: 1973, from a version in With a Wig and a Wag by Jean Cochran, copyright 1954, David McKay, Inc., publisher. It began:

“A man went out one day to shoot something for dinner. And as he was going along, he heard a sound in the air above him, and looking up, saw a great flock of geese, and they were all singing:

“La-lee-lu, come quilla, come quilla, bung, bung, bung, quilla bung.”

The story went on to say that the man shot a goose, and it sang the same song as it fell. When the man’s wife plucked the goose to cook it for dinner, each feather flew out the window, and while the goose was cooking she could hear the muffled tones of the “La-lee-lu” song from the stove. When her husband went to carve the cooked goose, it sang again, and the story related that finally:

“When he was about to stick the fork in the goose, there came a tremendous noise, and a whole flock of geese flew through the window singing:

“La-lee-lu, come quilla, come quilla, bung, bung, bung, quilla bung.

“And each one stuck a feather in the goose. Then they picked it up off the dish and all flew out of the window singing:
“La-lee-lu, come quilla, come quilla, bung, bung, bung, quilla bung!”

Whoever concocted this Maryland story used a repetitious sing-song verse as its theme: “La-lee-lu.” It is curious how closely that sing-song verse matches the repetitious first sequence chanted over and over by little beginners to their slightly older monitors in Bell’s schools some time after 1808 but before 1823. As the initial step, the slightly older monitors were charged with drilling the youngest ones to read: “la, le, li, lo, lu,” and later the same syllables in mixed order. As the very first step, it would have made a powerful impression on both monitors and beginners, and might well have surfaced in later play and story telling, eventually turning up as the tale, “The Singing Geese.”

In Mutual Tuition and Moral Discipline, or Manual of Instructions for Conducting Schools Through the Agency of the Scholars Themselves, Seventh Edition, by the Rev. Andrew Bell, London: 1823, he wrote on pages 89-91 about teaching the alphabet simultaneously with learning the syllabary.

“3. The first three pages of the script cards, or book, No. l, contains the letters i, l, t, o (with which it begins, on account of the simplicity of these characters, consisting of straight lines and a curve, which comprise the elementary forms of most of the alphabet), the vowels, a, e, i, o, u, y; a series formed by the combination of every consonant, in order, with every vowel, beginning with ba, be, bi, bo, bu, and ending with za, ze, zi, zo, zu; and again, of every vowel with every consonant, from ab, eb, ib, ob, ub, to az, ez, iz, oz, uz.

“The course of instruction commences... with the appointment of an able, active, expert, and trusty teacher and assistant to the class of beginners, and a tutor from a higher class to each child, or perhaps better, by uniting this class to that which has just learned the initiatory lessons....

“All being seated at the desk, or on the bench, but the teacher and assistant who overlook and direct them, the tutors instruct their pupils to trace, and, as they trace, pronounce the letters i, l, t, o, one by one, over the script primer, and then to copy them on their slates.”

Bell’s use of script instead of print in his primer was a major innovation, and, so far as I know, previously unheard of. Yet it made the task of learning to read far more difficult for beginners, since joined letters are far harder for them to distinguish than unjoined letters. The use of script for rank beginners turned up in America over fifty years later as one of Parker’s 1875 Quincy “improvements,” with teachers writing whole script sentences on the blackboard for children to “read,” even though they had not been taught a single letter of the alphabet. The use of blackboard script sentences for such rank beginners to “read” then took over most American schools from about 1880 to 1900, because of the vast, ballyhooed publicity from 1875 to 1883 on Parker’s child-loving “improvements.” Yet it is a curious fact that every one of the “improvements” in teaching beginning reading which were introduced by Bell, and later by Parker, were in fact stumbling blocks that promoted reading disabilities. Bell wrote:

“The tutors next teach their pupils to write and name the vowels, one by one, annexing each, as soon as they can make it, to the letter l, as in the card before them,- pointing with the pencil, and pronouncing, by previous spelling, or spelling on book, as they proceed, l,l, 1,e, le, 1,i, li, l,o, lo, lu, li; then reading la, le, &c.; y is omitted for the present, to prevent the confusion of li and ly, and to shorten the first lessons.

“When the pupil can execute this task with ease and readiness, his tutor calls upon him to spell and write, on the reverse or back of the slate, each syllable (or word) promiscuously, or in any order that he dictates. The tutor says le, pupil repeats le, then writes and pronounces l, e, le, and so on with the rest, la, lo, lu, li. He then reads them on the slate, as thus written - a practice which ascertains that the lesson has not been said by rote, but is actually known and understood.”
Bell said they then practiced with the teachers.

“Here let the master observe, that it behoves him to exercise his utmost energy and ingenuity in contriving to instruct his pupils in the most expeditious, for that is the best way, to write, spell, and read, in any order, and with perfect readiness, this primary and model lesson, la, le, li, lo, lu, for this is the key to the subsequent lessons of -

“4. The series formed by the union of consonants and vowels in order.

The key, of which the child has just been put in possession, enables him, by the exercise of his little mind, in which he delights, to dictate for himself the series of consonants and vowels, beginning with ba, be, bi, bo, bu, and ending with za, ze, zi, zo, zu. All that is here requisite is, to instruct him to write and name each consonant in order, and to annex to it the vowels, as was done with l, proceeding with every successive line, at the desks or seats, and on the floor, as with the sample which has been given.”

**“The lines beginning with c and g, may, on account of the hard and soft sounds of these letters, be deferred to the end of the series, when a few examples with the letter y may be introduced, as ca, ce, go, gi, ly, by, cy, dy, gy, fy.]**

Note that the supervised learning ended with la, le, li, lo, lu The child was expected to construct the rest of the open syllabary for himself from the “script card.” Of course, the use of confusing script letters instead of clear printed letters was itself an extraordinary and apparently unprecedented change.

Note from the comment below that the child had been expected to begin work on the syllabary before he knew the whole alphabet, only learning each consonant as he reached it in the syllabary. Presumably the child was given the name of each new consonant and its sounds with “a” before he had to work out for himself the syllables the new consonant made in combination with the rest of the vowels. However, that Bell did not make the procedure clear is anything but reassuring. He wrote:

“Arrived at the end of this first series, ba to zu, the scholar, being now acquainted with all the small alphabet, may learn the capital alphabet, either as the letters occur in his lessons, or by copying one every morning and evening, in order. The class now proceed to -

“5. A second series of the union of the vowels and consonants in order.

“This series of lessons commences with a,b, ab, e,b, eb, i,b, ib, o,b, ob, u,b, ub, and ends with az, ez, iz, oz, uz.

“The only difficulty here lies (as all the letters are now familiar) in distinguishing the short sound of the vowels, particularly e and i. Especial pains must, therefore, be taken with the first line, the key to the rest, which should be dwelt upon till the learner can perfectly distinguish these sounds; after which, he has a pleasure in dictating for himself, according to the example which has been given, the rest of the series, ac, ec, ic, oc, uc, to az, ez, iz, oz, uz, * with which these lessons terminate."

**“In teaching the alphabet, as commonly practised at home, with counters, the vowels and consonants being kept apart, the children, who do not write, may be taught to pick them up, and place them by the side of one another, so as to form, spell, and read every syllable of two letters in the order and manner above described, writing only excepted.”**
Note that the only instruction on the critical and difficult short vowels is on ab, eb, ib, ob, ub!

Bell continued:

“Before concluding this chapter, it may be important to draw the particular attention of the master to these combinations of vowels and consonants, by remarking, that one or more of them occurs in every word, except those of one letter, viz. a, i, o....”

Bell ignored the existence of vowel diphthongs (oi, ou, etc.), silent vowels (lain, lane, etc.) and silent consonants (lamb, etc.), just as he ignored the existence of consonant blends (string, etc.) and consonant digraphs (th, sh, ch). It would be extremely difficult to teach children to read English by “sound” using only his bare-bones Latin-style syllabary. Furthermore, it is obvious the children were to stumble through most of the syllabary, particularly the critical short-vowel closed syllabary (ab, eb, ib, ob, ub) without real teaching and without careful supervision. Nevertheless, by 1823, Bell was at least still endorsing in principal the basic “sound” syllabary, even though he omitted so much that is necessary in teaching children to read in English by “sound.”

This Seventh Edition of Bell’s Manual of Instructions published in London in 1823 at least described and endorsed the syllable method of teaching reading that is known to have been used by the Etruscans about 600 B.C., and that probably dates back to the invention of the vowels in Greece about 800 B.C. Yet only five years later, in 1828, Bell’s Manual of Instructions and its syllabary (inadequate as it was for teaching reading in English) would be hopelessly out of date after the publication of John Wood’s material at the Edinburgh Sessional School which abandoned both the ancient syllabary and “sound” totally, for a total emphasis on meaning.

However, note a significant change had already been made by Bell by 1823: the alphabet was not learned first in sequence. All consonants except “l” were learned only when used to make syllables with the already learned vowels. No indication is given that alphabetical order was EVER learned, except that the option was given that the children might use it to learn capital letters. For the most of the children, therefore, the use of dictionaries, etc., was out of the question. The children started on script, not print: that was certain to cause confusion, but he had made no mention of using script instead of print when he wrote earlier in 1808 about children practicing letters on sand trays. Instead, his 1808 text said children should learn the printed alphabet first. In it, Bell said he regretted that hornbooks were no longer used, and then said (page 57):

“In the absence of a hornbook, these alphabets may be readily and cheaply obtained, by cutting out of the spelling books the first and second leaves, and pasting down the alternate pages on strong brown paper or pasteboard, that they may endure the thumbing to which they are subjected, and save the remainder of the spelling-books, which is sometimes worn out in common schools before the child has learnt his A, B, C.”

Bell’s 1808 students obviously were practicing print, not script and were using it to learn the alphabet, in order, as the first step. (However, in his 1808 instructions, he said he wanted children to learn capitals before lower case letters, which is highly undesirable, but he reversed this undesirable method by 1823.) He claimed he brought the sand-tray method back with him from India and it was much ballyhooed. Yet he specifically rejected the sand-tray in his 1823 book. An astonishing difference in methods recommended by Bell developed between the date of his 1808 book and the 1823 book in its “Seventh Edition,” (the “First Edition” of which must have been published before 1823).

Rev. Dr. Andrew Bell, along with Joseph Lancaster, as mentioned elsewhere, was credited with founding the cheap monitorial schools for the poor, where older children taught younger children, and
teachers were largely dispensed with. Bell claimed to have perfected his methods when in charge of a school in Madras, India.

Just before going to India from his home in Scotland, he had been a tutor in the American South, but left America to return to Scotland almost immediately after the Revolution. Apparently no mention is made in his biography, referred to elsewhere, of what Bell’s activities may have been in America during the Revolution, other than the fact he was a tutor and somehow made a fortune in tobacco. (Many native-born Americans were losing their fortunes during the Revolution!) Both Bell’s and Lancaster’s monitorial schools had been popular in America. Lancaster had arrived in America in 1818, where his schools like Bell’s were already in operation, and Lancaster promoted his schools openly and widely until he was killed by a horsecar in Manhattan in the early 1830’s.

As the history makes clear, after returning to Great Britain from India, Bell had been essentially a promoter. It is tempting to conclude that what Bell was best at promoting was himself, since his teaching methods were appalling, as well as being astonishingly and incomprehensibly inconsistent.

Despite Comenius’ suggestion on syllabication, mentioned elsewhere, and despite some eighteenth-century French materials, it was Bell who made the first pronounced move away from syllables to whole words for teaching spelling and reading. He did that in his Madras School material, in which he recommended that children only slowly recite the syllables in a word, afterwards naming all its letters at once. Bell therefore abandoned the ancient method, in which children carefully recited the letters in each carefully separated syllable of multi-syllable words. In the old method, children spelled the letters in the first syllable and then named the syllable. They then spelled the second syllable and named it, and then repeated the names of the first and second syllable. They then spelled the third syllable and named it, and then repeated the names of the first, second and third syllable. They worked their way through all multisyllable words in that fashion. Bell discussed this first “improvement” of his in The Madras School, or Elements of Tuition, London: 1808 (pages 64-77), which was the 1808 text referred to above. I suspect Bell’s “improvement” in spelling methods was invented as a means to ease his lot as a teacher in India. His “improvement” concerned that repetitive (but useful) spelling drill which undoubtedly had been very boring for Bell.

Nevertheless, Bell’s “improvement” was not original. It had been suggested by Comenius in the seventeenth century, with the use of pictures as an aid to learning multi-syllable words. As has been discussed, dropping the “spelling” or reciting of letters in syllables was apparently first in use in France. Py-Poulain Delaunay in 1719 claimed that some people by that time wanted to renounce spelling in the learning of syllables. But it was not until 1755 that Cherrier produced a specific method which dropped spelling. So did some others in later years: Viard in 1759 and Luneau de Boisjermain in 1778 and the Year VI of the French Revolution.

Children had apparently always been asked to spell words in English in that fashion. First the word was visually broken apart by the children into syllables. In order to know how to do this, children were obviously taught the rule that a single consonant after a vowel was part of the next syllable, but if two consonants followed a vowel, one remained in the first syllable. Furthermore, if two vowels came together, the second was supposed to form a new syllable. These rules for separating syllables apparently only work consistently in the spelling of Latin. Yet they were followed in English spelling until Noah Webster dropped them, which can be demonstrated by the faulty syllabication in the New England Primer of the eighteenth century. The faulty effect was most noticeable when it produced open syllables with long vowels where the vowels should be short. However, by Bell’s time, spelling books commonly printed multisyllable words with the syllables already separated correctly instead of incorrectly as in the New England Primer. Yet children had no such convenient syllable separation in most of their reading books.
Bell was not finding fault with the ancient but inadequate method to break words apart into syllables. Nor is there any indication he taught that or any other method to children for words which had not already been separated. Since spelling words were commonly already separated in children’s spelling books of the period, they probably were also separated in Bell’s materials.

Breaking words apart into syllables by the ancient method produced the following separations for a regular word like “pandemonium:” “pan - de - mo - ni - um.” As mentioned, children had always “spelled” which meant reciting orally, in a cumulative fashion, collecting syllables as they worked their way through the word: p a n - pan, d e - de, pan-de; m o - mo, pan-de-mo; n i - ni, pan-de-mo-ni; u m - um, pan-de-mo-ni-um. The original purpose of this “spelling,” until about the seventeenth century in English, was not spelling as we know it, but only pronunciation. The children were actually working out the sound of an unknown word from the sounds of the syllabary they had previously memorized. In English, the memorized “working” syllabary was effectively extended by the end of the sixteenth century by memorizing irregular syllable patterns: eight, freight, weight; night, light, fright. Once children knew the syllabary and the irregular syllable patterns, they could pronounce anything in English.

Bell retained the naming of letters for words of only one syllable, and that was also the first step in the spelling books of the period. Yet Bell threw out naming the letters for each syllable in multi-syllable words, the next step in spellers of the period. Bell called his “improvement” “unreiterated spelling.” He only asked that children pronounce each syllable separately, and then name the letters afterwards all at once: pan-de-mo-ni-um, p-a-n-de-m-o-n-i-u-m. Yet, how could children separate any unknown long words into syllables (like the words they would see in the Bible) if they had not been taught how to syllabicate? How could children pronounce unknown irregular words (lightweight, breathable, cushioned) by their irregular syllables like “weight” if they had learned only the inadequate bare-bones Latin syllabary? The teacher would have to tell children most new words, as sight words, even one-syllable words like “night,” since the Latin syllabary was of no help on that irregular one-syllable word. It is obvious the child’s grasp on “sound” and on the syllable itself began to slip very badly under Bell, who was widely imitated and who was a major influence on education. Bell’s students, unlike earlier English-speaking children, were no longer being taught how to pronounce aloud anything printed in English (such as the Bible).

The full title of the 1808 book was The Madras School, or Elements of Tuition: Comprising the Analysis of an Experiment in Education, Made at the Male Asylum, Madras, with its Facts, Proofs, and Illustrations, To Which are Added, Extracts of Sermons Preached at Lambeth; A Sketch of a National Institution for Training up the Children of the Poor, by the Rev. Dr. Andrew Bell, London: printed by T. Bensley, for J. Murray, - Cadell and Davies; Rivingtons; and Hatchard, (all of London) and Archibald Constable and Co. Edinburgh. On page 346 of this 1808 book, Bell gave a “List of Elementary Books Used in the Madras Schools:”

“With these are to be read, as most convenient,

“All these books are in the list of the Society for Promoting Christian Knowledge, except No. 1 and 3.”

No copy of Mrs. Trimmer’s spellers has been available, nor No. 1 above, the “Card,” but Bell discussed some of its content, as mentioned. His “Card” appears to have given adequate practice to the basic syllabary. Bell spoke of Mrs. Trimmer’s beginning book on page 60:

“The fittest book for a beginner, as consisting solely of monosyllables and easy stories (one edition for boys, another for girls) of words of one syllable, is Mrs. Trimmer’s Charity-school Spelling-book, Part First.

“In perusing this initiatory book, the scholar spells the syllables on and off book: thus on book, b-l-u-n-t, blunt; off book, blunt, b-l-u-n-t.”

In 1808, Bell considered that learning the alphabet was the fundamentally important first step, as is obvious in the following quotation from page 58-60. Contrast it to his 1823 comments given later:

“When familiar with his alphabet, and able, without the smallest hesitation, both to tell every letter in any book, and write it on sand, then, and not before, he proceeds to his next stage. It is proper here to observe, that whenever I use the word spell by itself, I always mean spelling off book after the lesson has been said and the book is shut.... When, on the other hand, I speak of spelling (in the spelling-book), previous to the reading of the word, as is usually practiced throughout long spelling-books, &c., and termed simply spelling, as when it is said, ‘the scholar is in spelling,’ this I always denominate previous spelling, or spelling on book; and, in the Madras school, monosyllables only are taught in this way....”

The purpose of what Andrew Bell called “previous spelling” of polysyllables in spelling books was NOT “spelling” at all in the sense we know it: memorizing a sequence of letters. By naming the letters in these broken-apart syllables, children resurrected their memories of like syllable sounds and used them to work out related syllable sounds. Bell totally ignored the need children had for a method to decode new multisyllable words.

Despite this, it is beyond question that Andrew Bell in 1808 saw “spelling books” as the route to reading. That the fourth and fifth books in his list, Child’s Book, Part First, and Child’s Book, Part Second, were also spelling books is shown by his remark from page 79:

“The five spelling books I have named do not exceed in price a large spelling book, and one is not worn while the other is used; whereas it is not uncommon for a large spelling book to be worn out before the alphabet is yet learnt.”

That spelling books were “fundamental” in Bell’s 1808 philosophy is shown further by this quotation from page 62:

“In order that this fundamental branch of tuition may receive that attention which its essential importance requires, Mrs. Trimmer has prepared a spelling-book contrived to instruct, rivet, and confirm the scholar in this elementary process, which I have said is not only the groundwork, but the actual anticipation of all that follows.
“This ‘Monosyllabic Spelling-book’ consists of all the syllables which most usually occur in the English language, in a regulated succession from short and simple to long and difficult. It contains no reading which the child can either comprehend or readily learn by memory, or repeat by rote. While children are thought to be engaged in learning to read, they are often merely exercising their memories. This second book is taught by spelling on and off book, and afterward reading on book without previous spelling; and spelling off book in the same precise and perfect manner as the Charity-school Spelling book. And here, in reality, ends the chief labour in teaching and learning to read, for by the devices which follow it is contrived that little more remains to be done, and what does remain, consists almost solely in repeating and practicing what has been already taught and learnt.

“Observe, that from this time forward there is no more previous spelling, in which so much time is wasted, except indeed the scholar happens to meet with a syllable which, after all has been done, puzzles him, when he resolves that syllable, and that only, into letters by previous spelling, to enable him to read it.”

Andrew Bell was meddling with the spelling book after the monosyllable step, but he certainly was not throwing out spelling books in 1808 which he did by 1823. The only teaching on “sound” he gave children by 1823 was the basic Latin syllabary, and even most of that the children may have done without adequate supervision, to judge from his description. Furthermore, he had taught the alphabet first in 1808, and yet by 1823 Bell’s students were to learn the alphabet only incidentally as they learned the syllabary, not by itself.

Notice the comment concerning the old methods, “in which so much time is wasted.” As was stated in Part 4, “constantly occupied” was a theme which was promoted over and over as a presumed virtue of the monitorial schools.

Andrew Bell’s 1808 book included a copy of a letter he wrote to Richard Edgeworth in Ireland in 1806, and it contained his 1806 views on the first steps in teaching reading:

“Mrs. Trimmer’s Spelling Book, first part, is brief. Her books are sterling. Let the alphabet be made in sand (or on a slate, or with chalk), before the scholar proceed to spell or read. Let the progress be secure in every step, and you will be astonished at its flight....”

Included at the end of Andrew Bell’s 1808 book was, “A Sketch of a National Institution for Training up the Children of the Poor.” His interest in centralized control of the education of the poor was shared by Richard Edgeworth in Ireland, who had already been approached about helping to set up such national schools in Ireland, as indicated below. Like all good movers-and-shakers, Richard Edgeworth with his 1798 book, Essays on Practical Education, was famous, as was his novelist daugher, Maria, who had collaborated on the book. In their enormously influential book, Edgeworth endorsed his own phonic system, which he claimed he developed before he ever saw Sheridan’s. What appears probable is that Edgeworth had read The Irish Spelling Book of 1740, discussed elsewhere, which introduced Pascal phonics wholesale into Ireland and into the English language. However, while endorsing Pascal phonics, Edgeworth belittled the ancient syllabary and recommended its abolition. As discussed in Appendix B in the entry for Bumstead, Edgeworth also made the astonishing remark, presumably in his 1798 book, that learning to read is “the most difficult of all human attainments.” Yet, in 1798, as established by testimony of the general period, children learned to read easily and quickly by the very syllable method that Edgeworth was denigrating. Edgeworth’s remark is redolent of insincerity. It is interesting, therefore, that an early tie appears between Andrew Bell, who was apparently the first to throw out syllabicates in spelling and later the first to throw out the spelling book, and Richard Edgeworth, who apparently was the
first to throw out the basic syllabary itself. In different ways, both had moved from the syllable (“sound”) toward the whole word (“meaning”).

“As we have ventured not only to use your name, but to introduce you as a character in one of our “Popular Tales” (by we I mean Miss Edgeworth and myself), I presume still further on your goodness, and request you to send me any loose hints that your observations, since you came from the East, may have furnished relative to the education of the poor.

“I have been lately appointed, under an act of parliament, one of a commission to inquire into the funds that exist, and into the probable means which may be employed to extend the benefits of education among the lower orders of people in Ireland. To whom can I apply for instruction with more propriety than to Dr. Bell; from whom _____, _____, _____, have borrowed their most useful ideas?

“Have you seen Barruel sur l’Instruction publique, Chaptal, or Sicard, or a valuable little pamphlet by Christison of Edinburgh? Can you have the goodness to point out to me any new course of information?”

Why was Edgeworth reading Sicard, the Abbe de l’Epee’s successor? Note also that three of the four “authorities” that Edgeworth cited in 1806 were French, and the fourth was from Brougham’s Edinburgh!

Extracts from Andrew Bell’s reply to Edgeworth appeared on page 305:

“I have long wished to make my bow in person to Miss Edgeworth and yourself; and am happy in the occasion which you have now given me....”

Andrew Bell made it clear in his answer to Edgeworth that he endorsed government control of education (page 312):

“A single inspector general, with his secretary, both nominated by government, and removable at pleasure, will suffice to new-model the school, receive reports, visit them, detect deficiencies, point out the cause of failure, and see that they are conducted according to the system chalked out for them, and the principles of the institution. In their various progress, in their subsidiary and subordinate improvements, and the additions to our present practices, which will occur, a wide field of practical knowledge will be opened.

“Of the new creation which it will raise to religion, to society, and to the state, I shall say nothing.”

That last remark may have been innocent, but it does reverberate with “new age” overtones. It would be of interest, however, to learn who “Christison of Edinburgh” was to whom Edgeworth referred. According to Edgeworth, “Christison of Edinburgh” sometime before 1806 wrote what Edgeworth considered a “valuable little pamphlet,” and it presumably was, like Barruel’s (of France?), on “l’Instruction publique,” probably meaning government schools, and not just education outside the home, which the term “public school” usually meant in the eighteenth century. Did “Christison of Edinburgh” know Dugald Stewart, Brougham, Birkbeck, et al, also of Edinburgh?
Starting on page 315, Andrew Bell outlined his “Sketch of a National Institution for Training Up the Children of the Poor,” which eventually resulted in the National schools in England and Wales. Although they started out only under the supervision of the Church of England, state supervision had begun to a small degree by 1833, and it constantly increased in the years that followed.

“The expediency and utility of educating the lower orders of the people I have already argued... The only question then, which remains, is whether, the moral and religious education of those children, who are destitute of other means of instruction, shall be left dependent on the fortuitous bounty and direction of individuals, societies, and parishes; or be placed under legislative provision and control....

“But should it be thought expedient to place the education of the poor under legislative authority, little more remains to be done than what the law exacts, which requires that the parochial ministers “examine and instruct the young and ignorant persons of their parish; and that schoolmasters...be licensed by their bishop....

“...it may suffice for the present to begin with putting Sunday... and other charity and free schools for the poor under existing and appropriate authorities....”

Andrew Bell was endorsing centralized control, and it is only through centralized control that activists can make efficient changes.

The “achievements” of government education in Ireland which almost wiped out the Gaelic language and Gaelic literature that went back to at least the fifth century are discussed elsewhere. However, it is startling that both government schools and the whole-word method (but one that used phonics) were associated with Edgeworth in Ireland as early as 1806. Note also that before 1806 Edgeworth had been reading material by Sicard, who had taken over the work of the Abbe de l’Epee in teaching the deaf, and under whom Gallaudet had studied in Paris. That is where Gallaudet learned how to teach reading for “meaning” instead of for “sound,” and Gallaudet was also one of the principal promoters of government schools in America.

For whatever cultural reasons, it becomes apparent in the history of reading instruction from about the time of the French Revolution until today that there has consistently been in America and the British Isles an “in” group concerned with education, consisting of highly publicized and influential people like Edgeworth, Gallaudet and Andrew Bell, who are always presented to the public as dedicated friends of mankind. That “in” group, right up to the present day, has worked very hard to put education increasingly under the control of the central governments, and at the same time the same group has consistently promoted whole word “meaning” in the teaching of beginning reading instead of syllable “sound.” The “out” group, which has consistently received very little, if any, publicity, often opposed both practices (government-controlled education and “meaning” instead of “sound” to teach beginning reading). Yet the “out” group has been like a voice crying in the wilderness, since few people have ever known of its arguments or even of its existence.

For example, the “in” group in the early nineteenth century which was receiving massive publicity included Bell and Lancaster, whose organized, publicized schools prepared the ground for later government interference with education. It included Richard Edgeworth who promoted the government schools in Ireland that eventually almost destroyed the Irish language and Irish-language literature. It included the women writing the vapid, low-readability-level stories in English that were meant to replace the massively sold high-readability-level chapbooks, the women that the famous author Lamb called that “cursed Barbauld crew.” They were in practice hobbling children’s language development. Finally by the
mid-1820’s, the “in” group included John Wood of Edinburgh with his reading method which finally totally replaced “sound” with “meaning” in the teaching of beginning reading.

Yet both the people and the materials in opposition to the work of the “in” group faded into oblivion, such as the anonymous Scottish Schoolmaster quoted elsewhere, the elegant Goldsmith story of Goody Two-shoes, the once omnipresent and highly profitable high-readability-level chapbooks (in English and apparently in Gaelic), and spelling books for beginners with syllable tables. As they faded into oblivion, so did the former high level of literacy that had been associated with them. That former high level of literacy was widely replaced by that brand-new disease which had its origin in eighteenth-century France and that was acquired by teaching beginning reading by “meaning” instead of by “sound:” the disease of functional illiteracy.

In 1808, Andrew Bell had loudly endorsed spelling books for children who were beginning to learn to read, as well as endorsing the need for learning the alphabet first. Yet, the following astonishing about-face statement from Andrew Bell appeared in Chapter IV, page 92, of his 1823 text. This was a seventh edition (London: G. Roake, C. & J. Rivington, Hatchard and Sons; W. Blackwood, Edinburgh; and J. Cumming, Dublin). The first edition should have predated 1823. Bell had completely changed his tune in less than fifteen years, which, of course, raises the intriguing question, “Why?” (In 1823, Bell was still teaching the basic syllabary but using it to teach the letters, since the alphabet was not learned first.) Note Bell’s reference to the rank beginner “exercising his mind” by working out most of the syllabary for himself, and then, by immediately afterwards reading a meaningful story, insuring that the child’s “higher faculties are called into immediate and perpetual activity.” It sounds as if the Scot, Andrew Bell, were trying to avoid that atrophy of the brain which the famous Scot, Dugald Stewart (like the famous Scot, John Wood) claimed came from reading mindlessly.

“On monosyllabic Reading. l. On the reason of omitting spelling lessons composed of unconnected monosyllables and polysyllables.

“Hitherto the child has had the satisfaction of exercising his mind in forming regular series of all the syllables of two letters in the English Language; and has thereby acquired the first rudiments of spelling and reading. On this foundation he has now to rear the fabric of his future studies. From this time his higher faculties are called into immediate and perpetual activity. The tables of monosyllables and polysyllables, with which spelling-books were wont to abound - tables composed of words increasing in difficulty, and like the letters of the Alphabet, having no connexion, and conveying no instruction or amusement, to excite interest, keep up attention, or assist the memory; all such unmeaning and tiresome tasks - are discarded, and the scholar’s future exercises in writing, spelling, and reading, are composed of a progressive course of lessons, moral, religious, instructive, and entertaining, all of them, except a few stories in the first part of the second book, extracted or abridged from the Bible.. Besides the useful knowledge with which these lessons are fitted to store the mind, they are much easier to be learned and remembered, from the frequent recurrence of the same words, and from the sense of the text and context. ...These lessons are taught by writing, by spelling on and off book, by reading by pauses and clauses, and by an examination on the meaning of what is read....”

After an inadequate syllabary, the children were immediately moved into reading connected text, which, as Andrew Bell apparently recognized, gave them “context” help to guess unknown words. (No one can guess words in a spelling book column!) Furthermore, the tiny amount of reading matter was drilled on, over and over and over again. First they read it in script on the cards, and then (page 96):

“On teaching the printed characters.
“The script cards finished, the class proceed to the second book, from the beginning of which the lessons, they have just learned, were transcribed. They now read the same lessons in this printed book. From their previous knowledge of them, and the similarity of the printed and written characters, they insensibly acquire the former, while they still further perfect themselves in these initiatory lessons. These lessons are best learned, by transcribing the printed into written characters...

“Having revised [i.e., reviewed] these lessons, till they can readily read them in the printed book, they go through the remainder of the monosyllabic part of this book, writing, reading, and spelling, &c., as before.

“Finally, they may once more revise the whole thirteen pages, in a single lesson.”

Note that: the WHOLE thirteen pages! It was an extraordinarily emaciated introduction to reading. Yet, Andrew Bell said, concerning the time it took to cover this slender material that was replacing the beginning part of the older, very, very long spellers:

“In concluding this chapter, it may not be quite useless again to notice, that these thirteen pages can be read, distinctly and deliberately, in thirteen minutes, or about a quarter of an hour; and that they can be transcribed, by a fast writer, in an hour. It seldom, however, happens that the scholars spend less than three or four months, and frequently three or four times as long, in solely learning to read them. Such is the consequence, when the master, forgetful of his duty, does not take the trouble to direct and superintend his ministers in such a manner, that every day, and every hour, may be marked by a competent share of progress.”

So it took from THREE TO SIXTEEN MONTHS to cover these thirteen “meaningful” pages of sight-word context reading after the children had finished the inadequate Bell version of the syllabary. Yet, at the end of all that time, the children would STILL be unable to read other material! Therefore, before 1823, sight-word reading books had, indeed, arrived in the English language in the form of Bell’s material, and before 1823, the sight-word method was, indeed, already producing MASSIVE failures in Bell’s schools, AS BELL HIMSELF CONFIRMED! (Bell made no reference, of course, to the torture the little children were being forced to endure for three to sixteen months as they read, over and over and over, his ghastly thirteen pages.) Furthermore, these very first sight-word reading books produced the familiar “excuse” by their basal reader author/expert, Bell, that their failure was not caused by the horrible inadequacy of his material but instead was solely due to “the master, forgetful of his duty,” who “does not take the trouble” to teach properly.

Note that two of the buzz words (“useful knowledge”) widely known by 1825 had already worked their way into Andrew Bell’s explanation some time after 1808 but before 1823 for his about face from “sound” to “meaning”: “the useful knowledge with which these lessons are fitted....” One wonders how much contact the Scot, Andrew Bell, had with the movers-and-shakers using this phrase (the Scots, Brougham and Birkbeck, Stewart’s former students in Scotland), and if Bell’s idea of throwing out the spelling book came from that source. Stewart was apparently hostile to spelling books, according to Dr. Keagy’s American interpretation, cited elsewhere. In addition, Stewart’s remarks, quoted elsewhere, certainly indicated that Stewart endorsed only USEFUL knowledge, and that Stewart believed that stuffing a brain with too many unused facts resulted in an atrophy of that brain.

The following “improvements” in the teaching of beginning reading in the English language had already appeared at some unknown date before 1823 in Andrew Bell’s highly publicized work. That second work of Bell’s on the teaching of beginning reading had originally been published before 1823 but
after the 1808 date of the publication of Bell’s first book, which 1808 book was actually in contradiction to Bell’s later “improvements”:

1. Abandoning the teaching of the alphabet as the first step, and naming the letters only as they were read in the syllabary (which was in a mixed-up, not alphabetic order: la, le, li, lo, lu, etc.

   In America, Gallaudet in 1835 also abandoned the alphabet as the first step, instead teaching a collection of sight words, from which the alphabet was then taught. Edward Hazen also recommended the same kind of thing in his 1829 Symbolical Primer. Less extreme were Oliver Angell, in his 1830 reading series, and Samuel W. Seton (in his 1830 book, The Abecedarian) who recommended that children learn the alphabet simultaneously with their first sight words, as Bell had them learn it with his alphabetically mixed-up syllabary.

2. Abandoning the “sound” spelling book for beginners, although Bell focused no attention on the fact he had abandoned it, when he recommended that children begin by reading his “meaningful” material.

   In America, Dr. Keagy in 1826 (and apparently in 1819), and William Russell in 1826 had openly recommended the abandonment of the spelling book for beginners and the use instead of “meaningful” material. Keagy cited Stewart’s philosophy as the reason for his own recommendation.

   Apparently, the drive which had been initiated in 1826 to abandon the use of the spelling book for American beginners had achieved great success by some appreciable time before 1832. That is the year that Webster published his new, pathetic primer which was meant to be used before Webster’s own speller for beginners, even though Webster’s speller had been massively used for beginners from 1783 until 1826. The fact that Webster published such a whole-word primer (but with true phonics) for beginners in 1832 is virtual proof that spelling books must have gone out of use for American beginners some appreciable time before that primer of Webster’s came off the presses in 1832.

3. Introducing children to reading through script, not print, which became the norm in America from 1875 until 1912, but is no longer in use.

   The use of such connected script for rank beginners causes them to see words as unbroken wholes, and assures that the words will be read for whole-word “meaning” instead of sequential “sound.” Josephine Horton Bowden wrote in her article, Learning to Read, in the Elementary School Teacher, University of Chicago, September, 1911, about work done with beginners who were given sight words in script and in print:

   “...words were shown to the children right side up, and after five or ten minutes they were shown again, upside down....”

   Bowden said that only two of the five children noticed that the words were upside down. Bowden commented:

   “It would seem that the child sees the word as a whole and recognizes it upside down, just as he would recognize a toy upside down.”
Obviously, that would be true only for “meaning-”trained beginners who perceive words “all at once, and not for “sound”-trained beginners. “Sound”-trained beginners read letters sequentially in a forward direction, and get a very different result if letter sounds are read in a backward direction.

4. Controlling the amount of reading matter given to little children so that they have very little new material on which to practice decoding skills.

This results in the memorization of the little snippets on which they are constantly drilled and a virtual inability to read any “new” material unless the teacher reads it to them first.

5. Most importantly, teaching the beginning reading of “sound”-bearing alphabetic print with a massive emphasis on its “meaning” and a de-emphasis on its “sound.”

In modern terms, this must result in the formation of the wrong conditioned reflex for the reading of “sound”-bearing alphabetic print (presumably to the right angular gyrus on the right, “all at once” side of the brain, instead of to the left angular gyrus area on the left, sequential, side of the brain, or to mixed and conflicting reflexes).

The thirteen “meaningful” pages which appeared as script in Bell’s book one were repeated in the first part of Bell’s 1823 book two, but as printed material, not script.

The second part of the second book suggests one of the sources that Bell was using for his new ideas. Bell, or someone writing the book for him, had been reading Diderot’s Encyclopedie from the previous century very carefully - specifically, the article, “Syllabaire” (page 713 in the “S” volume). That article had said:

“Reading Lessons. When the children are firm on their letters and on their syllables, it is necessary to give them something to read, but this must be prepared.”

The Encyclopedie article then suggested printing one page with syllables divided and the same material on the opposite page with the syllables not divided. It stated:

“One begins by having the child read the left side; this is easy for him, he finds there in a different order the same syllables that he has seen before...one can, after two trials, hide the left from him and have him repeat the same reading on the right.

“But what material shall one offer for his first efforts? It seems to me that until now scarce discernment or attention has been brought to the choice that has been made....”

The author of the article (possibly Diderot, himself) felt that histories were good material for children, but only if they were written in short and uncomplicated sentences, in this anticipating Mrs. Barbauld! The author said:

“The story of Joseph, the most interesting and the most instructive of all for children, the most favorable to the development of the first germs of virtue which are in their hearts, and the most proper to put in their souls the happy idea and the useful conviction of perpetual attention of providence on men, seems to me to merit by all these titles, the preference on all other history (to be) the first under the eyes of childhood.”
Turning from Diderot’s Encyclopedie to page 98 and 99 of the 1823 Bell manual, concerning what polysyllabic text should follow the marvelous first thirteen pages of monosyllabic “meaningful” text, this appears:

“Thus prepared, the scholar enters on the reading lessons, consisting of monosyllables and polysyllables indiscriminately.

“This branch of the course commences with the interesting History of Joseph and His Brethren, in four parts, which together form the second part of the second book.’

The source for Bell’s choice of the “Joseph” story appears probable. It was probably Diderot’s Encyclopedie. Bell continued:

“The manner of reading this history, and every subsequent book, differs in nothing from what has already been described ...here the polysyllables are, in the first instance, read on book by syllabic reading, and spelt off book, after the lesson has been read, by unreiterated spelling. An example will suffice to illustrate what is meant.”

Bell’s numbers, given below, stand for children: first child “l” reads, then child “2”, then child “3” and so on. When Bell placed words in parentheses, he was attempting to show that these words were to be read with a pronounced wait between syllables. What he called a “pause” was a portion of a sentence, a few words or sometimes only one word that contained a single “meaning”:

“This history begins at p. 14, which is written on the corner of the slate, as before directed. The first lesson is the argument or contents, which the children read in order, each taking a pause.

“l The (His-tory) History - 2 of (Jo-seph) Joseph - 3 and - 4 his (Bre-thren) Brethren.

“The lesson once read over by syllabic reading, may be read again in the same manner, but no oftener that is requisite to learn to pronounce the poly-syllables at once, without resolving them into (mono) syllables; after which it is revised without syllabic reading, till it is duly learned, thus:-

“l. The History - 2 of Joseph - 3 and - 4 his Brethren.

“After this lesson follows

“Part I- which is written by itself, as the number of the page was. The next and following lessons go on, as just described, thus:

“l. Now - 2 (Ja-cob) Jacob - 3 (lov-ed) loved - 4 (Jo-seph) Joseph - 5 more than all his (child-ren;) children, and so on.

“In like manner, the class proceed throughout the whole of this history, resolving such words, and such only, into syllables, as they cannot otherwise read, - the lessons daily growing in length.

“Sometimes the polysyllabic words are written and learned before the class begin to read the lesson. But the best way is to write the whole of this book, which brings the scholar fast forward with his reading as well as writing, and may be done in far less time than is generally imagined. All along, after a lesson has been learned and said, the teacher examines the class, or, which is preferable, the scholars are taught to examine one another, on the meaning of every word and
member of a sentence, at first with the books open, and afterwards with them shut, each in turn putting the question to the scholar opposite to him; after which the hard words are spelt off book, - the polysyllables by unreiterated spelling.

“Next they revise this part of the history, reading it by clauses. They then go through the three other parts in the same manner; and lastly, they once more revise the whole four Parts, which, if before perfectly taught, may be done in four lessons.”

Note the exquisitely agonizing boredom of Bell’s unspeakably incompetent “lessons.” To torture little children with such exercises is a monstrosity that outrages sensibility. At the best, the children were obviously only memorizing the short little text, with the help of context. They still had been taught nothing of the sounds of many letters (ph in Joseph, etc.) so they were learning much of the spelling by rote, but the vast emphasis on “meaning” had fully arrived, as confirmed by the following dreadful statement:

“...the scholars are taught to examine one another, on the meaning of every word and member of a sentence, at first with the books open, and afterwards with them shut, each in turn putting the question to the scholar opposite to him.”

This Bell “meaning” text was the source and the jumping-off place for Wood’s slightly later utterly silly (and actually vicious) “meaning” work. That these foot-dragging, dreary exercises must have been painfully boring for little children should also be noticed. Trying to teach little children to read by “meaning” instead of “sound” has always been painfully boring and unbearably slow - and has always produced enormous numbers of failures.

Bell then listed (pages 99-101) the books in the 1823 series. ALL of Mrs. Trimmer’s books had been dropped! What is astonishing is that, not only were all spellers dropped, but so were the Psalter and catechism! Bell referred on page 101 to practicing a selection from the catechism, but, since the catechism was not on his list of books for the schools, it is difficult to see how its use could be guaranteed.

“3. On the perusal of the subsequent Tracts in the Course of instruction in the National Schools.

“Having now briefly propounded the processes, or methods of instruction in all the branches of the art of reading, it will be observed, that the uniform aim has been simplification - the resolution of every thing that is complex, into its elementary parts - monosyllables into the letters, and polysyllables into the syllables, of which they are composed - sentences into the pauses, or the smallest members which contain a distinct idea - and lessons into clauses, or larger portions of the discourse, according to the breaks in the sense, the progress and size of the class, - shorter in the beginner, and longer as the class and lessons advance.

“Of these practices, previous spelling ceases, when the scholars can read monosyllables without resolving them into letters: and syllabic-reading, when they can read the polysyllables, without resolving them into (mono) syllables. In the perusal, therefore, of the subsequent tracts, there is no more previous spelling, or syllabic reading, except when words occur which the scholar cannot otherwise read. But the reading by clauses, so important to the understanding, as well as to the circulation of the lessons, and unreiterated spelling (off book), so material to the saving of time, are continued throughout the whole course of study. Nor should pause-reading be
rashly abandoned, till the scholar is perfectly familiar with this practice, which is the best preparative for reading by clauses, and is attended with peculiar distinctness, and a brisk circulation of the lesson. Previously, therefore, to conning each of the subsequent lessons by clauses, it may be once, or oftener, if requisite, rehearsed by pauses. Nor need this practice terminate, but with the above mentioned tracts, by which time the scholar ought to be well versed in the art of reading, and duly prepared for the perusal of larger treatises and the study of the Bible....

“4. A few examples with remarks, on reading by pauses, and by clauses. The following examples are so marked, that they serve, at once, as specimens of reading by pauses and by clauses. A Pause is a given quantity, being invariably limited to the minutest portion of a sentence, which contains a meaning.... They are generally short in the elementary books, for the sake of a quick circulation, where the lessons are brief, and lengthened in the revisals... but so that a portion may fall to each member of the class, without repeating it oftener than is necessary to learn it. Thus, when the monosyllabic book, of thirteen pages, is revised by a class of thirty-six scholars at one reading, a clause may, on an average, be about one-third or one-sixth of a page, that each scholar may have one or two clauses and so in other cases.

“The following examples are taken, 1, from the 2nd Book, 2, the Sermon on the Mountain, and 3. the Catechism.

“l. The 2d Book.
The way - of God - is - a good way. Bad men - are foes - to God. Again - There is not - a thought - in our hearts - but - God.-“

The following examples are taken, 1, from the 2nd Book, 2, the Sermon on the Mountain, and 3. the Catechism.

Therefore, the ultimate source for the switch from “sound” to “meaning” in beginning reading in the English language appears to have been the books approved by Bell some time before 1823, which represented a complete about-face from Bell’s 1808 selections. What caused Bell to switch from “sound” to “meaning” some time between 1808 and 1823 is unknown. However, his use of a phrase like “useful knowledge,” his ideas that sound like Stewart’s, and his origin in Scotland certainly suggest he had some kind of connection with the Scottish Stewart/Brougham movers-and-shakers. Furthermore, his apparent use of a suggestion from Diderot’s Encyclopédie for a beginning reading book suggests he or someone influencing him had a liking for the Encyclopédie even though it was in great disrepute among many religious conservatives at the beginning of the nineteenth century.
Chapter 37
The Move Slowly Began Towards Government-Controlled Schools Bringing with It the Change from “Sound” Spelling Books to “Meaning” Primers

Concerning the religious element in the Lancastrian schools as opposed to the Bell schools which were sponsored by the Church of England, Alec Ellis said the Bible was to be presented in Lancastrian schools “without note or comment,” as the intent was to enroll children from all denominations. (Ellis wrote A History of Children’s Reading and Literature, Pergamon Press, Oxford: 1968.) The Lancastrian schools had, however, from their beginning, a religious emphasis, as is obvious from the remark about the Bible. Lancaster, himself, was a Quaker.

According to Mary F. Thwaite in From Primer to Pleasure in Reading, The Horn Book, Inc., 1972 (page 96):

“In 1833 the Government made the first state grant for education by voting a sum of £20,000 in aid of private subscriptions for the erection of school houses. The grants were administered through the two School Societies which had been formed to promote the Bell and Lancaster systems (virtually the same in their methods of rote-learning and use of older pupils as teachers but different in religious belief) - The National Society for Promoting the Education of the Poor in the Principles of the Established Church throughout England and Wales (1811) and the unsectarian Royal Lancastrian Association (1810), soon to be renamed The British and Foreign Schools Society.”

Thwaite was wrong that Bell and Lancaster were virtually the same in their methods. Bell had adopted the “meaning” approach in his reading materials and in addition had thrown out the “sound” spelling book for beginners some appreciable time before 1823, which Lancaster certainly had not done. It might be noted in passing that Lancaster had apparently lost the support of influential people in Great Britain by the time he emigrated to America in 1818.

Lancaster’s failure to drop “sound” as the method to teach beginning reading, and his failure to replace the “sound” method with the “meaning” method as Andrew Bell had done, may well have caused Lancaster’s loss of such support.

A book by James Kelly was published in Philadelphia in 1817 carrying the title, An Improved Method of Education Instituted by Dr. Bell... Also Joseph Lancaster’s Method of Teaching. The book was a teacher’s guide, and it described the Lancaster methods Kelly had previously used in Ireland with Lancaster’s personal approval. The Lancaster material that Kelly described consisted of “boards” on the first of which were the alphabet and two and three-letter “words.” These first “words” were obviously only syllables. In discussing his present version of the Bell method that he was using in America, for which he actually used Comly’s American spelling book and not Bell’s English materials, Kelly consistently referred to ba, da, be, de, and other particles as “words.” Therefore, Kelly probably also sometimes meant syllables instead of “words” when he used “words” in discussing Bell’s material.

According to Kelly’s 1817 description, Lancaster classes learned in the pattern of the old spelling books: alphabet, syllables, and then real words, the “boards” covering word lists after the syllables. The fourth Lancaster class was:
“To spell and read the boards appointed for the class, which are from table the seventh to the twentieth inclusive... which will prepare them for the fifth, or first reading class.”

Therefore, the children did not begin to read connected text until they had passed the fourth class and had learned how to spell words, obviously by sound and not by meaning.

Kelly described the same alphabet and syllable steps in his version of the Bell school in Philadelphia where he taught after leaving Ireland. However, the children were using Comly’s spelling book immediately after having learned how to form their letters in sand, and the syllabary was taught in Comly’s peculiar sequence. Comly’s was far more heavily a “meaning” text than Webster’s and rates only a Code 7. It is one of the few spelling texts which succeeded in straddling the critical 1826 change-date in America, being published for years before 1826 and many, many years afterwards, undoubtedly because of its bias towards “meaning.” However, in 1817, Kelly was using Bell’s “unreiterated spelling” for multisyllable words, so he was familiar with Bell’s original philosophy.

Both Bell and Lancaster appear to have been opportunists, although highly successful ones. Their “monitorial system” faded because of its failures, but the thrust to form religious schools for the poor was permanent and met with permanent success. In the meantime, Brougham was pushing for the establishment of government schools for the poor, but failed in his attempt. Yet, by 1830, successful religious charity schools were in operation: the National schools of the Church of England, the British and Foreign School Society schools, and the Sessional Schools of Scotland. After Brougham’s failure, it was these charitable religious schools that the record indicates the activists sought to “improve” by taking over the authority for running them. However it would be another forty years, in 1870, before purely government schools would come into being in England. Activists were then able to use superior financial resources (the public’s tax dollars) to push these religious schools for the poor, which for much of their existence had been dominated by government agencies anyway and not by the churches, from the center of the stage into a minority, underfunded position.

Ellis also wrote of the 1833 grant, and the laws passed about that time on education, as follows: (pages 14 and 15):

“In 1833 the House of Commons voted a sum of L20,000 ‘for the purposes of education’, an action which attracted very little attention at the time. The British and National Societies shared the grant and used it in the building of schools.... In 1839 a Committee of Council on Education was appointed by Order in Council ‘to superintend the application of any sums voted by Parliament for the purpose of promoting public education.’ Engels commented in 1844 that a mere L40,000 was devoted to public education in a budget of L55 million.”

Even though not much government money was going towards education by 1844, the critical date for government control was 1839, when the Committee of Council on Education was formed. After 1839, the Committee of Council on Education held the purse-strings and therefore had the potential power to control any religious schools in England and Wales which accepted any government money. In due course, as might have been anticipated, it exercised that power.

Concerning other legislation on education, Ellis wrote:

“(By the Factory Act of 1833) at the conclusion of their 8 hours of work, those between 9 and 13 were to attend schools provided by the employers....

“The Poor Law Reform Act of 1834 stipulated that children in workhouses should receive 3 hours’ instruction each day.... The Ragged School Union was founded in 1844 “to promote the
education of the waifs and strays of great cities...” Sunday schools continued to provide facilities... The average length of school life on a national level rose from approximately 1 year in 1835 to 2 years in 1851.”

Ellis confirmed that little effective governmental interference in education had occurred before 1851, despite the laudable efforts to lessen child labor. Before 1851, little time was spent in school: on the average, for the whole nation, only two years in 1851. Most of the adult population at that time, therefore, and for some years afterwards, had not learned to read in government-controlled schools. Furthermore, many religious schools were commonly refusing government grants before mid-century in order to maintain their independence.

“In its early days, state aid was confined to the two voluntary societies which had done the most to build schools and bring education within the reach of the underprivileged. These were the Church of England National Society, founded in 1811, and the British and Foreign School Society, set up shortly afterwards on the basis of non-sectarian education - but having, in practice, a close association with Nonconformity....” (page 40)

“State inspection of elementary schools began with the recruitment of the first two H.M.I.s in December, 1839. Their appointment followed approximately six years after the first Government grants had been made towards the education of the poor, and from 1839 acceptance of a grant automatically gave the right of official inspection. Dislike of inspection, however, often made school authorities unwilling to take advantage of the financial help available, and in 1847 there were, for example, in Lincolnshire only forty-three Church Schools under government inspection; ten years later the figure has risen to 124, but even then the local H.M.I., the Rev. J. J. Blandford, was lamenting that ‘the managers of the schools connected with the Church at Louth have not put them under inspection in order to avail themselves of the pecuniary assistance afforded... At Grimsby there are no schools under inspection....’ In other counties the position was similar, but as time passed, and as changes were made in the grants available... this reluctance was slowly broken down....” (pages 39-49)

Ellis felt the short time spent in school must have been harmful for basic literacy, writing:

“During the decade following the distribution to the religious societies of the first parliamentary grant, the standard of literacy remained low. The situation in the north-west was perhaps typical of the national level, in that a fair proportion of working-class children read with fluency but very few demonstrated by their expression that they understood what they read.”

Yet his own citations on pages 47-48 disprove that statement. (As will be discussed, “reading with expression” is a fake issue and has nothing to do with the fundamental ability to read.)

“In the later 1850’s it was not uncommon in British and Wesleyan schools in the north for at least 75% of the children to read books of general interest with fluency, but even in the highest standards there was an almost complete absence of expression.”

Most children in these schools were very young since most stayed in school only a few years. Yet, of the total number of school children in the British and Wesleyan schools, which included rank beginners, three out of four could read books that were not their school books, but “books of general interest,” which they read “with fluency.” Note, however, that these children were not in the Church of England schools
that had been adversely influenced almost from their beginning by Bell’s ideas on teaching beginning reading for “meaning.” By the late 1850’s, Ellis cited statistics from the Church of England schools which were almost the precise reverse of the British and Wesleyan schools, which will be discussed later.

Before the late 1850’s, what were the conditions for the learning of basic literacy in those other available schools, the “dame schools,” which were a major influence on much of the lower-class population until after that date?

English lower-class children had read far more competently, as the 18th century chapbook sales prove, when their education was limited to the much-maligned dame schools and they learned to read by simple “sound” instead of convoluted “meaning.” The motive of the poor in the eighteenth century for buying chapbooks had been the same as the motive today to buy television sets: simple enjoyment. Those children who learned, casually, to read in the informal dame schools needed no government-funded committee with a slogan like, “Read, read read!” in order to read and enjoy chapbooks, any more than children would need a slogan today like “Look, look, look!” to make them watch television.

Ellis wrote:

“There were in 1851, 13,879 ‘dames’ schools’ in England and Wales, the majority of which functioned for the supervision of children whilst their parents were at work, but could not be regarded as places of instruction. In the Census of 1851, more than 700 heads of such schools certified their returns with a mark....”

Dame schools were dying out by 1851. A number like 13,179 could only handle a portion of the population at infant-school age. It is unfortunate that 700 “heads of such schools certified their returns with a mark.” This means, however, that 13,179 “heads of such schools” did NOT “certify their returns with a mark,” or 95% of the “heads of such schools”!

The ability to sign one’s name is a standard test for literacy. These poor women, members of the underprivileged underclass in England, had a far, far higher literacy rate (95%) in 1851 than the general population in almost any country in Europe, including England, and certainly higher than the female population in almost any country in Europe, as shown by the statistics in Literacy and Development in the West by Carlo M. Cipolla (Penguin Books, Baltimore, Maryland: 1969). In his own text, Ellis reported on page 46 that the illiteracy rate in England in 1851 for men was 30.7% and for women 34.7%, citing “Cole” as his source. Yet the illiteracy rate for the dame school heads in England was only 5% in 1851! If they had been employed mainly as baby-sitters, their illiteracy rate would have exceeded the English average for women in 1852 of 34.7%, since they were members of the poorer classes in which illiteracy was far more common. Yet their illiteracy rate was not only not higher than the average of 34.7% for English women, but far lower: 5%. It is statistically obvious that the vast majority of these poor women were chosen by the parents of poor children for their ability to teach simple reading, not for their baby-sitting talents.

These dame school heads, commonly referred to as old women, were certainly over 25 years of age on the average. Therefore, they probably learned to read by the syllable method before the critical change-over period about 1830 in methods for teaching beginning reading. If these old women had any text at all for their dame-school charges, it was probably either a spelling book or the folded sheet of cardboard called the battledore. The battledore commonly included the syllabary and did not die out until after 1851.

Tuer had said in his book (page 414):
“A paper on the horn-book in Willis’s Current Notes for October 1855 thus opens: ‘Horn-Books are now so completely superseded by the Battledore and the various forms of Reading Made Easy that they are rarely met with, and few persons believe that such was formerly the means adopted to teach the infantine idea how to shoot.’

“The Battledore began to fail in popularity between the thirties and forties, but it lingered on until about the time of the Great Exhibition of 1851 or a little later.”

There is, of course, no guarantee these mid-century battledores which certainly included the alphabet still included the syllabary, but some may have, and certainly old ones still in use did. Old women who had learned by the syllabary knew the function of the syllabary, however. They did not even need a text to teach it, even the cheap cardboard battledores, which were still in print in 1851.

Some other simple, cheap material with the syllabary must also have hung on to mid-century and may have been used in dame-schools along with the horn books, battledores and spellers. In his book first published in 1897, Tuer stated (page 398):

“Among the last wooden tablets used in English schools was the small handleless deal slab with alphabet and figures on one side and syllabararium on reverse, also published by the Sunday School Union, and known as Freeman’s Lesson Board, which sold for a penny. It appears in a catalogue dated 1835, and only a couple of years ago the dustman cleared away the discarded stock.”

The battledores and simple material like Freeman’s Lesson Board probably died out after the mid-century BECAUSE dame schools were largely replaced by government-authorized schools by that time. Government reading textbook grants were given to such schools only for reading books published in series, or for the phony phonics charts, Reading Disentangled, which are discussed elsewhere. Like Goody Two-Shoes, therefore, the despised dame schools in 1851 could probably still turn out little children who could read because they were teaching with the “sound” method with their simple materials like the battledore and old spellers. Yet the schools taking government textbook grants demonstrated shortly afterwards they could NOT teach reading to the majority of children even up to the age of twelve. This is proven beyond any possible doubt by the enormous oral reading failure rates above the beginning levels on the graded tests known as the Standards, to be cited later. Yet for children to pass at the beginning levels was largely meaningless, as they were tested on reading books which they had memorized. As quoted later, one inspector said they could go on “reading” aloud even if their reading textbook fell on the floor. The oral reading failures occurred because the schools taking government textbook grants purchased reading books in “meaningful” reading series, and were therefore using the “meaning” method instead of the “sound” method for teaching beginning reading which was still being used in the dame schools.

Tuer quoted a reference to a vast quantity of a simple version of the horn book which had been printed only to end up as an inventory-glut. This would obviously have happened suddenly and unexpectedly. The glut suggests the market for this variation of the old horn book had suddenly dried up, to the presumed surprise of its unfortunate printer. A sudden drying up of the market for hornbook-like materials about 1823 would have been the case in schools influenced by Bell, and by about 1830 in the Sessional Schools in Scotland, the government schools in Ireland and the more “modern” Sunday Schools. On pages 269 and 270, Tuer quoted from “Notes Towards the History of the Horn-Book by Kenneth R. H. Mackenzie, Esq., F.S.A., Read 7th May 1863. (Society of Antiquaries)”:

“Passing from the Horn-book proper, covered with horn, we next come in point of date to those Horn-books merely covered with varnish or mucilage. These are probably of more recent
origin, and date from the beginning of this century only. The price of these varied from one penny
to twopence each, and the chief printers of those were a firm in Long Lane, Smithfield. Mr. Offor
told me that on the introduction of the spelling-book to a greater extent these objects became
obsolete, and upwards of a Million and a half of these common Horn-books were destroyed, on
account of there being no longer any demand for them, on clearing out the warehouse of his
brother and himself. Still they seem to have lingered on in use down in country villages till about
1820, many persons with whom I have conversed having been taught their letters from them. The
central northern and western counties abounded in them until the spelling-book became more
common. In Scotch parlance they were called Ah Bay Broads or A B Boards, and traces of their
use are still recoverable in various districts of the Scottish Lowlands and Border counties.
Between the introduction of the spelling-book generally, however, there was a transition period in
which folding cards called Battledores specially were used. Of these I beg to exhibit several
specimens. They contained more than the ordinary Horn-book, as may be seen, and were adorned
with rude woodcuts. But they in turn have passed away and are no longer in use. The copies on
the table were mostly printed in the Midland Counties, and bore prices varying from twopence to
fourpence.”

When Mackenzie was writing in 1863, more than thirty years after the switch from “sound” to
“meaning” in schools influenced by the activists, Mr. Offor and he could only have been guessing on the
cause of the hornbook and battledore’s demise. The hornbook, the battledore, and the
spelling-book-for-beginners had all been wiped out by the arrival of the “meaningful” primers for
beginners. It should be pointed out that the battledore with its pictures and folding pages was considerably
more expensive than the simple pasteboard hornbook. The hornbook and battledore were not competitors,
but were meant for different markets. The true battledore did not replace the hornbook, but the market for
both disappeared, the pretty pictures on the battledore probably making it linger a little longer for use as an ABC picture book.

Government schools enforcing mandatory attendance laws and controlling the content of what is
taught to the children of the people are a fact of life today in most of the Western world, including the
United States and Great Britain. Such government schools were virtually unknown before 1817 except in
militaristic Prussia and in France where they were one of the first fruits of the French Revolution. Yet
most people have been conditioned to regard these dictatorial institutions, which run roughshod over the
rights of parents, as one of the most notable “achievements” of “progress.” In her 1974 book, The
Victorian Country Child, now published by Sutton Publishing, Gloucestershire, Pamela Horn was giving
the standard, accepted interpretation of English educational history when she wrote the following
concerning the “appalling” educational facilities which such government-subsidized schools removed
from the English landscape. She based her comments in part on quotations from nineteenth century
government school inspectors, who must logically, of course, be considered vested interests.

The nineteenth century dame schools which the government school inspectors belittled in their
remarks had been in existence since at least about the mid-seventeenth century, and curiously had met not
only with little opposition such as theirs but instead had met with tacit approval until Brougham’s day
about 1817. That is a period of about two hundred years! It was only when activists mounted their
campaign for government-controlled schools starting about 1817 that the private dame schools began to
be described as appalling. It is therefore only logical to consider carefully the fact that the two opponents
to the dame schools whom Horn quoted were both government school inspectors with a vested interest in
government-subsidized schools. They had no authority whatsoever over the dame schools. The first
comments Pamela Horn quoted were from “the Rev. W. Warburton,” Her Majesty’s Inspector in 1858.
Horn said (page 26):
“Perhaps the worst offenders in this respect were the ‘dame schools’ which still survived in many localities, where mothers sent their youngsters for a penny or two per week and which were little more than child-minding institutions. In 1858 the Rev. W. Warburton, H.M.I. for the Berkshire, Hampshire, Wiltshire and Isle of Wight area, condemned these schools in no uncertain terms: ‘The greater part of the private dames’ schools are held in dwelling rooms... It is one of the many ways of making their bread adopted by people scrambling for a livelihood in no certain or definite calling. The children in such schools frequently spend a great part of the school hours sitting on forms round the kitchen, with dog-eared pages of spelling-books in their hands, from which they are supposed to be learning, while the “schoolmistress” is engaged in sewing, washing or cooking.’ He thought that their only merit was that they habituated the children ‘to some little restraint for certain hours every day...’ ”

The inspector’s comments were meant to be a total condemnation, but buried in their venom, by his very own testimony, can be found certain facts about most 1858 dame schools of which he knew: “The children... spend a great part of the school hours... with... spelling-books in their hands, from which they are supposed to be learning...” The children were therefore not using the first books of the sight-word reading series in use in the government-subsidized schools (the “meaning” approach), but instead were following the old-fashioned method of using spellers to learn to read (the “sound” approach).

The “Payment by Results” tests came out in the government’s Revised Code of 1862, only four years after the inspector’s acid remarks. Standards I and II in the government-subsidized schools concerned children of approximately seven or eight years of age, or older children who had failed Standard III. This group of children, apparently the majority of children in the government-subsidized schools at that time, were not required to spell ANYTHING in 1862, other than to write the letters of the alphabet from dictation. Even in Standard II, the only spelling (“Writing”) required was the following:

“Copy in manuscript character a line of print.”

At Standard III in the 1862 regulations (for children of about nine years of age who had passed Standards I and II), some spelling finally entered the “thorough and efficient” government-sponsored “tests”:

“Standard III

“Reading: A short paragraph from an elementary reading book used in the school.

“Writing: A sentence from the same paragraph slowly read once, and then dictated in single words.”

As described elsewhere, the children memorized their readers and, as one inspector said, could go on “reading” even if the books fell on the floor. However, the children could not memorize the spellings of all those words, so the spelling in Standard III was very demanding for such badly taught children, but the children did have the crutch of something like “short term memory” to help them, since they had recently looked at the short paragraph concerned.

Even as late as 1871, little spelling was required of seven year old children (and none, of course, of younger children). The New Code of Regulations in 1871 read for Standard I:

“Writing: Copy in manuscript character a line of print and write from dictation a few common words.”
As discussed elsewhere, very few lower class children went any higher in school than Standard III. The dame schools using “sound” spellers to teach reading, therefore, were far more demanding in 1858 than the government-subsidized schools using “meaning” readers were for years after 1871!

The inspector had said in 1858:

“The children in such schools frequently spend a great part of the school hours sitting... with dog-eared pages of spelling-books in their hands... while the ‘schoolmistress’ is (otherwise) engaged....”

That means, of course, that at OTHER times than “frequently,” the children did NOT sit while the schoolmistress was otherwise engaged. No matter how his statement is rearranged, the inspector has tacitly admitted that the dame schoolmistresses DID work with the children, and did not just “baby-sit” them, and what she was teaching them was how to spell and read!

Two other facts emerged: These were children of the poor, and yet their parents chose to spend their little money for a “private” education and even obtained the “dog-eared spelling books” without the government subsidy available in the government-subsidized schools. That some parents still chose to pass up the free schools and possibly free books or at least partly subsidized books is an intriguing fact. (Pamela Horn mentioned government-subsidized schools did sometimes have a charge for school “pence.”)

The last fact concerns what we call today, “individualized instruction.” In the crowded government-subsidized schools, little personal attention was possible, despite the good intentions of the schoolmasters. Yet in the relative quiet of a poor woman’s kitchen, sitting on a little bench, personal attention was not only possible but probable, and so were kindness and affection for the relatively few little children under the poor woman’s charge, whose parents she probably knew fairly intimately.

The contempt and lack of sympathy for the poor women running these little dame schools and the contempt for the problems of the poor in general are glaringly obvious in this inspector’s remarks. As Pamela Horn pointed out, these “inspectors” were almost uniformly upper-class men with little understanding of the lower-class teachers and students in the government-subsidized schools over whom they had dictatorial authority. After 1862, when government grants were awarded only on the basis of how many children passed the inspectors’ tests, the inspectors terrified teachers and students and were almost uniformly regarded as ogres.

It should never be forgotten that the abridgment of parental rights and of academic freedom in the nineteenth century was the government’s gift to the poor of freedom-loving England. Yet because of the admitted failure of government schools, both England and America are presently engaged in writing testing “standards” once again. Tests did not improve the English schools in the late nineteenth century, nor will they improve schools today. However, they will achieve something: a centralized control over the “truths” that are fed into children’s minds.

Pamela Horn stated (page 26):

“Particularly from the 1870’s, however, only a small minority of children attended dame schools. The vast majority in the country areas were educated at schools run in accordance with the principles of the National Society, a Church of England organization.”

Pamela Horn made it clear, however, that control over the schools was not exerted by the church, but by the state, in the person of “Her Majesty’s Inspectors,” who controlled the purse strings with their tests.
Government grants to schools were made only on the basis of “results” after 1862. She quoted the comments of another “H.M.I.” concerning the dame schools, eighteen years after Rev. Warburton’s comments, or in 1876. She said that inspector, who was working in the Chester district:

“...likewise condemned [the dame schools] as places ‘where a number of children are huddled together, learning almost absolutely nothing except perhaps knitting....’” Nevertheless, in view of what has been said about the low temperatures in the ordinary day schools, it is perhaps worth noting that this H.M.I. considered one of the reasons for the survival of the dame schools was that parents believed them ‘warmer than the school.’“

Score another one for parental choice among the poor! They freely chose to pay out some of the very little money they had to improve their children’s circumstances! The inspector admitted the parents were protecting their children’s health which was endangered in the government-subsidized icy schoolrooms. (However, as mentioned, in the government-subsidized schools, school “pence” was often collected, so it may not have been a greatly increased expense in some cases.)

Turning this inspector’s 1876 statement inside out, as was done with the 1858 statement, also reveals an unwilling admission from him that the women in these warm kitchens were also teaching something besides knitting: “learning almost absolutely nothing” is NOT “learning absolutely nothing.” Therefore, even according to his exceedingly hostile comment, something besides knitting WAS being taught, and part of that something WAS being learned.

The private dame schools that had been everywhere before 1817 and had produced a large degree of literacy among the poor were essentially gone, however, fifty years later, by 1867. To follow the changes in reading instruction in Great Britain and Ireland after 1817, it is necessary to follow the history of such organized charitable schools as those founded by Bell and Lancaster, and the history of the government schools for the poor in England and Wales after their founding in 1870. Reading texts apparently were often edited to fit the requirements of these tax-subsidized schools. The private schools for the children of richer families, still very much in existence, do not appear to have been a determining factor in the make-up of texts for instruction in reading. Presumably, they used the same reading series as the government-subsidized schools. However, until about 1860, the charitable schools, despite partial government subsidies, often could not afford to buy these reading series, but, as will be mentioned, depended largely on the Bible as a textbook.

The dame schools had represented “control from the bottom.” Teaching methods that had worked in these little schools had persisted, but methods that did not work died a natural death. Government-controlled schools represented “control from the top” by “experts.” What “works” in government-controlled schools is not objective success, but conformity to regulations framed by “experts.” When government regulations do not concern the actual operation of the school itself (as when fake “local control” is permitted) the same end has always been achieved through the government’s requirement that all teachers be “properly licensed” or that their teaching “results” should be “tested.” “Properly licensed” teachers are only those who have been subjected to brainwashing in teachers’ colleges, the curriculum of which always conforms to “expert” opinion. As a result of de facto control by “experts,” virtually all teachers colleges, everywhere, have always endorsed teaching reading by “meaning” and an enormous amount of other harmful nonsense.

When teachers and administrators later read “professional” educational journals, they only get more of the same brainwashing from “experts,” but wrapped in the vocabulary of whatever is the current worthless enthusiasm, such as “whole language” at present.
Even though fake “local control” may be permitted, “control from the top” by “experts” is therefore maintained through influencing the teaching methods and philosophies of “properly licensed teachers,” and through government “testing” of their teaching “results.”

On page 45 of A History of Children’s Reading and Literature, Pergamon Press, Oxford: 1968, Alec Ellis wrote concerning the growth of such regulations and requirements in England and Wales:

“Educational development in the elementary sector between 1833 and 1870 was implemented virtually without legislation, but through the agency of departmental Minutes. Numerous attempts were made in 1843, 1853, 1855, 1867, and 1868, to improve the facilities which were available, but in each case they proved abortive in the face of opposition from religious organizations. It may be inferred from the regularity with which the topic was raised, that there was a growing movement favourable to popular education.”

The above is one of the most frightening of the developments. Parental authority and school autonomy were taken away from the poor in England and Wales, not by a properly elected legislative body, but by the dictatorial actions of bureaucrats. This is clear from the statement by Ellis quoted previously:

“Educational development in the elementary sector between 1833 and 1870 was implemented virtually without legislation, but through the agency of departmental Minutes.”

The bureaucrats achieved their planned and effectively PRIVATE “development” despite “opposition from religious organizations” which had apparently successfully opposed their necessarily PUBLIC legislative “attempts” of 1843, 1853, 1855, 1867 and 1868. “..(T)he regularity with which the topic was raised... favourable to popular education” shows that two groups had developed: the “religious organizations” working in opposition to government schools, and “a growing movement” of non-religious organizations promoting government schools. Yet the power was on the side of the government-school “movement” which had captured dictatorial powers through “departmental Minutes.” Furthermore, this was in Edmund Burke’s England which has always quite properly boasted of its liberty. Yet the dictatorial bureaucrats continue today on both sides of the ocean, acting as if they own the children of the public.

Ellis wrote on page 46:

“In many of the manufacturing towns, only a minority of children obtained education of any kind, and in 1852 extremely few aged 12 or more would be found at school.”

The false assumption is made that a person must attend a formal school past the age of 12 to be educated, and therefore those who did not in 1852 were uneducated. Among those in 1852 who had not attended school past the age of 12 was Father Isaac Hecker, since “12” was a normal school-leaving age when he was a boy in America in the early nineteenth century. Without any further education, Hecker at about age 20 fitted right in with the Transcendentalist philosophers in New England, studying Hegel, et al, which required a vast amount of “reading comprehension.” Eventually Hecker threw it all up and became a Roman Catholic convert and founder of the Paulist Fathers. Yet no one ever raised the suggestion that Hecker might have been uneducated because he left school at 12.

Of course, some of Hecker’s contemporaries did not attend school more than a year or two: Abraham Lincoln had only about a year’s attendance. In the previous century, Benjamin Franklin had only about two years. I never heard anyone say that Benjamin Franklin was uneducated. At that, the under-educated Lincoln and Franklin did better than some underprivileged women who almost never attended school, like
the Bronte sisters in England, for instance, from whom came such works as Wuthering Heights and Jane Eyre.

With America’s mandatory school attendance laws, we have solved the “education problem” of people like Hecker, Lincoln, Franklin and the Bronte sisters. Now most American children must attend school to age 16. Isn’t it consoling to know that most native-born American functional illiterates attended school EIGHT YEARS LONGER than Abraham Lincoln and SEVEN YEARS LONGER than Benjamin Franklin? Hecker, Lincoln, Franklin and the Bronte sisters learned to read when the only method used was “sound,” but our functional illiterates were taught how to be functional illiterates by the “meaning” method which does take years to “teach.” As a result, they cannot even read a paragraph in a newspaper out loud without missing those low frequency words that they cannot “meaningfully” guess from the context.

In The Victorian Country Child by Pamela Horn, The Roundwood Press, Kineton: 1974, now published by Sutton Publishing, Gloucestershire, she reproduced literacy data on convicts under sixteen years of age, all apparently among the poorest classes. The data concerned Oxfordshire County and certain of its court Sessions between 1851 and 1853, and between 1861 and 1864. Children in the former period ranged in age from 12 to 15, and would have been five-year-olds of school age between 1841 and 1845. Children in the latter period ranged in age between 10 and 15 and would have been five-year-olds of school age between 1852 and 1859.

That the spread of formal education had made some difference was shown by the fact that, of the former group of 14 children, 6 were illiterate, and, of the latter group of 10 children, only one was illiterate. Of the former group who learned to read before the widespread existence of schools and schoolbooks for the poor, and when AVERAGE school attendance in England was only about one year, 8 of 14, or 57%, received the comment, “Reads and writes imperfectly.” Of the group in school between 1852 and 1859, when average school attendance was about two years but when government-approved reading series were still not widely used in schools for the poor and the poor learned to read by “sound” in spelling books, 9 of 10, or 90%, received the comment, “Reads and writes imperfectly.”

Yet, as will be shown, when the government-subsidized schools had really spread, and children learned uniformly from “reading series,” which taught by “meaning,” instead of “sound,” which books the children had to use to pass reading “standards,” the statement was made that 80% left school without having obtained any permanent benefit. Even though the children had used these “meaning” reading series for five years or so (which, as will be shown, they usually did not read independently but instead memorized by chanting them aloud in chorus), it was acknowledged that eighty per cent could not even “read and write imperfectly” when they left school! This is further proof that with the increase in school attendance and the use of the “meaning” reading series and the demise of the “sound” speller, literacy had decreased, not increased.

Similarly, it is a notorious fact today that in American prisons the majority are illiterate, even though they attended government schools using “meaning” reading series for many years. Present-day illiterate convicts, who have served many years of mandatory attendance in government schools before serving their time in prison, make a sad comparison to the majority of the little Oxfordshire “convicts” between 1851 and 1864, who may have had only one year in school but who were not illiterate, probably because they learned to read by “sound” and not by “meaning.” Furthermore, as Pamela Horn’s pathetic tabulation indicates, these very poor children were often imprisoned for minor offenses such as stealing a cotton handkerchief, or fifteen ounces of bacon, or a cotton dress.

One of the reasons these poor children had been able to learn to read with only a year or so of school is that they were shielded from exposure to the new “meaning” texts appearing after 1826, since their
schools were too poor to buy them. Ellis showed that many schools for the poor, the kind of schools in which the little “convicts” would have learned to read, had no school books other than Bibles until after the mid-century (page 16-19):

“It was the normal practice where books were provided in schools for the Bible to be used as the textbook for instruction in reading, a feature which was continuously criticized by inspectors after 1839. In the diocese of Winchester, the schools were simply extensions of Sunday schools, and an adequate education for working-class children was thought to comprise an ability to recite the Church catechism and to master the mechanics of reading from the Bible. Children memorized the contents of the Bible so that it was impossible to test their reading ability unless they were presented with the same words in a different context.”

This is obviously ridiculous. Anyone who could memorize the Bible would be a genius. These children, who had not learned to read in “meaning” primers, could really read!

Ellis continued:

“In 69 Midlands schools out of 103 for which returns were compiled in 1844, Bibles or extracts therefrom were the only form of reading material, but in most schools throughout England and Wales no attempt was made to provide books of any kind....

“A further difficulty was the price of secular books in relation to that for Bibles and Testaments. In 1844, a well bound and printed new Testament could be obtained from the S.P.C.K. for 6d, whilst its 4th Reader cost ls. 6d.... As long as this situation persisted it was unlikely that secular books would be introduced into schools in large numbers.”

Ellis referred on page 16 to:

“...a report in 1847 for the southern counties of Berkshire, Hampshire, and Wiltshire... of a population of 6213, 17% could read the Bible fluently, 50% could read simple passages from the Gospels, while the remaining 33% were learning letters and monosyllables.”

This was obviously an 1847 school “population” of young children, one-third of whom were beginners. The rest must also have been very young and under 12 years old, since, as Ellis said later concerning 1852, very few over 12 years of age were in school. Yet, two-thirds of this very young population could read very well. Since they had only the Bible, and no “books of any kind” provided by the school, they were all obviously shielded from Andrew Bell’s appalling reading materials.

The Bible, which had been the mainstay of the schools for the poor, including the Church of England schools using S.P.C.K. (Society for the Promotion of Christian Knowledge) materials, began to be thoroughly displaced by “meaning” reading series by 1860. Ellis wrote of conditions in the schools of the British and Foreign School Society, which were probably representative of most schools (pages 53-54):

“An inspector of British schools contrasted the situation at mid-century, when in most schools the Bible was the only reading book, with 1860 when books written in a readable style, upon the subjects of everyday life, were easily accessible.”

Therefore, by 1860, the “meaning” reading series, which had displaced the “sound” spellers after about 1826 as the correct beginning material, had finally taken over virtually all the schools, including the schools for the poor. The 1862 government reading standards were set up to test achievement only in such “meaning” reading series. The spelling book which had taught beginning reading by “sound” was
implicitly outlawed for beginners since the first book of the government-approved “meaning”-method reading series was the only one that was subsidized for beginners with government money.

The Bible was no longer considered to be a suitable test of reading ability, but only books in the “meaning”-method reading series were. Nor, of course, was any mention made in the “standards” of ability to read the catechism! Schools predictably taught reading with the government-subsidized reading books so that children could pass the government-required reading tests. The Bible was pushed out of the schools as a reading text, along with the catechism that had been part of English elementary education for three hundred years. For those who recall Orestes Brownson’s testimony quoted elsewhere in this history concerning the education activists’ aims in America about 1830 to remove religion from education, but without making a direct attack on religion, the developments in Great Britain by 1860 will hardly seem accidental.
Chapter 38
Beginning Reading Materials Published After 1826 in the British Isles Shifted to “Meaning.”

Those school reading books which were published after about 1826, even though schools for the poor usually could not buy them until about 1860, had shifted from “sound” to “meaning” very suddenly. School books available in Great Britain not long after 1830 show that by then “meaning” had almost buried “sound” for beginning reading in publishing. The victory for “meaning” can best be shown by the list of “approved” books listed by the British government in 1848, the only books on which government subsidies were to be available. (For the government to issue any such list of “approved” books was blatant censorship, of course.) Ellis stated (pages 20-21):

“In 1847 the Committee of Council agreed to reverse its decision regarding grants for books in schools, and resolved that it was expedient to encourage the introduction of ‘the most approved lesson books.’ Schedules of these books were prepared for the approbation of the Committee, and all books, for the purchase of which grants were made, were to be selected by school managers from the Schedules (figs. 8-14).”

This material which Ellis included was titled, “Schedule of Lesson Books for the Scholars, Reproduced from the Minutes of the Committee of Council on Education, Vol. I, 1847/48) p. 22-28.” Ellis stated (page 18):

“Among the publishers who produced books for elementary school children in the 1840’s were the British and Foreign School Society, the Irish Commissioners of Education, the Edinburgh Sessional School, Messrs. Chambers, and the S.P.C.K. In 1844 the latter body issued its first Educational Series and selections from Lady Eleanor Fenn’s series of graded reading primers, Cobwebs to Catch Flies (1783?). Kay Shuttleworth compiled The First Phonic Reading Book (1843) which was approved by the Committee of Council on Education, but was subjected to scathing criticism in The Quarterly Review.”

Kay Shuttleworth was intimately concerned with the founding of normal schools in England to train teachers. As will be shown in a later reference, the “phonics” in such normal schools was phony phonics, the two-step comparison of an unknown whole word to a memorized sight-word previously learned for “meaning.” The claim was actually made that the use of “phonics” was possible on only about 50% of English words! Kay Shuttleworth’s 1843 text cannot be located, but presumably was two-step phony phonics, or Code 3.

Note that the S.P.C.K. (the Society for the Promotion of Christian Knowledge) which was preparing the material for the Church of England schools was still following the Bell “meaning” approach to beginning reading. It was using the impoverished vocabulary and syntax of Cobwebs to Catch Flies in place of the speller, although its author, Lady Eleanor Fenn, had obviously not abandoned the speller. Lady Fenn had written A Spelling Book, Designed to Render the Acquisition of the Rudiments of Our Native Language Easy and Pleasant....

Ellis said (page 21):

“Two schedules were prepared in 1848, one of books and maps for the use of scholars and the other for teachers and pupil-teachers. It was intended to amend the Schedules, as particular books
either ceased to be used or were introduced into schools. The publishing house of Longmans was appointed as agent of the Committee for the distribution of books to schools... Listed in the Schedules for the use of pupils were 83 books, 43 of which were reading books... The prerogative of rejection was exercised on two groups:

“(1) the unsuitability of a work for elementary education; and

“(2) the book belonging to a category of literature too numerous to be contained in a list.

“The principal classes excluded were ..languages, biography.... reading lesson books not forming part of a series...

“The schools of the National and British Societies were not the sole beneficiaries of the new grants as they had been in 1833.”

The table did not name the publisher, William Chambers, whose company Ellis had implied published some of the 1848 materials listed. Presumably, that company published one of the series named on the table only by its author. On page 51 of his book, Ellis implied that it was during the 1850's that Chambers published a series called the Educational Course, and then referred to Chambers publishing two reading series after the 1870’s, Educational Course and English Readers. Ellis said Chambers also published the subject-matter texts, Historical Readers, apparently in the 1880’s, and Elementary Science Manuals, apparently in the 1890’s, thereby following the publishing trends. In an appendix to Pamela Horn’s 1974 book, The Victorian Country Child, she published an excerpt from the Standard IV level of W. & R. Chambers’ 1863 series, Chambers’s Narrative Series of Standard Reading Books, so Chambers was publishing that reading series in 1863, very possibly also called Educational Course. On page 77, Ellis said Chambers’ Sixpenny Books for the Young were part of the juvenile fiction being published in the 1880’s largely for sale as school prizes. Therefore, Chambers was one of many British publishers of school texts during the nineteenth century, and the materials Ellis described suggest Chambers was fairly typical of commercial British publishers at that time, as opposed to government or charitable publishers such as S.P.C.K.

The table showed S.P.C.K. published two reading series in the 1840’s. (It made no mention of the fact that S.P.C.K. also published the Bible at a huge discount for schools. Nor were purchases of the Bible to be eligible for any government grant money in church schools!) The table stated, “These books are in use chiefly in Church of England Schools connected with the National Society.” Both S.P.C.K. reading series lacked a speller. Since one was the purely sight-word “Cobwebs” approach, so, presumably, was the other, carrying on the Andrew Bell “meaning” approach that had been used by the National schools since before 1823, at which time Bell had thrown out the speller for beginners.

No information is available on the books used by the British and Foreign School Society, of which the schedule said, “These books are in general use in schools of the British and Foreign School Society.” The fact that no speller was listed, and that the books were a “reading series,” suggests a move towards “meaning” and away from “sound” for beginners.

The British and Foreign School Society schools in 1848 when this government schedule was published had been almost uniformly using the Bible as a textbook, as stated earlier. Yet in their schools, as in the National schools, no government grant money was to be available to purchase new copies of the Bible or portions of the Bible, such as the Psalms that had been used in the Western World for beginning readers for two millennia. In effect, by holding the carrot of government money in front of the noses of the church school managers in 1848, the government schedules were encouraging the church school managers to remove the Bible as a basic reading text and to replace it with the “meaning” reading series.
Only twelve years later, by 1860, the testimony given previously indicates the Bible was gone as a basic reading text even in religious schools which were accepting government grants, and the “meaning” series were firmly in place.

The third series listed was a blatant sight-word “meaning” series about which the 1848 “schedule” wrote:

“Compiled and published under the authority of the Commissioners of National Education in Ireland. These Reading Lesson Books were compiled for the National School established under the Board of Education in Ireland, but they are also extensively in use among all classes of schools in England, Wales, and Scotland.”

This “meaning” series in print by 1836 (and possibly earlier) was not a product of the competitive market place, but was a government series written under the control of the movers-and-shakers. Yet the series was the most widely used of ANY on the 1848 list and was still being printed in 1869! Note that this defective series prospered in the climate of “control from the top” that is the hallmark of government-sponsored schools. It will be discussed later, because its method was the classic Code 3 sight-word “phony phonics” that became dominant later, instead of the John Wood pure Code 1 sight-word approach based on word length. Yet the Irish National Schools “meaning” reading series superficially appeared to follow the phonetic sequence of the old “sound” spelling books. The seemingly standard “spelling book” sequence of the new Irish Readers probably tended to deflect criticism.

The fourth set of approved reading texts on the government list were by Rev. J. M. M’Culloch. The British Library has filed under T. 975* (5) a collection of “tracts,” one of which is A First Reading-Book for the Use of Schools; Containing the Alphabet, and Progressive Lessons in the Long and Short Sounds of the Vowels, by the Rev. J. M. M’Cullock, A.M., “Minister of Kelso, formerly Head-Master of Circus Place School, Edinburgh; Author of “A Manual of English Grammar, Philosophical and Practical, &c., Edinburgh: Published by Oliver & Boyd, Tweeddale Court; and Simpkin, Marshall & Co., London. 1837.” This First Reading Book is apparently the first book in M’Culloch’s reading series which was approved for government subsidy in 1848.

I did not have an opportunity to analyze the reading books themselves, the first two of which were in the binding, except to scan them, so cannot affix a firm Code number, but the philosophy, as expressed in the preface before the First Reading Book indicates that M’Cullock was producing a sight-word, context-dependent series, in which the “phonics” was to be analytic phonics meant primarily to help in enunciation (perhaps Code 4), though it could be taught with sounding the letters (at least Code 7) or, as he wrongly attributed to Jacotot, without any knowledge of the letters (Code 1)

As mentioned earlier, in his comments on Professor Pillans’ endorsement of Wood’s Sessional School in Edinburgh in 1828, the Scottish Schoolmaster had referred to the Circus Place School. M’Cullock had been headmaster at the Circus Place School some time before 1837. The Scottish Schoolmaster had said of that school:

“The Professor refers to not to Circus Place School, where your masters and misses are taught after the new plan, but proposes to lead his pupils to witness the wonders performed at the Davie’s Street and Market Street Schools, where the children of the poor are instructed. In August 1826, I had occasion to be in Edinburgh, and hearing much said in praise of the method of tuition practiced in the Sessional School (Market Street), I prevailed upon a friend of mine to accompany me to see it....”
The Circus Place School of Edinburgh in 1828, therefore, was in step with the improvements of the activists which were in use at the Sessional School. The Circus Place School was a monitorial school for the children of prosperous families, set up just like the monitorial school for the poor of the highly publicized John Wood of Edinburgh. When McCullock’s book was published in 1837, its title page stated he was formerly “Headmaster of Circus Place School.” That would presumably be about the time Professor Pillans made his comment on Circus Place School in 1828, to which the Scottish Schoolmaster referred. That McCullock was in sympathy and connected with the activists is suggested further by this comment in his preface, in a footnote, after he had said children could be taught the alphabet either at the beginning of their instruction or during their learning of the first words:

“If the teacher prefers to both of the above methods the system of Jacotot - the system which dispenses with alphabetic instruction altogether, and to introduce the pupil from the first to the knowledge of words - he has only to omit the early pages of the book, and commence with the first sentence.”

Yet, according to his preface, his “Books First, Second and Third” did teach the sounds of the alphabet, but a close reading of his statement shows the purpose was primarily enunciation, not decoding of print. His books could probably be used to teach phonically (and would then rate perhaps a Code 7) but they could also be used to teach by the alphabet method and “analytic phonics” on whole words, rating perhaps a Code 4, or could be taught, a la Jacotot (or, more precisely, according to M’Cullock’s wrong interpretation of Jacotot’s method), and rate a Code 1. They are therefore curious books, straddling various viewpoints.

Although M’Cullock took the time in 1837 to mention the opinions of Jacotot in Belgium, he TOTALLY OMITTED any mention of his famous fellow-schoolmaster in Edinburgh, John Wood, whose views on beginning reading at that very time were being promoted in far-away America. Yet what is revealing concerning M’Cullock’s awareness of the changes being promoted by Wood is that McCullock’s “reading series” in 1837 totally omitted the speller as the beginning step and introduced children to reading through “meaningful” sentences.

Yet, in 1823, only 14 years before, Mavor in the preface to his speller which was quoted previously had taken it for granted that the columns of words in a spelling book were to be the beginning step in reading. Mavor’s speller had been published by Longwood’s, who became the book agent for the British schools in 1848. Mavor’s “sound” syllable speller had been the mainstay of Longwood’s business for years, as a source quoted previously had testified. Yet by 1848, only 25 years after Mavor revised his massively-used Longwood speller in 1823, the publisher Longwood became the book agent for all the “meaning” reading series in Britain which had displaced its own once-massively-used speller for beginners! Longwood apparently managed to straddle the period of the switch from “sound” to “meaning” while maintaining its comfortable profits.

M’Cullock wrote in his “Preface”:

“In the following little work, an attempt has been made to furnish a series of Lessons fitted to serve the double purpose of introducing a child by easy gradations to the pronunciation of the English language, and of providing him with a kind of reading adapted to interest and exercise his opening faculties.... The principle is this: - to present only such lessons in the first instance, as exemplify the simple and primitive powers of the letters, and to introduce the learner to secondary and anomalous sounds by slow degrees and after..... intervals. Accordingly, it will be found that the lessons (are)... arranged in the order of the sounds of the letters; that the words of which they consist have been selected with a reference to their sound rather than their length; and that so far from restricting the beginner to words of one syllable, easy disyllables and... trisyllables have
been admitted in preference to monosyllables whenever the former exceeded the latter in simplicity of pronunciation.

“In the FIRST BOOK, all that is attempted is to furnish the means of familiarizing the pupil with the powers of the long and short vowels, and the primitive sounds of the consonants most in use - the most anxious care being taken to exclude from the lessons all words in which either vowels or consonants have other than their simple sound. In BOOK SECOND, .... is conducted... exercise on double consonants, diphthongs... and broad sounds of the vowels, and on single consonants, such as c and g which have two different sounds. And it is not until he has proceeded to the THIRD BOOK when he may be supposed able to read a simple lesson with tolerable felicity, that he is introduced to words in which an arbitrary combination of vowels and consonants is found. In short, the plan pursued throughout is to familiarize the pupil with the prevailing sounds before embarrassing him with any of the numerous varieties and anomalies, and thus to teach him the laws of English pronunciation * in a gradual order of development, suited to a tender capacity....

“A few anomalous words, indeed, such as do, to, of, as, &c, which are so very much in use as to render it impractical to construct the simplest sentence without their aid, have withstood all attempts to exclude them; but these necessary deviations from the general principal will not present, in the first instance in which they occur, any material impediment to the pupil’s progress.... October 29, 1837”

The preface is disarming. The material sounds like excellent story-approach context versions of Noah Webster’s phonic speller. It is his footnote which raises grave doubts:

“It is perhaps scarcely necessary to guard the reader against supposing he will find a full and systematic view of English pronunciation in the present series of works.... The author has long been of opinion, that the time for a child to be taught orthography and orthoepy in the systematic manner in which they are exhibited in the best Spelling-books, is not at the commencement, but at the close of his Elementary Education.”

His further remark about the “ordinary” way of teaching suggests that the method normally used in Edinburgh by 1837 was the sight-word method, and that the teaching of phonics (“enunciating the letters”) was the exception. Furthermore, if “enunciating the letters” were not done, the syllable tables were to be dispensed with:

“If this method of enunciating the letters is followed, it will be found advantageous to teach the pupil to spell and pronounce the columns of syllables as well as the words on pages 8, 9, 10, 11, and 12; but if the ordinary mode is preferred, it will be better to omit the unmeaning syllables altogether and to confine his attention to the words in sentences. (These) last, his eye and memory assisted by his previous acquaintance with their sounds, will enable him readily to acquire, even though he may not be able to collect their sound from naming and combining the letters.”

In other words, the “ordinary” method in Edinburgh by 1837 was sight-words, followed by “elocution,” the children imitating the teacher’s enunciation, but children might have learned phonics from M’Cullock’s book intuitively because of the book’s arrangement.

M’Cullock’s books were very widely used, which suggests they were widely promoted. The government list of approved books stated:

“Dr. M’Culloch’s Series of Reading Lessons is in very general use in efficient middle-class schools, and the best Parochial and other Elementary Schools, in the north of England and
Scotland. As their character has become known in the midland and southern counties of England, they have had a constantly increasing sale.”

Yet the 1837 series must have run into trouble in “the best Parochial... Schools... in... Scotland,” because a powerful group there chose to write its own series, suggesting dissatisfaction with available material. The 1848 government list stated:

“Scottish School Book Association.... This new series has been compiled under the superintendence of the chief members of the Scottish Schoolmasters’ Association, and may be regarded as the work of the most intelligent members of that body. The use of these books is becoming more general in the parochial and private schools of Scotland.”

It is evident, with the phrase, the “use of these books is becoming more general” that the series was not taking the market by storm. The Scottish Schoolmasters’ Association and “the most intelligent members of that body” may very well have included people like the Scottish Schoolmaster who published in 1829 that wonderful collection of letters, but they did not have the influence of the activists. The primer the Scottish Schoolmasters produced (apparently about 1845) was a wonderful Code 8. The British Library has a copy under call number 12203 c 40 (1845?):

The title page repeats the above to “Compiled for the Scottish Schoolbook Association” and then has the alphabet in small letters underneath. That the material is meant to be phonic is shown by this remark on the title page: “Note - c and g sound hard as in can, go, in the first two Books. The soft sound is not introduced till No. III.” The bottom of the title page had the rest of the material which appeared on the cover. The fact that “method” in reading was important to the compilers of the book was shown further by the note on the back cover:

“N.B. - For directions as to the manner in which this book should be taught, see Report and Syllabus, to be had gratis of the Publishers.”

The primer taught the long vowels and the open syllabary before introducing sentences of two letter words, all words of which were open syllables with long vowels which had just been taught. It then taught the short vowels and closed syllabary and followed it with sentences of two letter words of long and short vowels, all of which had been taught. It then covered short “a” words of two and three letters, followed by sentences, working up through short “u” words of up to four letters, followed by sentences using the sounds introduced to that point. It continued to follow a systematic, phonic pattern through the book (one curious touch being its reference to the “short” sounds of the vowels as the “shut” sounds). It was deadly serious, however, about pupils’ learning its material, as shown by this note at the end:

“NB The pupil should not be allowed to leave this book, till he can read every lesson easily and accurately.”

The British Library’s copy was stamped Sept. 13, 1852. No further reference to the book has turned up in any sources I have seen, and I suspect it was not in use very widely. It apparently did not survive very long, as the appalling Irish Readers of 1836 or earlier did, which were still in print in 1869. It should be noted, however, despite its heavy reliance on “sound,” that it was a phonic primer, not a speller. The speller had obviously disappeared by 1845 as the text for beginners.
A disturbing fact is that William Collins II was “appointed publisher to the Scottish School Book Association and the Irish National Schools” some time after 1856, and:

“In a period of 10 years he provided the latter body with 2,320,500 copies of 31 books.”

Among those were the Irish Readers which Collins was then publishing (Ellis, page 51).

“In 1875 William Collins II purchased the Scottish School Book Association for which he had been agent” (Ellis, page 91).

Presumably, William Collins II was the heir to William Collins of Glasgow (Ellis, page 18):

“The house of Collins had issued its first school book in 1821 on commercial arithmetic, followed by a book of elocution. Collins attained success in 1836 when he published Leitch’s Practical and Economical Readers, and in 15 years sold 1 1/2 million copies.”

The list of approved books in 1848 included “The Juvenile Reader, by Neil Leitch, A Reading Lesson Book for the first or second class of an elementary school used in Scotland.” The British Library has, under call number 12985. A. 89, an 1848 copy of The First Monitorial Class Book, “Twenty-Fifth Edition. By N. Leitch, Late of Annfield School, Glasgow. F. Orr & Sons, & J. Lumsden & Son; Oliver & Boyd, Edinburgh; Whittaker & Co., London.” This older book, in a twenty-fifth edition, was not on the approved list, but, with the word “monitorial” in its title, it must have been originally published far earlier. It was very possibly one of the widely sold series of “Practical and Economical Readers” originally published by the Collins company in 1836, to which Ellis referred on page 18, and it may have been published by these other companies by 1848 under some arrangement with the original publisher, Collins. Composed largely of short sentences, and despite some short vowel arrangement on some few words, this early book by Leitch was Code 1 in its over-all effect. It therefore seems likely that Neil Leitch’s Juvenile Reader which was on the 1848 approved list was also a Code 1 book.

Even though the Scottish Schoolmasters had published a Code 8 book diametrically opposed to Code 1 treatment about 1845, all their textbook sales some time after 1856 were apparently being handled by the successful publisher of the very early Code 1 Leitch readers, who were also publishing at that very time in 1856 the Code 3 Irish Readers! Such a publisher would hardly be likely to promote the Code 8 material. It sounds as if the activists had buried the Scottish Schoolmasters’ “sound” opposition to “meaning” in beginning reading that had been published about 1845 by having the Collins company, the publisher of “meaning” materials, absorb that “sound” opposition about 1856.

The next reading materials on the 1848 list appeared as:

“Sessional Schools of Scotland by Rev. Dr. Andrew Thomson of Edinburgh, Compiled by the late Rev. Dr. Andrew Thomson, of Edinburgh, an eminent divine of the Scottish Church. The circulation of these books is nearly confined to the Sessional Schools of Scotland.”

Copies of Thomson’s material have not turned up. However, John Wood of the Edinburgh Sessional School and his reading materials were highly regarded. It seems unlikely that Thomson would have chosen a different approach for the Sessional Schools. The probability is that Thomson’s materials for beginning readers were similar to Wood’s: meaning-bearing, not sound-bearing.

Thomson’s materials for the Sessional Schools did not include a speller. Spellers had been the backbone of lower schools in 1823, when according to Mavor the “great” did not stoop to write any of the
flood of spellers which were then appearing. Mavor had acknowledged in 1823 that spellers were the books with which children were then taught to read. Yet the 1848 list of seven government-subsidized reading series, none of which contained spellers, made it clear that a beginning reading book was the foundation book by that date. (Unlike those in America in 1848, most of these beginning books were not called primers.) Therefore, the government-approved list in 1848 had actually endorsed the dropping of the speller for beginners by requiring that all reading materials be “reading books in series,” which meant that the first book would have to be a reading book and not a speller.

Only ONE speller was on this 1848 approved list, and it was obviously not meant to teach beginning reading. It was the Rural Spelling Book, by C. W. Johnson, F. R. S. That was a curious touch: the ONLY approved spelling book in 1848 was written by one of the “great,” a Fellow of the Royal Society, even though Mavor in 1823, twenty-five years earlier, had said that the “great” at that time did not stoop to writing spelling books! One wonders if Johnson, an F. R. S., knew the education activist, Brougham, who was also an “F. R. S.”

Reading Disentangled was listed even though it was not part of a reading series, just as the solitary speller which was listed was not part of a reading series. Reading Disentangled was described as “in very general use for the instruction of very young children in reading in all classes of Elementary Schools,” “Reading Disentangled, being a Series of Elementary Reading Lessons on Sheets, By the Author of ‘Peep of Day.’” The “Schedule” said further that it consisted of 37 sheets of Foolscap broadside” and sold at full price for 6 shillings.

The British Library catalog lists their two earliest copies as follows:

“Reading Disentangled, or, Classified Lessons in Spelling and Reading - London: Printed and Sold by Roake and Varty (1836?), British Library Shelf Mark 625.K.9.”

This earliest edition, however, could not be located at the time the British Library wrote me in answer to my request for information on copies. Instead, the second earliest edition was available, listed as:

They also had an edition of 1873, indicating the sheets were in use for a very long time.

The British Library letter to me said that, in the first book listed above, sheets one to 17 were recorded as labeled, “First Series,” and sheets 18 to 34, “Second Series,” while in the Fourteenth Edition of 1855 the sheets were consecutively numbered from one to 37. Obviously, it was the second version approved for school use in 1848. The name of the author is given as Mrs. Favell Lee Bevan Mortimer.

Since Reading Disentangled was in “very general use for the instruction of very young children in reading” in 1848, that fact implied that reading “very generally” WAS “entangled” for such young children by 1848. Yet the Scottish Schoolmaster in 1829, who had taught hundreds of young Scot boys to read by “sound” for 30 years, showed in the most casual fashion that he considered teaching children to read to be very simple. He also said, again very casually in 1829 as if the fact were to be unquestioned, that children could read fluently by seven years of age. Because the syllable table and “sound” spellers for beginners were thrown out starting in the 1820’s, and by the same kind of people that the Scottish Schoolmaster was opposing on other grounds, the “meaning” method that had been used in their place had been producing massive “entanglements” long before 1848.

A copy of the 1860 Harper edition of Reading Without Tears is in the Harvard library. It is a Code 3 sight-word text with two-step whole-word phony phonics. That was the pattern of most mid- and late-nineteenth century British beginning readers. Children first learned some whole sight words, and then took the endings from known whole words and prefixed them with beginning consonant sounds from other known whole words to build new words. To confirm that this was the intent, Mortimer said a word like “egg” should be read as a whole. Obviously, the word was all “ending.” Her book started with sentences of two and three-letter words in very large print with rhyming words across the top built from the same endings, and gradually reduced the print and lengthened the words.

Whenever such rhyming was used to teach beginning reading after 1826, the whole-word approach was being used - the building of new whole words from the endings and beginnings of other whole words which had been learned previously as sight words for their meaning. This was in contrast to the eighteenth-century spellers whose emphasis, when they listed rhyming words, was on the sounds of the letter patterns within those words instead of on the meanings of the whole words. The spellers used these sound patterns of meaningless collections of letters to build words synthetically. “Meaning” had nothing whatever to do with it. In fact, it was this very absence of “meaning” in the pre-1826 spellers about which the activists had complained so loudly and so long before and after 1826!

Mrs. Mortimer’s Reading Without Tears of 1850 is a Code 3 book and has little to do with the old spelling book sequence and handling of phonic material. Yet when I received from the British Library the photocopies of their 1855 edition of Mrs. Mortimer’s Reading Disentangled, which had first been published about 1836, I found it more systematically covered the sounds in English than Reading Without Tears. Furthermore, it did so very much in the old spelling book sequence. That was also true of the Irish Readers which apparently first came out in the early 1830’s. In the 1830’s when change to a generally Code 3 approach was taking over in beginning reading instruction in the British Isles, to have omitted the old spelling book sequence would presumably have aroused too much latent opposition. However, it should be noted that Mrs. Mortimer’s heavily sight-word 1850 textbook, Reading Without Tears, was still in print when the 1928 United States Catalog was published, but the more phonic Reading Disentangled classroom charts apparently did not last past about the 1870’s even in England.

Despite its following the old spelling book sequence, Reading Disentangled rates only a Code 4, and not the higher code of almost all the old spelling books. That is because of its heavy emphasis on reading paragraphs containing sight-words whose sounds have not yet been taught. Each chart did teach a phonic lesson, but from whole-word examples. Following the old spelling book pattern for the sounds in English was characteristic of some of the first challengers of “sound” through the 1830’s, as with the Irish Readers, where the hidden emphasis was actually on “meaning.” It was only years later, as with the later editions of the Irish Readers and Reading Without Tears, that the primers assumed more of the “Dick and Jane” storybook form we know today instead of the word-list spelling book phonic sequence interspersed with prose paragraphs.

Both of Mrs. Mortimer’s works used the same general approach: attaching consonants to endings from known whole sight words to build new words. For the most part, each of the Reading Disentangled
charts introduced a new sound in meaningful whole words, separated their endings from their initial consonants, and then practiced those endings in rhyming words, with a sight-word story on the side of each chart. Despite the fact that the charts followed the old spelling book sequence of phonemes, they still rate only a Code 4 because of the emphasis on whole words and “stories” before real decoding has been taught.

That the move to “meaning” and away from “sound” in Great Britain was fairly uniform by 1840 is shown by the 459th edition of Rusher’s Reading Made Most Easy, a Code 1 book, which the Harvard library dated to 1840. Its first section has two-letter sentences, the next three-letter sentences, the next four-letter sentences, and so on, without a trace of “sound” teaching, not even initial consonants plus endings from known words (Code 3 phony phonics). Yet the original “reading-made-easies” dating back to the eighteenth century were very different.

In Children’s Books in England - Five Centuries of Social Life, F. J. Harvey Darton, Third Edition, Revised by Brian Alderson, Cambridge University Press: 1982, First Edition 1932, Darton reported that among the materials published for children, besides schoolbooks, were Mrs. Marat and her Conversations, Mrs. Mortimer’s The Peep of Day, Far Off, Near Home, and Line Upon Line and about a score of others using the dialogue form. Darton said that those authors did not seem to know that by the use of the dialogue device they were continuing the “catechism” approach used by Aldhelm and Aelfric in the early Middle Ages, and that the catechism method had been the longest lasting approach used with English children.

Therefore, Mrs. Mortimer’s The Peep of Day was apparently arranged in the conversational dialogue form popular at the time, and it was apparently meant as a religious text, and not as a reading text like Reading Disentangled or Reading Without Tears. Darton added on page 249 that children had, besides Mrs. Marat’s and Mrs. Mortimer’s works, the works of Mrs. Jerram (whose maiden name was Holmes, and who wrote the Child’s Own Story Book, Third Edition, 1843), and the works of Mrs. Leathley such as Chickseed without Chickweed. Darton said that 250,000 copies of the latter book were sold starting in the late 1850’s.

Yet, when compared to the vast sales of chapbooks in the eighteenth century, the sale of 250,000 copies of Mrs. Leathley’s book over a period of many years is hardly impressive. That becomes particularly obvious when it is realized that children’s books like the above, although not school books, nevertheless were often bought in large numbers with school funds for use as prizes for school children. Yet all of the massive sales of eighteenth century chapbooks had been made to the actual users of those books, who bought them for themselves or their children and those users paid for the books with their own money, not government funds!

In summary, as a review of the 1848 approved materials for teaching beginning reading makes obvious, government money was being used to foster the “meaning” approach to teach beginning reading, instead of the “sound” approach. The result was a collapse not many years later in the size of the market for books and pamphlets, as will be discussed in the next chapter.
Chapter 39
The Long-Term Effect on British Book Sales Caused by the Switch to “Meaning” in Teaching Beginning Reading

“Little manuals of more direct religious purpose found almost equal favour. Such was the successful Peep of Day (1833), by Mrs. Favel Lee Mortimer, which reached a sale of a quarter of a million copies by 1867.”

Between 1833 and 1867, this book meant for little children reached a sale of a quarter of a million copies, and was “successful,” like Mrs. Leathley’s book mentioned by Darton which also sold 250,000 copies. The quarter-million sales of Peep of Day over a period of forty-three years are very unimpressive compared to the millions upon millions of chapbooks sold in the previous century when the population was far smaller.

Children born in 1825 and afterwards would have learned to read about 1830 or afterwards. The assumption can be made that the majority of those children except for the poor were taught to read English by “meaning.” Yet almost all born before 1825 except those taught in schools using Bell’s 1823 texts were taught by “sound.” It is possible to estimate when the population of uncomfortably disabled “psycholinguistically guessing” readers taught by “meaning” exceeded the population who could read English automatically and comfortably by “sound.” In populations in the nineteenth century, speaking very roughly, I have heard it said that children fifteen and under formed about half of the total. If true, that means that in 1840 fifty percent of the population would have been born in 1825 or later and the majority in that group old enough to read would have read uncomfortably by “meaning.” Furthermore, the percentage of “meaning” readers would increase sharply with each succeeding year. By 1864, those having been born before 1825 and so having learned by “sound” would be over forty years of age, and in that time of shorter life spans would be a relatively small part of an expanding population. By 1874, when these “sound” readers would be over fifty years of age, they would be an even smaller part of the nineteenth-century expanding population. However, many of the English poor continued to learn by sound after 1830 until as late as the 1850’s, so they swelled the population of “sound” readers in England to some extent for twenty or even thirty years longer.

In possible confirmation of the fact that populations in the nineteenth century tended to have fifty percent or so under fifteen years of age, population figures were given in Volume 18, page 233, of the Encyclopedia Britannica (1963). Table 5 showed age distribution in various countries in the mid-twentieth century, and populations in less developed countries which tend not to use birth control do tend to have close to fifty percent of their populations under fifteen years of age. It should be remembered that, in the nineteenth century, when modern health care was unknown, mortality rates were far greater almost everywhere, including Great Britain, which would tend to lower the average ages further. Sample data from Table 5 is shown below.

With the effects of the differences in the sizes of age groups in the population in mind, it is interesting to quote the only actual statistics that Ellis gave (page 80) on sales of penny literature aimed at the poor in the last half of the nineteenth century. His statistics concerned only the 1860’s. His figures indicate that the residual “sound” readers among the poor were still buying vast amounts of worthwhile reading matter in the 1860’s.

Ellis also mentioned, quite significantly, that “penny fiction” in its serial form died out after 1880, which could only have happened if it had ceased to be sufficiently profitable to issue it in a serial form. The market for penny fiction had therefore obviously shrunk by 1880. Ellis wrote:

“In the 1880’s “penny fiction” of the kind described began to be difficult to obtain in its serial form, but was still available in 6d. volumes, and was widely circulated among young people....

“In contrast to this type of publication, there were numerous periodicals in which were serialized the Bible, the history of England, and even editions of the works of Bunyan, Cervantes, Scott, Shakespeare, and other writers. Books of an educational character were published in serial form too, for example Cassell’s Popular Educator, which at the cost of 1d. per issue was first issued in 1852. Cassell was estimated to have sold between 25 and 30 million copies of his penny publications each year in the 1860’s.... Other publishers emulated Cassell with cheap ‘libraries’....”

A sale of 25 and 30 million copies EACH YEAR such as Cassell had in the 1860’s is enormous and would be considered so even today in America. Contrast those 1860’s YEARLY sales figures of cheap penny literature catering to the poor to the “successful” sales figures of Alice in Wonderland of 180,000 copies between 1865 and 1898, a period of THIRTY-THREE YEARS (Ellis, pages 66-68). Alice in Wonderland was a hard-cover book, of course, bought by the prosperous. It would appear that the English poor in the 1860’s, who had still generally been learning to read by “sound” until the 1850’s, were buying ENORMOUSLY more literature than the prosperous English, who would have been taught to read with the “meaning” reading books published after 1830. Note also the apparently high intellectual level of Cassell’s material being sold to the English poor in the 1860’s!

Yet these vast sales figures from the 1860’s are the only publishing statistics which Ellis produced for cheap reading matter in the last half of the nineteenth century, though he said other publishers had imitated Cassell. Ellis referred to large sales of children’s magazines, but as quoted elsewhere, these were used in schools, and the indication is that their actual totals were in no way comparable to Ellis’s 1860’s figures.

The sale of such a children’s magazine is discussed in Children’s Books in England - Five Centuries of Social Life, F. J. Harvey Darton, Third Edition, Revised by Brian Alderson, Cambridge University Press: 1982, First Edition 1932 (Page 343). Darton wrote of the Chatterbox magazine. It was introduced December 1, 1866, and published until well into the twentieth century. Darton said, without giving any dates on its use, that it had been used in schools as a reading book, but contractions presented a difficulty for oral reading (another indication that the children of the period could not really read). “She’ll” and
“we’re” were a problem but not “he’ll” because that contraction was omitted from the stories “on moral grounds”!

The magazine was therefore used to practice oral reading, probably from about the 1870’s when the enthusiasm for “supplementary reading” seemed to invade the English schools as it had invaded the American schools after Colonel Parker’s influence. Since about 1830 in schools using a series of reading books, it had been customary for teachers to read a selection first and for children to repeat it afterwards in chorus, before individual children read it aloud. Therefore, in no way was school “reading matter” teaching children to read independently in England any more than in America, until real phonics began to find its way back into the schools in both countries about the turn of the century.

The sales of magazines for use in schools in the late nineteenth century certainly cannot be equated to the sales of chapbooks bought by individuals for their personal use in the early and mid-nineteenth century, either in quantity or in purpose. Figures on sales of publications in the nineteenth century confirm that the “meaning” approach in the teaching of beginning reading had badly damaged the publishers’ market in Great Britain by the end of the nineteenth century. That market had shrunk and in part dried up as the government schools that taught reading by “meaning” had increased.
Chapter 40
The Mid-Nineteenth-Century Unsuccessful British Phonic Systems

In the 1840’s in England, Isaac Pitman produced his special phonetic print, in which the actual spelling of words was altered by the use of his expanded alphabet. His material was used for a relatively brief time in Great Britain and America.

In America, a variation on Pitman’s material was constructed in 1853, presumably by Elias Longley. Longley spoke of the method’s having been “perfected” in 1853, in his 1857 copyrighted American Phonetic Primer, Longley & Co., Cincinnati, Ohio. Longley’s version of Pitman’s material was used in Syracuse, New York, in the late 1850’s and early 1860’s, as well as in other areas. In the “Introductory Remarks” to his 1857 book, Longley wrote:

“The experience of every observing teacher agrees with the declaration of an eminent English educator, that ‘learning to read is the most difficult of human attainments,’ and that ‘scarcely anything appears more unreasonable, illogical, contradictory, and perplexing, than the ordinary methods of teaching the art.’ More time is spent in learning to read and spell our language, than is necessary for the acquisition of all the other branches of a good English education.

“The cause of this difficulty is, that the letters have no fixed power or sound.... The result of this absurd and lawless manner of spelling is, that no one can tell the spelling of a word from hearing it pronounced, or its pronunciation from seeing the manner in which it is spelled... The remedy for this evil is a phonetic alphabet....”

The anonymous Scottish Schoolmaster in 1828 would have emphatically disagreed with this quotation published in 1857 that “learning to read is the most difficult of human attainments” since for thirty years his little charges had read fluently by seven years of age. That was in the days before “meaning” had displaced “sound” for beginning reading. That was also shortly after the late eighteenth century when Oliver Goldsmith wrote so charmingly about little Goody Two-Shoes and her highly successful teaching of neighborhood children with the simple syllabic “sound” spelling book. The Scottish Schoolmaster comments came not too long after eighteenth-century adult Englishmen, quoted elsewhere, wrote fondly and even wrote poetry about learning to read by the “sound” syllabary in the eighteenth century in the so-called dame schools.

Yet, as discussed in Appendix B in the Bumstead entry, it is absolutely astonishing to find that the 1857 quotation about reading being “the most difficult of human attainments” came from Richard Edgeworth, writing in Ireland in 1798! Edgeworth SHOULD have known that what he was saying in 1798, when children were still uniformly taught to read easily and quickly by the “sound” syllabary, was absolutely senseless. That raises the question of how Edgeworth could have become so confused, or whether he was not really confused but had some unspoken motive when he chose to make a remark that was simply wrong in the late eighteenth century.

Furthermore, both the Scottish Schoolmaster and Noah Webster in America would have been flabbergasted by the monumentally wrong conclusion that:

“...no one can tell the pronunciation [of a word] from seeing the manner in which it is spelled....”
Not long after Pitman’s material appeared, W. L. Robinson in England invented a pronouncing print using normal spellings. It used the standard 26 letters of the alphabet but the letters carried additional markings to demonstrate their variant sounds. In 1864, Edwin Leigh in the United States published a similar pronouncing print using normal spellings. Since both men were doing essentially the same thing in essentially the same time-frame although on different sides of the Atlantic Ocean, it is very surprising that neither Robinson nor Leigh appears to have referred to each other in his writings. Robinson stated he had worked with Pitman’s materials first. It is therefore conceivable that both Robinson and Leigh were independently inspired by Pitman’s work and had never heard of each other.

The earliest text by W. L. Robinson which I found at the British Library (call number 12983.aaa.24) was The Pronouncing Reading Book, for Children from Seven to Ten Years of Age, on a New Plan, Lessening the Difficulty of Learning to Read, and Imparting a Correct Pronunciation, with an Introduction to the Art of Reading, London: Longman, Green, Longman and Roberts. It included “A Chart (on the) Powers of the Letters. 63 Characters Representing 44 Sounds. Compiled by W. L. Robinson, 1862.”

Robinson said in his introduction:

“The advantages proposed by this Book are a saving of time in learning to read, and the acquisition of a right pronunciation of our language.

“The work is intended to be a First Reading Book for Children able to say words of one syllable at sight and words of two syllables by spelling....

“Children properly taught should speak well at three years of age; and, by means of very short daily lessons, ought to acquire the alphabet and learn regular words of one, two and three syllables by five years of age. At about five they may begin with The Pronouncing Reading Book, and may read it through twice or thrice in the next year, and at the same time have their first lessons in writing. At six, a more advanced Reading Book printed in ordinary unmarked type may be used, and along with that spelling may be taught by writing short extracts....

“The expedients used in Walker’s, Webster’s, and other pronouncing dictionaries are largely employed here. Useless silent letters are printed in italics, and letters with dots or diacritical marks, are used in twenty varieties, whereby the pronunciation of vowel and consonant letters having more than one power, is... indicated.”

In his 1862 text, Robinson made it clear that children were expected to learn to read before they moved into his “reading book.” However, that even then he expected them to do so with his explicit phonics was only made clear in a later book.

The book included a notation that his “Reading Sheets” as well as the Phonic Reading Book were also “supplied to the public and to schools direct from the author, William L. Robinson, Wakefield.” This was a bad sign by 1876. The important publisher, Longmans, had handled Robinson’s material in 1862, but now was no longer doing so. Simpkin, Marshall, the present London publishers, were also major publishers, but, if they had been promoting the book successfully, would Robinson have gone to the
trouble also to supply material “direct from the author?” An author normally does this only if convenient, commercial channels are effectively closed to him.

The beginning of the book included a chart entitled, “Robinson’s Phonic Lessons.” To some degree, it was similar to the kind of thing Leigh was doing in America, though not so effective. Robinson also described what he thought were the only methods available to teach reading. It is staggering to realize that in 1876 Robinson apparently was totally ignorant of the existence of the ancient syllabary “sound” approach and the use of the speller with analytic or synthetic phonics to teach beginning reading, which had been banished less than fifty years earlier!

Robinson wrote:

“Robinson’s Phonic Method Explained

“Addressed to Teachers. Methods of teaching reading - There are four principal methods of teaching to read. First, the alphabet or old method, in which the child is taught to utter the names of the letters in their order, and then to say, if it can, the word they constitute. Second, the look-and-say method, in which the teacher points to and says the word as a whole, without either naming the letters or giving their powers, the child repeating it after the teacher, so that by frequent recurrences it becomes imprinted on the memory. Third, the various Phonic methods more or less perfect, in which the child has to give the sounds or powers of the letters and not their names in the order in which they occur and from their sound to ascertain what the word is. Fourth, the Phonetic method, (Ed.: the Pitman print) in principal and manner of teaching similar to the Phonic but in which an enlarged and special alphabet of about 34 single letters is used, containing many new ones of an unusual form. Each letter stands for a particular sound and that sound is never represented by any other letter; consequently the irregularities of our language are avoided and the power of reading books phonetically printed is acquired sooner than the reading of ordinary printed books by other methods. When the child can read phonetic books fluently, he is passed into ordinary books, the increased difficulties of which are soon overcome.

“Comparison of Methods - The first or the old alphabetic or name method is the worst of the four; the tiresome and time-wasting process of spelling words aloud rarely gives the child the power of saying them, and he has at last to be told them on the Look and Say system. The second or Look and Say method, though tolerably rapid in its results, is very unphilosophical, as these results are entirely due to the memory alone. It is, however, a useful adjunct to the phonic method in respect to those irregular words in which the names or the powers of the letters are inadequate to enable the child to say them, one, two, eight, rough, cough, etc. The fourth, or phonetic method, has never found much favour with the public and probably never will, owing to its strange looking alphabet. There remains for us to consider the third, or the various kinds of phonic teaching, some of which have received a considerable amount of attention and public favour, and are used in the Normal Training Colleges for elementary teachers (Ed.: presumably the sort of approach used by Kay Shuttleworth). Good reading can, of course, be taught by any one of these four methods, but they are so manifestly dissimilar in principle and detail that it is impossible to conceive of them as possessing an equal value. The time necessary to acquire good and fluent reading will differ in all of them....

“In most of the phonic methods at present in use, no attempt is made to give assistance to the child by means of italic letters and accents; the consequence of which is, that about 50% of the words remain irregular, and must be taught the child on the Look and Say system.... The object of the present adaptation of the phonic principal of teaching to read is, to increase the number of words which are regular or suitable for phonic teaching to about 75 per cent, leaving only 25 per
cent irregular words to be dealt with on the Look and Say system instead of 50 per cent as in the more defective phonic methods.

[Footnote, page ix] “Two carefully recorded experiments showing the value of the phonetic and phonic methods for saving time in teaching to read are worth preserving. The first was that of a man twenty-seven years of age, a prisoner in the Wakefield Gaol in 1855, whom I taught to read on Pitman’s phonetic system, the school masters of the establishment having considered it an impossibility to teach him to read on account of the dullness of his intellect. I gave him three lessons a week of twenty minutes duration each, for thirteen weeks. At the end of the tenth week, he had read through the Gospel of St. John in phonetic type and was then transferred to the ordinary printed Testament, reading through again the same Gospel in the next three weeks. The schoolmasters then resumed his education and some months afterwards, in addition to reading, he had also learned to write well. The second experiment was with my own phonetic system, upon a child two and a half years old who acquired the phonic alphabet and 300 monosyllables by three years of age; about 1900 words of one to three syllables in nine months more when she was put into books for the first time; and at four years of age had read ninety of Aesop’s Fables, three chapters of one of the Gospels, and 200 lines of poetry. At four and a half, the child could read books and newspapers fluently at sight. This experiment took place many years ago, and no evils whatever have resulted from this precocious teaching. The lessons indeed were very short, three a day of five minutes duration for the first six months, three a day of ten minutes for the next six months, and three a day of fifteen minutes each for the succeeding two years, the average daily instruction having been less than half an hour a day.

[Page xi] “Learning to read on the Phonic system is so easy and pleasant and requires so little mental effort that children of three years of age may be taught without the slightest (detriment) to their health.

[Page xx] “An experience of eighteen years in the Wakefield Lancastrian Infant School into which this system was introduced in 1858 has also shown that when the children taught phonically are removed to the upper schools there is a greater aptitude to spell correctly than in those who have been taught alphabetically. The Phonic Reading Book may be commenced at five years of age and be read through twice or even three times before the children leave the infant school at seven years of age.

[Page xxi] “A child sent to school at three may be employed in the lessons on sounds, (and) the vocabulary lessons and sheet reading lessons until five years of age, when he is put into The Phonic Reading Book which he ought to read fluently at seven.

[Page xxii] “Mrs. Harper, the (experienced) teacher of the Wakefield Lancastrian Infant School, and now about to conduct a Board school in Leeds on the Phonic system, has, at my request, furnished me with her opinion as to the best mode by which an ordinary alphabetic school may be converted into a phonic one.....

“Wakefield, March, 1876. W. M. Robinson”

Robinson said that “Mrs. Harper” felt it would require six weeks to change a school from alphabetic to phonic, although it would take teachers months to adapt to the change. Mrs. Harper, as will be mentioned, promoted Robinson’s method before the London School Board, apparently unsuccessfully. It is interesting that Robinson wrote the above in 1876, the same year that Leigh’s phonics began to be opposed in Massachusetts.
The use of Pitman’s phonic print died out because children who were trained to read words which were spelled phonically had trouble later memorizing conventional spellings, although they read fluently. The same objection applies to the newer ITA print of the Pitman company which was widely used about twenty years ago in both Great Britain and America. The problem of spelling has been raised concerning the current IBM Ready to Read phonic program, in which the children use computers. With that program, children may use “invented” instead of solely dictionary spellings and reportedly may become dependent on those wrong spellings. However, Robinson’s method was enormously successful in turning out good readers and resulted in no such spelling problems since it used only the letters of the alphabet to spell words correctly, but with additional markings on the letters. Yet Robinson’s program died out too. Robinson’s material apparently met the same kind of opposition in England that the wonderfully successful Leigh material was meeting at the same time in America.

Yet, by the 1890’s, phonic reading materials were apparently beginning to be available in England again. That was the same period in which Rebecca Pollard’s and Ward’s phonic materials were becoming available in the United States. A book from an English phonic series from the 1890’s is listed in Early American Textbooks, 1775-1900, which suggests a renewed interest had developed in phonics in England in the 1890’s. The text was wrongly listed on page 77 as:

Yet Laura Soames was clearly the author of the Albany Phonetic Readers. The name, Barnes, appears nowhere on the Department of Education library’s copy of the No. 2 reader. The contemporary American Catalogue showed that Macmillan put out her materials in 1894: L. Soames’ Phonetic Method for Learning to Read, Nos. 1, 2, 3, Macmillan was conceivably putting out American editions to match Swan Sonnenschein’s English edition.

The following note was at the beginning of the No. 2 Reader:

“To the Teacher. This little book is Holborn’s Practical Infant Reader No. 2 transcribed phonetically, and [I thank]... the Educational Supply Association for allowing me to use it.... Brighton, May, 1893, Laura Soames. Teacher’s Manual in Preparation, the Child’s Key Shortly, Albany Phonetic Readers NO. 1, 2, 3,...”

The next page showed the “English Phonetic Alphabet” with phonetic respellings. While the material was very poor, it did demonstrate a renewed interest England by 1893 in teaching reading phonically.

For the most part, however, teaching children to read by phonics appears to have been as unsuccessful in Great Britain as it was in America until about the turn of the twentieth century.
Chapter 41
A Description of Some Beginning Reading Materials Available in the British Isles After 1826

The nature of beginning reading materials changed sharply after 1826 in the British Isles as in America. Following are descriptions of some of these British books, which survived on the shelves of the British Library.

A parody of the old spelling book form appeared in London in 1838, published by “T. Hogg,” with the title, The Child’s First Book and Sunday School Primer. It was a terrible book, but by 1838 a market must have existed for such incompetent works. It began with alphabets and only open syllables, but no closed ones. By page 6, two letter sentences appeared:

“Do to us, as we do to ye. As I do do so do ye.”

Pages 8 and 9 contained three letter short vowel words:

“bib dib fib nib rib
fob mob nob rob sob
bad dad lad mad sad”

Pages 12, 13, 14, had three letter words in alphabetical order with no real sound analogy, followed by sentences. Although page 29 had many words with sound analogy, the book as a whole was no higher than Code 5. It ended with very long textual material and, overall, truly was a terrible book. The probability is that there were many books like it for sale in the British bookstores of the period.

In a volume marked, Reading Books, Grammar, Etc., British Library call number 12985 bbb 26, are several texts on reading. One is titled The New Class Books, for Reading, Spelling, & Questions. Part I. Reading. “London: Simpkin, Marshall, & Co., Stationers’ Hall Court Leicester: Printed and Published by J. F. Winks. Twelve Shillings per Hundred - Full Allowance to Schools.” It carries the British Library stamp, “February 26, 1852.” It begins with the alphabet in capitals and small letters and on page 2 appears:

“First Reading Lessons
FIRST LESSON - TWO LETTERS
 Am I at We go on
So go on Is he up
Do as In So he is
Lo it is We do so
Am in it If we be
So do to He is in
Am as he Do ye it
Is he as As we do
Do go to Lo it is
Up in it So we go

“So we do go on to it
Do ye so as he in it
Lo if ye do so as he
As he is or as we be
Or it is so as ye do
Do so as ye go on to it

(Page 3) “SECOND LESSON - THREE LETTERS.
“No man can see God
God can see all of us
Let me go in His way
It is sin not to go in it

“For to sin is to do bad
We are not to sin at all
Or we can not go to God
So let me not sin at all

“A bad boy is in his sin
I can not go in his way
We are all of us to die
We are not to die in sin

“If you or I die in our sin
We can not go to God
The Son of God did die
For me and for all of us (No periods were used.)

(Page 4) “THIRD LESSON - FOUR LETTERS

“Let me go to my task
And try to know more
I must know all I can
Thus I am made wise

“If I love what is good
Then God will love me
The word of God is good
And it is the best book

“No book can be like this
It tells that God is love
Let me read this book
It tells God made all

“All us and all we see
The sun moon and sky
And sea and dry land
And saw all were good”

Page 5 had “Fourth Lesson - Four Letters.”
Pages 6 and 7 had one syllable words of four letters, though on page 6 are the five-letter words, “points” and “great,” and on page 7 “whole” and “heart.”

Page 11 contained, “Who Made All Things?”, a one-syllable religious text, and one-syllable texts continued to the end on page 32.

Advertised on the back of the book was Second Reading Lessons. The advertisement wrongly said that the first book only had four-letter words but rightly said it had only one-syllable words. The second book had two-syllable words and easy passages from Holy Scripture.

The third book was described as First Spelling Lessons, Containing Words of from One to Four Letters and One and Two syllables. Note that the children had read TWO sight-word books before they were given ANY spelling in this reading series published by the major publisher, Simpkin, Marshall, & Co. about 1852. Yet only thirty years before, as attested to by Mavor, spelling had been the beginning step in reading.

The description of the series continued:

“Part IV Second Spelling Lessons Containing words of from two to five syllables, also scripture names accented and explained, with explanations of religious words.

“They may be had of any Bookseller in the kingdom.”

In the same binding as the previous book appeared a series of toy books published in London by J. Bysh, 157 and 158, Albany Road, Old Kent Road, and stamped by the British Library April 16, 1861. These toy books were parodies of the older spellers and the newer primers, with aborted, mixed up syllabaries, very like the often appalling toy books printed in America from about 1830 to 1870.

One of the parodies was only ten pages long but claimed to be Mavor’s Spelling Book, Arranged for the use of Preparatory Schools. Two of the ten pages were on the insides of the front and back covers. The little monstrosity began with a picture alphabet followed by short words which rapidly turned into multi-syllable ones. The publisher’s use of Mavor’s name was a tribute to the fame of Mavor’s spelling book. The publisher obviously hoped the fame of Mavor’s speller would increase his own sales.

Another London publisher of toy books capitalizing on the fame of former books (and by doing so confirming their fame) was T. Goode, 30, Aylesbury Street, Clerkenwell. The British Library copy of his little parody is stamped March 5, 1858, and titled The Royal Primer, Illustrated, an obvious imitation of John Newbery’s eighteenth century publication, a version of which continued in print as late as the 1820’s.

On the inside of the cover is the alphabet in capital and small letters, along with the digits. The first leaf is marked, page “3,” and has mixed capitals and a picture of a boy at the bottom, followed by the open, but not the closed syllabary. Yet it is the closed syllabary which contains the critical short vowels, which reportedly are found in about sixty per cent of English syllables.

Page 4 did show short vowel rhyming words: “bad lad pad dad mad sad; bid did hid pid rid lid; bed led red fed ned med.” That was the end of the sound treatment. Next came word categories: “Ale bread buns beef milk beer cakes lamb flesh port rum crum beans pies tarts wine crust cream veal peas.” Under this interesting list was a picture of a hen and a swan, for unexplained reasons. Next came another word category: “cap coat fan hoop shoes hat cloak... clogs stuff slip lace frock scarf shirt gown frill muff stays shift.”
This was followed on page 5 with another unrelated picture of swans and these interesting sentences, without periods: “I am he go ye up to it As we go If he be As he is As I am It is so As I do So do you We go on Go by us Do ye as we It is to me Lo I am he As if ye do Oh not do so By it I am I am to be Ah me it is so.”

Then came more “meaningful” text without periods: “Will you go to see the rabbit I will show you the way It is in my aunt’s garden”

Page 6 had a picture of a dog, and long sentences, some with divided two-syllable words.

Page 7 had more pictures and the same kind of sentences, one section being religious.

Page 8 showed spelling columns by sound analogy, with words of four, five and six letters.

Page 9 had a picture of a lion and text.

Page 10 contained a two-syllable word list, with the syllables accented.

Page 11 which was the inside back cover, concluded, in the style of The Royal Primer of the eighteenth century and Anglican primers since the sixteenth century, with grace before and after meat and the Lord’s Prayer. At this point, however, the printer must have run out of woodcuts for pictures, because immediately after this serious material he showed a picture of boys fencing! In no way could such a nonsensical publication as this be considered anything except a toy book, and a very poor one, at that.

Bell and Daldy were major publishers, and put out probably in 1863 The School Primer, “Illustrated with 65 Engravings.” Bell and Daldy’s Illustrated School Books. London, Bell and Daldy, 186 Fleet Street.” The copy at the British Library is stamped 7 April 1863, under the library’s call number 12982 aa 57. The following appears at the beginning:

“The lessons in this Primer are arranged step by step. In almost every instance, words used in any one page may be found either at the end of the lesson or on the previous pages. Where this arrangement has not been possible, words have been printed in Italic letters; with these the Teacher is requested to help the pupil if it be necessary.”

This sounds as if the book were meant to be a sight-word book, but Bell and Daldy in 1863 were apparently reacting to the influence of people like Robinson and Pitman who had been promoting phonics in beginning reading. The approach in the book is very like the German analytic-synthetic method, and, overall, the book rates a Code 6. It could be higher if used with more phonic emphasis.

It began with showing the alphabet in small letters, and followed it with the letters in mixed order. On the next page began a section marked, “Alphabet.” The letters were shown next to pictures which contained their shapes:

\[
\begin{align*}
a & \quad \text{(Picture of trellis, a shaped)} & a \\
t & \quad \text{(Picture of sign, t shaped)} & t \\
c & \quad \text{(Picture of cat)} & \text{at} \\
& & \text{cat}
\end{align*}
\]
On the next page, this appeared, but with pictures in the space shown below between the two columns:

<table>
<thead>
<tr>
<th>h</th>
<th>cat</th>
</tr>
</thead>
<tbody>
<tr>
<td>h</td>
<td>hat</td>
</tr>
<tr>
<td>r</td>
<td>car</td>

</tbody>
</table>

The normal word approach, therefore, was apparently being used for every letter.

This was followed by syllables of two letters, but always open syllables in words of two letters. The phonically irregular word, “do,” was footnoted with a proper phonetic pronunciation. Common words of three letters followed, some phonically arranged, but included were the irregular words “was are old you boy the.” On later pages, words were arranged by phonic analogy at the top of each page under “Practice.” Although I did not add this note at the time I took notes, it is obvious these word lists were followed by text. For 1863, the book used a very phonic approach and rates a Code 6.

However, a book published in 1845 was very different and rates a straight Code I. It was titled, An Easy Introduction to Reading the English Language, Designed for Sabbath-Day Schools, in Six Parts. “By a schoolmaster, Wellington: Sold by Richard Corner, South Street, and Simpkin, Marshall and Co., London, MDCCCLXV price 8d.” It was as weak as the 1852 Simpkin, Marshall and Co. text described earlier.

The parts were described as follows:

“The alphabet & c. with twelve lessons, four lines each, of words not exceeding two different letters. II. A table of words, with seventy-one lessons, eight lines each, of words not exceeding three different letters. III. Forty-five lessons... of words not exceeding four different letters. IV. Fifteen lessons... of words not exceeding five different letters. V. Twenty-three lessons... of words not exceeding six different letters. VI. A table of words of seven and eight letters, with ten lessons of monosyllables in general.”
The 1845 text was religious, but it is evident that the emphasis was on context reading, and not on spelling lists. No mention was made at all of spelling anything, only of reading it. It is evident that the book itself followed the straight sight-word approach, but limited the introduction of new words by letter-length: first two-letter words, then three, and so on. That was the pattern which had been followed in many old spelling books and which had first been introduced by Dilworth in 1740.

The massively used Irish Readers will be described later, and the massively used Reading Disentangled has already been described. The few other beginning reading textbooks and toy books which have just been described in this chapter were obviously not such best-sellers, but they are very probably representative of the general beginning reading materials which were published in the British Isles from about 1826 until 1863. Such materials were apparently “meaning” oriented like the Irish Readers and Reading Disentangled, with Code 1 or Code 3 approaches, until a shift began to appear after 1860 towards “sound,” as with Bell and Daldy’s materials and Robinson’s materials. The shift was probably originally sparked by the advent of Pitman phonetic print in the 1840’s. The shift paralleled American developments, such as Leigh print, and the American developments were probably also sparked by the arrival there of Pitman phonetic print. Yet, as will be discussed, that beginning of a return to “sound” was aborted in England just as it was in America, and it disappeared shortly after 1870.
Chapter 42
On the Arrival of “Thorough and Efficient” Inspectors and “Standard” Tests in Great Britain

The greatly increased centralized control of the testing Standards which arrived with the Revised Code of 1862 was cushioned by the seeming increased liberty that resulted from the government’s abandoning the list of “approved” textbooks that had been in existence since 1848. It is possible that there had been claims that the government-approved list of textbooks amounted to government censorship, and the eventual dropping of the list was possibly in response to such claims. It certainly would have been impossible to introduce Pitman’s 1840’s phonic materials or Robinson’s 1862 phonic materials into the government-subsidized schools if Pitman’s or Robinson’s phonic materials were not on the government-approved list, and the promoters of those materials would certainly have complained about such a state of affairs. Pitman’s material actually pre-dated the 1848 list, but it was notably absent from the original list of “approved” materials. It may be meaningful that the first heavily phonic British book I turned up, other than Robinson’s and Pitman’s materials, was Bell and Daldy’s. That did not come out until 1863, one year after the approved textbook list was dropped.

It is interesting to notice, historically, that every increase in government “control” of education is camouflaged by a seeming granting of increased “liberty” in some other area. The present shell game, both in America and Great Britain, concerns the increased “parental choice” of the school buildings in which to enroll their children, while the governments tighten the screws on curriculum in ALL school buildings by moving to institute national “achievement” tests. Who ever heard of a school that did not “teach to the tests”? Parents may now select the building into which to place their children. Yet the governments may now select the “truths” to place in those same children’s heads, and those “truths” are certainly not going to be Biblical ones!

Ellis stated (page 44):

“In 1858 the Minutes of the Committee of Council were consolidated and reduced to form a code. It was specified in Article 4 of the Code of 1860 that ‘the object of the grant is to promote the education of children belonging to the class who support themselves by manual labour’. Schools could only be assisted if they were associated with a recognized religious denomination or if ‘the Scriptures are read daily from the Authorized Version’ (Article 8) in addition to secular instruction. Grants were available only to schools which were open to inspection (Article 13).”

That the Scriptures were read daily does not sound so impressive when it is remembered that the Bible, and the Psalms, as texts for the children to use, had effectively been removed from the schools by the “approved” list of textbooks that had arrived in 1848. Having the church schools “open to inspection” was also extremely undesirable, particularly since the government “inspectors” might have very different ideas about the universe and “truth” than either the church school personnel or the parents of the children.

One such enormously influential “inspector” for many years was Matthew Arnold. A review of Arnold’s life and opinions is confirming evidence of the fact that letting government “inspectors” into church schools is not, necessarily, a good thing.

Alec Ellis wrote the following in Chapter 6, “Books in School 1850-1870,” in A History of Children’s Reading and Literature, Pergamon Press, Oxford (et al): 1968, page 50:
“Matthew Arnold advocated the adoption of chosen texts and looked to the Committee of Council to select suitable books. It is curious that he was not so much concerned with the relative merits of books as the need to standardize their use in schools.”

Need? That implied a conviction that a central authority should exist to standardize “truth” in church schools. Only church schools received government textbook grants at the time, purely government schools not yet having come into existence in England. Who was this Matthew Arnold who advocated a central authority to decide what textbooks should be permitted in religious schools? Was he religious?

According to The Columbia-Viking Desk Encyclopedia, Volume I, The Viking Press, Inc., New York, 1953, page 68, Arnold’s father was Thomas Arnold (1795-1842) a preacher who was headmaster of Rugby (1827-42) who:

“...gave new life to whole English public school system by reforms (adding mathematics, modern languages to course of study; introducing monitorial system; encouraging independent thought).”

The reference to the “monitorial” system indicates the elder Arnold was among those “reformers” who were opposed so strenuously by the humble but brilliant and witty Scottish Schoolmaster. The Scottish Schoolmaster of course, had no such influence as the headmaster of Rugby.

The encyclopedia said that Matthew Arnold (1822-1888), Thomas Arnold’s son, was:

“Inspector of elementary schools 1851-86, he became (1857) professor of poetry at Oxford.... his own poetry showed romantic pessimism, (e.g., Dover Beach....)”

For 35 years, as one of the inspectors who controlled the purse-strings for government grants to church schools, Matthew Arnold exercised authority over the religious schools under his control. Furthermore, he is on record, as quoted by Ellis, as coveting even further authority for the educational bureaucracy. Arnold wanted the government bureaucracy to have the power to authorize “standard” sets of textbooks for church schools, which obviously meant the power to control the contents of the textbooks.

The final two stanzas of Matthew Arnold’s poem, Dover Beach, written in 1867, (quoted from the Viking Book of Poetry) show the attitudes of this government appointee who had such disturbing authority over church schools but who coveted even more for that government bureaucracy of which he was an honored part:

“The Sea of Faith
Was once, too, at the full, and round earth’s shore
Lay like the folds of a bright girdle furl’d.
But now I only hear
Its melancholy, long, withdrawing roar,
Retreating, to the breath
Of the night-wind, down the vast edges drear
And naked shingles of the world.

“Ah, love, let us be true
To one another! for the world, which seems
To lie before us like a land of dreams,
So various, so beautiful, so new,
Hath really neither joy, nor love, nor light,  
Nor certitude, nor peace, nor help for pain;  
And we are here as on a darkling plain  
Swept with confused alarms of struggle and flight,  
Where ignorant armies clash by night.”

Arnold’s unpleasant atheistic poem denied the objective existence of faith, hope and love. This poem by Arnold, the son of a clergyman, was therefore deeply anti-Christian, and Arnold certainly must have known it to be so. To appoint this atheist/agnostic to oversee Christian schools made about as much sense as to appoint Friedrich Nietzsche or Karl Marx. It only made sense if those appointing him were activists with a hidden agenda to help the tide of faith to recede a little more quickly.

Did Arnold think a child’s beliefs could be influenced by schools, such as the schools over which Arnold was given power? One would assume so, judging from Stanzas from the Grand Chartreuse (also from The Viking Book of Poetry36.) containing Arnold’s gloomy agnostic thoughts while visiting a monastery:

“For rigorous teachers seized my youth,  
And purged its faith, and trimm’d its fire,  
Show’d me the high white star of Truth,  
There bade me gaze, and there aspire;  
Even now their whispers pierce the gloom:  
What dost thou in this living tomb?

“Forgive me, masters of the mind!  
At whose behest I long ago  
So much unlearnt, so much resign’d!  
I come not here to be your foe,  
I seek these anchorites, not in ruth,  
To curse and to deny your truth.

“Not as their friend or child I speak!  
But as on some far northern strand,  
Thinking of his own gods, a Greek  
In pity and mournful awe might stand  
Before some fallen Runic stone -  
For both were faiths, and both are gone.

“Wandering between two worlds, one dead,  
The other powerless to be born,  
With nowhere yet to rest my head,  
Like these, on earth I wait forlorn.  
Their faith, my tears, the world deride;  
I come to shed them at their side.”

“Wandering between two worlds, one dead, The other powerless to be born,” sounds as if Arnold were anticipating a New Age. So many activists were back then, just as today. What he makes abundantly

clear in his second, unpleasant poem is that he had been brainwashed by “rigorous teachers” who “seized” his youth, “masters of the mind,” who had forced on him a totally anti-Christian view of reality. In effect, Arnold stated, based on his own experience, that a young person’s religious faith can be intentionally destroyed by his teachers. One wonders who his teachers were. Certainly his activist father must have been among them. However, the fact that this atheist/agnostic, Matthew Arnold, had inspecting authority over a number of Christian schools for 35 years was not only an abridgement of the schools’ religious freedom but was an abomination.

Ellis reported (pages 55-56):

“The Code of 1860... made clear that books must be selected from the list compiled by the Committee of Council....”

Therefore, the censorship of school books was firmly in place right up to the time when it was suddenly abandoned, and “control” was replaced by the “Standard” tests. Ellis had stated (pages 44 and 56):

“The Newcastle Commission on The State of Popular Education in England (1858) reported in 1861. It had considered the measures which would be required for the extension of sound and cheap elementary instruction and decided that it was necessary to institute an examination in schools, on the results of which the position of teachers would depend. These proposals were made effective in the Revised Code of 1862....

“A small section of the Newcastle Report dealt with the Book Department of the Committee of Council. It was argued that the Committee could be accused of censorship no matter to what extent it protested to the contrary. Many books were in circulation which contained errors and were thus unfit for use in schools, but were not condemned by the Committee of Council, whilst others did not appear in the list for the sole reason that it must be confined within reasonable limits....

“The Newcastle Commission recommended that a general annual grant should supersede the various special grants, including that for books, and that the list should be withdrawn.

“...In accordance with the recommendations of the Newcastle Commission, grants were paid to schools on the basis of attendances and results....”

The “results,” of course, were the tests on the Standards. It was a direct swap: the approved book list was traded in for the testing “Standards.”

As noted elsewhere, literacy had been high in the British and Wesleyan schools of the north before government control increased.

Ellis had stated (pages 47-48):

“In the later 1850’s it was not uncommon in British and Wesleyan schools in the north for at least 75% of the children to read books of general interest with fluency, but even in the highest standards there was an almost complete absence of expression.”

Yet “expression” has nothing whatsoever to do with reading ability. The area affecting expression is on the opposite side of the brain from the areas concerned with decoding ability in reading. That is demonstrated by a report by Sid J. Segalowitz in his book, Two Sides of the Brain (Prentice Hall, Inc.,
Englewood Cliffs, New Jersey: 1983, pages 37-38). Segalowitz told of a teacher with an impairment in a certain area of the right hemisphere similar to Broca’s area on the left, who lost all ability to speak with “expression,” despite retaining her other capabilities. Because she could no longer speak with expression, she lost control of her classes.

Children can be drilled, of course, to speak - and to read - with expression. That they SHOULD be drilled to do so, I deny. Unless they have similar brain damage to that of the unfortunate teacher, they will speak - and read - with expression automatically when moved by their own feelings to do so, and that is soon enough, indeed.

Over 75% of the children - obviously meaning the total of all children including beginners in the schools - could “read books of general interest with fluency,” which meant books OTHER than the readers they had been drilled on. That certainly proves that those northern children in the late 1850’s, before the “meaning” reading books had invaded their schools, were doing very well indeed.

However, Ellis then made this statement, seemingly opposing it as a sign of “improvement” over the presumed “failure” of the plus 75%:

“Standards of reading improved rapidly in the Church schools of Chester, Shropshire, and Stafford. Whilst in 1859 the inspector estimated 25% of the children could read passably a book such as the 3rd Irish Reader, in 1861 he found that 33% of them could read fairly well from their accustomed book and 8% could read whatever suitable book was placed before them.”

The 75% “expressionless” but accurate readers of general texts in the late 1850’s in the north, probably all under twelve years old, were enormously more successful than the only 8% of children in Chester, Shropshire and Stafford who were able to read such general texts in 1861! Furthermore, even with the text read over and over in school, only 33% of this latter group could read that text well enough for the inspector to consider that they passed it! Those results were reminiscent of Bell’s “meaning” material in 1823, when he said it sometimes took sixteen months to cover the first thirteen “meaningful” pages of context reading successfully! The first book of the Irish Reader series to which Ellis referred was a Code 1 to Code 3 book, and its appalling nature is discussed elsewhere. It is not surprising that the children getting those “meaningful” Irish Readers were failing, or that the children in the charitable schools in the north could read so well. That is because many charitable schools in the 1850’s were not yet using the “meaning” reading series, undoubtedly because they could not afford to buy them.

However, since many children at that time were tested in oral reading only on books they had practiced over and over in school, the resulting comments on reading achievement are not reliable, except for the “fail” rate. Those who were unable to read what they had practiced over and over obviously could not read at all, like the 75% failing in Chester, Shropshire and Stafford in 1859, and the 67% failing in 1861.

Ellis reproduced an 1857 “estimate” of the number of years children spent at school. Such “estimates” are obviously guesswork, and are of limited use. What seems certain, however, is that many British children, like many American children at the time, spent very little time in school, so it was critically important to make the most of that time. To give a child who would spend only a year or two under instruction a book like the Code 1 first Irish Reader teaching sight-words by “meaning” instead of a “sound” battledore or speller was a criminal act: in no way could such unfortunate children learn to read.

Pamela Horn (page 2-) referred to the gradual increase in government inspection of charitable church schools:
“The number of Government Inspectors also rose and by 1850 had reached twenty-three. As yet their duties remained extremely wide - they included approving specimen building plans, ascertaining ‘means of instruction’ (such as inspection of subject-teaching, books and school apparatus) assessing ‘organization and discipline,” and inquiring into religious teaching. Most of the H.M.Is. were recruited from a well-to-do background and had enjoyed an education at one of the older Universities before they assumed their inspectorial role; they were naturally held in some awe by the humble elementary school teachers whom they visited, and also by the pupils. But as yet they did not inspire the fear and dislike which future generations of teachers and children were to feel towards them.

“This transition from respected superior to dreaded ogre took place only in the early 1860s, as a result of a change in Government policy in regard to the distribution of state grants.

(page 41) “Under the new ‘Payment by results’ system introduced by the Revised Code of 1862, all future grants, except for building, were to be made on the basis of a capitation payment of 12s. per child per annum; four shillings of this depended upon the child’s regular attendance at school (under a qualified head teacher) and the rest upon his or her performance at an annual examination in the three ‘Rs’ which was now to be conducted by an H.M.I. Failure in any one of the three subjects examined - reading, writing and arithmetic - meant the loss of 2s. 8d. from that particular child’s grant. The examinations were arranged in a series of Standards and each child was expected to move up a Standard every year. The details of the Standard examination are given below.

“Standard I
Reading: Narrative in monosyllables.
Writing: Form on blackboard or slate, from dictation, letters, capital and small, manuscript.

“Standard II
Reading: One of the Narratives next in order after monosyllables in an elementary reading book used in the school.
Writing: Copy in manuscript character a line of print.

“Standard III
Reading: A short paragraph from an elementary reading book used in the school.
Writing: A sentence from the same paragraph, slowly read once, and then dictated in single words.

“Standard IV
Reading: A short paragraph from a more advanced reading book used in the school.
Writing: A sentence slowly dictated once by a few words at a time, from the same book but not from the paragraph read.

“Standard V
Reading: A few lines of poetry from a reading book used in the first class of the school.
Writing: A sentence slowly dictated once, by a few words at a time, from a reading book used in the first class of the school.

“Standard VI
Reading: A short ordinary paragraph in a newspaper, or other modern narrative.
Writing: Another short ordinary paragraph in a newspaper, or other modern narrative, slowly dictated once, by a few words at a time.”
These reading “Standards” sound considerably less impressive when considered alongside the fact that the only books used were the schools’ reading books, and these had been practiced aloud in chorus, over and over, generally until they were memorized. Concerning such memorization, Pamela Horn quoted from the autobiography of an inspector in rural Wales some ten years later, during the early 1870’s, E. M. Sneyd-Kynnersley. (He said that the “great aim of inspector, teacher and children was to finish by 12:30 (p.m.) at the latest.”)

“Our plan of campaign was delightfully simple. Most of the children were in the two lowest standards. These were supplied with slates, pencils, and a reading-book, and were drawn up in two long lines down the middle of the room. They stood back-to-back, to prevent copying, and did dictation, and arithmetic, sometimes dropping their slates, sometimes their pencils, sometimes their books, not infrequently all three, with a crash on the floor. When we had marked the results on the Examination Schedule, all these children were sent home, and the atmosphere was immensely improved. Then we proceeded to examine the rest, the aristocracy, who worked their sums on paper. As a rule, if we began about 10 we finished about 11:45.... They read with a fluency that in those early days used to amaze me, knowing, as I did, that they knew very little English; till I found by greater experience that they knew the two books by heart, and could go on equally well if the book fell on the ground....”

According to Ellis (page 44), the 1860 “Code” was consolidated from the “Minutes of the Committee of Council” but did not concern testing. The “Revised Code of 1862” was the first which instituted testing by standards. The “New Code of 1871” resulted from the 1870 legislation which had authorized the establishment of government schools under school “Boards” to be supported by taxes, the first true state schools in England.

In the “Revised Code” of 1862, Standard I was not required to spell words, but Pamela Horn said (page 42):

“In the course of time the Code was amended somewhat, so that writing was tested in Standard I by a ten-word spelling test, in Standard II, III, and IV by a prescribed number of lines of ‘Dictation,” and in Standard V by the reproduction of a short story read twice by the Inspector....”

Her comments are puzzling, since these additions do not actually appear in the published code for 1871 so when they were added is unknown. Possibly they appeared in the codes of 1881 or 1882.

Up through Standard IV in 1871, children were only tested on reading from books used in the school, and the dictation was also from the same books. This explains Pamela Horn’s following remarks (page 43):

“Again, through the judicious comparison of notes between teachers in a particular district, dictation exercises could be made a simpler proposition - as H.M.I. Kenney-Herbert pointed out in respect to the Aylesbury district of Buckinghamshire in 1887. According to his experience ‘spelling proper (was) not taught, but the spelling of particular passages of particular books.’ He went on: ‘We have now for some time been giving dictation from the books “ordinarily in use at the school”, according to the instructions. Now it is a very difficult matter to find passages of a certain length suitable as tests of spelling; they occur, of course, but are few and far between. Teachers naturally observe what pieces are chosen and, when they meet, compare notes. The result is that the passages soon become “stock”, and it is not uncommon to see a smile of
That spelling books had once again received importance in the schools in the 1880’s is shown by the comments of “Flora Thompson” quoted later, from pages 47-48 of Pamela Horn’s excellent book. The probability is that phonics had come back in the British schools in the 1880’s through the spelling books, just as happened in America. Nevertheless, the spelling failures in England for adults who would have learned to read about 1870 were spectacular by the 1890’s, reported in the “Introduction” to The New-Method Speller, which was copyrighted in America in 1892 by Warren H. Sadler, and printed in Baltimore, Maryland, by the Sadler-Rowe Company in 1892.

“...In England it is reported that at a recent examination of candidates for Public Service, nineteen-twentieths of the class failed in spelling, and an Educational Report of that country says: ‘Spelling is not what it should be. What we want is to teach spelling, and not merely to practise spelling.’

“Civil Service examination papers in this country also show a remarkable deficiency in this important study.”

The spelling failures in both countries in the late nineteenth century resulted from teaching beginning reading by the “meaning” method which had arrived as the Siamese-twin to the government-controlled schools. The harmful effects of that method appear most starkly in bad spelling. Bad spelling appears to be the hallmark of permanently impaired conditioned reflexes in reading.

Pamela Horn commented (page 46) concerning “payment by results” which was the effect of the Revised Code of 1862:

“In the average school, the grant formed anything between one-third and one-half of the annual income... A series of bad reports could cripple a school financially, and might also affect the teacher’s own salary.... In these circumstances, it is easy to understand the despair of teachers when, despite all their efforts, a poor result was obtained. At Olsworthy Wesleyan School, Devon, in 1886, the log book sadly records: ‘Have worked harder this year than ever before. - No good”.... Who can doubt that in this tense atmosphere the children’s own position would often be extremely uncomfortable....

“In this sort of situation, it is scarcely surprising that as time passed ‘examination day became more of a torment in schools, and the inspectors themselves became slaves of the examination machine, filling in forms, visiting schools and writing reports.”

The amount of human suffering that has been caused by government-controlled schools is incalculable.
Books were prepared, predictably, to meet the Revised Standards of 1862, and one of them was the following in 1864, published by Simpkin, Marshall and Co., two of whose texts from 1848 and 1852 have already been described:

“Reading Book, containing easy Lessons in monosyllables, also writing, arithmetic, & spelling Lessons, adapted to meet the requirements of the revised code for Standard I. By two certificated masters. London: Simpkin, Marshall and Co., E. C., Manchester: John Heywood. 1864.”

In its preface, it repeated the requirements of the 1862 standards:

“Requirements of Standard I of Revised Code Reading: Narrative in monosyllables.

“Writing: Form on black-board or slate, from dictation, letters capital and small, manuscript.

“Arithmetic: form on black-board or slate, from dictation, figures up to 20, name at sight figures up to 20, add and substract figures up to 10 orally, from examples on blackboard.”

It then gave its aim:

“The object and aim of ‘The Infant School First Standard Reading Book’ is to provide teachers of infant schools with a graduated series of lessons, adapted to meet each of the requirements of the Revised Code, for Standard I.

“We learn from the reports of Her Majesty’s Inspectors of Schools that there have been more failures in this than in any of the other standards. This is attributed to the want of proper apparatus, and it is sincerely hoped that this little work will, in some degree, assist in producing much better results.

“In this series of books, Reading, Writing, and Arithmetic have been combined, so that the progress of the child in each of these subjects may be more equalised, and the work of the teacher thereby facilitated.

“This book with thirty-two additional pages, is published as ‘The First Standard’ Reading and Home Lesson Book. T. S. B., J. G.”

The make-up of the book was like Andrew Bell’s “meaning” materials of 1823, dependent on context for word identification, but the lessons were simple little monosyllables at the Standard I level. Nevertheless, despite the extreme simplicity of Standard I, “Her Majesty’s Inspectors of Schools” had said “there have been more failures in this than in any of the other standards.”

Ellis reported (page 57) the percentage of over-all failures in reading in 1864 at ll.87, in 1865 at ll.23 and in 1867 at 9.29. (It should be remembered that failing children were not tested again in the same standard, so this does not represent all the children actually in the schools.) Ellis also said:
“A single book was read continuously until the examination when a child could repeat the text from memory....”

The real failures in these years would have been very much higher, if the children were not just reciting the texts from memory. (They were doing the same kind of thing in American schools at that time. Classes read the same texts over and over and over again in chorus, after the teacher had read the texts to them first so that they “knew” all the “words.”)

Ellis had a further very disturbing comment (page 89):

“In 1870 the most expected of working-class children by the Government was that they should read a newspaper on leaving standard VI, a requirement which could well have been met by a child of 8 years old. Inspectors admitted that no attainment below Standard IV could be of permanent benefit to a child, and yet 80% of children passed only in the lower standards before leaving school. Fewer than 10% of the children attended school for 4 years.”

Therefore, under the government-controlled schools of 1870, 80% of the children left school with “no permanent benefit,” and unable even to read a newspaper, no less a chapbook. No wonder the sales of cheap printed materials aimed at the poor in England had so greatly declined by the last half of the nineteenth century.

In Ireland, the National Schools had been established by an Act of 1831, and were under the authority of the National Commissioners of Education. Although the earliest Irish Reader I have seen is dated 1836, from the date of the Act setting up the Irish National Schools, the original Irish Readers might have been printed as early as 1831.

The Irish Readers (to be discussed later) which had been in use from at least 1836 (and possibly from as early as 1831) to after 1869 (to judge from two editions available at the British Library) demonstrate the two-step sight-word phonics that has become dominant in reading instruction in the English language. Two-step sight-word phonics rates a Code 3 on a scale of 1 to 10, where one is straight “meaning” and 10 is straight “sound.” Yet to the average adult the harmfulness of these materials is not evident: they look “phonic.” Their harmfulness can only be understood if it is acknowledged that the act of reading is a set of conditioned reflexes which, once formed, may not be unformed, because once people begin to read they are exposed to printed matter for the rest of their lives. Those conditioned reflexes, therefore, cannot be extinguished through disuse.

It is the existence of different and opposite conditioned reflexes which accounts for the extraordinary differences of opinion in rating the difficulty of teaching beginning reading. The Scottish Schoolmaster in 1829 stated that by the time a child is seven he can have been taught to read anything fluently, and he, himself, had been teaching children to read for thirty years by the “sound” approach. Yet Longley, as mentioned elsewhere, made this statement in 1857 when the “meaning” approach had taken over, and he obviously believed it:

“The experience of every observing teacher agrees with the declaration of an eminent English educator, that ‘learning to read is the most difficult of human attainments’....”

The astonishing source of Longley’s quotation was Richard Edgeworth, and the probable insincerity of that remark by Edgeworth in 1798 has been discussed earlier.
Recorded differences over many years in the degree of the loss of reading ability due to aphasia can demonstrate the effect of differences in beginning reading methods over those same years.

An instance of loss of reading ability, a form of partial aphasia, which was only temporary, is given in The Waysiders, by R. M. N. Crosby, M. D., Delacorte Press, New York: 1968, page 103. Dr. Crosby said the British physician, Lordot, had told in 1843 of a temporary loss of his ability to read in 1825. Lordat had reported in 1843:

“Whilst retaining the memory of the significance of words heard, I had lost that of their visible signs. Syntax had disappeared along with words: the alphabet alone was left to me, but the function of the letter for the formation of words was a study yet to be made. When I wished to glance over the book which I was reading when my malady overcame me, I found it impossible to read the title. I shall not speak to you of my despair, you can imagine it. I had to spell out slowly most of the words, and I can tell you, by the way, how much I realized the absurdity of the spelling of our language. After several weeks of profound badness and resignation, I discovered whilst looking from a distance at the back of one of the volumes in my library that I was reading accurately the title Hippocratis Opera. This discovery caused me to shed tears of joy.”

Dr. Lordat was an adult when he had his aphasic attack in 1825. He would therefore have been taught by the syllable/spelling book approach, or “sound,” after having first learned the alphabet.

Note that his loss of reading ability was total, except for the letters of the alphabet. Isolated letters and other meaning-bearing symbols are thought to be stored on the right side of the brain, where the Japanese Kanji characters are stored. Yet the syllabary, which is pure sound, would have been stored on the left or language side of Dr. Lordat’s brain, where the Japanese Kana syllable characters are stored, and so would the spelling book words which were built on that syllable foundation. Dr. Lordat apparently had a temporary impairment of some sort on the left side of his brain, which affected the area concerned with reading “sound,” (presumably the left angular gyrus area) but not its mirrored counterpart on the right side of the brain, (the right angular gyrus area) which presumably deals with the “meaning” of symbols like the alphabet and the Japanese Kanji characters.

Yet Dr. Lordat also had made the extraordinarily puzzling comment, “Syntax had disappeared along with words.” People before 1826 learned to read with syllables first, instead of words, while today we learn to read with whole words. As a result, did those who learned to read by syllables have more of an awareness than we do today of what appear to be the three sequential steps in speech: syllables/syntax/words?

Another instance of temporary loss of reading ability is given by Dr. William H. Calvin and Dr. George A. Ojemann in Inside the Brain, A Mentor Book, The New American Library, Inc., New York: 1980, page 32. The book used a fictitious name for the patient who had a stroke on the left side of the brain:

“Upon sitting down to read (the newspaper), he discovered to his astonishment that he could not read. He could see the paper, recognize the letters individually, but only the shortest two- and three-letter words made any sense.... His spoken language was normal.... A year later, Fred had recovered most of his ability to read.”

That patient, who was reported on page xii to be an older man, was living when the book was published in 1980. Assuming he was 60 or 70, he would have learned to read about 1925 or 1915, when most American reading series taught heavy phonics in supplemental charts (in effect, the old spelling book approach), but only after having started with a little exposure to sight-words in a beginning primer.
The man’s retention of the alphabet and some short words suggest these were handled by the right side of his brain which was not affected by the stroke, while the “sound-bearing” remainder of his reading vocabulary, which needed to be handled by the left side, was affected by the stroke.

The third case was reported by Sid J. Segalowitz in Two Sides of the Brain, Prentice-Hall, Inc., Englewood Cliffs, New Jersey: 1983, page 92. Segalowitz said:

“Not everyone uses exactly the same strategy for reading. Our schools, in fact, fluctuate between two teaching methods, phonics and whole-word. Although most people use a phonics approach to reading at least to some extent, it is conceivable that some people can make do with just recognizing the shape of the words. For example, Ken Heilman reports a case of a right-handed man who suffered a left hemisphere stroke. He became globally aphasic, yet could read quite well (considering his condition). Heilman writes:

“After his discharge, his wife noted that when he wished to communicate what he wanted for dinner he would open a cookbook, read through the references, and indicate what he wanted to eat by pointing to the appropriate place in the text. His wife stated that, in addition to the cookbook, the patient kept other printed material next to his favorite chair and would communicate with her by using this strategy... (This patient) was able to learn more than 100 American Indian signs. American Indian signs are a pantomime-based system of general communication in which hand postures and motions represent iconic images of major lexical items. With (a subsequent) right hemisphere lesion, the patient lost not only the ability to read but also the ability to comprehend and express these ideographic signs.”

Since the loss of the unfortunate man’s ability to read followed the damage to his right hemisphere, there can be little doubt that he was reading with the right hemisphere. Heilman had published in 1979 the book to which Segalowitz referred. The patient had presumably been an older man, since strokes are much more common among older people. Therefore, the man may very well have learned to read with some of the heavy sight-word programs being promoted by “experts” in the 1920’s, or, if he were considerably older, with the heavy sight-word programs in wide use in the 1890’s and earlier such as the Heart of Oak readers (which were almost exactly equivalent to our present day “whole language” approach). In any event, undoubtedly because of the method by which he had been taught to read, the man had stored written matter on the right side of his brain, as “meaning” and not “sound” bearing, and so was able to use that right side to read until his tragic final stroke.

What these three case histories over a period of many years show is that different conditioned reflexes can be formed in reading, and the reflexes which are formed are apparently dependent upon the method by which reading is first taught. The initial approaches in the Irish Readers of 1836, therefore, in the very first book which children were given, were critically important, however trivial they seem when they are described.

The first Irish Reader had started with pure sight words (a Code 1 approach). Later, although it seemed disarmingly like real phonics, the book used already learned sight words to form new words by affixing different consonants. That is two-step, whole-word, phony phonics. The “new” words were then practiced by reading them in context selections aloud which provide “meaning” clues to the just-learned “whole words.” Whole-word phony phonics is a Code 3 approach. The Irish Reader approach, therefore, was a whole-word approach and it would have resulted in wrong reflexes.
Concerning the history of the Irish Readers, Ellis stated (page 50):

“The five Reading Books compiled and published under the authority of the Irish Commissioners were extensively used in both the National and the British schools of England and Wales.... The series was unfavourably criticized by an Assistant Commissioner in the report of the Newcastle Commission. He considered that the lowest classes in Ireland were more advanced educationally than their counterparts in England, a fact which rendered unsuitable the use of the Readers in English schools. The style was beyond the comprehension of children in the northern counties, and the sentences were too long and complicated for pupils unaccustomed to sustained thought.”

It should be acknowledged that the higher-level Irish Readers did contain difficult material, unlike the first Irish Reader, but it should be emphasized that children never read school material independently by 1859, when the Newcastle Commission began. The teacher read material to them first, with the “proper” inflections, and the children repeated the material in chorus, over and over again, until finally each child read a portion aloud. It was widely acknowledged that children at that time memorized their reading texts. But even with this endless drill, the Newcastle report begun in 1859 conceded that the English children in the northern counties could not really handle the Irish Readers. (Yet it should be remembered that, only twenty years before, English children in the northern counties had been able to handle the “long and complicated” sentences of the Bible which they obviously could not memorize!)

The Irish Readers, which were Code 1 at their beginning, and Code 3 shortly after their beginning, had first been published for the government schools in Ireland in the 1830’s. They had spread throughout government-subsidized schools in England and Wales. (Why should THAT have happened?) The Irish Readers were in “extensive” use in England and Wales at the time of the Newcastle Commission, which began in 1859, and an 1869 revised copy is available at the British Library. Therefore, for at least thirty-three years and probably for considerably longer, these readers had been doing massive damage to literacy in Ireland, England and Wales.

Douglas Hyde’s comments, quoted elsewhere in this history, described the Irish children who were being given a government school education in English as appallingly ignorant, particularly the minority who spoke Gaelic at home. Since these Irish children were almost certainly being given the Irish Readers published by Collins, that means the “Assistant Commissioner” of the “Newcastle Commission” was apparently not getting the real facts on Irish achievement. The children in the “northern counties” of England were failing with the awful things, and so probably, if Hyde were correct, were the Irish children.

William Collins II of Glasgow, Scotland, was publishing the Irish Readers by 1869, and by doing so carried on the textbook approach of the older William Collins of Glasgow (presumably not his father but his uncle or grandfather, since the younger man was not called William Collins, Jr.). The older William Collins had published The First Monitorial Class Book by N. Leitch which had a twenty-fifth edition by 1848. It was effectively a Code 1 pure sight-word book, despite its listing of some short vowel words. It obviously omitted teaching the alphabet, but taught letters through their use in words. By page 2, it was using two-letter sentences in small letters: “go up. he is.... if we be. go to it.” The use of small letters was necessary, of course, because the alphabet in capitals had not been taught either. Pages 3 and 4 had sentences of two letter words, and then, on page 4, the following, using three-letter words:

“bad, man, fat, sad, lad, mat, bag. hen, pen, red, get, ten, men, net. bad men. my fat hen. a sad lad. go to bed. a red mat. get a pen. a fat man. my net bag. I am in. a hat peg. get red wax. we met. my pen is bad. set me in bed. get me a net bag. my hat is wet.”
The fact that a word list of short “a” and short “e” words preceded the above sentences did not mean the children were taught the short sounds: they were taught whole words, and then immediately practiced them in “meaningful” contexts. The word lists on the succeeding pages introduced some short o and short u words, but they were mixed in with other shorts, so attention could not even be intuitively focused on them. Some brighter children might have done this on the short “a” and short “e” words given above, but not on the following mixed lists. Therefore, the children were not being taught and were not learning the critical short vowel sounds present in about sixty per cent of English syllables, but only whole words to be used immediately afterwards in context.

By page 7, capitals began to be introduced in words and the words became four letters long. The book ended on page 12 with 5 letter words. It was, in effect, a Code I book for beginners. Collins senior had also had enormous sales on the Leitch readers, which were presumably like Leitch’s The First Monitorial Class Book. Therefore, Leitch’s highly successful book, published by Collins senior of Glasgow, anticipated the phony phonics of the highly successful Irish Readers, the publication of which was taken over by Collins junior of Glasgow sometime after their original publication in Ireland.

The book began with the alphabet in capital and small letters on page 3. Yet the children were supposed to learn the letters through their use in the context selections, just as with Leitch’s book, because page 4 was the first lesson, clearly entitled, “SECTION I. LESSON I.” It contained a picture of a cow, and over the picture the letters “a i m n o s t x y.” These letters were then used in sight-word phrases in columns under the picture: “an ox, it is, no ox, my ox, it is so, is so it is, is it an ox? is it my ox? is it so? no.” The page had used no capitals, obviously because the alphabet in capitals had not been taught. Yet it took time to introduce the use of the comma and the question mark, both “meaning” and not “sound” bearing!

The same approach was continued on page 5, which was “LESSON II.” It introduced the small letters “b f g h e u p r” and phrases using only some of the letters covered so far: “is he up or no? go up. I am up. is he an ox? he is on my ox. I am on an ox. go up to it.” The probability is that the children retained no memory of those letters which were not used in words, since the focus of the material was on words.

“LESSON III” continued with the rest of the letters: “c d j k l q w z v” and again used only some of them in context: “lo, we go. do as we do. do (go) up. is he at j, or at z? he is at z; I am at j. is it q? no, it is p. is it v? no, it is u.”

“LESSON IV.” contained isolated sight words at the beginning: “to do go we.” They were followed by more phrases: “am I to go to my ox? is it so? it is. am I to go in to it? is he to go to it? he is to do as we did.”

On page 6, “SECTION II. LESSON I,” some of the capitals were introduced in sight words, and the first phony phonics appeared. The children up to this point obviously had been reading print as meaning-bearing whole words. Three pairs of words then appeared: “can had, rat hat, mat sat.” Section I had covered two letter words and this section moved into three letter words. This looks to the unwary as if the short “a” sound were being taught, but obviously the children at this point would be conditioned to see these words as more “whole words.” Four of the words provided the “phonogram” “at” from which were built more words by adding the consonants r, h, m, and s (pure analytic “phony phonics,” building new words from old words). Under the words was a picture of a cat biting a rat, a nasty touch for little children, followed by this “meaningful” context: “The cat has a rat. Can it be Sam or Pat? It is Sam. Pat
had on a hat. He sat on a mat.” The use of the article “a” (pronounced either u or a) obviously interfered with any generalization the children might make for themselves about a consistent sound for “a” from the short “a” words being used. Furthermore, the difficult sound “th” had not been taught, but the sight word “the” was introduced.

Page 7 had “LESSON II. bad, has fat, Ned bed, net Sam has a fat ram. Dan has a bad pen. Let Ned go up to bed. It is a bad net. Has Sam a hat? No, he has a cap.” Although this might seem to be teaching the “short e” sound from the words “Ned, bed, net,” what kind of generalization could a beginning reader make for himself with the unexplained inclusion of “long e” in “he,” as well as the short “u” sound at the end of “the”? The child would therefore learn ALL these words as “whole words.”

On the bottom of page 7 was “LESSON III. den fed get hen yet pet pen Dan The fox is in his den. Can I get a pen? Ben fed my pet hen. Dan is not yet in bed; he is a bad boy.” Note the inclusion of sight words containing vowels not yet “taught”: “short o” in fox and not, and the diphthong “oy” in boy.

Page 8 had “LESSON IV will bit pig lip pin pit sin tin A fat pig is in the pit. Ned has a bit of tin. My cat is a pet. A rat bit its lip. Is it a pin or a pen? I will do no sin.” Note the untaught sound of a terminal “y” in “my.” Note the irregular sound of “o” in do used immediately before a regular sound in no, both different from the sounds of “o” in the previous lesson in fox and boy. This provides four different sounds for the letter “o” in sight words before the letter “o” is “covered” by a list of three-letter “o” words in the next lesson. Note the probably phony inclusion of a religious inference.

On the bottom was “LESSON V,” which ran over to page 9. “fits fig gig I will go to you now. Tom has a new hat. It fits him, and it fits me too. Did Ned get a fig? Sam is to go in the gig.” “Short o” had not been covered in the word lists before the “phonic” lessons in this section. Yet the previous lesson had included four different sounds for “o” in sight words: do, no, fox, and boy. This lesson includes several variants of sounds and spellings of “o,” all of which would have to be absorbed as sight words: go, you, now, to, too! In the word “new,” the lesson includes the untaught diphthong “ew.” If not pronounced to rhyme with few, it makes the same sound as “oo” in “too,” “to,” “do,” and “you.” With the handful of sight words the teacher had been pronouncing for him to repeat up to this point, a little child might stumbleingly try to make the “sound” vowel and spelling generalizations for himself that used to be handled in the spelling books. However, the mixture of spellings and sounds on “o” would throw such a child back to remembering his sight words solely for their “meaning.”

Next came “LESSON VI. bog, cot dog pot toy doll Tom has his top. A doll is a toy. The cot is on a hill. Is it a pot or a pan? It is a pot. Ned saw a pig in the bog. Mat will get a dog for me. The dog ran at a cat and bit it.” The casual reviewer might think “Section II” had been teaching the short vowel sounds. Words have been listed up till now with “short a,” “short e,” “short i,” and now “short o,” but, as has been seen, those sections were very defective. This one is clearly so: “o” is in the middle position of three-letter words, but note the difference in sounds. Five have short “o,” but the sixth has the diphthong “oy,” which had already been used in a sight word in a previous lesson. The children would absorb this new word, “toy,” by a consonant substitution on the previous pure sight-word, “boy.”

“LESSON VII cup put fur rub run sun [Note the mixture on “u”, giving it THREE sounds in only SIX words: cup, put, fur! That should remove any lingering belief that the intent in Section II has been to teach the short vowel sounds, in the order a, e, i, o, and u!] Ned put his leg in the tub. Has not a cat fur? It has, and so has a fox. The sun has set; I do not see the top of the hill. Bid the lad get a cup. A dog can run. Has Bess a tub? Bid her rub it dry.” The children would find “dry” easy to remember: just compare it to the previous pure sight-word, “my,” using a different beginning.
“LESSON VIII for got nor not ill far Bid Tom go and get the pen for me. Tim has not got a pen nor a pin. To do ill is a sin. Can you run far?”

Note the words conveniently grouped for initial consonant substitution: for-nor, and got-not. Furthermore, the sight-word “for” would have to be distinguished from the sight-word “far” by “visual analysis.” The “r” controlled vowel sounds have not been taught: er-ir-ur, plus ar and or.

Page 10 had:

“LESSON IX Snap Fred bled spin rug drum (picture of boys with drum and fife) Fred sat on a rug. Pat has a drum. My dog Snap bit a rat, and its leg bled; it is in a trap; but do not let it go. I can spin and flog my top, but not in the sand. If you hit my cat with a rod it will spit and run.”

Note the continued ugly content which curiously is so often to be found in “meaning” texts for little children: a dog biting a rat, whose leg bled, while the rat was held in a trap from which it was not to be freed, followed by talk of hitting a cat and its spitting and running. The material has now “progressed,” however, to four letter words, containing consonant blends. Yet no attempt is made to teach these blends in any consistent fashion as “sound.”

Page 11 had:

“LESSON X plan house, crop bled Bob plot flax stay (picture of cottage and man) Is his crop of flax in the bog? No, it is in a plot of land on the hill side, near his house. Bob is in bed; it is a bad plan to stay in bed too long; but he is not well, and can not get up. Ned hit him, and his lip bled.”

That was another nice content touch for impressionable little children: “Bob” is in bed because Ned beat him, and “his lip bled.” Note also that the list of words at the top are pure sight words, with no attempt to group them phonically.

The book proceeds with two “story” lessons to a page and six to ten words at the top of each. These words were being learned as sight words, and would provide the sight-word bank which could be used later on which to draw to compare known words to unknown words to see like parts.

To the casual observer, Lesson XIII seems to deal with a terminal “silent e” which makes the first vowel a long sound. Lesson XI had a silent e word, “rope,” and Lesson XII another one, “like” but there is no reason to think the rule was taught with these isolated sight words. However, Lesson XIII included cane, care, give, date, hate, made, lame, takes and Jane. Note the three exceptions to the rule out of the nine words given: care, give, and takes. These exceptions would need some explanation, which undoubtedly was not given. So it is doubtful that the children could have intuitively absorbed the silent “e” rule. The probability is that no attempt was made to teach it.

Section III did seem to have the lessons arranged phonically, but that the intent was “elocution” and not decoding becomes clear with the words listed at the head of Lesson XIX on page 35: feint gray rein veil prey. Any text attempting to teach children to decode such words by their sounds would never mix words in this fashion. The intent here was obviously to teach whole words, to be pronounced (“elocution”) with the long “a” sound. Children had an opportunity to practice that pronunciation in the seven-line story which followed the word lists. That was the form in which lessons in Section III appeared: a list of words with a particular sound to pronounce, followed by a short story using the words, very much as done in My Fair Lady: “The rain in Spain stays mainly on the plain.”

With Section IV, even the “elocution” phonics ended. The sentences on page 44 were sad, indeed:
“We shall be glad when we grow old that we were taught to read. But some boys and girls do not love to read; they say it is too hard.”

“Frank took no pains to learn; he did not look at his book: and when his turn came to read, he could not, and so lost his place in the class....”

Section V was a section of little stories, each preceded with five or six two-syllable words divided by hyphens. Page 64 was the last page in the book, and introduced italic letters to print a page of religious material.

The 1869 copy was published after the spelling book as a beginning book was no longer even a memory. The 1836 copy, however, came out immediately after the change. Primers, or beginning reading books in the 1830’s parodied the old spelling book arrangement, obviously to placate the public which had a memory of the old approach.

The 1869 book was a revision of the 1836 text, and, while much had been changed, it repeated verbatim some of the sentences in the earlier text and followed its general form. Both were Code 3 books, the earlier one more explicit in its “phonic” treatment, which is to say, in demonstrating how to form new words from known sight words. A copy of the 1836 text is in the British Library under call number 1212 b.20, and is titled, First Book of Lessons for the Use of the Irish National Schools, Dublin, Printed by John S. Folds, 5, Bachelor’s Walk, 1836.

On the inside of the title page, this appears, which is not in the 1869 revision:

“Teachers will observe that the first Section of Lessons is designed merely to make the child familiar with the forms of the Letters. In the second and third Sections, there is a regular gradation from the simplest to the most difficult sounds. It is recommended to Teachers, to make their pupils perfectly acquainted with one Lesson before they proceed to another, and to exercise them as much as possible on the meaning of such words and sentences as admit of being defined and explained.”

Page 3 had the upper and lower case alphabet, and the vowels, “a e i o u and sometimes w and y.”

Page 4 listed the consonants, the alphabet in italics and figures.

Page 5 had a list of sample words as a phonic key, not unlike Webster. That was very curious, as no further use was made of it in the book!

The very form of the book, from Section II on, paralleled much of the phonic content of spellers, but the intent was obviously very different. Words were taught as wholes and practiced immediately in context, and the “phonics” in Section III was obviously aimed at elocution, and not decoding.

Starting on page 6 appeared the first lessons:

“FIRST BOOK
Lessons in the Forms and Sounds of the Letters.
SECTION I.
LESSON 1.

aimnoestxy
“an ox, my ox is it an ox?
  it is, is it? it is my ox.
  no ox is so, is it so? no.

“LESSON II.

  b f g h e l u p d r n

  “is he up, or no? is it b or h?
  go up? fy, be up? it is h, is it.
  is it on an ox? it is b or p.

“LESSON III.

  e j k l g & w z j

  “ho, we go; is it j or z?
  so we do; he is at z, I am at j
  ox, go up is it c, or k, or d?”

These were almost the same as the 1869 version, and the effect would be the same: the children would form a conditioned reflex to regard words as meaning-bearing wholes. However, surprisingly, this 1836 version then included the alphabet to be learned in Lesson IV and V, in capital and small letters and in italics. Lesson VI and VII were as follows:

“LESSON VI

“I am to go to my ox; is it so? As he is to go, am I to go? I am. Is he to go up? no, do as we do.

B L K V C Q U R J Z

“LESSON VII

“So I am to go up on my ox. Do ye to us as we do, do so. Lo, he is at K; I am at Q. Is it C, Z, Y, V, J, or B?”

On page 9 began SECTION II:

“LESSON I.

“cat hat ram
  fat mat rat

“Can it be Pat or Sam?
  Sam has on a hat.
  He sat on a mat.
  Has Pat a hat? no.
  Pat is on a fat ram.
  The cat has a rat.”
Note that the word list has five words with the phonogram “at,” which “whole words” the children could distinguish from each other by the initial consonant. By page 9, the children would perceive words only as “wholes” after the treatment of Section I.

“LESSON II.

“bed         hen         net
  den         leg         pen

“Ned has a pen.      Let Sam go to bed.
  It is a bad net.   A hen has a leg.
  A man in a den.    Can I get a pen?”

The words to be compared as wholes in this list would be “den-hen-pen.”

(Page 10) “LESSON III.

“fig         pig         tin
  lip         pit         wig

  Has a pig a lip?     A cat in a net.
  Mat has a fig.       A wig on a pen.”

The words to compare as wholes here would be “fig-pig-wig.”

“LESSON IV.

“bog         dog         pot
  cot         fop         top

“Tom has his top.     A doll is a fop.
  A cot on a hill.    Sam has a dog.
  A pig in a bog.    Is it a pot or a pan?”

The words to compare as wholes here would be bog-dog, cot-pot, and fop-top.

“LESSON V.

“cub         fur         sum
  cup         gun         sun

“Ned has cut his leg.      Tom has a gun.
  Has a cat fur?       Is it cub or cup?
  Is it sum or sun?   A dog can run.”

In the 1836 version, five lessons had been set up in the sequence of short a, short e, short i, short o and short u. In the 1869 version, this sequence was blurred.

(Page 11) “LESSON VI
“A dog ran at a cat, and bit it.
Bid him go and get my pen.
My ... is on a pen; is it not?
O, Sir, it is. To do ill is to sin.

“LESSON VII

“I can get a wax doll, and a cap.
But let me get up, and go to bed.
If I sin, I am bad.
Let me not sin, as bad men do.”

This section looks as if it teaches short vowels, but it has not done so, essentially for the same reasons as given for the 1869 book. However, on Lesson VIII, it included a whole-word approach which was omitted in the 1869 book. Blends were passed over as sight words in that text. In this, the children were carefully shown how to build new sight words from previously learned ones: nap became snap, rap became trap, and so on. After it taught these words, they were practiced in sight-word contexts, using, without previous teaching, such words as “do” and “was”:

LESSON VIII

“nap snap pit spit
rap trap log flog
led bled top stop
lip slip rug drug
pin spin rum drum

“LESSON IX

“Snap bit a rat. Its leg bled.
It is not a trap; do not let it slip.
Tom was on (Page 12) a rug; he had a drum. I can spin and flog my top, but not a doll.
A log hit a cat; it did not spit and run.

“LESSON X

“Stop it is a bad drug; let it drop.
Bob is in a snug bed; he is in a nap;
it is a bad plan to be in bed at ten.
A crop of flax; is it in a bog?
No, it is in a plot at my hut. Ned hit Top a rap; his lip bled.
It is a sin to do ill.”

The resemblance in the sentences to those in 1869 is obvious. The book then continued with much more explicit treatment on building new words from old words, and used it to cover the silent “e” rule, which was covered so vaguely in the 1869 issue:

“LESSON XI

“can cane mad made
hat hate man mane
“He has a hat on his pate; has he not?
Can you lend me a cane? I will give it back.
Snap has not a mane, he is not mad.
I hate to do ill; I was not made to be bad.”

The next lessons followed the same approach for long e, long i, long o, and long u words formed by the addition of a silent “e”: sample words, followed by sentences. By LESSON XVII, the material was all sentences.

Starting on page 16, SECTION III was much more explicit about building new whole words from old ones, arranging the lessons of “instruction” in the order of the vowels. Sometimes the words were alike in their endings and sometimes in their beginnings: elm, helm, help; and sometimes internally: mend, send, tent. It is true the old spelling books arranged words by such phonic analogy, but children taught to read with spelling books had been drilled from the beginning to regard words as amalgamations of letters to be read as “sound” and not as wholes to be learned for their “meaning.” The resemblance between the spelling book and the sight-word primer is therefore only seeming and not real.

The word lists were all immediately followed by sentences, obviously fostering context guessing on the newly taught sight words.

“LESSON I

“act  fact  ark  bark
ant  pant  arm  harm
ask  task  art  cart (sentences)

“LESSON II

“elm  hemp  nest
helm  melt  send
help  mend  tent (sentences)

(Page 17) “LESSON III

“ink  limp  risk
drink  list  silk
lift  ring  sing (sentences)

“LESSON IV

“cord  fork  scorn
cork  horn  sort
corn  horse  stork (sentences)

(Page 18) “LESSON V

“bust  gulf  lump
burn  hunt  trust
curd  hurt  turn” (sentences)
Isolated phonemes were now introduced, first “th” initially and then terminally, and then varied spellings for the “au” sound and the short “u” sound. Note in Lesson VIII and IX the greatly varied spellings for these sounds. The purpose of this section is obviously elocution, and not decoding. Children were only being taught how to pronounce correctly.

“LESSON VI

“this  these  
that  them”  (sentences)

“LESSON VII

“bath  girth  theft
depth  smith  thick
fifth  tenth  width”  (sentences)

“LESSON VIII

“ball  salt  wall
call  stall  warn
halt  tall  wasp”  (sentences to page 20)

“LESSON IX

“glove  month  worth
love  word  worn
sun  work  world”  (Irish accent?)

The lessons continued with “sh” spellings followed by sentences, and then the same treatment for “ch, wh, oo, oi, ea, ei-ey, ew-ue, aw, au, ou, ow,” and “ie-oe.” That last was on page 32. Pages 33 to 36 contained just sentences, with the last page religious, ending with the Roman numerals. This pattern was familiar from the spelling books which had covered all the variant sounds in English and their spelling. What made this book so different was that it drilled children to regard words as “wholes” in Section I, and then, in Section II and III, falsely seeming to adopt the spelling sequence, actually taught words as wholes and then practiced them in context so that they would continue to be perceived dominantly as meaning-bearing. The “phonic” treatment was whole-word consonant substitution. However, by the time the 1869 version was printed, the necessity to ape the old spellers had disappeared, and much of the phonic sequence in the original Irish Readers had disappeared too. Section III in the 1869 version dispensed with much that was in the 1836 version.

Ellis wrote on page 51:

“William Collins II issued his first school atlas in 1856 and was later appointed publisher to the Scottish School Book Association and the Irish National Schools. In a period of 10 years he provided the latter body with 2,320,500 copies of 31 books.”

The Irish Readers published by Collins obviously had great influence. The reason for the failure of the children using them, referred to previously, becomes apparent when their Section I is considered: a pure sight-word “meaning” introduction to reading.
It was the use of such government-approved books as the “meaning”-approach Irish Readers which caused the scandalous drop in reading ability which Ellis reported (page 89). Inspectors admitted that no attainment below Standard IV could be of permanent benefit to a child, and yet 80% of children passed only in the lower standards before leaving school at the end of several years’ attendance. Yet, as referred to elsewhere, English bootblacks and others like them in the eighteenth century who had been denied such “formal” education had nevertheless learned to read ably when “sound” was the only approach known. They were, in fact, such accomplished readers that they pooled their coins to buy periodicals like the famous, high-readability-level Spectator. The literate poor of the eighteenth century had been turned into the functionally illiterate poor in the nineteenth century by the government-controlled schools.
Chapter 44
The Wrong Methods Endorsed by “Experts” Arrived Piggy-Back on the New Government-Controlled Schools on Both Sides of the Ocean

The “sound” spelling book for beginners was under attack in England, Scotland and Ireland in the same period of time as in America, starting in the 1820’s and continuing to about the 1840’s.

The dropping of syllabic spelling (“sound”) by John Wood in the Edinburgh Sessional School in Scotland was referred to approvingly in The Spelling-Book Superseded by Robert Sullivan of the government schools of Ireland. Robert Sullivan was very probably the “Prof. R. Sullivan,” whose other material was shown on the 1848 list of approved textbooks for English schools, Schedule I. - Lesson Books for the Scholars, which list has already been discussed. On that schedule, Prof. R. Sullivan was listed as having written three of the approved books, An Attempt to Simplify English Grammar, Geography Generalized, and An Introduction to Geography and History. He is probably also the man who wrote Sullivan’s Literary Class Book praised by Baker, as discussed later. In The Spelling Book Superseded, Sullivan recommended using new and different methods than the old spelling books for teaching spelling even to older children. The Spelling-Book Superseded was published in “Rochester” in 1853 but whether it was Rochester in England or America is unknown. The 1853 Rochester edition in the Harvard Library was the sixth edition and showed that the book had had three major revisions by that date, so presumably the first edition had been at least ten years or so earlier. As late as the 1876 American Catalogue, it was still in print, appearing as “Sullivan, R. - Sullivan’s spelling book superseded. New Ed. 31 c” available from “Sadlier.”

Sadlier published Catholic school books at the time, so unfortunately the new philosophies apparently had reached the Catholic schools, too. One of the saddest things in “reading instruction history” is the gullibility that people demonstrated when they were faced with such self-proclaimed “experts.” This proves that there is nothing new about the astonishing gullibility shown by school administrators today concerning “whole language.” However, the record on Sullivan’s book demonstrates the blanketing effect in the English-speaking world of the educational philosophies of the period, and shows also that such “expert” works as Sullivan’s could persist for many years.

Sullivan said he had been working in the National Schools of Ireland (the government schools) “with which it is his pride and pleasure to have been so long connected,” These government schools appeared in Ireland some time after the Penal Laws were repealed which for about a century had forbidden the teaching of Catholics. The Penal Laws, of course, confirm beyond the slightest shadow of a doubt that some people can hold illiteracy in high regard, in such high regard that they can actually legislate it for certain groups of people in order to control them. As has been mentioned, Richard Edgeworth had been involved by 1806 in the original planning for these Irish government schools, only seventeen years after the French Revolution which had finally installed the idea of such government schools into Western culture. As discussed in the section on France, the brand-new idea of founding government schools instead of church schools had been bubbling away for decades among the anti-religious philosophers of France whose later major achievement was the bloody and anti-religious French Revolution.

For many years in the Irish government schools after they were finally founded, teachers were forbidden to speak in anything but English to children who could speak only Gaelic, and teachers were forbidden to teach Irish history. This is discussed by Douglas Hyde in “Irish as a Spoken Language,” from his A Literary History of Ireland, which chapter was reprinted in Irish Literature, Bigelow, Smith &
Douglas Hyde saw the problem, understandably, as a national one, but it was anything but that. The problem was (and remains) centralized governmental control of education, in all countries. Such governmental control was and is exercised by cliques of change-agents. The resultant “education” was and is tailored to their specifications. This “education” has shaped and continues to shape the minds of children. No longer was and is the content of a developing child’s mind to be determined by its parents. It was and is to be determined by “government schools,” the curriculum of which was and is consistently shaped by change-agents. Even in private schools the curriculum became controlled, because most textbooks being published were written for sale to government schools, and their teachers were “trained” in normal schools whose curriculum has been under the control of change-agents.

The excerpt by Douglas Hyde which is quoted later, while completely true in itself concerning the harm being done to Irish children, gave no inkling of the suffering that had been caused to the lower-class English families by the move there to government-controlled schools about the same time. Because of the use of the sight-word method, these English schools were unable to provide even simple literacy to the bulk of their students. Yet, after about 1870, parents were often prosecuted criminally if they held their children out of these schools. They were prosecuted even when an older child was minding younger children so the mother could work for money to buy food, and even when these poor children lacked the shoes with which to walk to school through snow or mud! The real issue with government schools in all countries, and in England and Ireland as in others, was the existence of change-agents who were imposing their will on others, through having manipulated passage of the necessary enabling legislation.

Things were obviously not going very well with government education of the poor in England, in the same general period during which Hyde wrote of government schools in Ireland, which schools were obviously for those who could not afford private schools. Hyde’s excerpts give an appalling account of these government schools as they developed in Ireland, and their “achievements” from the early nineteenth century to 1891:

“According to the census of 1891, something over three quarters of a million people in Ireland were bilinguists, and 66,140 could speak Irish only, thus showing that in thirty years Irish was killed off so rapidly that the whole island contained fewer speakers in 1891 than the small province of Connacht alone did thirty years before.

“This extinguishing of the Irish language has not been the result of a natural process of decay, but has been chiefly caused by the definite policy of the Board of “National Education,” as it is called, backed by the expenditure every year of many hundreds of thousands of pounds. This Board, evidently actuated by a false sense of Imperialism, and by an overmastering desire to centralize, and being itself appointed by the Government chiefly from a class of Irishmen who have been steadily hostile to the natives, and being perfectly ignorant of the language and literature of the Irish, have pursued from the first with unvarying pertinacity the great aim of utterly exterminating this fine Aryan language.

“The amount of horrible suffering entailed by this policy... by insisting upon <children> growing up unable to read or write, sooner than teach them to read and write the only language they knew, has counted for nothing with the Board of National Education, compared with their great object of the extermination of the Irish language, and the attainment of one Anglified uniformity... in vain have disinterested visitors opened wide eyes of astonishment at schoolmasters who knew no Irish being appointed to teach pupils who knew no English...
“In vain have the schoolmasters themselves petitioned to be allowed to change the system, in vain did Sir Patrick Keenan (afterwards himself Chief Commissioner of National Education) address the Board saying, ‘the shrewdest people in the world are those who are bilingual; borderers have always been remarkable in this respect, but the most stupid children I have ever met with are those who were learning English while endeavoring to forget Irish. The real policy of the educationist would in my opinion be to teach Irish grammatically and soundly to the Irish-speaking people, and then to teach them English through the medium of their native tongue.’

“...Will it be believed, the Board of National Education insists upon the Irish-speaking child starting out from the first moment to learn to read a language it does not speak. (For many years the schoolmaster was not even allowed to explain anything in Irish to a child who knew no English! This rule, however, has been abrogated.) It is forbidden to be taught one syllable of Irish, easy sentences, poems, or anything else. It is forbidden to be taught one word of Irish history. Advantage is taken of nothing that the child knew before or that came natural to it, and the result is appalling....

“The children are taught, if nothing else, to be ashamed of their own parents, ashamed of their own nationality, ashamed of their own names. The only idea of education they now have is connected not with the literary past of their own nation, but with the new Board-trained schoolmaster and his school, which to them represent the only possible form of knowledge. They have no idea of anything outside of, or beyond, this. Hence they allow their beautiful Irish manuscripts to rot - because the schoolmaster does not read Irish....

“A friend of mine traveling in the County Clare sent me three Irish MSS. the other day, which he found the children tearing to pieces on the floor. One of these, about one hundred years old, contained a saga called the ‘Love of Dubhlacha for Mongan,’ which M. d’Arbois de Jubainville had searched the libraries of Europe for in vain. It is true that another copy of it has since been discovered, and printed and annotated with all the learning and critical acumen of two such world renowned scholars as Professor Kuno Meyer and Mr. Alfred Nutt, both of whom considered it of the highest value.... The copy thus recovered and sent to me is twice as long as that printed by Kuno Meyer, and had the copy from which he printed been lost it would be unique....

“It is a remarkable system of education, and one well worth the minutest study that can be paid it, which is able to produce these effects, but with even the smallest philological regard for the meaning of words, it cannot be called ‘education.’“

The last paragraph applied equally well to the government “education” in England, Scotland and America at the same period. The people shaping education in all these countries were soul-mates.

However, government schools achieved a particularly nice touch in Ireland: not only were they crippling reading ability as in England, Scotland and America, but they were destroying a language: Gaelic. Government schools are continuing to destroy a language today, but it is English this time, with the abandonment of the teaching of grammar and real literature. The “whole language” method in government schools is now throwing out spelling books, as well.

But the problem, as discussed, was not a nationalistic one: it was the shaping, under centralized governmental control, of the minds of the children of private citizens. The control of these centralized educational policies has consistently been in the hands of change-agents in all countries. In England, Scotland and America, therefore, the centralized educational control was resulting in damage, too - most of all to literacy and religion.
Sullivan had also written previously, Outline of the Method of Teaching in the National Model School, obviously the Irish National Model School. In the section, “Orthography,” Sullivan dispensed with the spelling book and said he wanted it replaced by dictation, which most naturally would follow the method given in another text he wrote. That text contained words likely to be misspelled, such as those of similar pronunciation, and also practical rules on spelling. He said, “Such a Text Book has since been supplied by the Author.” He claimed children without dictionaries or spelling-books would learn the meaning of words from their reading lessons (which is largely true, of course, once they know how really to read, but they were not learning how to read independently with the sight-word primer method which had replaced the spelling book for beginners). In a footnote on page 9 with the above comment, he referred to being able to distinguish the spelling of meet, mete, and meat, and said, “The sound of it is not sufficient; we must know how it looks: and this the eye will enable us to do, for, as has been well said by an American writer, ‘the eye in such cases may be said to remember.’” His quoting an American is further confirmation that the educational pond in the English language was a common one shared by English-speaking countries. Sullivan also quoted on pages 10 and 11 the Edgeworths of Ireland concerning the ridiculous practice which had been in use since the eighteenth century of having children learn the dictionary by heart, and then said (page 12):

“The following is from “Wood’s Account of the Edinburgh Sessional School....”

Sullivan’s familiarity with Wood’s school in Scotland is further proof of the shared educational waters in the English language which were being energetically stirred by activists. In the New York Public Library is a twenty-one-gun blast at that Edinburgh Sessional School, printed just about the time the school was becoming “famous,” in 1829, portions of which publication have been quoted previously. It was entitled, Letters Addressed to the Parochial Schoolmasters of Scotland, Concerning the New Method of Tuition. Containing Strictures on Professor Pillans’ “Principles of Elementary Teaching”.... “By a Schoolmaster,” Montrose and Edinburgh: 1829.

That blast came from someone who was obviously well acquainted with the school and the educational practices of the time. His persuasive, highly literate remarks were not passed from English-speaking country to English-speaking country and reprinted like Wood’s works, whom Pillans was endorsing. Instead of that, all the favorable publicity concerned Wood and those like him. Yet the Edinburgh Sessional School of the late 1820’s was as fraudulent in its claims and phony publicity as the infant school movement starting about 1818, as the Quincy movement was starting in 1875, as Progressive Education was from the 1890’s to the 1930’s, as Open Classroom was as generally practiced in the 1970’s (though it should have been otherwise), or as “Whole Language” is in the 1990’s. All of these met with sickening acceptance apparently as a result of massive publicity.

Why did the blatant error of John Wood’s school, visible to anyone who was honest enough to look it straight in the face, get such vast publicity, even way back in 1828, that it hopped a channel and an ocean, and spread from Edinburgh not just down to London but over to Ireland and across to the United States?

Sullivan quoted from Wood’s opus. The quotation is another indication that the improvement in Wood’s school was moving from “sound” to “meaning” by throwing out the syllabic spelling book, and that Professor Sullivan of the Irish government schools was endorsing that move, probably more than ten years before 1853.

The quotation from Wood read:

“In the Sessional School, the children are now taught to spell from their ordinary reading lessons, employing for this purpose both the short and the long words as they occur. Under the
former practice in the school, of selecting merely what are longer and apparently more difficult words, we very frequently found the pupils unable to spell the shorter and more common ones....

“In former times, the practice prevailed of telling a long story about every word which was spelt: thus, in spelling the word exemplification, for instance, even a child in the higher classes used to say, ‘e x, ex; e m, em. exem; p l i ple, exemple; (f) i, fe, exemplefe; c a ca, exemplefeca; t i o n, shun, exemplefecashun; six syllables, and accented on the penult syllable.’ This obviously, as a general practice, was a great waste of time, and is, we believe, almost universally exploded. In our own school, the pupil, in spelling, merely names the letters, making a marked pause at the end of each syllable....”

That “improvement” in the old method of spelling had been adopted by Andrew Bell before 1808, and he had named it “unreiterated” spelling. As mentioned earlier, Bell discussed this first “improvement” of his in The Madras School, or Elements of Tuition, London: 1808 (pages 64-77). Yet Bell’s “improvement” was not original. Dropping the “spelling” or reciting of letters in syllables apparently first appeared in France, although, as discussed, Comenius had recommended it for multi-syllable words.

Py-Poulain Delaunay in 1719 claimed that some people by that time wanted to renounce spelling. In 1755, Cherrier published a method which dropped spelling, and so did some others in later years: Viard in 1759 and Luneau de Boisjermain in 1778 and Year VI of the French Revolution. Such an “improvement” was an obvious move away from syllable “sound” and toward whole-word “meaning.”

Sullivan continued, on page 13:

“The following extract is from ‘Thayer’s Lecture on Spelling and Definitions,’ (delivered before the American Institute of Instruction)....”

Sullivan showed in a footnote that it was published “by Knight in the Schoolmaster,” additional proof of how little a barrier the Atlantic Ocean was to spreading confusions. The following quotation, however, was reasonable:

“I have said nothing of the practice, once so common, of assigning lessons in spelling and defining from the columns of a dictionary, sweeping through the whole, from the letter A to the last word under Z - if the pupil continued long enough at school to accomplish it... one of the most stupid and useless exercises ever introduced into a school....”

Thayer was referring to the obvious fact that the meaning of words could only be learned properly in the context of sentences. But it is interesting that Sullivan in the Irish National Schools was reading what Thayer had to say before the American Institute of Instruction.

In “Orthoepy, or the Correct Pronunciation of Words,” (page 82), Sullivan referred to the fact that Thomas Sheridan was the first to conceive of a pronouncing dictionary, and referred to Boswell’s biography of Johnson:

“The ANALOGIES of the language, the AUTHORITY of lexicographers, and above all, the CUSTOM of the most correct and elegant speakers, are the guides to which we must refer in all cases of difficulty. Nor can these difficulties, in every case, be resolved by such references; for we shall often find analogy opposed to analogy, authority to authority, and custom divided, even among the most elegant speakers. The following passage from “Boswell’s Life of Johnson” will serve as an illustration:
“‘Besides, sir, what entitles Sheridan to fix the pronunciation of English? If he says he will fix it after the example of the best company, why, they differ among themselves. I remember an instance: when I published the plan for my dictionary, Lord Chesterfield told me the word great should be pronounced so as to rhyme to state; and Sir William Yonge sent me word that it should be pronounced so as to rhyme to seat, and that none but an Irishman would pronounce it grait. Now here were two men of the highest rank, the one the best speaker in the House of Lords, and the other the best speaker in the House of Commons, differing entirely.’

“In this case the pronunciation of Lord Chesterfield prevailed, though opposed to analogy because he was considered the most polite speaker of his day....”

Concerning Johnson, whose greatness cannot be doubted, his behavior does suggest that the “great” are not above jealousy. Thomas Sheridan’s contribution to culture was monumental: a PRONOUNCING synthetic-phonics dictionary. Although Sullivan acknowledged the fact, Sheridan has been denied almost any credit for this contribution in any other sources that I have seen, and the fact that Sheridan was the first to have the idea has to be pried out of references by inference. (Surely, that is a very strange state of affairs.) The 1963 Encyclopedia Britannica, for instance, only refers to Lord Bute’s giving a pension to Sheridan to promote Sheridan’s scheme for a pronouncing dictionary, with no mention that Sheridan’s was to be THE first to show pronunciation directions for anything except accented syllables, and that it was a major milestone in culture. (The fact that Perry took Sheridan’s idea and produced a pronouncing dictionary ahead of him does not alter the fact that the concept itself was Sheridan’s.)

I suggest that Johnson, unlike the Encyclopedia Britannica, did realize the extent of Sheridan’s contribution. Though Sheridan had been Johnson’s supporter and friend, envy won out over friendship and may have contributed to Sheridan’s and Johnson’s eventually becoming enemies.

Professor Robert Sullivan obviously knew of Sheridan’s contribution, but except for his reference I have never seen Sheridan’s invention alluded to in any other materials except the passing reference in the Encyclopedia Britannica to Lord Bute’s granting of a pension to Sheridan to promote his scheme for a pronouncing dictionary. Sullivan also knew of Wood’s ideas. Knowledge of Sheridan’s wonderful contribution sank into oblivion, but Wood and his harmful ideas were referred to for years in writings on education on both sides of the Atlantic.

Professor Robert Sullivan was apparently a luminary in the nineteenth-century Irish government schools and his textbooks were apparently famous in the mid-nineteenth century in England and America. His book that was meant to replace spelling books, and that endorsed the “meaning” method, is one of the hosts of confirmations from both sides of the Atlantic that the promoters of the “meaning” method in teaching the reading of English were also the promoters of government schools. Yet both the “meaning” method in the teaching of beginning reading and the idea of government schools which were being promoted by such “experts” as Sullivan had not originated in the British Isles in the nineteenth century.

As has been discussed, both concepts had originated in France in the eighteenth century. In the eighteenth century, both topics, beginning reading instruction and government schools, had been of great interest to the movers-and-shakers both before and during the French Revolution. The French Revolutionists had left a copious paper trail on those topics that the English language movers-and-shakers of the nineteenth century could consult.
Chapter 45
On Charles Baker, A Particularly Disturbing Self-Confessed Change-Agent for Over Thirty Years

Concerning the use of wrong methods in connection with government-subsidized schools, it is particularly surprising to find that the idea of using the pure deaf-mute reading method for hearing children was being spread in England in the nineteenth century, with no apparent connection to Gallaudet. However, it is highly unlikely, obviously, that no connection ever existed. Angell had claimed in his 1830 primer that he had been uninfluenced by the 1826 Franklin Primer, and his claim was very unconvincing. So was Charles Baker’s claim unconvincing, given below, that he had independently arrived at the idea of using the pure deaf-mute method to teach reading to hearing children. It should be noted that Baker’s personal history may suggest that he was an activist in the teaching of reading BEFORE he worked in a school for deaf-mutes. (Note the third and fourth paragraphs of the second excerpt.)

Baker’s particularly interesting document is filed with other papers in a volume in the British Library and was stamped by the British Library July 14, 1864. The paper is titled, On Teaching Reading, - A Paper Read to the Church Schoolmasters’ Association, Doncaster, “By Charles Baker, Headmaster of the Yorkshire Institution for the Deaf and Dumb. London: William Macintosh, 24, Paternoster Row.” Its “Preface” reads:

“Several years have elapsed since this Paper was read, and printed for private circulation, - its reappearance is due only to repeated inquiries for it, which have not arisen altogether from its original circle of hearers and readers; these inquiries the author is desirous of gratifying, since the lapse of time does but confirm the view which he carried into practice thirty years ago.

“The mode of teaching reading which he then endeavoured to bring into favour has met with some adherents. These, however, are not generally to be found among Schoolmasters, nor among compilers of school-books, nor yet among the framers of the Revised Code - for Group I. is to be examined in monosyllables! while the views advocated in this paper are founded on the conviction that short words are, from their sameness of appearance, and difficulty of comprehension, a barrier to progress. Eastfield House, Doncaster, March 31st, 1864”

The fact was that his “views” had very generally been adopted by 1864, except his “view” that beginners should not be limited to monosyllables. It is of great interest that his description of how to teach reading was an almost perfect match for the way reading was actually taught in England by the 1870’s, at which time beginners were no longer limited to the monosyllables to which he objected. (Standard I in 1871 required that children be tested in texts that contained multisyllables.) Baker had apparently begun his work with the deaf about 1831. He admitted in 1864 that he had been promoting sight-words for beginners for thirty years, which presumably would have been since at least 1834. He said that others shared his aim. This corroborates the fact that the switch from “sound” to “meaning” after 1826 was the result of purposeful work by activists. Baker’s disarming claim that he and the others had not been successful in their efforts is refuted by the reading books in print in 1864, the year he published this paper.

Baker’s paper was very long and almost all of it is pertinent, but only the most important sections are quoted below. On page 4, Baker quoted a remark from an unnamed “expert” who was also quoted by Longley, as mentioned elsewhere in this history, along with the fact that the so-called “expert” was Richard Edgeworth. Baker also made it clear that his intent was to affect the method of teaching reading
in the National Schools. Furthermore, the “Church Schoolmasters Association” which he was addressing was obviously composed of the teachers in the National Schools.

“...’Reading,’ as usually taught, ‘is the most difficult of human attainments’....

“I shall divide the subject of this paper into two parts, the first, comprising my own theory and experience in the art of teaching Reading; the second, the means which I would suggest for obtaining a better style of reading in our National Schools.

“Thirty years have elapsed since my attention was first directed to this branch of instruction. I was then examining the principles of a work by Dufief on the French language; and it became quite clear to me that we learn French, in England, chiefly by remembering the phases or appearances of the words, and this was one of the principles of the work.

“Soon afterwards I became engaged in the instruction of the deaf and dumb, and one of the first observations I made was, that we kept the children six, eight, even twelve months, learning the alphabet on their fingers - learning to distinguish one letter from another - and acquiring the art of forming the letters on their slates. Not an idea was communicated to the children during this process - not even the name of a single object around them....

“...I commenced a new system - that of teaching the children words from the first day of their admission, and at the end of six months, I had the satisfaction of seeing that the children were acquainted with the name of every common object about them, and in all respects equal to pupils who had been eighteen months under instruction on the old system. I will just add, in passing, that this improvement has found its way into nearly every Institution for the deaf and dumb in the kingdom - though in every case resisted at first.

“The more I practised this course myself, the more I became satisfied that a method somewhat analogous would be applicable to teaching reading to every child - but it was working in my own mind for several years before I ventured to recommend any one to put it in practice. I was confirmed in my views by reading the works of Pestalozzi and Jacotot, and the first time I suggested such a departure from the ordinary course of teaching reading was in the case of a hearing and speaking child in Doncaster.”

Now this is, as the Scottish Schoolmaster would have said, “the veriest fudge.” Pestalozzi taught by heavy - ludicrously heavy - syllabic phonics, so that alone was a misstatement. Jacotot used massive phonic analysis.

But, more importantly, Baker had become a director of an institution for the deaf and dumb about 1831. It is inconceivable that in that position at that time he would not have heard of the Abbe de l’Epee’s methods, as refined by Sicard, which used sight words. In the previous section on French history, mention was made of a visit to Sicard’s school in the early part of the French Revolution by an Englishman concerned with the teaching of the deaf, so it is certain that knowledge of Sicard’s work had reached those concerned with teaching the deaf in England. Even outside the group of those concerned with the teaching of the deaf, other Englishmen knew of Gallaudet’s general work on education, as shown by previous citations. If Englishmen knew of Gallaudet’s work on general education, it is also highly likely that they would know of his career in teaching the deaf. It is therefore highly likely that Baker, director of a school for the deaf in England, would have heard of Sicard and his highly publicized work in France. He should also have heard of Gallaudet and his highly publicized work in America between about 1817 and 1830 in which Gallaudet used pure sight words for the deaf.
In Barnard’s American Journal of Instruction, in his 1860’s article on Gallaudet, he told of Gallaudet’s use of the pure sight-word method with a little deaf-mute girl, even BEFORE Gallaudet went to France in 1815. Baker very likely might also have heard that, by 1835, Gallaudet had written a deaf-mute-method reader for hearing children, in which he taught the alphabet only after teaching sight word. That 1835 reader, The Mother’s Primer, was widely used. Yet Baker had the unbelievable arrogance and probable dishonesty to imply that he, himself, had INVENTED the use of pure sight words for the deaf and, later, that he was the first to have promoted that approach for hearing children! He wrote:

“A lady of this town, the mother of several children, was remarking to me with regard to one of them, that she was just about to commence a task which would extend over two years - that of teaching the child to read - that she had occupied this length of time with each of her elder children, and that it was a dreary and disheartening labour. I found that she commenced in the orthodox way with A, B, C, went on with a b ab; b a b bab, b a b e, babe; and so on through all the established gradations of the time. There was no syllabic spelling at that time, [Ed.: presumably like Andrew Bell’s] no phonic system [Ed.: probably not referring to Robinson but to Shuttleworth], no “Fonetic Nuz” [Ed.: presumably Pitman’s], no “Reading Disentangled;” [Ed.: by Mrs. Favel Lee Bevan Mortimer, published by Varty] none of the inventions of later days; for, Mrs. Williams, [Ed.: who wrote Syllabic Spelling], Dr. Kay Shuttleworth now Sir James Kay Shuttleworth, Bart., the Pitmans, and Varty were alike unknown. There was nothing but alphabetic teaching with all its impediments, choking the progress as fast as progress was made.

“I asked the lady referred to whether she would have the courage to forsake the old path altogether, and to try a new one. I found that she was willing, from her past painful experience, to adopt any course I might suggest, and I desired her to begin with some interesting child’s book in a large type, such as Barbauld’s Lessons - not the Hymns, at first, as being too full of figurative language - and to read a lesson of a few lines to the child with the book open, and the child’s attention fixed on it - pointing to each word as she read the sentences - thus giving the child an interest in the matter of the lesson; then to take a single line, and to read it deliberately, the child repeating each word after her - to repeat that line over and over again, till the child knew each word by its appearance; then to add another line, and another; and to go over the whole together, for a quarter of an hour; to resume the lesson a few hours after; going again over the old ground; but adding some new sentences, and thus to proceed day by day, attentively marking the progress she made.

“I was here met with the objection, since so often raised, How will the child learn to spell? I desired that with the reading exercise writing should commence, and not the writing of letters merely, or parts of letters but of words, and not words without meaning, but the names of objects, such as pin, can, nut &c, and if accompanied with pictures of the objects, so much the better. I also pointed out how much the child would learn from analogy, even as to new words, which had in their formation, syllables, prefixes, or terminations, similar to others already taught - adding that I relied on writing, copying first, and dictation afterwards, for teaching correct spelling.”

Baker’s comment that the child was to “learn from analogy” was a reference to the use of Code 3, two-step, whole-word phony phonics. Of course, with phony phonics, the emphasis remains on “meaning.”

“I then referred her to an extract from Edgeworth’s Practical Education to which I would also draw your attention.
“As it is usually managed, it is a dreadful task indeed to learn, and if possible a more dreadful task, to teach to read; with the help of counters, and coaxing and gingerbread, or by dint of reiterated pain and terror, the names of the four-and-twenty letters of the alphabet are perhaps in the course of some weeks firmly fixed in the pupils’ memory. So much the worse, all these names will disturb him if he had common sense, and at every step must stop his progress....”

(Ed.: He quoted the Edgeworth’s 1798 book at length. The book was critical, obviously, in the shift from “sound” to “meaning.”)

“Although in these days we are much in advance of the work I have quoted, in many respects; there is much that is good yet to be drawn from it in others. But what was the result of the experiment of the lady with her child? Four months sufficed to enable the child to read any chapter in the New Testament.”

At this point alarm bells should be ringing in any experienced teacher’s head. Some rare children can make such progress, with any method. Nevertheless, when a little five or six year old can learn to read the New Testament after only four months of sight-word teaching, the achievement ranks with climbing Mount Everest.

“My next trial was of a different character to any I had hitherto directed or superintended. A friend at Portsea, who was anxious that the method should be tried with the convicts there, wrote to me for precise instructions. He supplied himself with lessons in large type, the words of which were visible at several yards distance, and operations were commenced with the lowest class of convicts - those unable to read - success attended the experiments; in a few weeks they were able to read any of the lessons set before them.”

Here he claimed that “in a few weeks” convicts learned to read with sight-words. We should remember that the vast majority of our convicts are functional or total illiterates - and virtually all of them spent years in government schools which almost uniformly teach by sight words. Yet most of our convicts not only did not learn to read with sight words “in a few weeks,” but did not learn to read after many years!

“The same course was recommended by me to other individuals, and followed with equal success.”

The truth hidden in this statement is that he continued actively to promote the sight-word method. The words “equal success,” however, are open to interpretation.

“My next experience was personal, and took place several years after. My eldest child was approaching seven years of age, the time when, in my opinion, regular instruction in reading should commence; the age, at which the mind unfolds rapidly, and requires constant direction. My success gave me confidence, and I rejected all other methods of teaching reading; successive experiments confirmed me in the plan I had adopted, and proved that a child may be taught to read better, and with less trouble to the teacher, and with less harass to itself by rejecting alphabetic teaching altogether, and without having recourse to either the Syllabic or the Phonic methods.

“About this time, I met with the following confirmation of my experience....”

Note that his oblique comments at this point did not state flatly that he had used the method with his own child. Nor did he flatly state that his own child succeeded with the method. Baker’s wording, which
had been clear and direct, had suddenly become indirect and vague. Furthermore, children in England at that time were very often taught to read at three years of age. The probability is that his seven-year-old child could already read fairly well.

However, Baker followed this comment with an undated quotation he claimed was from the American “President Lindsey’s” Lecture on Domestic Schools, in which Lindsey suggested that groups form wherever one person could read so that person could teach others. This is an obvious extension of the Bell/Lancaster ideas, as well as related to the purposes of Lord Brougham’s Society for the Diffusion of Useful Knowledge. Yet in all my historical research in education, I have never heard of the American “President Lindsey” who was apparently from Tennessee, whom Baker chose to quote. Baker had heard of this obscure Lindsey from America but never mentioned a far more famous American, Gallaudet, of whom Baker most certainly should have heard through his work with deaf-mutes. Lindsey was not identified as a teacher of the deaf, and very probably was not such a teacher. Yet, as mentioned in Chapter 22, Kentucky, next door to Tennessee, was the fourth state in America to establish a school for the deaf, in 1823, preceded by New York, Pennsylvania and Connecticut. By 1863, there were 22 American schools for the deaf, all teaching by de l’Epee’s and Gallaudet’s “meaning” methods, not by Heinicke’s “sound” approach.

Baker reported that Lindsey had said:

“Adults have been recently taught to read, in penitentiaries and elsewhere, in a very short period - even within one or two weeks, in some cases - who previously did not know a letter. The chaplain or teacher opens his Bible - directs the eye of his pupil to the first verse of the first chapter - reads it distinctly - points out each word to the learner, and makes him repeat it - and so on to the end of the verse. In a few minutes, the pupil can read the verse backwards or forwards. He now knows the words by their phases or appearance in the book.

“Many children have been taught to read in this manner, by individuals who had never heard of M. Jacotot, - and long before he was born. By him, indeed, the method with certain modifications, has been announced to the world as a grand discovery: and it constitutes the first stage in the progress of his ingenious and greatly admired system of instruction. Let every teacher, however, do what he can. Let him adapt his mode of instruction to the circumstances of his pupils. He will succeed, upon any plan, within some three or six months, in teaching his class or company to read. Were such a system to be put immediately and universally into operation in Tennessee, there would not be an individual, between the ages of six and fourscore, incapable of reading, at the end of the year throughout the State. Not a dollar is wanted for the purpose. Any books will answer. Any place will do....”

Therefore, Lindsey in Tennessee some time before about 1861 claimed children and adults could learn to read with the “whole language” sight-word approach in only three to six months and sometimes in one or two weeks! Even the “whole language” advocates today do not make such bizarre claims. After quoting Lindsey’s puzzling claims (and why did he make them?), Baker continued:

“I personally superintended the next attempt thus to teach Adults to read; it was made at Millbank Penitentiary. Myself and two friends were received by the chaplain, the schoolmasters, and several officers and three classes of convicts were taken in succession....”

So, Baker and “two friends” went to the trouble to introduce the sight-word method to the prison: more activism.
“...but with the lowest class, consisting of about twenty, brought forward for the occasion, I was deeply interested. They might be called the very subsidence of society, and they were selected that morning by the schoolmasters present, for their utter inability to read. We took a large type lesson* containing about fifty words, and commenced by reading the whole of it, the lesson was placed before them, and their attention was directed to it; each sentence was then read, and the men were called upon, first simultaneously, then individually to read it after the teacher. Every sentence was read and understood. Questions on the sense of the lesson were asked and answered correctly, except in one or two instances; and with the exception of one youth, and he of very low intellect, every word in the lesson was pointed out by everyone in the class, as it was called for, unconnectedly, and every word read, connectedly; the only occasional stumbles in the course of the lesson being with the small words such as no, as, so, upon, unto &c. This was a very satisfactory experiment to me, as it proved in how very short a time adults might be taught to read; and I remember one strong impression that my mind received at the time, connected with Sunday Schools. I had shortly before visited one, where two-thirds of the pupils were engaged in spelling lessons, while on this plan each child might have carried away in the precious hour devoted to instruction, both in words and meaning a living lesson from our Saviour’s life, instead of dead letters, acquired only to be forgotten before another Sunday.”

*“One of Mimpriss’s Gallery Lessons on the Gospels.”

Baker’s “piety” was undoubtedly a good selling point with his gullible audience.

Baker mentioned at this point that he was able to appoint a schoolmaster to replace one at the prison (to the great misfortune of the convicts). Baker’s activism in this instance also should be noted.

Next Baker claimed he taught a gentleman’s eldest son “Willy” who had tried to learn to read for two years with no success. However, with Baker’s inspired sight-word teaching, Willy was a good reader in only a few weeks. What IS wrong with all our present-day “Willys” taking reading remediation that they cannot read after only a few weeks’ instruction in sight words?

Baker finally commented that his sight-word inspiration was not totally unique, and gave a bow to others doing similar work. Yet Baker continued to ignore Gallaudet and the fact that the method Baker was promoting was based on de l’Epee’s deaf-mute method of pure sight words learned as “wholes” for meaning:

“It is no little satisfaction to me that I am not here to-day under the disadvantage of advocating a new thing. You have seen that Jacotot, the Edgeworths, Dufief, and President Lindsey have all been before me - some in principles - others in their application. Whether what I have said, or may yet say, is accepted or rejected by your verdict, I feel confident that all who are present must (go) with me to a great extent.

“You know that we do not spell words to little children when we are teaching them to speak, and that we endeavour to make them understand, not by selecting the shortest words, but words of simple meaning, whether they are long or short.

“You are aware that for the same reason that we do not speak to little children in monosyllables, we do not divide polysyllables, pausing in their utterance, in order that each syllable may be better understood....”
Here Baker even rejected Andrew Bell’s already watered-down approach of pausing between syllables when learning to read new words. Instead, Baker endorsed a total shift from “sound” to “meaning.” He continued:

“I must now say a few words on the mode of teaching reading which experience has led me to adopt and to advocate. Convinced that its general acceptance would be a public advantage, I have done all in my power to make it known especially by means of the little works of which I claim the parentage. In several of them I have made a few observations on this subject. I will read from the preface of ‘Reading without Spelling.’“

Here Baker acknowledged he had been doing all in his power to promote the pure Code 1 sight-word method, and that he had written books on the topic.

Baker’s directions for teaching a reading lesson were also very like those given in the 1870’s and 1880’s by the Cassell company and by T. J. Livesey, Master of Method, and Lecturer on School Management, Training College, Hammersmith. Baker said that the teacher should begin by first reading a sentence to the class, pointing to all the words. After the teacher had read the sentence, then the pupils could imitate the teacher. Yet there was, of course, nothing new in that. It had been followed since the 1820’s, and its original excuse for existing was that it was supposed to aid pronunciation. Baker also said that approach would help pronunciation. Yet it is evident the pupils were only parroting, not reading. Baker said:

“By this course of proceeding it will generally be found that the pupil will read the entire lesson with ease... Writing from dictation will be sufficient spelling exercise, first the words, then sentences, then whole lessons....

“There are some excellent directions for reading, gathered from a variety of sources, in the introductory portion of Sullivan’s Literary Class Book. Enough, I do not hesitate to say, for every schoolmaster, and saving the necessity of reference to more expensive works. Of this book I think every schoolmaster should have a copy if only for the first 50 pages....”

The Sullivan who wrote Sullivan’s Literary Class Book is probably Professor Robert Sullivan who wrote The Spelling-Book Superseded which has already been discussed. He also wrote several general textbooks on the 1848 English list of government-approved textbooks. That English list had also included the atrocious but massively used Code 1 to Code 3 Irish Readers from the Irish government schools. Any “directions for reading” given by Professor Robert Sullivan, who was associated with the Irish government schools, undoubtedly fitted right in with the Code 1 to Code 3 Irish Readers which had been written for the Irish government schools. Furthermore. Sullivan had made a point of praising John Wood in Edinburgh, Scotland, who was using a Code 1 approach to teach beginning reading. These activists, such as Baker, Wood, Sullivan and others in the British Isles, and Gallaudet, the Alcotts and others in America, all appear to have been cut from the same piece of cloth. It is certain that their writings dovetail to an astonishing degree.

On page 18, Baker wrote:

“The writer of two articles communicated to Dr. Forbes Winslow’s Journal of Psychological Medicine takes up this subject on different grounds, and arrives at the same results. He considers that a very large proportion of the stupidity now existing in the world is artificial and the direct result of educational influence.”
As discussed elsewhere, that is just what Dugald Stewart of John Wood’s Edinburgh had thought. Baker continued concerning the articles to which he referred by an anonymous author:

“- After touching on many other points of great interest, he examines the prevailing mode of teaching reading and spelling. He says: -

“It is commonly supposed that the visual organ must analyze each word into its component parts or letters, and that adult readers are constantly deciphering the page in this way, although habits may render them unconscious of the operation, and able to perform it with great rapidity. With this view I can by no means coincide, believing that all words, not of extraordinary length, are perceived as distinct objects, without any necessity for analysis, but as a subject is recognized at a distance, not by any observed combination of several peculiarities but by the tout ensemble with which we are acquainted. Indeed, to those who read daily, common words are more familiar objects than detached letters; and it is a well-known fact that persons, who are doubtful about a question of spelling, will often write down both the alternatives... so as to see, by comparison, what arrangement will produce the accustomed appearance....”

Note the description of “global” sight words by a French term, “tout ensemble.” Did the writer of that article use French sources? Was his original source possibly “Dufief” to whom Baker had referred? However, the excerpt from that unnamed writer anticipated Cattell’s ideas between 1883 and 1886 but was written some time before 1864.

Baker’s next comment was bizarre, and anti-sound. Baker said because of many variable vowel sounds, the knowledge of letters when reading could actually be hurtful! He continued:

“The educational periodicals have occasionally referred to the subject of teaching reading during the last few years, but none of them have grappled with the entire subject, simple as it may seem to those who have read this Paper. In the monthly Paper of the National Society for December, 1862, we read as follows -

“We do not proceed wisely in presenting the alphabet to the child in the commencement of its reading studies, because the alphabet is a collection of abstract signs... but if you place a picture of a horse or cow &c. before the child, or give the words “horse” “cow” &c. as representative of the picture of a real animal, the child will immediately associate the picture, and next the word or signs, with its previous and more perfect impressions. Therefore a short picturesque sentence should be selected to teach the child as a first reading or alphabetic lesson (and then the letters)....”

Note the endorsement by an unnamed author in English of a “sentence” method in December, 1862, recalling Dr. Keagy’s similar comments in 1826, which have been quoted previously. Baker continued on page 22:

“One of the most successful schoolmasters in Nottingham, Mr. George Herbert, of University School, recently delivered a lecture to the Schoolmasters’ Association of that town and county, in which he advocated the principle of teaching reading which is described in this paper. He referred to several instances which had come under his notice, in which children from five to six years of age, taught upon the plan he recommended - by words instead of letters , - in lessons of fifteen minutes a day, had learned to read well, two in thirty, two in fifty, and in three cases in sixty hours.
“Unfortunately, however, the Revised Code steps in, and not content with prescribing what rate of payment shall be made for certain Results, but also the manner in which those results shall be achieved - for its says Group I. shall read a ‘narrative in monosyllables’ it is clear then that the robin, the sparrow, the squirrel, the cabbages, carrots, potatoes, the shoemaker and other familiar objects, the lion, the tiger, the elephant, and such well-known pictures must not enter into the lessons of Group I., but that words, which are so obscure, that many volumes have been written to illustrate and elucidate their office, force, and meaning, may form the stock from which the lessons for the little ones are to be drawn.

“A writer in The Museum for January, 1864, makes some sensible remarks on the subject in an article entitled, “Reading and Spelling.”

The writer of The Museum article had recommended conversation with the class before introducing reading instruction. Although he mentioned the alphabetic and phonic method, he endorsed the use of tablet lessons (sheets of paper with printed words) put in front of the class, which the teacher was to read first, so that the children could mimic her. This is the exact approach which was used in many readers of the 1870’s, and, of course, was the apparent method used to teach Mrs. Mortimer’s Reading Disentangled, which was composed of such sheets of sight-word paragraphs, with Code 3 two-step phony phonics lessons on the side.

Baker continued on page 25:

“Spelling is best acquired by copying... and... dictation. The late James Simpson, Esq., of Edinburgh, whose life was devoted to practical improvements in every department of education, writing on this subject to the author of this pamphlet, says, ‘He much likes the teaching of reading by entire words instead of syllabic analysis. He was always hostile to vocal spelling. We spell only when we write. He would like to know how the entire word system answers after long trial?’

So “James Simpson, Esq., of Edinburgh” whose “life was devoted to practical improvements” in education, endorsed “meaning” over “sound” in teaching beginning reading. He also knew about 1864 that the “word system” had had a “long trial,” and knew Baker was the man to ask about its progress. Baker was saving for his Grande Finale his most outrageous statement in his answer to Simpson’s inquiry:

“To this inquiry, which has been frequently made since the subject has been canvassed, it may safely be replied that a single failure of it has never been reported - while many who have had the courage to renounce their old habits and prejudices, are ready to attest its value.”

So Baker claimed in 1864 to have promoted for over thirty years a fail-proof method of teaching reading. He had said before this that, during this period of more than thirty years, he had done “all in my power to make it known.” Now he said “a single failure... has never been reported.” Yet the method was only the same pure Code 1 sight-word approach which has resulted in massive reading failures and produced “reading remediation” classes in every benighted country in the Western World which has used it.

Baker’s words, “... it may safely be replied that a single failure of it has never been reported,” certainly lend themselves to paraphrase: “It may safely be replied that Baker was lying.”
Chapter 46
New Reading Texts Appeared, to Meet New Testing “Standards” and to Conform to Current “Expert” Philosophy

British publishers of reading texts after 1862 freely admitted that they constructed those reading books to match the government Standards which first appeared in 1862. The testing Standards were arranged in levels of difficulty. Children were tested at the first level on texts of one-syllable words, and at the higher levels on increasingly difficult texts composed of multi-syllable words. The new textbooks matched those levels of the testing Standards.

More reading series came on the market after the “approved” list of textbooks was dropped in 1862. That was the same year that the testing Standards were adopted, with their various levels of difficulty. The number of reading series then greatly increased after the arrival of government schools in 1870, because government schools had more money to spend on such things as textbooks than the church-affiliated schools did.

Not long after 1870, the new government schools crowded out many of the partially government-subsidized church schools because the purely government schools were given considerably more tax money. The church schools sorely needed but did not get sufficient tax money to up-grade their facilities to meet the newly-imposed government requirements. In his book, Ellis said that many church schools simply collapsed after 1870 because of the new government demands which they were unable to meet. The government subsidy carrot for which the church schools had originally given up their liberty turned out in the end to have been poisoned.

Pamela Horn wrote (page 27 of her book) the following concerning the quality of the new reading textbooks. She said that in 1876 one of the inspectors remarked that, although:

“...there are three or four very good series, there are many others altogether inferior, ... announcing that no child who reads them can possibly fail....”

Yet the new reading textbooks were not only written to conform to the new testing “Standards” but to “expert” philosophy in the teaching of reading, as described in the following chapter on the “expert,” Livesey, and the previous chapter on the activist, Charles Baker. “Expert” reading methods also appeared in books which were not meant to be used in schools. The influence of such “experts” became truly pervasive.

Some texts which were probably more expensive than school primers were the “reading-made-easy” books which were popular in England in the mid-nineteenth century. Their “stories” were arranged by word-length - first two-letter word paragraphs, then three-letter-word paragraphs, and so on. This “reading-made-easy” element of word length, which had been used by John Wood in the materials for his famous Edinburgh school in the late 1820’s (and which actually dated back to Dilworth’s 1740 spelling book), was implicitly adopted in the government testing Standards of 1862, and in the reading texts written to conform to those Standards. That is because the lowest testing Standard was limited to one-syllable words, and one-syllable words can easily be arranged by letter-length. It was the practice of controlling the use of words by the number of syllables in words, which is necessary in the “reading-made-easy” approach, about which Charles Baker particularly complained about 1863. Baker wanted straight sight-words used, but without introducing words according to their numbers of letters or syllables.
Andrew Tuer surmised that “reading-made-easies” may have originated in the eighteenth century. Certainly the title did, and variations on those words occur on spelling books even in the seventeenth century. However, it is clear from R. C. Alston’s A Bibliography of the English Language from the Invention of Printing to the Year 1800, Volume IV, Spelling Books, “Printed for the Author by Ernest Cummins, Bradford, England, 1969,” that eighteenth-century books with similar titles were simply spelling books, not reading books like the mid-nineteenth century materials. W. Rusher’s unlocatable 1789 Reading Made Most Easy, referred to by Tuer, most probably was also a spelling book. Certainly Alston concluded that Rusher’s 1789 text must have been a speller, because he included it in his Volume IV, Spelling Books.

Some of the “reading-made-easy” titles before 1801 which Alston included in his listing of spelling books are shown below. Alston’s listing indicates that the “reading-made-easy” books before 1801 were not sight-word primers, even though by the mid-nineteenth century they had become sight-word primers. For those copies listed below that he was able to examine, he concluded that each was a spelling book. (Capitals have been added to titles where Alston did not show them.)

No. 875 Anonymous. The New Reading Made Easy; or an Introduction to the Reading of the Holy Bible.... New edition, London, H. Goldney, 1790. Alston said that no earlier editions had been located.

No. 876. Williams, Jeremiah. The Newest Reading Made Completely Easy: or, an Introduction to Reading the Holy Bible.... Thirty-sixth Edition; Coventry, M. Luckman, and sold by G. Robinson & P. Oriel, London. Printed around 1790, but Alston said that no earlier editions had been located.

No. 930 Babcock, Elisha. The Child’s Spelling Book: Calculated to Render Reading Completely Easy to Little Children;... Compiled by a Printer. Hartford, John Babcock, 1798.

No. 955 Hewetson, Isaac. Reading Made Easy; or a Step in the Ladder to Learning.... Penrith, Anthony Soulby. Alston listed it as possibly published in 1800.

From the Scottish Schoolmaster’s statements quoted earlier, it is evident the “reading-made-easy” books before 1828 of which he knew were spellers that began with the syllable tables and then arranged word lists and reading selections solely by their length: first two-letter words, then three-letter words, and so on, working up finally to two-syllable and three-syllable words. Arranging words not only by the numbers of syllables but by the number of letters in one-syllable words apparently had become the “reading-made-easy” element before the nineteenth century.

Introducing words in spelling books according to the number of syllables in those words was a very old practice, having appeared in the New England Primer and elsewhere for many years. Coote’s speller
in the late sixteenth century had also introduced his meaningless lists of syllable patterns at the beginning of his speller according to the numbers of letters in those meaningless syllable patterns. That, of course, did not represent a shift from “sound” to “meaning,” even though it involved counting letters.

However, the practice of introducing one-syllable meaning-bearing WHOLE words, NOT JUST SYLLABLE PATTERNS, by the number of letters in those whole words, was first announced by Thomas Dilworth as an “improvement” in his famous 1740 speller, as discussed elsewhere. That was a clear shift from “sound” to “meaning,” even though it was probably inspired by Coote’s speller. Dilworth’s foolish invention, underemphasizing “sound” in favor of visual memory, must rapidly have spread, appearing in Newbery’s books and elsewhere.

Alston listed the following spelling book as early as 1746. That was only six years after Dilworth’s speller appeared which was the first to arrange one-syllable meaning-bearing words by their length:

“Weald, William, Reading Made Easy, London 1746.... There were clearly a large number of editions between 1746 and 1850 but I have only been able to trace one complete text, a reprint entitled Weald’s Lessons Improved, Scarbro, 1847....”

Note the date, 1746, and the use of the words, “reading made easy.” Weald’s was a spelling book, and very possibly one of the first with its one-syllable word lists arranged, like Dilworth’s, by letter length, but in association with the words, “Reading Made Easy,” which words had been used in various combinations since the seventeenth century. The Scottish Schoolmaster had clearly identified one-syllable word-length as the “reading made easy” element by 1829, and very possibly it was first identified as the “reading made easy” element in Weald’s 1746 speller.

But by the mid-nineteenth century, the “reading-made-easy” had crossed totally from “sound” to “meaning.” “Sound” syllable tables and word lists which could be arranged by “sound” analogies had disappeared. Only “meaningful” stories remained, in which word identification was “helped” by context guessing. The stories appeared in the order of word length: first paragraph composed of two-letter one-syllable words, then paragraphs composed of three-letter one-syllable words, and so on.

Edinburgh, Scotland, had produced the “expert,” John Wood, by 1826, who became famous all over the English-speaking world in three years or less (which fame powerfully suggests that John Wood was being packaged and sold by influential people). Edinburgh was still producing “experts” to promote sight-word reading in the period 1850-1870. Ellis quoted James Currie of the Church of Scotland Training College at Edinburgh. The college was the probable successor to Wood’s Sessional School since Wood’s Edinburgh school was to be turned into a training college in the late 1830’s, as mentioned elsewhere in this history.

James Currie had obviously been a highly respected authority in the period after 1850. His name showed up, for instance, in one of the lead quotations in the article, “Reading,” on page 304 of Sonnenschein’s Cyclopedia of Education, Syracuse, New York: C. W. Bardeen, Publisher, and London, England: Swan Sonnenschein & Co., 1889. (The other quotation was by the famous Scot psychologist, Alexander Bain.) Currie defined reading as “learning to recognize in written signs words which are already familiar to the learner in spoken language.” That leaves no possibility for building vocabulary through reading! However, Bain’s definition was that reading “is the art of pronouncing words at sight of their visual characters,” which was considerably better.

Ellis said of Currie (page 52):
“Dr. Currie considered that it was necessary for the contents of the books to be graduated in order to afford the children sufficient practice in each stage of their progress.... He advocated the use of “Look and Say” which he thought was free from the objections raised against phonics....”

Baker had openly claimed great success with “Look and Say” and Currie implicitly claimed success. Ellis said (page 48):

“James Currie, the Principal of the Church of Scotland Training College at Edinburgh, suggested standards of attainment which should be reached by children at elementary school. On leaving a good infants’ school at the age of 7 years, a child should be able to read with fluency easy narratives and the simpler parts of the Bible, and having progressed further should be capable of reading accounts in newspapers, either silently or orally....”

Currie was giving the kind of achievement standards for the teaching of reading that had been the norm in the days of the Scottish Schoolmaster some thirty or so years earlier, before 1829, which middle-aged Scots would still assume were only natural. For Currie to admit the kind of disabilities that the sight-word method was actually producing in children would have provoked a public reaction. Yet it is flatly impossible that children would have been able to read as well as Currie said they could read if they had been taught with the sight-word method that Currie endorsed.

Anywhere in the English-speaking world today, test the oral reading of seven-year-olds with “easy narratives and the simpler parts of the Bible,” if they have been trained with sight words and phony phonics, and assuming they have not previously been drilled on reading aloud those same materials. Then count the massive errors and the stumbling with the “best” readers. In no way can that kind of performance be called “reading.” The weaker readers will probably just mumble occasional words and then stare blankly at the page in front of them. It was NO accident that group oral reading tests disappeared in America when the sight-word method started its come-back in America in the 1920’s.

Note that Currie agreed with most “experts” of the twentieth century that a series of readers were “necessary” for children learning to read in order to match “each stage of their progress.” Yet the Scottish Schoolmaster had said:

“Between the age of five and eight, a child may be taught to read, with fluency, any of our best authors in prose or in verse....”

The Scottish Schoolmaster, after his thirty years of teaching little children to read, was aware of no “stages” in the progress of children to reading fluency, which “stages” would require books to match each “stage.”

Actually, these staged books were how the reading failures were covered up, and how the reading failures are covered up today. Children are supposed to be reading “at their grade level,” but there is no such thing as a grade level if children have really been taught how to read.

After “meaning” displaced “sound” in the teaching of beginning reading after about 1830, children simply memorized their reading books at their “reading level” by chanting them orally in school (although the “chanting” practice went out with the nineteenth century). Children were then judged on their “achievement” by how well they could recite their memorized “readers.” The same appalling practice was followed in America in the nineteenth century.

“Learning by rote was the usual method adopted, and the standards set were not very high. Anyone passing a school at this period would hear the monotonous sing-song chanting of children’s voices as they repeated the sentences learned off by heart:

‘Ann is ill

Take a pill’ 112

and so on.”

Her “112” citation was “Sybil Marshall - Fenland Chronicle (1967)” which was obviously based on an historical document. Note that the seeming “phonics” in the chanting is only phony phonics. It is consonant substitution on a learned word: ill, pill, and is used in context with what is probably a sight-word: “take.”

That “chanting” of a text which had first been read aloud by the teacher was around for a very long time and was permitted to pass for reading. The original excuse for it was that it taught proper “pronunciation” and “expression,” since before 1826 it had actually been used in the upper grades to teach elocution, apparently primarily in Scotland. (Its heavy emphasis in Scotland may well have been because a heavy Scottish accent could hamper children, when they became adults, in their dealings with the English.) Elsewhere in this history, the text by Livesey outlines the steps in “teaching” that produced such chanting.

Ellis reported in his chapter, “School Books and Literacy 1870 - 1902” (page 97) comments on the publisher, Jarrold, which appear to concern the 1890’s. Ellis’s comments confirm such “chanting” after 1870, when the London School Board was formed, and probably as late as the 1890’s:

“Jarrold the publisher issued a set of Empire Readers which were adopted by the London School Board and met most of the suggestions made by inspectors. The series reduced the difficulties of beginners to a minimum by the use of large clear type, and by confining the attention to words of similar sounds and combinations of letters in the books for younger children. A careful graduation [sic] of lessons ensured continuous progress, and a large number of dialogues served to produce natural and easy reading in place of monotonous chanting....”

Besides the assumption that “chanting” had been the previous norm in “reading instruction,” note the “words of similar sounds and combinations of letters in the books for younger children.” That is “phony phonics.”

“Trends” show up best in minor publications, which base their content on the way the marketing wind in publishing is blowing. One such primer is First Series - Educational Course. The Primer, by The Rev. W. L. Nelson, Dean & Son, Ludgate Hill, London. The British Library copy is stamped 2 February 1871, so presumably was published about that time. Its title page said Nelson was “Head Master of St. Stephen’s School, Edinburgh,” and that the book was “Embellished with upwards of One Hundred and Fifty Engravings of Familiar Objects.”

First appeared the alphabet in capitals. On page 5 appeared the lower case alphabet, a picture of cat, and mottos top and bottom and on other pages: “Careful habits produce good results. Diligence produces its own reward.” The mottos were in small print, presumably to be read by the master.
After the lower case alphabet appeared four pages with a “Picture Alphabet of Well-known Objects: “e” e-le-phant, “f” flag, etc.

Page 10 had the alphabet in regular and in mixed order.

Page 11 had pictures of animals, with their names underneath.

Page 12 gave the short vowel closed syllabary and some names.

Page 13 had pictures and words: ta ble easy chair fire place.

Page 14 had the long vowel open syllabary followed by some words.

Page 15 had pictures and phrases: a loaf of bread, sow - ing corn, wa- gon

Page 16 had phrases of two letter words.

Page 17 had pictures and words: birds lin net spar row

Page 18 had two letter words and phrases.

Page 19 had pictures and words: car ri age, ex press train...

Page 22 had two and three letter words and sentences.

The pictures were always arranged on opposite pages by themes: seed - ing, chick - ens, shep herd. Some words were arranged by analogy on later pages.

By page 30 it introduced three letter blends: bla ble bli, etc.

The book ended on page 40. It was a poor blend of some of the earlier spelling book and some of the new “book one” approach. Only because of its syllabary and blends, it rated possibly as high as Code 5.

A series which was published in 1871 or 1872 had only the Standard VI copy available at the British Library, but that has material of interest. The inside of its cover read: The School Board Readers. “A New Series of Standard Reading Books for Elementary Schools. Edited by a former inspector of schools.”

“The Editor of these Books being a gentleman of great experience, the Publishers not only await with confidence the judgment of Teachers as to their excellence, but they challenge comparison with any existing Series of Readers, more particularly as they are framed exactly to meet the requirements of the New Code of 1871, having been compiled since its adoption.

“The distinctive features of this Series are as follows: -

“1. That each book contains within itself all that is necessary to fulfil (sic) the requirements of the New Code, 1871; that is to say, a Course of Graduated Reading Lessons, Spelling and Dictation Exercises, and sufficient Examples in Arithmetic for home lessons for the whole year.

“2. That they are designed expressly for Schools under School Boards, as they contain no distinctly denominational teaching.
“3. That Illustrations are introduced where they are considered necessary.

“4. That, in addition to their exactly meeting the requirements of the New Elementary Schools, the lowness of their price cannot fail to recommend them.

“5. That the Type, Paper, and Binding will be found all that can be desired.

“THE PRICES ARE AS FOLLOWS: -

“ELEMENTARY READING BOOK, Part I., containing lessons in all the short vowel sounds.
Demy 18 mo., 16 pages, in stiff wrapper. 0 l s. d.

“ELEMENTARY READING BOOK, PART II., containing the long vowel sounds, and other monosyllables.
Demy 18 mo., 48 pages, in stiff wrapper. Price 0 2

“STANDARD I., containing Reading, Dictation, and Arithmetic.
Demy 18 mo., 96 pp., neat cloth, price 0 4

“STANDARD II., containing Reading, Dictation and Arithmetic.
Demy 18 mo., 128 pp., neat cloth, price 0 6

“STANDARD III., containing Reading, Dictation and Arithmetic.
Fcap. 8 vo., 160 pp., neat cloth, price 0 9

“STANDARD IV., containing Reading, Dictation and Arithmetic.
Fcap. 8 vo., 192 pp., neat cloth, price 1 0

“STANDARD V., containing Reading, Dictation and Arithmetic.
Crown 8 vo., 256 pp., neat cloth, price 1 6

“STANDARD VI., containing Reading, Dictation and Arithmetic, and Lessons on Scientific Subjects.
Crown 8 vo., 320 pp., neat cloth, price 2 0

“To be followed by a Series of ELEMENTARY MANUALS on the Special Subjects of the Revised Code.

“CHARLES GRIFFIN & CO., 10, Stationers’ Hall Court, London”

The Preface on the Standard VI book read:

“This book is intended as a higher Reading-book, either for the First Class in the School or for Pupil-teachers....

“REQUIREMENTS OF THE NEW CODE, 1871 [Ed.: for Standard VI]

“Reading. - To read with fluency and expression.
“Writing. - A short theme or letter, or an easy paraphrase.

“Arithmetic. - Proportion, Vulgar Fractions, and Decimals.”

The Griffin & Co. books demonstrated the undeniable fact that in England by 1871 both teachers and texts were under the straitjacket control of the government tests. Those “thorough and efficient” tests which had arrived in 1862 had abolished by 1871 any lingering academic freedom in the government-controlled schools!

Ellis said (page 91):

“The terms of the Forster Act of 1870 resulted in a vast increase in the publication of school books.... In 1875 William Collins II purchased the Scottish School Book Association for which he had been agent, for in the face of expansion the existing arrangements became unwieldy. 920 school books were listed in the catalogue for 1875 compared with 571 10 years earlier....

“In 1879 Blackie’s Comprehensive Readers were the first of what was to be a wide selection of school books in arithmetic, geography, grammar and history. School editions of the classics were issued in the same year. Other publishers who were involved in the publication of school books were Bell, Blackwood, Cassell, Chambers, Constable, Gleig, Lockwood, Longman, Macmillan, Nelson, Rivington, Seeley, and Warne.”

A series he did not mention was Moffatt’s. On page 92, he gave further information on these publishers, who put out:

“...more than one series of readers such as Blackie’s Advanced Readers, Elementary Text Books, and School Series; Cassell’s Modern School Readers and School Board Series, and Chambers’s Educational Course and English Readers. Each publisher was not necessarily issuing new books continually, for example, no works in Gleig’s School Series were published between 1872 and 1880. Inspectors expressed particular satisfaction with Bell’s Readers, and Nelson’s Royal School Readers, the latter of which were ‘more extensively used than any others’ in many areas.”

The British Library has a copy of a January, 1877, issue of The School - A Monthly Journal Illustrated, of Edinburgh. Its publishers stated on page 24:

“To meet the demands of school boards and country trade, the school books of Nelson, Longmans, Murray, Collins, Blackwood, Chambers, Oliver and Boyd, and others may be supplied on a short notice.”

The names of Nelson and Collins appear on both lists, the list of publishers named by Ellis, who was emphasizing English use, and the Scottish list from 1877. The Scottish list implicitly suggests the series it listed were the ones in widest use in Scotland in 1877. Not surprisingly, the record shows that Nelson, Collins, and Oliver and Boyd were Scottish publishers, and so may have been some of the others, and the omission of some of the English publishers mentioned by Ellis might have been expected. However, for many years, both Nelson and Collins had vast sales of their reading series in both countries, so their reading books may be cited as a kind of norm for the period in which they were published - Collins for the earlier period, and Nelson for the later.
Ellis had said, as quoted above, concerning the period after 1870 (page 92):

“Inspectors expressed particular satisfaction with Bell’s Readers, and Nelson’s Royal School Readers, the latter of which were ‘more extensively used than any others’ in many areas.”

The two publishers whose readers have most consistently turned up in available references, therefore, are Nelson and Collins (whose Irish Readers have already been described), although Collins’ books seem to have faded after 1870 when Nelson became more prominent. Yet at no time was there any market monopoly, which is an unspoken commentary on how ludicrous the McGuffey market-monopoly myth is in America.

The Nelson Reading Series

Concerning Nelson’s, Ellis said on page 65 of his Chapter 8, “The Golden Years of Children’s Literature Part I 1860-1890”:

“The commercial success of Nelson was achieved through the publication of books for children... In the 1870’s the house of Thomas Nelson was the largest publisher of juvenile literature.”

A brochure on the history of the Nelson publishing company which the Nelson company published recently contains these comments:

“(in 1858)... the firm became known as Thomas Nelson and Sons. Since July 1852 (the sons) had been in sole control of the business, their father having been forced to retire through ill health. The educational department went on to build up its list of publications....

“Thomas Nelson, the founder, in his last years an invalid, died in Edinburgh on 23 March 1861. He had the great satisfaction of seeing the small business which he started as a second-hand bookshop develop into an organization giving work to almost 600 people. His vision of producing good reading for the masses had been fulfilled.”

Note here that Nelson, the founder, had expected the “masses” of adults before 1861 to want good reading, and his “educational department” for children was only one part of his successful company. In 1861 when he died most of the “masses” still could really read.

“...there took place a dramatic change in the law, which was to have a long-lasting effect on the educational publishing industry and on Nelson’s in particular. On the passing of the English Education Act in 1870, to be followed shortly by a similar Act for Scotland, the Nelsons were quick to recognize the new demand that would be created for improved school-books. They resolved at once to meet this challenge. With the help of W. Scott-Dalgleish as editor, Thomas Nelson junior launched the “Royal Readers.” These not only proved highly successful, but set a standard which was to be imitated by many other publishing houses. The “Readers” were supplemented by books on history, geography, English language and literature, all written to meet the requirements of the new Act. The school-book department now formed the backbone of the business.”

The quality of the Nelson materials undoubtedly did set a publishing standard concerning the appearance of books. Their nineteenth century readers are, indeed, superior publications in their publishing format. Furthermore, the readers above the primer level are comparable in the quality of their content to the best of readers, such as the higher books in the American McGuffey series. Yet the Nelson
“Royal Readers” of 1870 certainly did NOT set the standard in how to teach beginning reading. In the teaching of beginning reading, the Royal Readers simply followed the pattern which had become dominant by 1870 and which was endorsed in the teachers’ colleges: teaching beginning reading by “meaning,” and not by “sound.” The “phonics” that was endorsed in teachers’ colleges was phony phonics: building new “whole words” from old “whole words” that had been taught by sight. “New” words were produced by adding or substituting letters on previously memorized “old” words (Code 3). It would be many years later before the Nelson company, like other publishers in England such as Blackie’s, would produce truly phonic materials (Code 10), again not setting a standard but only responding to the demands of schools. Hardly surprisingly, these later materials also were of very high publishing quality.

Yet the Nelson company had apparently been following current practices in the teaching of reading before their 1870 materials. Listed on page 71 of Early American Textbooks - 1775-1900, published by the U. S. Department of Education, Washington, D. C., 1985, is “The Little Reading Book in Words of One Syllable. London, Edinburgh, and New York. T. Nelson and Sons, 1868. 32 p.” The size of that book suggests it was a primer, or beginning book, and the fact it was arranged “in words of one syllable” suggests it was a sight-word book. Therefore, even before its 1870 sight-word beginner’s text, the Nelson company was preparing sight-word readers, like most other publishers.

The Nelson brochure noted that some time after 1880:

“The ‘Royal’ school series now consisted of 70 titles, and, in addition to other school texts and Sunday school reward books and cards, there was a comprehensive catalogue of books for the drawing room and home reading, books on travel and natural history and tales for the young. These were to remain the staple products of the firm until the early 1890’s.”

Amidst all these high-quality materials, the Nelson company probably did not pay very much attention to its little light-blue book, only covered with a paper cover, perhaps about four by six inches, which was entitled Nelson School Series, The Royal School Primer. Illustrated., T. Nelson and Sons., London, Edinburgh, and New York. (The British Library copy which I saw had the catalog number 12202 cc 3 107, and was stamped on its back cover, “July 12, 1872.”) Nelson’s did not know that this little, flimsy publication was destroying a good part of its future markets for books, because it guaranteed that the “masses” for whom Nelson senior had published would have considerable trouble in the future with the ability to read. The Royal School Primer would turn children into inefficient “subjective” “meaning” readers instead of into efficient “objective” “sound” readers, and, in addition, it could produce bumper crops of “functional illiterates.”

Inside its cover, it advertised:

“The Royal Primer Wall-sheets. For class teaching, the large type lessons in this book, with pictures, have been published in a large form, as Wall-sheets for the School-room.”

It then gave the following “Hints to Teachers”:

“I. Teach the child to read the words at sight on the Wall-sheets, without spelling them.

“In English, spelling is frequently of no use in helping a child to read; for example, the pronunciation of the most common words such as one, two, does, who, &c. cannot possibly by learnt from the spelling. In reading lessons, all such words must be taught each as a whole.

“Spelling is of use, not so much for reading as for writing; and it is therefore of the utmost importance that slate exercises should be introduced as early as possible. For this purpose, the
simplest possible form of character has been adopted in this book, as a first step toward writing. See note on print-writing - page 2.

“2. Make constant references to the Wall-sheets; and always point to the parts of the animals and other objects as they are mentioned in the lesson.

“The principle of association comes into powerful play here. The picture suggests the whole story, and the parts of the picture suggest the words used in telling the story. We have abandoned the plan of forcing into the Primer all the possible sounds of the vowels and consonants. On that plan the child is made to utter a great many sounds which it has no occasion to use; to learn a great many words which it cannot understand; and often to wade through pages of tiresome repetition, and even of pure nonsense. We have used the child’s own vocabulary. We have simply told a story of each picture as the child might tell it, using no words which a child is not itself in the habit of using daily.”

The first page gave the alphabet in small and capital letters, followed by this further advice, but no mention of teaching the alphabet:

“To Teachers - This book has been arranged in two parts - Reading-lessons and Word-lessons - so that they may be taught either together or separately. The length of each day’s lesson is left to the discretion of the teacher.

“The Word-lessons at the end of the book (page 27 &c.) contain all the words employed in the Reading-lessons, grouped with additional words of the same sound. As they are systematically arranged, and of progressive difficulty, they are well adapted for showing the child the process of word-building from single letters.”

The “Word-lessons” at the end of the book were whole-word phony phonics, building new words from old. The statement that the word lessons contained all the words employed in the reading lessons is misleading, since many of the words in the first reading lessons were not covered in the word-lessons till much later, and, I suspect, in some cases not at all.

Page 2 contained the small and capital alphabet in print writing, and said, concerning “Print writing”:

“This new form of letter is especially adapted for being copied with the pencil or pen. The letters are not the ordinary written characters of the so-called script but such a modification of printed characters as a good pen printer easily and naturally makes.

“The value of this character for school purposes can hardly be over-estimated... Children who practice it will pass easily from it to the ordinary written character at a later stage.”

Yet no mention is made of learning this “Print writing” alphabet before beginning Lesson I, just as no mention was made of learning the printed alphabet which preceded it. Teachers had instead been specifically told, “Teach the child to read the words at sight on the Wall-sheets, without spelling them.”

“Page 3 Part I READING-LESSONS. Practice.

<table>
<thead>
<tr>
<th>cat</th>
<th>hen</th>
<th>pig</th>
</tr>
</thead>
<tbody>
<tr>
<td>dog</td>
<td>tub</td>
<td>fly</td>
</tr>
</tbody>
</table>

“Note: Read these words to the child; then make the child read them till it is perfectly familiar with them. Endless mistakes and confusions arise from overlooking the simple principle that the
reading of a word should come first, and the spelling of it afterwards. NEVER ASK A CHILD TO SPELL ANY WORD TILL IT HAS PRONOUNCED IT.

“Exercise
dog, cat, hen, pig, tub, fly

A dog and a cat.
A hen and a fly.
A pig and a tub.”

Page 4 [a good quality picture of a cat at the top, with each sentence, as on page 3, on a line by itself]

“This is a cat.
It is a fat cat.
I can see its tail.
I can see its paws.
It has a long tail.
It has soft paws.

“Teach the children to read the words at sight without spelling them. Spelling should be a separate exercise. An oral lesson in spelling, or a slate exercise, may be given each day from the Word-lessons at the end of the book.”

The first lesson had introduced five words, each with a short vowel sound: cat, hen, pig, dog, and tub, plus a variant spelling for long i: fly. Yet no mention had been made of vowels, and there was no way any child could generalize about the short vowel sounds with only these six words, all of which had different sounds. The so-called first word-lesson which was supposed to go with this reading lesson had only employed the short a sound. Now, in only the second lesson, new vowel sounds are introduced in sight words, with no explanation: long e in see, long a in tail, and the diphthong aw in paws. Note also the special sound “th” in this, which combination of letters stands for a letter missing in our alphabet (but present in the Icelandic.) Note the variant sounds of “s” in “has” and “see.” The “word lesson” to go with the second reading lesson concerned only words built from short “a” phonograms, plus one long “a” word (name). Therefore, the only way a child could operate on these two lessons which were a wild mix of letter sounds was by pure sight-word reading. Wrong conditioned reflexes in reading would be well on their way to being formed before Lesson 3 was even started, even if the child had been taught the alphabet, which seems unlikely.

Page 5
“The cat sees a mouse.
Run, mouse, run!
If you do not run, the cat will catch you.

[Picture of mouse]

“This is the mouse: the cat did not catch it.

“Before proceeding to the next page, make the children read the above sentences in different order. For example in “This is a cat,” “it has a long tail,” “I can see its tail,” and so on. Most of the lines may also be turned into questions, by simply transposing the words, and pointing to them on the Wall-sheets in the following order: -
‘Is this a cat?’ Answer - ‘this is a cat.’ ‘has it a long tail?’ Answer - ‘it has a long tail’ &c.

Page 6
“1. Do you see the cat?
   I can see it.
   It is a fat cat.
   It has soft paws.

“2. This is its tail.
   It is a long tail.
   I can catch the tail.
   The cat can catch its tail.

“3. Do you see the mouse?
   I see it.
   Has the mouse a tail?
   It has a long tail.
   This is its tail.

“4. Cat! Do you see the mouse?
   The cat sees the mouse.
   Run, mouse, run!
   The cat sees you.
   The cat will catch you if it can.
   Run, Run, Run.”

Page 7 - [More of the same, followed with this note confirming vocabulary control:]

“The sentences in these two pages consist of the same words as the previous lessons and no others.”

Page 8 - [Picture of dog]
“Tom and his dog.
   Do you see that dog?
   It is Tom’s dog.
   Tom is kind to it and the dog loves Tom.
   It will play with him, and do what he bids it.”

Page 9
“Tom is at the pond: he throws in his stick.
   Good dog, bring it out.
   The dog swims for it.
   [Picture]
   See, here he is with it: how well he swims.

“This lesson on the dog, and subsequent lessons on the sheep, the hen, the bird’s nest, &c. gradually introduce new words to the pupil - a few at a time.”

Page 10 and 11 - [Little paragraphs as before]
“The words of the previous lessons and no others are here worked up into new sentences.”
The book follows this pattern, in large print, to page 26. Then Part II, beginning on page 27, contains the “Word-lessons.” By comparing those word lessons given below to the reading lessons quoted above, it will be apparent that, in no sense, were the children being given real phonics, but only whole-word, phony phonics.

“Lesson I

```
at  r-at  an  r-an
c-at  s-at  c-an  and
f-at  th-at  m-an  h-and
```

A cat A rat A man A hand”

Lesson I in reading had included the words “cat, dog, hen, pig, fly, but, and.” The sounds in none of these words had been taught, and presumably even letter names were not taught, or this would not have been marked “Lesson I” Yet note that no mention is even made of “dog, hen, pig, fly, but” in this first word lesson, though they were in the first reading lesson. Instead, only the two words, “cat,” and “and” are used to build new words. “Cat” produced “fat, rat, sat, that.” The parts of “and” produced “can, man, ran, hand.”

“Lesson II.

```
ad  ag  am  as
h-ad  b-ag  l-amb  h-as
l-ad  r-ag  sh-all  n-ame
```

“A lad. A bag A lamb I shall

“Lesson III

```
ar  t-ar  ap  ass
b-ar  st-ar  c-ap  l-ass
f-ar  are  l-ap  gr-ass
```

A bar A bar A star A cap An ass

“Lesson

```
ed  l-ed  et  y-et
b-ed  N-ed  g-et  y-es
f-ed  r-ed  l-et  fr-esh
```

“A bed Ned Red Yes

“Lesson V

```
en  m-en  h-en  end
B-en  h-en  th-en  b-end
d-en  t-en  wh-en  s-end
```

905
“A den Ben A hen An end

“Lesson VI
	em b-eg est ell
h-em l-eg b-est t-ell
th-en egg n-est w-ell

“A hem A egg A nest A well

“Lesson VII

be we b-ee b-een
me she s-ee gr-een
he the tr-ee sw-eet
here these thr-ee sh-eep

“We see A tree A sheep Three

“Lesson VIII

is if its th-is
h-is it s-its w-th

“This His With Its”

The approach is obviously one of building words from other words. Yet note that even the appearance
of vowel order is not really followed: Short “a” words were followed by short “e” words, but then long
“e” words were inserted before working with short “i” words, but no attempt had been made to include
long “a” words.

Lesson 9 continued with short “i” in id, im, and in spellings, lesson 10 and ll with similar short “o”
phonograms, and Lesson 12 with short “u” phonograms. Lesson 13 on page 30 concerned the short “i”
special phonograms ill, ick, and ing, and Lesson 14 ilk, and ink, and give-live, which are exceptions to the
silent “e” rule, but, then, silent “e” had not been taught.

Lesson 15 concerned the phonograms ong and ond, and “o” like “u” short: come, some, love and

glove.

Lesson 16 confused the teaching of “oo” which can either sound like good or pool. Instead it “taught”
“ood” “ook” in words which mixed both these sounds. To add to the confusion, it finished with the
irregular words, “to, do, too.”(also exceptions to the silent “e” rule). Lesson 16 concerned ood food good
ook book look m-oon s-oon w-ool to do too a book the moon a stool wool.

Lesson 17, page 32, was more phonically regular, with so go no ow sow row snow grow throw oat
coat boat snow -a boat a coat more.

Lesson 18 contained ow cow sow how now bow ouse house mouse out stout trout a cow a sow a
mouse a trout.

Lesson 19 concerned ...ind find kind ite kite white ine mine wine a fly. a kite. wine. the sky.
Lesson 20 covered all ball call hall aw paw jaw straw a ball a hall a paw straw. Note that “paw” as a sight word had occurred in reading lesson two!

Lesson 21 covered calf half back jack catch latch thank bank a calf jack a latch a bank.

Lesson 22 covered the ate and ake and ade phonograms: ake bake cake lake make take ade fade made ate gate mate a cake. a lake. a gate. a mate. Note that this “lesson” could have been avoided by teaching the silent “e” rule.

Lesson 23 covered ail tail nail hail pail sail, aid laid maid, ain pain rain, a tail a nail a maid a pain.

Lesson 24 covered bird third, her herd, one young no, they there, a bird one three where.

Lesson 25 covered eat meat seat beat neat heat ew few new yew you two... new meat. two seats.

(Lesson 26 was missing from the notes I took at the British Library in 1991.)

Lesson 27 covered ay day may say lay play w arm wh at (Both of the last were written separated, followed by these words:) a day. may. play. What? (written with a capital and a question mark).

It should be evident that this primer was teaching sight words in its “reading” lessons and the purest of phony whole-word, sight-word phonics in its words lists. It is, effectively, Code 2.

This primer was followed by No. I. Royal Readers, First Series. It began with one-syllable words and worked up to two-syllable words at the end. The “Preface” said:

“As a special lesson in Pronunciation, the more difficult words are divided into syllables, and accentuated. Teachers will find that, when their pupils have learned to pronounce words correctly in syllables, the difficulty of spelling them has been greatly reduced.”

The Andrew Bell approach had triumphed. Now children were incapable of finding syllables in words for themselves. The first lesson in Part I of The Royal Readers No. I is reproduced below, to show that it was “meaning” oriented and did nothing to make up for the lack of “sound” teaching in the primer:

“THE SEE-SAW

“Look at me! I am up in the air. See, I let go both hands, and yet I do not fall.
Now, John, do you try. You go up, and I go down.
Take care, and hold fast while you are up in the air.
See-saw! Up and down. It is great fun to ride on the see-saw.

are fun let try
fall hold now yet fast John see you

Hold fast. See-saw.”

According to the preface, the list of words following the lessons were meant for “oral” spelling, and the phrases at the bottom for “dictation.” The 1871 “standards” required that children in Standard I be able to spell a few words. However, the following note appeared at the bottom of this page:
“It is not advisable at this stage to include in the spelling-lesson the most difficult words of the reading-lesson. Reading is easier to the child than spelling. The spelling of difficult words is introduced step by step in the subsequent lessons.”

The Preface to The Royal Reader No. 1 had recommended that children be questioned at length about the pictures, which concerned the stories. The Royal Reader No. 2 included actual comprehension questions after the stories.

New editions of reading series in England at that time were common and normal, but it is interesting that the approach of The Royal School Primer (presumably published about 1871) was greatly modified in the revised New Royal Primer, Part I (and presumably Part II) which T. Nelson & Sons, Ltd., published some time before 1884. (However, both the older and the newer primers appeared in the Trade Catalogue of School Books which Nelson published in 1884. The earlier primer in paper covers sold for 1 1/2 pence and 2 1/2 pence in limp cloth; the New Royal Primer cost 1 pence for Part I and one pence for Part II in paper, but two pence for each in limp cloth.)

The newer primer also had a Part I and Part II, but they were published separately. Yet the approach of the earlier primer was totally gone. Part I followed the sequence of short vowels, and Part II of long vowels. The “Word-lessons” at the end of the book, formerly Part II, were totally omitted. The inside cover read:

“This Primer may be used in connection with any of the ordinary methods of teaching to read. The plan of each Lesson and the arrangement of the whole Book are the result of long experience and very careful experiment....

“Accordingly, each vowel lesson is introduced by a picture and a corresponding key-word. Below the key-word there are other words that rhyme with it. Each of these words is presented to the eye of the child in two forms - as a whole, and with the letters separate - in order to show that the complete word is a combination of letters.

Part I. is confined to the Five Short Vowel Sounds.
Part II. contains the Long Vowel Sounds arranged on the same plan.

“The primer is followed by an Infant Reader consisting chiefly of Simple Stories.”

Of course, this sounds phonic. Page 2 and 3 had the alphabet in capital and small letters. Page 4 had a grid of 28 boxes, holding 27 two-letter sight words in large letters, in the following rows:

“so, go, lo, no,
he, be, me, we,
at, an, am, as
if is in
on or of ox
by my up us
to do”

These were sight words, since no vowels had been taught, and they mixed long and short vowels. It was also the two-letter word approach which had been used when the two-letter syllabary was first dropped, but this version was set up to rhyme. In the absence of teaching by “sound,” rhyming becomes a device to remember sight-word distinctions. Twentieth century sight-word readers make a vast use of rhyming. Yet it is almost totally ignored by phonic readers.
Page 5 had a picture of a dog cart and children on the top, followed by three groups of sentences:

“I am in. Go on.
Is he to go in? No.
He is to go on.
On, on, we go.”

This was context using the sight-words just taught.

On page 6 the short-vowel treatment finally began, and it turned out to be only the use of consonant subtitutions on the phonogram “at.” Short “a” itself, to be used in combination with any letter, was not taught. Nor was it ever taught, but just the three phonograms “at,” “an,” and “ap,” before which consonants were placed to form new words. At the top of page 6 was a picture of a cat, with the letter “a” to the left and the phonogram “at” to the right. Under the picture were three words that had been built from “at”:

“cat
rat
mat”

On the opposite page 7, the “word-building” was repeated at the top: a. at. cat. Under that appeared:

“ 1.
“A cat. A rat.
On a mat.

“ 2.
“A fat cat sat on
the mat.

“ 3.
“Is it a hat? It is
my hat.”

The same treatment appeared on pages 8 and 9 for the phonogram “an” and on pages 10 and 11 for the phonogram “ap.”

On page 12, the phonogram “ed” appeared with the three words built from it being bed, fed red. On the opposite page appeared the three sentences, using the same sight words from page 4 that the other samples had used, and the sight word “the” which had been introduced on page 7. Pages 14 and 15 covered the phonogram “en” in the same fashion. Page 16 introduced “ig” with the three words built from it, pig, big, fig, and pages 18 and 19 covered “in” which had already been used as a sight-word on page 4 and in many of the sentences. Short “o” was covered with the phonograms op, ox and og, and short “u” with the phonograms ub, un and ut. The book ended with the lower and upper case alphabets again, “For Slate Work.”

The Nelson material from some time before 1884 was an improvement over the previous Nelson version of about 1871, but it was still only Code 3. It was using a basic sight word vocabulary in which to practice “new” words built on a small handful of phonograms, to which were affixed consonants. This so-called “short vowel” book used only three different consonants out of the 21 in the alphabet for each short
vowel. Yet the syllabary used almost all of the consonants for each short vowel. True sound was therefore not being taught, but only the “trick” of word building from known sight words - “phony phonics.” Despite the “phonic” appearance of the little book, the children were being conditioned to deal with print as composed of meaning-bearing whole words, and not as arising from sound. Part II of the newer Nelson primer from some time before 1884, dealing with long vowel sounds, is not available, but it is reasonable to assume that it used the same approach: building a handful of words from long-vowel phonograms. This was the kind of Code 3 phony phonics being promoted at the normal schools in the 1880’s.

The Cassell Reading Series

In 1879, the Cassell company which had published the massively successful materials in the 1860’s for adults published a reading series for schools. The company had also published earlier readers before 1879, as shown by what were presumably imports of Cassell materials listed in the 1876 American Catalogue of Leypoldt. The company’s name by 1879 was Cassell, Pelter, Galpin & Co. The British Library has a copy of the first book in the 1879 series under call number 12202.eee.37, and its title is First Infant Reader. The Modern School Readers, “Price 2d (or in Limp Cloth 4d).”

On the back of the title page of the first book the following appeared:

“To the Teacher. The experience of many years has convinced us that a judicious combination of the WORD and PHONIC method of teaching children to read is the best.”

Compare that 1879 English statement to the 1878 American statement in the Appleton Readers:

“The experience of many years has convinced us that a judicious combination of the word and phonic methods is the best.”

Trans-Atlantic communication was obviously in fine working order in 1878-1879.

The Cassell comments continued:

“Very many children attend school at between three and four years of age, and (the) Kindergarten system of teaching the shapes and names of the letters of the alphabet affords pleasant and instructive lessons suited to the capacity of young scholars.... The alphabet being mastered, in so far as the shapes and names of the letters are concerned, WORD-BUILDING is the next process. Construct simple syllables consisting of short vowels followed by single consonants, such as it, an, am, ox, on, &c., and build up a number of words by successively prefixing single consonants. In prefixing the consonants, special attention must be given to the powers of the consonants. Care should be taken to select only such words as have a meaning in the minds of the scholars.

“Three exercises should be adopted in word-building. -

“I. Construction, by means of single letters, on the alphabet stand.

“II. Printing on the blackboard and on the slates.

“III. Reading from large sheets.

“Immediately sufficient words are known, easy and natural sentences should be constructed, and the very common words of exceptional pronunciation should be gradually introduced. The
facsimilies of the “Reading Sheets” will show how a system thus begun is gradually built up step by step, with the easiest possible gradations, always bearing in mind that our object is not so much to teach a few words as to cultivate the power in Children of making out words for themselves.

“I. Introductory - by repetition from the “Reading Sheets” (Numbers iii to xii)

“II. READING LESSONS, constructed entirely with words from the “Reading Sheets” (Numbers III to XII). The engravings in every case illustrate the text.

J. H.

“Note - In the early stages in teaching Reading, the blackboard should be in constant use.”

Note the “constant use” of the blackboard, just as was occurring in America at the same time.

It is abundantly clear that J. H. was recommending whole-word, phony-phonics which was apparently the norm in England as in America by 1880. By 1880, Robinson had made little dent in the reading approaches in England, and Leigh’s approach was disappearing in America except in St. Louis, and in its McGuffey adaptation of 1879.

Reading Sheet I covered the capitals, and II the small letters of the alphabet. Reading Sheet III on short “a” included these phonograms, with seven words built from each by prefixing them with a consonant: at, ad, an. It then had the following context:

1. A man a hat a bat
2. A pan a lad a rat
3. A cat and a rat
4. A fat man a bad lad”

Sheet IV followed the same approach, with the following phonograms on short a, and words underneath them as on the third sheet: ap, am, ar, and five context uses under them, the last of which was “Sam has a fat ham.”

Out of 21 possible consonant combinations with short “a,” this phonogram approach had used only six, but it then moved on to short “e”. As a substitution for either the old syllabary or true sounding and blending phonics, the Cassell material was doing only 6/21 of the teaching job.

Sheet V on short “e” covered six consonants before moving on to Sheet VI on short “i,” again doing only 6/21 of the teaching job on closed syllables with “e”. However, short “i” covered 8 of 21 consonants, a slight improvement. Sheet VII covered short “o” with seven consonants, and Sheet VIII short “u” with seven consonants of the possible 21.

Yet this had been shown on Sheet IV:

“To be named at sight: ‘a as has’“

This had been shown on Sheet VI:

“To be named at sight: ‘is his ‘tis’“

This was shown on Sheet VII:
“To be named at sight: ‘of, the’”

This was shown on Sheet VIII:

“To be named at sight: ‘put’”

Ten sight words had therefore been introduced by the time the incomplete short vowel phonograms were finished.

Sheet IX continued the hopelessly inadequate “syllabary” approach, but on open syllables followed with “context” selections. The Cassell material certainly could not be called a synthetic phonics approach:

“Sheet IX (long e and o)

b-e  w-e  s-ee  g-o
h-e  y-e  b-y  n-o
m-e  b-ee  m-y  s-o

“To be named at sight: “to do you”

1. Can you see the bee?
2. Do not hit the bee.
3. Sit by me in the sun.
4. Bid Ned go to bed.

-----

1. My dog has a pup.
2. Let me see the pup.
3. The rug is set. Do not sit on the rug.”

That ended the vowel teaching, without having covered, even inadequately, long “a”, long “i” or long “u”, or any of the diphthongs: oi, oy, au, aw, ou, ow, oo, etc. Sheet X then moved into what was really spelling, and not decoding practice:

“Sheet X Terminal double consonants

-ill  -ass (no example)  -ell (seven examples)
(two examples)  -inn (no example)  -egg (no example)
(Includes doll)

To be named at sight: “was, saw, off”

This was followed by the usual collection of sentences for context reading.

Sheet XI covered consonant digraphs, which is necessary phonetically, but note that they were handled as initial consonants with phonograms, which is the word-building approach, not sounding and blending:

“Sheet XI - Compound Initial Consonants

sh-e  th-an  th-is  sh-ot
This was followed again by sentences.

After having done a totally inadequate (ludicrous?) job of teaching “phonics,” the final Sheet XII concerned itself with whole-word modification, the making of plurals or possessives from existing words. It followed this list of words with the usual sentences, and included this:

“To be named at sight: ‘who, what, are’”

The “Introductory lessons” in the book which duplicated part of the lessons from the Reading Sheets just repeated the sentences from those Reading Sheets, but none of its ludicrous “phonics.”

What this establishes, plus the notes by J. H., was that the Cassell reading books were teaching typical phony phonics, building meaningful whole words from phonograms and consonants, and then using them immediately in “meaningful” contexts, such as that shown below, along with the teaching of pure sight words.

Cassell also published in 1879 The Second Infant Reader... “in Two Parts.”

“Introductory - Being Reprints from the Reading Sheets Nos. 13-24, Reading Lessons Constructed Entirely with Words from the Reading Sheets Numbers 13 to 24. The engravings in every case illustrate the text.”

Text followed all of these lessons, but the comments which follow concern only the “phonogram” phonics which were taught at the head of these lessons, and the new “sight words” which were introduced.

Lesson XIII covered long “a” with silent “e”, and Lesson XIV long “i” with silent “e”. Lesson XV covered long “o” with silent “e”, and long “u” with silent “e” and also gave three sight words: boy, girl, first. To teach these words as sight-words and then pretend to be producing a “phonic” text is monstrous: teaching “ir” should have been systematically covered with er, ur, ar, and or, and “oy” should have been covered along with the other diphthongs. The eighteenth century spelling books would never have introduced these words without focusing attention on their phonemes.

The next two lessons covered some consonant blends but as phony “phonogram” phonics, with the phonograms clearly separated from the consonant blends with hyphens:

Lesson XVI covered double initial consonants, as “gl-ad.”

“Sight: one, two”

Lesson XVII covered double initial consonants, as “tr-od,” and consonant digraphs at the end, as “d-ash,”...

“Sight: here, then, these”
Lesson XVIII covered double terminal consonants, as “b-ack.”

“Sight: bird, were, once”

(Missing XIX in notes)

Lesson XX covered double terminal consonants, as “D-ick,” “f-ish.”

“Sight: eve, come, some”

Lesson XXI covered double terminal consonants, as “l-ock,” “wr-ong,” “m-ust”

“Sight: hear, said, says”

Lesson XXII had no heading, but covered columns of two syllable words, a few of which are shown:

“af-ter un-der let-ter
nev-er (columns under all these)

“Sight: they, their”

This was followed with sentences.

Lesson XXIII introduced these phonograms with “ee,” and columns of words under them:

“eel eed een eer
r-eel (columns)

“Sight: any many lamb”

Lesson XXIV covered “oo like u-full, oo like u - rule,” and produced columns of words under three such phonograms:

“h-ood l-ook f-ood

“Sight: could, would, should”

By this point, the content of the reading selections in these lessons had become increasingly like those in the 1826 Franklin Primer.

Cassell’s Third Infant Reader had these remarks at its beginning:

“It is assumed that the scholars at this stage have acquired sufficient powers of generalization to name any simple word when its type is given. Thus if pail is known, they should be able to name nail, sail, snail, &c. Hence, in the second part of this book, in addition to the words of the “Reading Sheets,” other but similar words are carefully introduced. In other respects, the Third Infant Reader is constructed on a plan similar to that of the First and Second Readers.”

It could not be clearer that the “phonics” taught was whole-word phonics with consonant substitution.
Sheet XXV began with these phonograms: a-long g-ain aid, m-aid, hay. At the end, it badly mixed spelling types with the same sounds but different spellings, and with no explanation given to the children for the confusion: stay, break, bear, pear, great, veil, grey.

Sheet XXVI covered “e long” with words built from these phonograms, again with mixed spellings: s-ea, st-eal, th-ief, f-field.

Sheet XXVII covered “i long” with mixed spellings: d-ie to dye, eye; fl-y, ch-ild, s-ign (and under it h-igh, n-igh, n-ight, r-ight, tr-ied, fl-ies).

Sheet XXVIII covered “o long,” oak ow.

Sheet XXIX covered “o long,” oe, old, bolt, with examples, yolk, roll, most, shew.

“Sight: build, built, climb”

Sheet XXX or XXI (notes missing one or other) covered “u” as in mule, ewe, d-ue; oo as in moon bl-ue; oo as in good fr-uit, p-ut, f-ull.

Sheet XXXII covered “a broad,” all, b-all; aw; p-ause; w-alk; c-aught.

Sheet XXXIII had “a” as in c-alf; “a” like short o - w-ant; “o” broad, f-orm, “o” middle sh-oe, l-ose.

“Sight: de bt, heir, hour”

This phonic “lesson” is ridiculous. No child could absorb such a mixed-up, overloaded mess except as pure sight teaching. Since the word selections in each lesson were followed with context stories, that assured the children would remember the words as sight words.

Lesson XXXIV had “e short,” d-ead; “o like short u,” s-on; “y short,” Ma- ry, po-ny.

“Sight: knee, knew, knife”

Lesson XXXV had “idle e final”
else, purse, trifle.

“Sight: moth-er, broth-er, fath-er”

Lesson XXXVI had “Sounds of Ough.”

“Sight: laugh, four”

This comment appeared at the beginning of the next book:

“In the Fourth Reader, new words are carefully introduced, they should in each case form the subject of a short word lesson. For example,

tak-ing    din-ed    ask-ed”

Aside from that curious comment on adding endings to whole words, there was no phonics in that book. However, the 1879 Cassell series as a whole looked “phonic” to the unwary. Yet it had left out
more phonics than it taught, just like most reading series in use today in America and Great Britain, and its sequence was unspeakably confused and unbearably complicated on the little phonics which it did cover. By using whole-word consonant substitution, followed by heavy reading selections employing these words, the 1879 Cassell series would not turn out “sound” readers but would turn out “meaning” readers with the usual high fail rates and reading disabilities.

In summary, the drive for government-subsidized schools of the nineteenth century in Great Britain had brought with it the “meaning” method in the 1820’s (as with John Wood’s in Scotland, the Andrew Bell monitorial schools, etc.) Shortly afterwards, “suitable” reading texts such as have been described in this chapter and in earlier chapters arrived to teach children to read by “meaning.” Despite ineffective challenges by phonic methods in the mid-century which have been described previously, teaching reading by “meaning” apparently remained the norm in schools in Great Britain until after the turn of the twentieth century.

However, as in America, an emphasis on spelling apparently returned in the 1880’s. It must have produced the same “accidental” effect in Great Britain that it did in America. That effect was to remediate much of the appalling disabilities caused by the “meaning” method of teaching beginning reading.
The Nelson and Cassell series, and those like them, were only following the lead of the “experts” in the teachers’ colleges. This is evident from a guide to teaching reading published probably in 1880. No publication date is given but internal evidence suggests it was published in 1880. Its title is Moffatt’s How to Teach Reading, Illustrated with Notes of Lessons, “By T. J. Livesey, Master of Method, and Lecturer on School Management, Training College, Hammersmith. Author of How to Teach Arithmetic, etc., etc., London, Moffatt and Paige, 28, Warwick Lane, Paternoster Row, E. C..” Moffatt and Paige also published reading series from the 1870’s through 1900.

The “Introduction” read:

“...In teaching reading, it will thus be seen:-

“(a) The teacher has to cultivate the eye to distinguish and remember varieties of form. In all his reading lessons, but particularly in the earliest stages, he will have to aim at stimulating and strengthening the observing faculties of the children. He will compare and associate the forms to be learnt with such as are already familiar - linking on the unknown to the known. He will analyse on the blackboard the more complex forms into their simpler elements; calling on children to reproduce them with pencil or with kindergarten sticks.

“He will introduce variety into his lessons, so as to invest the subject with interest; and by a repetition that is not monotony, he will endeavor to fix the forms firmly and permanently in the memories of the children.

“(b) The teacher has to cultivate the ear to recognize and remember sounds....

“(c) The teacher has to train the vocal organs to produce sounds distinctly and correctly....

“(d) The teacher has to cultivate the understanding and judgment. Even in the earliest reading lessons, he will not rest satisfied with mere mechanical accuracy, but will see that the children understand what they read, and read it so that others can understand it.

“By explanation and illustration, he will clear up all difficulties in text and subject matter; and by constantly questioning children as to the meaning of what they read, will drill them into habits of intelligent thought....

“(e) The teacher has to cultivate the literary taste and the emotions. To teach expressive or rhetorical reading with the maximum of success, the teacher will need to be a man of culture and of strong feelings, and will earnestly endeavor to make his pupils think as he thinks and feel as he feels....

“Chapter 1 (page 4) The Methods of Teaching Reading.
In the teaching of reading there are two fairly distinct stages.
1. In the first or elementary stage, the teacher has to help the children over the mechanical difficulties of the subject, until they are able to make out words for themselves and pronounce them with ease and accuracy.

2. In the second or advanced stage, he has to cultivate the intelligence and taste of his pupils, so that they may not only understand and appreciate what they read, but interpret it to others with truthfulness, elegance, and force.

“The so-called “Methods of Teaching to Read” have to do with the first stage only of reading, and have been designed to assist the children to recognise words for themselves.

“The different methods of teaching reading are: -

I. The Alphabetic
II. The Phonic ) Synthetic Methods.
III. The Phonetic).
IV. The Look and Say. Analytic Method.
V. Mixed Methods.

“I. THE ALPHABETIC METHOD.

By the “Name” method, or “Reading through Spelling,” or, as it is usually, though somewhat loosely, called, the “Alphabetic Method,*” children are first taught the names of the letters of the alphabet, and then, by spelling, their combinations in syllables and words.

**"The Phonic and Phonetic Methods are also alphabetic methods.”

“The sounds or functions of the letters are not formally taught; but the children are left to discover them by a process of “silent induction.” The method is one of synthesis, commencing with the simplest elements of written language, viz., letters, and gradually leading up to the most difficult words.

“How Reading is taught by the Alphabetic Method

“l. The children having learnt the twenty-six letters of the alphabet, - or even a few of them, - by some such method as that described on page 27, pass on to the spelling of small words.

“2. Such a sentence as it is an ox being placed before the children on tablet or blackboard, the teacher spells each word slowly and distinctly, pointing to each letter as he names it.

“3. The children repeat each word simultaneously after the teacher, thus: - i, t, it; i, s, is; a, n, an; o, x, ox.

“4. This is repeated again and again, simultaneously and individually, until each child in the class can spell his way through the sentence.

“5. When the children have mastered the spelling of the words; they are then taught to read them; and only when they hesitate and “stick” at a word are they called upon to “spell it.”
“The children continue to read by spelling until they have mastered the First Book, by which time they get accustomed to read off words at sight, resorting to spelling only in the case of new and difficult words.

“Arguments against the Method.

“The main objections raised against the Alphabetic Method are: -

“1. The names of the letters of themselves very rarely suggest the sound of the word they represent.

“2. Since there is nothing in the names of the letters to suggest the sound of the word, the mere naming of the letters, - apart from seeing them, - is no help to the reading of words. The voice, in naming the successive letters only does what the eye can do much quicker. The evidence of sound lends nothing to the evidence of sight. The method seems to appeal to the ear without really doing so. It pretends to be Phonic, but it is not.

“3. Not only is it no help; but the spelling of words actually distracts the attention from the main purpose of the lesson, which is reading; for since the eye sees the succession of letters much quicker than they can be named, spelling only retards the “reading off” of words, and gives rise to hesitation and slowness.

“4. The method can only be defended on the ground that it teaches spelling as well as reading. But it may be urged that it does this, even, in an unscientific way. It inverts the true order of teaching. Reading should come first, then spelling.

“With our orthographically anomalous language, spelling depends in great part on the visual memory. When we wish to be sure of the orthography of a word, we write it down to see how it looks. Even when called upon to spell orally, we try to call up a picture of the word, and look at it with the “minds’s eye,” trusting to the sight of the letters, not relying on their sounds.

“Since spelling depends chiefly on the strength and accuracy of the visual impress, and as a correct visual impression of a word is only obtained by repeatedly seeing it, it follows that much reading (and writing) is the best preparation for correct spelling; and that reading should precede spelling, not follow it.

“II. THE PHONIC METHOD.

“The Phonic, like the so-called Alphabetic Method, is synthetic, and commences with the letters of the alphabet. By it the children are taught the sounds or powers of the letters (instead of their names), and the combination of these sounds in syllables and words.

“The sum of the sounds c + a + t = cat as truly as the sum of 300 + 40 + 6 = 346. And just as children pronounce the whole number 346 by naming in order the several parts of it, - three hundred- (and) forty-six,- so they pronounce, for they cannot help it, the whole word Cat by repeating in order, and without pausing, the true sounds of its letters.

“Now, if the sounds of the letters in English were constant, as in German or Italian, and we had one sound for one symbol, and one symbol for one sound, it is clear that such a method would be easy, interesting, and scientific.
“BUT THE ENGLISH ALPHABET IS FULL OF IRREGULARITIES AND CONTRADICTIONS; I. The Same Symbol Represents Different Sounds.

The five vowels do duty for nineteen or twenty different sounds; and not one of these letters has a constant value. (A table for vowels was inserted here.)

“2. The Same Sound is represented by Different Symbols.

To represent forty sounds in English, we use, including digraphs, some two hundred symbols; so that the sounds are as unreliable as the symbols. A few very instances will suffice to illustrate this phonetic jumble.”

It should be noted here that, even if he were correct and not greatly exaggerating, “two hundred symbols” is a very much smaller load on the memory than the “10,000 highest frequency words.” Also, “two hundred symbols” is only a little more than double the Japanese Kana symbols which little Japanese first graders handle with ease, after which they then take on and conquer over their school years about 2,000 Kanji picture characters.

A table for letter sounds was inserted in his text at this point, arranged in columns. For the sound of “a” in “ale” was listed “April, brain, straight, goal, hay, great, rein, they, deign.” For the sound of “i” in “ice” was listed “line, lie, height, spy, buy, eye, guile, silent, sign, rhyme.” For long “e” was listed “even, me, fee, pea, key, people, brief, conceal, police.”

For the consonant sound of “k” in “kick” was listed “week, cock, music, chorus, talk, ache.” For the sound of “m” in “madam” was listed “am, lamb, hymn, home, psalm, phlegm.” (In phonic programs, children simply have the silent letters in these words pointed out to them.) For the sound of “sh” in “shin” was listed “shake, sugar, chaise, pshaw, potion, passion.”

Yet this scouring of the language for spelling irregularities is meaningless since such word irregularities are a very small percentage of the whole English language, and, even so, can be handled in groups: chorus-Christmas, etc., talk, walk, chalk, etc. That such irregularities can be handled with ease is proven by the first-grade teachers of real synthetic phonics, of which I was one. They have the majority of their phonically-trained children reading almost anything put into their hands fluently at first sight by Easter.

The majority of such first-grade children also learn very soon to spell irregular words with ease and apparently do so mainly by exposure, apparently “storing” the memories on the left, sequential, side of the brain instead of the right, “global,” side. The fact that sequence and sound have little to do with “global” memory is the probable reason for most of the misspellings I have received from second-grade sight-word-trained children in which letters in a word were arranged in a jumble, with disoriented sound-sequences. It is also the apparent reason for the total inability of an intelligent third-grader I taught to sound out from her store of sight words the new word “picnic,” even though she could read her third-grade sight-word reading book fluently. Comparing the spelling scores of phonic vs. sight-word trained children is actually the best way to show the enormous superiority of the truly phonic method, and to show that letter sequence has surprisingly little to do with global word memories.

However, methods such as the old Lippincott series by Charles C. Walcutt or the old Economy method are not truly effective phonic programs, nor, from its description, is the English series written by Hunter Diack and J. C. Daniels. Yet any visitor to a classroom taught in the correct manner by Sue Dickson’s Sing, Spell, Read and Write truly phonic program can confirm for himself that most children taught proper phonics can handle word irregularities with ease by the end of first grade. Also, if such a visitor could go back in time to sit in the anonyScottish Schoolmaster’s parochial schoolroom before
1829, he would find the little “sound”-trained seven-year olds there zipping through the oral reading of the Bible, which is full of the kind of words that Livesey cited like lamb, psalm, and people.

Livesey continued:

“3. Of the twenty-six letters three are redundant, viz., c, q, and x, which could be represented by s and k for c soft and hard; by k, and by ks respectively.

“4. This eccentric orthography has been characterized by Professor Max Muller as ‘unsystematic, unintelligible, unteachable.’ The late Lord Lytton said of it, ‘A more lying, roundabout, puzzle-headed delusion than that by which we confuse the clear instincts of truth in our accursed system of spelling, was never concocted by the father of falsehood.’ Sir C. E. Trevelyan calls it ‘a labyrinth, a chaos, an absurdity.’ Professor Meiklejohn has said, concerning it, ‘A child can put no trust in the symbol - he cannot believe his eyes; he can put no trust in the sound - he cannot believe his ears.’ And last, not least, a witty Churchman has said, that ‘the spelling of English is an aid to faith; for when a man has once realized that t h - o - u - g - h spells tho (long sign), and that r - o - u - g - h spells ruf, he is in a condition of mind to believe anything he is told.’”

Livesey completely twisted Lytton’s meaning in a story Lytton had written some decades earlier. Lytton put these words into the mouth of a “Dr. Hermann.” As Mitford Mathews pointed out in Teaching to Read, Historically Considered, The University of Chicago Press, 1966, Lytton only did so to mock Horace Mann (Herr Mann) in Mann’s war against teaching English by “sound.” Presumably, Livesey was given this earlier quotation by someone else or he would not have misrepresented its real meaning by quoting it out of context.

Livesey’s book was published in England about 1880. In 1886 and 1887, James McKeen Cattell was living in England, and, as discussed elsewhere, gave a paper before the Aristotelian Society in London on his great “whole-word” “discoveries” in reading psychology. Presumably Cattell would have been checking available sources in England on reading about that time - which were scant indeed - but Livesey’s book would have been one of them. Later, R. R. Reeder wrote his reading history at Columbia in 1900 when Cattell was in a position of great influence there. Reeder curiously dredged up the obscure Lytton quotation from about a half-century before, again misrepresenting its real meaning. Mitford Mathews some sixty years later in his book, Teaching to Read, Historically Considered, took the time to correct Reeder’s interpretation. Curiously, Reeder also paraphrased Livesey’s argument against spelling in reading, claiming as Livesey did that it slowed down the reader.

That Reeder in 1900 should paraphrase Livesey from England some twenty years earlier suggests Cattell at Columbia may have handed Reeder at Columbia a copy of Livesey’s book from about 1880. A parallel incident suggesting that Cattell brought home to America information on English material on reading was W. S. Gray’s listing, in his 1917 bibliography, of the Englishman Romanes’ 1880’s reading tests as the earliest reading tests ever done. (Romanes, like Cattell, had addressed the Aristotelian Society in London, as recorded in Sokal’s book on Cattell, An Education in Psychology.) Gray had begun the work on his 1917 University of Chicago doctorate at Columbia in 1914, under the personal direction there of E. L. Thorndike who was Cattell’s close friend and ex-student. (However, as mentioned in Chapter 24, William James also reported on pages 538 and 539 of his 1890 psychology text on Romanes’ reading experiments. James had also visited England in the 1880’s. As recorded earlier, James had become Cattell’s close friend some time before the end of 1892.)

Next, Livesey wrongly concluded that to teach by simple phonics was impossible:
“5. Without some modification of the English alphabet, then, it is clear that the Phonic Method is wholly impracticable. Two methods, however, have been devised, by which the Phonic principle can be applied to the teaching of English. The first may be called the ‘Phonic Sign Method’ (Robinson’s); the other is the ‘Phonetic Method’ (Pitman’s, or Ellis’s).

“THE PHONIC SIGN METHOD

This is a purely Phonic Method, by which children are first taught the sounds of the letters; then their combinations in syllables and words. Its peculiarity is, that the twenty-six letters of the English alphabet are combined and marked (as seen below) so as to make up sixty-three symbols, representing forty distinct sounds.”

Livesey showed on page 11 a table on Robinson’s Phonic Alphabet, and then said on page 12:

“It will be seen from the preceding table, that

“(i) Redundant Letters are retained, so as not to interfere with English spelling.

“(ii) Digraphs, or double letters, are used where they stand for simple sounds, as ee, oa, th, etc.

“(iii) Diacritical Marks, or accents, are employed to show the various sounds of the letters, as,

a in man; a (long sign) in mane (long sign).
a (umlaut) in far; a (circumflex) in small.

“(iv.) Silent Letters are printed in italics.

“The following is a specimen lesson in Phonic type from Robinson’s Phonic Reading Book: -

He then reproduced in Robinson’s phonic type The Three Fishers by Kingsley.

“How Reading is Taught by the Phonic Sign Method

“I. The extended alphabet will have to be learnt first. In other words, children will, -

“(i) Learn the forms of the sixty-three symbols.
(ii) Learn the sounds of the sixty-three symbols.
(iii) Learn to associate the sixty-three sounds with the sixty-three symbols.

“(i) To impress the form of a letter on children’s memories, the teacher may, -

(a) Point out the symbol on the alphabet card.
(b) Compare its shape with some familiar thing.
(c) Draw the letter on the blackboard.
(d) Let children draw the letter on slates.
(e) Let children construct the letter with kindergarten sticks.
(f) Let children pick out the letter from a reading tablet.
“(ii) To teach children to appreciate and remember the SOUNDS of the letters, the teacher may, -

(a) Show them how the different sounds are produced (see pp. 52-53), allowing children to imitate by putting tongue, teeth, lips, etc, in a similar position.
(b) Associate kindred sounds, showing, for example, that p, t, k, s, f, are produced by the same organs as b, d, g, z, and v, respectively, the former being whispered, the latter vocalized.
(c) Compare and associate, where possible, letter sounds with familiar nature sounds, as, -

“z” with the buzz of a fly. “m” with the hum of a bee, “s” - hissing of steam, “sh” - signal for silence, “ch” - the sound of a locomotive, “p” - the puffing of smoke, “w”... with the bark of a dog, etc.

“(iii) To teach children to ASSOCIATE sound with symbol, the teacher may, -

(a) Point to the letters when he teaches their sounds.
(b) Let children give the sounds of letters, as he points them out here and there on blackboard or tablet: as p, e, g, - t, o, p, the children, at the end, repeating the whole word, peg-top.
(c) Give out successive sounds, as p, e, g, - t, o, p; or pronounce the word peg-top, and call on individual children to point out the letters sounded.

“2. When children have learnt the letters, they will pass on to Vocabulary Sheet Lessons, consisting of words of from one to four syllables, containing no double consonants, no silent letters, no irregularities.

“(i) The children will first spell the lessons through, that is, repeat the letter-sounds in succession; as (marking letters) cart, hart, sharp, church.
(ii) When children can spell through the lessons, the teacher will call on them to read words at sight, or by “mental spelling” alone.

“3. The Reading lessons will alternate with Sound Lessons.

(a) Teacher will utter successive sounds, as p, o, t; sh, o, p; and call on children to name the word.
(b) Teacher will give children a word, as pot-shop, and call on them to utter its component sound.
(c) Teacher will spell silently, that is, will place his mouth in position to form the letter-sounds of a word, - and call on children to name the word.
(d) Teacher will give out a word to children, and call on them to spell it silently.

“4. When they can read the Vocabulary Lessons, the children will pass on to Tablet Reading Lessons, then to the Phonic Reading Book*, and last of all to ordinary Readers.

*“Robinson has provided Vocabulary Sheets, but no reading tablets. Ordinary tablets may easily be converted into phonic tablets by putting in the diacritical marks, and colouring the silent letters.”

“Arguments for the Method.

“1. It makes reading a pleasant and an easy task: the most puzzling words, as “psalm,” “debt,” “gnat,” etc., at once lose their difficulty.
“2. Exercising, as it does, the constructive and reasoning faculties, it is interesting and satisfying; for children, when they know the alphabet, can make out words for themselves.

“3. It teaches spelling better than the Alphabetic Method, because the evidence of the ear supports the evidence of the eye.

“4. It ensures thorough training of the ear and vocal organs, removes defects of speech, promotes distinct articulation and tends to eradicate provincialisms. The method was employed with great success by the late Mr. Robinson, of Wakefield, and is at present used with the best results in some of the large Yorkshire schools. (See Mrs. Harper’s evidence before the London School Board.)”

Livesey’s reference to the “late” Mr. Robinson establishes that Robinson had died before Livesey’s book was published about 1880. Furthermore, Mrs. Harper’s testimony to the London School Board must have come after Robinson’s 1876 book, or Robinson would probably have mentioned it.

“Arguments against the Method.

“1. The opponents of the method urge that the use of the same letter with diacritical marks, to indicate (different) sounds, is apt to confuse the children. This is not found to be the case in practice. Children are twice as long (say, two months) in learning the phonic, as they are in learning the ordinary alphabet; but when this is learnt, they are able to read words better than children who have been learning to read by the alphabetic method for a much longer time.

“2. It necessitates the use of superfluous digraphs and silent letters. But it does this in order to retain the English spelling, and it may be urged that the fault lies in the language, not in the method.

“3. It cannot teach anomalous words like one, who, etc., which must be taught by the “Look and Say.”

“4. It is difficult to teach by this method, and requires skill and training on the part of the instructor*.

*“This is why it is not so “popular” as the Alphabetic Method, which can be used by anybody, even a “butcher, or baker, or candlestick maker.”

“III. THE PHONETIC METHOD

“This is a purely Phonic method by which children are taught the sounds of letters, then their combinations in syllables and words; but it differs from the other phonic methods in having an alphabet of its own.”

On page 18, Livesey gave Pitman’s phonetic alphabet and a sample of text printed in it.
“How Reading is taught by the Phonetic Method.

1. The letters of the Alphabet are first taught, - a few at a time, - by their powers only, as in the Phonic Sign Method described on page 13.

2. As soon as children know a few letters, they begin to read easy words. They are told to repeat the successive letter-sounds of a word quickly, and they cannot help pronouncing the word.

“In Mr. Ellis’s Phonetic Readers, - now out of print, - the transition was facilitated by a (book) in which the same lesson was printed on opposite pages in Phonic and Romanic type respectively.

“For a fuller discussion of the Phonetic Method, the reader is referred to “The English Language Spelled as Pronounced,” by George Withers (Trubner & Co.) and Mr. Spedding’s article on “Teaching to Read,” in The Nineteenth Century for June, 1877.”

The fact that The Nineteenth Century published an article on reading in 1877 is of interest, because it was supposed to publish James McKeen Cattell’s article on reading in 1887, but it never did so, instead publishing another article that Cattell wrote.

The Nineteenth Century was a famous English periodical, and the one which had agreed to publish the talk mentioned earlier by the American psychologist, James McKeen Cattell, which he gave before the Aristotelian Society in London on February 21, 1887. On May 28, 1887, Cattell rewrote the Aristotelian talk for The Nineteenth Century under the title, “The Way We Read.” That paper is listed among the Cattell manuscript files at the Library of Congress in Washington, D. C., but only the first page (of no importance) is there. (Why is the rest of the paper missing?) The missing remainder of two or three pages would be of great interest. In his excellent book on Cattell, An Education in Psychology, Sokal recorded Cattell’s own comments concerning his Aristotelian address, to the effect that his paper had aroused a considerable interest and had been followed by a lengthy discussion by the intellectual members of that society. However, The Nineteenth Century never did publish “The Way We Read” but did publish a second paper submitted in 1887 by the young psychologist, Cattell, “The Time It Takes to Think,” listed as “22 (1887): 827-830.”

On pages 538 and 539 of his 1890 psychology book, William James quoted from page 136 of the book by George John Romanes of England, Mental Evolution in Animals (1884). (Sokal recorded that Romanes had also addressed the Aristotelian Society, on an unknown topic, about 1887.) In his 1884 book, Romanes said his reading experiments had shown a great difference in the time people took to read materials. “Perception-Time” was the title James gave to the section in which he quoted at length directly from Romanes concerning his reading experiments. That section title has a great resemblance to the title of Cattell’s second article, “The Time It Takes to Think.” Therefore, Cattell’s second article may also have included some material on Cattell’s reading experiments. However, it is certain that speed of reading, or reading rate, became a subject of great interest to psychologists and reading “experts” after about 1890, and Romanes’ and Cattell’s experiments must have initiated that interest.

Livesey continued:

“Arguments against the Method.

1. It has been urged that the method is likely to destroy correct spelling. Phonetic teachers deny this...
“IV THE LOOK AND SAY METHOD.

“By the “look and say,” or “Reading without Spelling” method, children are taught to recognize and pronounce whole words at a single effort, without stopping to spell them. A child gets at once a general impression of the shape of a word, associating (it) with its sound and with its sense; and has this “visual impress” made vivid by analysis and permanent by repetition. The method is analytic - beginning with the whole word, then proceeding to its parts.

“How Reading is taught by the “Look and Say” Method.

“1. An easy sentence is placed before the children, on black board or reading-table, as, -
   It is an ox.

“2. The teacher, pointing to the words, names them in succession without spelling; the children repeating the words simultaneously after the teacher. (This several times.)

“3. The teacher, pointing to the words, calls on children to read them simultaneously without help, -
   (i) Forwards,
   (ii) Backwards,
   (iii) Promiscuously.

“4. Individual children are called on to read the words in any order in which the teacher may point to them.

“5. Teacher now takes up each word separately for analysis, and -
   (i) Asks children the number of letters in the word.
   (ii) Tells them the names of these letters.
   (iii) Calls on them to pick out the same letters on an alphabet card or reading tables.
   (iv) Lets them print the words on slates.

“Arguments for the Method.

“1. Reading depends chiefly on the eye. The eye “takes in” things as wholes, and afterwards examines their parts. General features strike the eye first: familiarity alone makes it (conversant) with detail.... We may recognize a person and know him for some time, before we notice that he has grey eyes or small teeth or large ears.

“It is much the same with words. It is easy for the eye to carry away a general impression of a word sufficient for purposes of recognition; but it is only by seeing the word again and again that it can distinguish all its letters at a glance.

“2. The method is analogous to that of learning a spoken language. In learning to speak, the child hears a word as a whole, remembers it as such, and associates its meaning with its sound. In learning to read, the child sees a word as a whole, remembers it as such, and associates its meaning with its form.

“3. By whatever method a child is taught, he is not able to read until he can recognize words at a glance; and the Look and Say Method arrives at this end by the quickest and directest route.
“4. There are many irregular words in English, like two, one, who, beauty, etc., which can only be taught by “Look and Say.”

“Arguments against the Method.

“1. It has been urged against the method, that since general impressions are relied on, general resemblances, as between the words through and thorough, often lead to confusion and error. On the other hand, it may be said, that it is a part of the method to analyze and compare, so that all such resemblances would be pointed out and contrasted.

“2. It has been said, that by this method, children do not acquire the power of the Alphabetic Method. (Yet) children acquire unconsciously a knowledge of the powers of the letters; they get familiar by analysis with commonly recurring syllables, and they acquire a habit of syllableizing mentally, new words like con-fla-gration, and of pronouncing them with but little difficulty.

“3. Some have said that the method does not teach spelling. This is not correct, since much reading produces good spelling, and this method gives practice in reading from the beginning.

“4. It is the strongest objection to the method, that it begets a slovenly pronunciation. Clear enunciation depends on the distinct articulation of each separate letter of a word, and this end is not attained so well by the Look and Say, as by the Phonic Method.

“V. MIXED METHOD.

“Since there are good points in all of these methods, it is possible to construct out of them a method which shall embody the most valuable features of each.

“Adopting the Look and Say Method as a base, the teacher might, incidentally, and by degrees, teach the sounds of the letters, and ensure that accuracy of enunciation which the Phonic Method undoubtedly gives; while by teaching the names of the letters, and allowing children to spell words after reading them, he might secure all that is valuable in the Alphabetic Method. How this may be done in practice, will be shown in the next chapter.”

At this point, Livesey suggested teaching letters a few at a time, with those that are similar, or by nine words, with pictures, that contain all the alphabet:

“Lesson I, box, II, jug, III, can, IV, fez, V, vest, VI, drum, VII, quill, VIII, whip, IX, key.”

Livesey disliked picture alphabets because he said they did not contain the names of the letters. He did not seem to realize the purpose of most picture alphabets is to give the actual sounds of the letters, and that, in their alphabet, the Phoenicians had named their letters for actual objects in their language which began with the sounds of each letter, so that the names functioned just like a picture alphabet! On page 35, Livesey gave what he considered to be “An Improved Picture Alphabet.”

“Horace Mann has well said, that ‘while, as a general rule, six months are spent in mastering the twenty-six letters of the alphabet, a child will learn the names of twenty-six playmates or twenty-six playthings in one or two days. The consideration of this fact has suggested the following method of teaching the alphabet.’"

Livesey then showed pictures with their names: a corn, bee hive, ce dar, de er, ea gle, ge ranium, ef figy.
“By repeatedly seeing picture and letter side by side, the two become inseparably associated in the child’s mind. When therefore he sees the letter alone, it recalls to him the associated picture, and remembering the name of the picture, he remembers, of necessity, the name of the letter....

“The words thrown into rhyme and set to easy music will form a pleasant and instructive exercise for infant schools, thus: - A is heard in Acorn that grows upon a tree, b is heard in beehive, the workshop of the bee, c is heard is cedar, whose boughs are broad and dark, d is heard in deer that bounds across the park (etc.).

“EARLY BLACKBOARD OR TABLET LESSONS.

“1. When children have learnt the alphabet, they may be taught to name short words at sight, just as they have been taught to name the letters.

(Page 38) “2. The first reading lessons should be either on tables, in type large enough to be seen easily by a whole class, or, better still, should be printed by the teacher on the blackboard.

“The advantages of blackboard lessons are
(a) The children can see the letters made, and can watch the process of “word-building”
(b) The letters can be printed big enough to be read by a large class.
(c) The same words can be variously arranged, or variously combined in different lessons, so as to ensure repetition without risk of monotony.
(d) Special typical difficulties or irregularities can be classified on the blackboard, and made the subject of special lessons....

(Page 39) “3. Success in teaching reading will depend very much on the easy gradation of lessons, and on the systematic arrangement of the regularities and irregularities of the language. The first blackboard lessons should begin with the easiest words, and should lead up step by step to the more difficult combinations. They should be confined to the regular monosyllables, so that children may get some idea of law and uniformity at the outset. Contradictions and anomalies which, after all, are but exceptions to a rule, and serve only to perplex and to discourage beginners, should be kept, at first, altogether in the background....

“STAGE I In first lessons, the teacher will print on blackboard three or four two-letter words, arranging them in columns, thus

“I am on an ox
Am I on an ox?
An ox I am on.
Am I? I am.

“In all such blackboard or tablet lessons, the teacher will -
1. l. Point to each word in succession and name it, the children repeating the words simultaneously after the teacher. (This several times.)
2. Point to the words in succession and let children repeat them alone simultaneously. [He said as before, “forewards,” etc.)
3. Let children, when they are called upon, spell a word after reading it, as “am, a, m, am “
4. Call on individual children to read the word [He said as before, forwards, backwards, promiscuously] or name the words, and call on children to point them out.

5. Let children print the words on their slates.

"Two-letter words. The teacher in the first stage will confine his lessons to the thirty-six (or so) two letter words contained in the English language, viz: [He gave a table with these:]

Short vowel sounds - an am as at ah, if, it, is, in, or, of, on, ox, us up. Long vowel sounds - lo no so go ho oh do to (irregular) he be me we ye ma pa ta ta ha, ha! my by fy! hi!

"STAGE II.

"I. The lessons in this stage will consist of the two-letter words already learnt with a single consonant prefixed.

"Here the “phonie” method comes into play, and the powers of the consonants should be taught in a systematic series of lessons, thus

"(i) The sound of B in b-at, b-ox, b-it
(ii) The sound of C in c-at, c-an....
(iii) The sound of D in d-in, d-an, d-on
(iv) The sound of F in f-ox, f-an, f-at

"and so on, until children are familiar with all the powers of the letters.

"Then the words so learnt may be thrown into sentences, as

a. a fat rat sat on a mat. fan, the cat, ran at the rat.
b. dan has a hat. And Pat has a bat.
c. The man has a sup In a tin can or cup, etc., etc.

"STAGE III.

"I. Artificial and uninteresting because unmeaning combinations, as ab, ad, ag, ap, etc., have so far been purposely kept out of sight. They are useful combinations, but should be taught only in words, never alone.

"2. Now that children are familiar with the powers of the letters, the transition from known words to such as contain these combinations is extremely easy.

"Certain known words should be taken as the “key-notes”; analogy will do the rest; thus: -

"Key-notes b -at c -up d -in b -ad, c -ut, d -id, f -op, b -ag,
   c -ull, d -ip, f -og, etc., etc., etc., etc.

"3. When such combinations are known, words can be multiplied almost indefinitely, and learnt by the easiest transitions, thus -

"ad gives dad, had, lad, mad, pad,
bag gives rag, fag, wag, lag, nag
cut gives hut jut nut rut but
cull gives dull hull lull null....
did gives bid hid kid lid rid, did
dip gives nip lip pip sip tip,
fop gives mop hop pop sop,
fog gives bog dog job hog log.

“4. Such words can be easily strung together in sentences, as -

1. A nag and a hog and a kid and a frog
   All ran a-way from a dog in the bog.

2. The bad dog was mad, and it bit a fat lad.
   And cut his top lip. Oh, de-ar me! how sad!

“STAGE IV.

“1. When children have become thoroughly familiar with the short sounds of the vowels, words containing the long vowels should be introduced. It should be pointed out that the final E mute lengthens a vowel sound.

(Page 43) “Lists of words should be printed on the blackboard in illustration of the law, and read by the class, thus short A, (and) long....”

[Here a table was inserted showing short a words becoming long a by adding an “e”: h-at h-ate, m-an m-ane, t-ap t-ape, b-it b-ite, p-in p-ine, r-ip r-ipe, n-ot n-ote, c-on c-one, h-op h-ope, j-ut j-ute, t-un t-une, t-ub t-ube.]

“2. It may next be pointed out that the sound of long e in here and mete is usually expressed by ea as in fear or by ee as in deer. Lists of words should be printed on the blackboard to read by the class, as...” (showing “here fear, deer,” and next to “fear: rear near hear,” to “deer: peer leer veer,” next to “peat: neat heat meet beet,” and so on. Some of my notes here are unclear.)

“3. Double consonants may now be introduced, and lists of words, as before read off from blackboard, as sh-op sh-ip sh-in, ch-op ch-ip ch-in, th-at th-ick th-in, wh-at wh-ich wh-en, gr-ass gr-ape gr-een, kn-ee kn-ife kn-ew.

“4. The words learnt in Stage IV, may be combined in sentences, as The lean deer sleep beneath the fine beech trees in the wide green park near the sea, etc.

“READING PRIMER

“When children have had such preparatory blackboard lessons, they will be able to take up a Primer and read it with comparative ease. They should not be confronted with new verbal difficulties until they have grown accustomed to the use of books....

(Page 44 to 45) “3. Even when children have passed into books, the blackboard may be occasionally used with advantage.

“(i) For introducing new typical sounds in a series of words, to be mastered by the children before they are met with in reading lessons, as...”

[Livesey listed ng ie oa and under them sing king, etc., field wield chief brief thief grief, etc., boat oat etc.]
“(ii) For introducing exceptional sounds and teaching by contrast with regular sounds, as...” [Livesey listed as regular, “cull,” and irregular, “full.” Under cull, he listed lull fuss thrush but, and under pull he listed, bull puss bush. He showed another pair of regular and irregular columns: dear fear clean speak meat wheat, opposed to tear bear lead bread dread, etc.

“SCHEME OF READING LESSON.

“PRIMERS.

“Children should be standing in a semicircle, so that teacher can walk round and see that each child is pointing to the place.

“I. Teacher names the words at the head of the lesson, children pointing to each word as pronounced.

“2. Teacher again names the words, and the children repeat each word after teacher, and then spell it - simultaneously.

“3. Children read the words simultaneously without the teacher - a forward, b backward, c horizontally. About five minutes may be devoted to this exercise. If the books are well graduated, the only new and difficult words are arranged at the head of the lesson, so that if children know these words, they will be able to read the lesson with tolerable fluency.

“4. Teacher reads first paragraph through, and asks or gives meaning of new words.

“5. Teacher reads same passage by single words, children repeating after him simultaneously.

“6. Children read the passage simultaneously without the teacher.

“7. Individual children are called upon to read the passage. (The succeeding paragraphs to be treated similarly)....

“Chapter III. THE QUALITIES OF GOOD READING AND HOW TO SECURE THEM

“The qualities of good reading are (l) Distinct enunciation, (2) Correct pronunciation... fluency... intelligence in reading... expression....

“Chapter X (Page 93)

“Practical Steps in a Reading Lesson.

“I. Explanation and simultaneous reading.

“First Step, before opening books, the teacher will generally make a few introductory remarks bearing on the lesson... to arouse interest, etc.

“Second Step, the teacher reads aloud the hard words at the head of the lesson, distinctly enunciating each letter and syllable; and the children repeat each word after him simultaneously (this several times).
“Third Step. - Children then read the same words simultaneously, without the teacher, forward, backward, horizontally.

“Fourth Step. - Teacher then reads the first paragraph slowly, and elicits or explains the meaning of difficult words and constructions.

(i) In most lessons, at least in the higher classes, there will be some words which are entire strangers to the children....

(ii) To secure the intelligent and intelligible reading of a passage, the teacher should explain it, or see that it is understood, before the children are allowed to read it....

“Fifth Step. - The children read the first paragraph simultaneously and slowly in a monotone, enunciating each letter distinctly, and pronouncing each word clearly, forcibly, and separately... (up to standard II).

“Sixth Step. - The teacher reads the same paragraph in phrases, the children reading after him simultaneously, and imitating his emphases, pauses, inflexions, etc.

“Seventh Step. - The children read the same passage simultaneously and alone, with expression, the teacher stopping and correcting when the class are not working together. (Dispensed with in higher as well as Fifth)....

“Eighth Step. - After the simultaneous reading of a paragraph, the children will be called upon to read the same paragraph individually, the teacher occasionally reading as a model.

(Page 98) At the end of the lesson, the teacher should question rapidly

“(a) on the meanings of words explained in the text, and

“(b) on the subject (matter) and purpose of the lesson. (Blackboard should be turned away from children and books closed.)”

Livesey gave after this in Chapter V the notes on a reading lesson to Standard I from Moffatt Explanatory Reader I.

Livesey also showed a lesson from the much higher Standard IV, as quoted below from page 117:

“Scheme of Reading Lesson, Standard IV.
N.B. The scheme is the same for Standards VI and V.

“I. Teacher reads words at the head of the lesson, children repeating them after him simultaneously.

“2. Children read same words - forward, backwards, horizontally simultaneously with the teacher.

“3. Teacher reads first paragraph slowly, eliciting or explaining meaning of underlined words, etc. (See notes below.)
“4. Teacher reads first paragraph in phrases with expression, the children read after him simultaneously, imitating his emphases, pauses, etc.

“5. Teacher calls on individual children to read the same paragraph. (The other paragraphs are to be treated similarly.)

“6. At the end of the lesson, children close books and teacher examines on text and subject matter.

Livesey’s book therefore establishes, beyond any reasonable doubt, that the “correct” method of teaching reading in England about 1880 was Code 3, phony phonics from memorized whole sight-words: “meaning,” instead of “sound.” Furthermore, any help it could give children independently to decode words was almost totally lost by the “teaching” procedures he described, in which children only parroted and memorized the text which was previously read aloud to them by the teacher.

Livesey’s publisher, Moffatt, exceeded Livesey’s advice about teaching by “meaning” in its reading series published in the early 1880’s. The British Library has, under call number 12201 33 20, Moffatt’s Explanatory Readers, First Primer, Moffatt & Paige, 28, Warwick Lane, Paternoster Row, London. The British Library copy, stamped March 26, 1885, is about four by seven inches, and the type in it is large. The primer in an earlier series of Moffatt’s, published in the 1870’s, was not available.

The first page contained the small and large alphabets and the digits. The second page, numbered page 4, had the following:

“Is it by me. It is by an ox. He is by it I go up to it. We do go. We go. Do so. We go to it. Go to the ox. It is by me.

“I am on it. My ox is on it. It is to be so.

“Lo he is in. I go in.”

Page 5 continued:

“Is he to go? He is by it. Is it my ox? Go to it. We go up to it.

“Lo it is up. It is my ox. I go up to it. Am I to do so? Do as I do.”

Then it moved immediately from two-letter sentences into three-word stories:
“THE PIG.

The pig is in the sty. Do not hit the pig. Let him eat.

“Is he not fat? Yes, he is so fat he can not run.”

Page 6 continued with the words, “The Fox,” a picture of a fox, and under it new words in pairs of two, with no “sound” relationship, followed by sentences:

“fox, big sly, box in, out.

“The fox is sly. Do not go to him. He bit Tom one day. Tim is a big boy. He has a cap on.

Page 7 read introduced the first four- and five-letter words:

“Tom has my toy in his box. May I get the toy out of the box?

“BAT AND BALL

“Rolls, ball dry, like bat, hard

“The ball rolls as you hit it. I like to play at bat and ball with Tom. Tom can hit the ball hard.

“One day the ball hit me in the eye, but I did not cry.

Page 8 read:

“My new cat. [Picture of girl and cat] new, call, like, Snow, name, white

“I see the new cat. Do you like her? Yes, I like her. What is her name?

Page 9 read:

“Her name is Snow. We call her Snow, for she is white like snow.

“THE HAY. play, grass cow, when soon, row

“The sun is up. It is now day. Let us run out, and play on the hay.

“The hot sun will soon dry the hay. It is for the cows to eat, when the grass does not grow.

Page 10 and ll read:

“MY OLD DOG [picture of dog] name, what, just, lets, back, him

“That is my old dog. His name is Bob. Bob will do just what I tell him. He lets me get on his back and pat him. I am fond of my old dog Bob.

“THE WET DAY.
“play, must, rains, room, cold, will

“Can we not go out and play? No, for it is a wet day. See how it rains!

“When it is fine, then you shall go out. Get your ball, and I will play with you.”

The new words were listed first on the following pages, followed by the “story.” Only those words are shown below, by page number, which establishes that Moffatt’s beginning book in the 1880’s was using a straight, Code 1, sight-word approach, unlike the Code 3 endorsed by Livesey, whose book they had published about 1880. Just as in America where the Leigh method was eclipsed after 1880, the move in England was back to sight-words, after a brief interlude of phonic use in materials like Pitman’s and Robinson’s and their few imitators. What little phonics survived was the Code 3 version of Livesey’s, but Moffatt was not using even that in this text published by 1885, which the British Library stamped March 26, 1885:

Page 12 - look, this, doll, nice, like, small
Page 13 - frock, night, with, found, lace, tore
Page 14 - buy, glad, when, good, comes, school
Page 15 - eyes, drives, hair, coal, strong, kind
Page 16 - owls, white, yard, large, black, egg
Page 17 - come, large, warm, cold, play, now
Page 18 - field, rain, small, corn, ground, grain
Page 19 - dress, great, fire, flame, girls, pain
Page 20 - house, white, come, twice, back, front
Page 21 - shoes, these, chair, smart, nice, new
Page 22 - grass, birds, field, skip, lamb, dew
Page 23 - small, like, best, page
Page 24 - blue, none, must, look, eggs, four
Page 26 - bird, eyes, sees, dark, path, bark
Page 28 - chair, floor, does, doll, hand, says
Page 29 - large, does, bright, eyes, light, sleeps
Page 30 - name, glad, time, back, went, jump

Page 32 was the last page of the book. It had a picture of a mill. and read:
“At the top of the hill, there is a mill. The wind makes the sails go round.

“The mill grinds the corn into flour. With the flour men make nice bread.”

This Code 1 primer had used over 150 words, without the slightest indication that they were in any sense a phonic selection. Any Code 3 “word-building” with this list would have to be outside the text itself, but the utility of such “word-building” would probably be very slight, considering the overloading with pure sight-words learned in context.

Livesey’s teacher’s guide published about 1880 had given Code 3 material the official blessing of a teacher’s college “expert.” Therefore, that his own publisher, Moffatt, should almost immediately afterward, by 1885, have published this Code 1 primer is something of a mystery. Apparently, Charles Baker’s Code 1 kind of “expertise,” quoted earlier, was more influential on Livesey’s own publisher than Livesey’s Code 3 “expertise.”
Chapter 48  
Mandatory School Attendance Laws Were Passed About the Same Time That Tests Proved That Government-Controlled Schools Were Producing Functional Illiterates.

Concerning the length of time spent in school, Ellis stated (pages 48-49):

“In a report of a Conference on School Attendance in 1857 it was estimated that...

“42% attended less than 1 year  
22% attended 1 or less than 2 years  
15% attended 2 or less than 3 years  
9% attended 3 or less than 4 years  
5% attended 4 or less than 5 years  
4% attended 5 or less than 6 years”

That means that in 1857, at the time when Britain had assembled its world empire, only three percent of its population had attended school more than six years. Its colonial administrators are widely considered to have been an efficient lot, and yet most must have come from that 97% of the population that had attended a formal school less than six years. Nevertheless, they were obviously educated men, in the real sense of the word “educated,” instead of the fallacious sense of equating “education” to time served in a government school. To put these figures in another light, and to show the hopelessness of government schools, virtually all of America’s large population of functional illiterates have attended school far, far longer than did 97% of the population of England in 1857!

Ellis referred to the preface to Social Problems (1873), by Sir James Kay-Shuttleworth. In it, Kay-Shuttleworth described the spade work which had been necessary in order for the government to be able to take over education. Ellis wrote:

“The nation had to be awakened to a sense of its necessity; the religious communions had to be reconciled to the interference of the secular power; the school managers had to be trained in all the details... [etc.]”

After all this hard work by activists, (and his 1873 comments certainly confirm that a cadre of activists had been hard at work for years), the government was in a position to take over the role of parents and to be the controlling influence in the training of the nation’s children. Surely, it is no accident that the de-Christianization of Europe, including Great Britain, has proceeded in direct proportion to the growth of government-subsidized schools and compulsory attendance laws.

The hostility to religion shown by government-school activists in such places as France and Mexico in the nineteenth century was not openly shown in Great Britain and America, although we are getting plenty of it today. Concerning the historical record on such hostility elsewhere, see the article on Mexico in The Catholic Encyclopedia (1913) on anti-religious legislation which affected schools there as early as 1857. In France, government schools were one of the first-fruits of the French Revolution in 1789, which revolution inaugurated a time of great religious persecution and one of history’s most depraved periods. However, it is not unreasonable to conclude that the primary source of government schools everywhere in modern times WAS the French Revolution, even though government schools had first been suggested in
modern times twenty-six years earlier, in 1763, by the Frenchman, Chalotais, in his enormously influential Essay on National Education.

In contrast to what happened in Mexico and France (and in many other places), Orestes Brownson testified from his own certain knowledge as an undercover activist in 1829 and 1830 that the drive against religious education in America was intended to be indirect. The drive against religion in education has remained largely indirect in America until fairly recently. Furthermore, as Pamela Horn pointed out, most of the government-subsidized schools in England were church schools until the twentieth century. Nevertheless, much of the curriculum was effectively under the control of the state because of the state’s control first of textbooks and later of tests, and the state’s implicit control at all times of the “certification” of teachers.

It is almost incredible but nevertheless true that, because of such state control, the Bible and catechism were removed as official textbooks in English church schools by about 1860! Although both the United States and England permitted some mention of religion in the schools in the nineteenth century, the secularizing effect was very much in place. A particularly nasty example can be found in the Syracuse, New York, board minutes from about the 1850’s, when mandatory school attendance laws were being invoked to try to force a Jewish child to attend school on the Sabbath, Saturday.

Ellis’s comments on page 82 certainly suggest that “control” was the dominant concern of the activists:

“The Education Act of 1870 provided for the formation of School Boards in every school district which did not possess adequate facilities, and empowered them to formulate by-laws which would render compulsory the attendance at school of children aged 5 to 13. The London School Board implemented these provisions but granted exemption to children over 10 who had passed Standard V, and who were obliged to work for domestic reasons....

“Successive legislation was intended to ensure the attendance of children at school. The Sandon Act of 1876 rendered parents liable to financial penalties if their children did not receive the required quantity of instruction, and the Mundella Act of 1880 stipulated that the framing of attendance by-laws should be compulsory. In 1882 compulsion was in operation throughout the country....”

“Compulsion” did not result in better education in the 1870’s and 1880’s as Ellis showed by referring to sources from the period, which remarks of his are quoted shortly, any more than it has resulted in better education today. However, it certainly did result in children serving more time in government schools. Ellis stated on page 86:

“In 1870 the average length of school life was 2.55 years; in 1880 it was 5.19 years; in 1890, 6.13 years, and in 1897, 7.05 years. Thus since 1870 the period actually spent in elementary schools in England and Wales by the average pupil was almost trebled.”

The religious schools had been under the influence of the government for many years, because of following the carrot of government financial grants. Yet after the 1870 Act they were put at a sharp financial disadvantage to the newly-formed government schools. They were suddenly being forced to pay very dearly for their carrots. Ellis stated (pages 82-83):

“The 1870 Act allowed voluntary bodies 6 months in which to remedy any deficiencies which existed in their educational provision. The Societies were stimulated to build new schools, and between 1870 and 1880, 1 million new school places were made available. Whilst school
boards received income from local rates, government grants, and fees, that of voluntary schools was confined to government grants, fees, and voluntary subscriptions. Government grants to voluntary schools were increased by the Education Act of 1876.”

Some of the voluntary schools simply caved in under the new financial burden which put them at such a disadvantage to the government schools which were supported by local taxes (“rates”). They turned their schools over to the government. Ellis stated (page 95):

“The appointment of school boards, which enjoyed such wide powers and an availability of adequate finance, was instrumental in securing higher standards of provision in schools. The effect of the reforms was detrimental to the voluntary schools for which the burden became so overwhelming that many of them opted to be placed under the jurisdiction of the new boards.”

Ellis wrote further on the effect of the 1870 legislation on private schools for the poor (page 84):

“There were 200 ragged schools in London in 1870 which were attended by 23,000 pupils, but most of the schools disappeared after the establishment of the school boards.... Unfortunately large numbers of dames’ schools were not assimilated into the new system. In 1878 there were still hundreds of children in Leicestershire who were taught in unsuitable premises in these schools. Inspectors did not have the power to intervene and local authorities were often unwilling to do so. One inspector of schools in Yorkshire advocated that either they should be abolished or made subject to inspection....”

That Yorkshire inspector certainly was not endorsing “freedom” in freedom-loving Yorkshire! As Pamela Horn said, inspectors came from the upper classes in England. Such inspectors would have little understanding or sympathy for poor parents who were sending their children to dame schools run by poor women. Therefore, the dame schools certainly were not being judged and found wanting by a jury of their peers.

Ellis wrote concerning the background for the passing of the Education Act of 1870:

“Approximately 1 1/2 million children in 1870 were on the registers of inspected schools, but at a conservative estimate an equal number attended either establishments which were completely unsuitable for educational purposes, or no schools of any kind. An inquiry into Liverpool schools for poorer children in 1869 revealed that 25% were in the former category and another 25% in the latter. The Education Act of 1870 was intended to remedy this situation.”

Presumably he meant that of the poorer Liverpool children under age 13, half were not in “inspected” schools, and of this half, an equal number were in “unsuitable” schools and an equal number in no school.

Those not in school, however, obviously may have been earlier in either a government-inspected school or an “unsuitable,” (i.e., not government-inspected) school and should be omitted from statistics. Of the remaining numbers, about two-thirds of the poorer children by 1870 received the government-inspected instruction which produced such appalling failure rates on reading tests. As government control over education increased, the literacy rate had dropped accordingly because of the methods used in the government-controlled schools.

By 1876, the dame schools were almost gone. Therefore, there was a large population of young people by that date who had learned to read by “meaning,” instead of “sound.” Ellis included a chapter on books published between 1860 and 1890, and glowingly (and properly) reported on the wonderful flood of children’s books which appeared in those years, including, for instance, Alice in Wonderland. This
implies a great “growth” in literacy, and produces a vision of crowds of happy children now being able to read delightful children’s books.

However, Ellis also gave some reports on sales figures of children’s books which can be compared to school population figures. The results of these can be compared to his sales figures for cheap commercial periodicals for adults in the 1860’s. This analysis tells a sorry tale of declining literacy as “meaning” replaced “sound” in the teaching of beginning reading. The “thorough and efficient” government-subsidized schools teaching reading by “meaning” had almost wiped out the once-profitable commercial market for cheap printed matter for poor children. Almost the only cheap periodicals for young people after 1870 were published by church groups, which were, of course, not in business to show a profit. Ellis said (page 78):

“The majority of children’s periodicals were the products of religious organizations....”

A major source for children’s book sales was the widespread use of books as prizes in school. For instance, Ellis said (page 77):

“After 1870 the R.T.S. [Ed.: Religious Tract Society] recognized the demand for prizes in the newly opened board schools. Most of the Society’s best sellers were published in these years....”

Since commercial publishers were obviously largely uninterested in publishing cheap periodicals for children, this indicates the profits from publishing for the poor had dried up. Yet, when the population was far smaller in the eighteenth century, the poor had bought so many cheap chapbooks, full of exciting stories and unsettling philosophies, that the upper classes had busied themselves printing “suitable” material for their inferiors to read to counteract the enormous “bad influence.”

True literacy can be achieved with only a year or so of instruction by “sound” instead of “meaning.” The ability to read, once truly acquired, does not disappear in adult life, as is demonstrated by the letter from Mrs. Spray which Pamela Horn quoted, given elsewhere in this history. Nor should the ability to read disappear, as properly taught reading is only a set of conditioned reflexes. Other conditioned reflexes acquired in childhood do not disappear either, despite infrequent use, such as the ability to ride a bike or to roller skate - or to row a boat. English children after the 1870’s were in school for considerably more than a year and yet they were obviously NOT acquiring the conditioned reflexes underlying true reading ability. On page 84 in his chapter, “Elementary Education for All 1870 - 1902,” Ellis was obviously referring to 1870 - 1892 sources concerning the failure to achieve true literacy:

“However, the educational system as it existed was subjected to severe criticism. The large sums of money which were expended did not yield permanent results because the majority of children did not continue their education on leaving school.”

Of course, the “because” in the above is fallacious. Instead, the results were not “permanent” even after years of compulsory attendance because the children had been taught reading by “meaning” instead of by “sound” and had therefore not acquired the proper conditioned reflexes. As Dr. Hilde Mosse said on page 78 of Volume I of The Complete Handbook of Children’s Reading Disorders, Human Sciences Press, Inc., New York: 1982:

“Reading disorders can be caused by an inability to form the necessary conditioned reflexes or by the establishment and practice of wrong reflexes.”

Actual statistics presented by Ellis confirm failures, though he interpreted them as showing improvement. It should be remembered that a child could not be presented for examination in a standard

940
which he had previously failed. Therefore, statistics on children taking the tests tell nothing of the numbers of children ineligible for the tests, which might have been very large indeed. Ellis said (page 90):

“Continuous improvement was shown in examinations, and whilst in 1872 children in standards IV to VI comprised only 17.96% of the school population, in 1886 the proportion had risen to 34.68%. Also, the index of backwardness diminished so that the proportion of scholars aged 10 and over presented in the lowest standards for examination purposes fell from 63.71% in 1872 to 36.33% in 1886.”

In “reading” the children were largely only reciting memorized texts. Yet 83% of the children in 1872 were tested at Standard III or lower, and 65% were still being tested at that level in 1886, to say nothing of those failing. Statistically, only 50% of all the children, and excluding NONE who had previously failed from taking the tests, should have been at that level, which was anything but demanding! The Scottish Schoolmaster’s seven year olds would all have read fluently, not at the Standard I required of seven-year-olds in the 1880’s, but at Standard VI (though probably without “expression”). Yet two-thirds of the children ten years old and older in 1872 were “examined” at Standard III or lower, and more than one-third in 1886 (to say nothing of the failures ineligible for testing, and to say nothing of whether those actually presented for testing “passed” the standard at which they were tested!)

The material being “tested” was still largely memorized material even after 1884. Ellis said (page 92):

“...In 1884 the Revised Instructions to H.M.I.s [Her Majesty’s Inspectors] referred to the length of lessons in books:

‘It may be taken as a general rule that 40 lessons and not less than 80 pages of small octavo text should be required in standards I and II, and not less than 60 lessons and 120 pages in higher standards.’

“The purpose of this regulation was to prevent the use of books in which the contents were so meagre that they could be learned by heart in the course of a year, and represented no accurate test of a child’s reading ability. Two pages were regarded as a minimum for an effective reading lesson and longer lessons were desirable for older children. Narratives and poetry could well be longer than those which dealt with technical information relating to geography, history and science.”

Note the “two pages” for an “effective reading lesson.” A class of thirty or so children would read and reread those thin two pages after the teacher, and then discuss its content ad nauseum. The 1884 regulations did nothing to remove the longstanding “learning by heart” of “reading” texts on which children were tested.

As late as 1888, the children obviously lacked the ability to read independently and to sound out words, which abilities had been the norm in the eighteenth century. Ellis said (page 93):

“...in 1888 an inspector remarked that many of the geographical readers contained ‘too many hard names to be good for instruction in reading.’”

The upper grade children using these readers continued to stumble over pronunciations, even though they had been already been given the correct pronunciation by the teacher’s reading them orally first.

Yet spelling books apparently were again receiving emphasis in some English schools in the 1880’s, just as in America, and may also, as in America, have stressed phonics, so by the turn of the century real
reading achievement was undoubtedly increasing. Paradoxically, it was at that point that testing was dropped! That spellers which could result in teaching reading to upper grade children were clearly in use by the 1880’s is shown by this comment by Pamela Horn (page 47):

“Again, at Cottisford in North Oxfordshire, the young Flora Thompson remembered with bitterness her own brushes with the H.M.I. In this particular area in the 1880’s the office was held by an elderly clergyman.... All of the other children shared Flora’s apprehension. ‘There was no singing or quarrelling on the way to school that morning. The children... walked deep in thought; or, with open spelling or table books in hand, tried to make up in an hour for all their wasted yesterdays...’”

However, as time went on, the vise of centralized control in education continued to tighten in England, despite the dropping of testing. Actually, the tightening of the vise represented another trade-off, as when the control of texts was dropped and replaced by testing. That is because when testing was dropped at the turn of the century, local control was lost and central control was installed. Ellis wrote (page 85):

“There was an immediate need for a closer integration of the educational system.... (In 1900) a Board of Education was formally constituted.

“In 1902 an Education Act was passed which was probably the most important event in the history of education in England since the full recognition of elementary education as a national necessity in 1870. School boards were replaced by Local Education Authorities, which made possible a closer co-ordination of elementary and secondary education.”

Once compulsory attendance has been achieved, “control” in education is exercised most in the three “T” areas: by controlling Tests, by controlling Textbooks, and by controlling Teachers through “certification.” It is absolutely astonishing that teacher “certification” has been permitted to develop in England and the United States since both countries prize freedom so much. In countries with a free press and free speech, how can any group claim the right to “certify” anybody as a “suitable” teacher for OTHER people’s children? What has happened to the old concept that a teacher has authority only because he is acting “in loco parentis” obtaining his limited authority directly from the children’s parents, who freely but temporarily choose to give it to him? Yet certification of teachers has been around in both countries for about the past hundred and fifty years, and it is built on the assumption that the responsibility for children’s education does not rest with the parents but with the state. It appears that great numbers of Paul Reveres have been as sound asleep as Rip Van Winkle for that hundred and fifty years, when instead they should have been out riding to spread the alarm.

The controlling of tests first arrived in England with the Revised Code of 1862 as a trade-in for dropping the controlling of textbooks, as has been described. The reading failures the tests disclosed from the formerly “approved” textbooks were enormous. That by 1870 the schools were still failing in this most fundamental task, the teaching of reading, is shown by Ellis’s comment on page 89:

“In 1870 the most expected of working-class children by the Government was that they should read a newspaper on leaving standard VI, a requirement which could well have been met by a child of 8 years old. Inspectors admitted that no attainment below Standard IV could be of permanent benefit to a child, and yet 80% of children passed only in the lower standards before leaving school.”
Therefore, the “inspectors” who were actually testing the children said 80% of them in 1870 had received NO benefit from attending the government-subsidized (and controlled) schools! That was an enormous waste of time and money!

With the arrival of the true government schools, and not just government-subsidized schools, under the act of 1870 came the “New Code of Regulations 1871.” The following is taken from page 303 of the microfiche at the New York Public Library, call number: “1871 IV 303. Author: Great Britain - Parliament. Title: Sessional Papers.”

“Standard of Examinations - Reading

“Standard I - One of the narratives next in order after monosyllables in an elementary book used in the school.

“Standard II. A short paragraph from an elementary reading book.

“Standard III. A short paragraph from a more advanced elementary reading book.

“Standard IV. A few lines of poetry or prose.

“Standard V. A short ordinary paragraph in a newspaper or other modern narrative.

“Standard VI. To read with fluency and expression.

“Writing.

“Standard I. Copy in manuscript character a line of print and write from dictation a few common words.

“Standard II. A sentence from the same reading book slowly read once and then dictated in single words.

“Standard III. A sentence slowly dictated once by a few words at a time from the same book.

“Standard IV. A sentence slowly dictated once by a few words at a time from a reading book used in the first class of the school.

“Standard V. Another short ordinary paragraph in a newspaper or other modern narrative slowly dictated once by a few words at a time.

“Standard VI. A short theme or letter, or an essay paraphrase.

“No scholar may be presented... for their examination... under a lower standard or under the same standard. After 31 March 1873 no scholar above 9 years of age and no evening scholar above 14 years of age, will be examined in Standard II.”

The spelling test above Standard I does seem moderately demanding, but, as quoted elsewhere, teachers taught “spelling” by practicing those sentences in the readers which seemed suitable for spelling tests, and so seemed likely to be chosen by the inspectors. Therefore, the “practice” effect was very evident and would have resulted in much higher scores. Furthermore, children could apparently “pass” in reading at higher levels while still failing in lower levels of spelling. The percentage of errors permitted
before a child was “failed” in spelling is not indicated. It is highly unlikely that 100% accuracy was
demanded. If only 70% accuracy were demanded on simple sentences, then the testing was not very
demanding. However, I have turned up no information to date concerning the specific failures in spelling,
which would be illuminating.

Baker made a great point in his 1864 paper of opposing the monosyllable Standard I 1862 reading test
because it was unnatural. By 1871, only seven years later, note that Standard I called for the reading of
multisyllables. Those preparing the Standards must have been listening to Baker or to those who agreed
with Baker.

Ellis described the codes of 1881 and 1882 (pages 89-90):

“Code of 1881: Requirements in reading

“Standard

I Read a short paragraph from a book not confined to words of one syllable.
II Read a short paragraph from an elementary reading book
III Read a short paragraph from a more advanced reading book
IV Read a few lines of prose or poetry selected by an inspector
V Improved reading
VI Improved reading”

Ellis said (pages 89-90):

“...Reading was tested in the ordinary class books if approved by the inspector, but these
books were to be of reasonable length and difficulty, and unmarked. Every class was to possess
two or three sets of reading books although this was considered by many to be quite inadequate.”

Nine years had elapsed between the first testing standards adopted in 1862, and the New Code of
1871, and ten years elapsed before that was revised in 1881. Yet, only ONE YEAR elapsed until a new
code was adopted in 1882. Obviously, something had gone awry which needed mending. One thing
apparently was Standard IV, which required that children “Read a few lines of prose or poetry selected by
an inspector.” That was the same as the 1871 Standard IV, except that the words had been added,
“selected by an inspector.” With the addition of those words, children had lost the advantage of “reading”
poetry they had previously memorized in class. As a result, apparently, of the too-demanding phrase,
“selected by an inspector,” Standard IV was totally revised in 1882, and that demand was omitted.

“Code of 1882: Requirements in Reading

“Standard

I Read a short paragraph from a book not confined to words of one syllable
II Read a short paragraph from an elementary reading book
III Read a passage from a more advanced reading book, or from stories from English history

IV Read a few lines from a reading book, or history of England

V Read a passage from some standard author, or from a history of England

VI Read a passage from one of Shakespeare’s historical plays or from some other standard author, or from a history of England.

VII Read a passage from Shakespeare or Milton, or from some other standard author, or from a history of England.”

These standards effectively lasted only eight years, since the pressure to meet testing “standards” which had existed from 1862 greatly lessened after 1890. Pamela Horn pointed out (page 49):

“Even the apparently over-strict Brodie [Ed.: an inspector] welcomed the ending in 1890 of the old ‘payment by results’ system in its most rigid form.... The Code of 1890, which brought about this modest improvement... was reinforced in 1895 by a further alteration, which allowed the Inspector to substitute ‘two visits without notice, spent simply observing the school in a normal day’s work, for the annual pre-arranged examination visit.’ Although by no means all schools adopted the new form, many did....”

Centralized control of reading instruction therefore slipped after 1890, with the phasing out of the tests, and so did “teaching to the tests” which was geared to match the sequence in the reading textbook series.

In the 1870 - 1902 period, Ellis said that the control of textbooks was effective only under the London School Board. However, in 1884, the official “Instructions to Inspectors” in England specified that books were supposed to “conform to the requirements of the Code”.or to be rejected if were rated by individual inspectors as “unsuitable.” Nevertheless, the instructions did not involve lists of approved books. Ellis said (pages 95 and 96):

“The Committee of Council was adamant that inspectors must not recommend the use in schools of any particular books, but it was widely held that managers and teachers required guidance in their selection. It has been shown that in practice the Committee maintained some control over the publication of school books in the Instructions to Inspectors, and in 1884 the latter were permitted to ‘disallow the use of any books which are plainly unsuitable, or which do not conform to the requirements of the Code’.

“A further controlling factor in the use of school books was the appointment of school boards after 1870, in which many of the members were highly qualified to exercise supervision. The London School Board found it necessary to withdraw numerous books from schools under its control because they infringed the rules which related to religious instruction.”

Note the censoring of religious references in textbooks by the London School Board, with which government group the professedly-agnostic-but-effectively-atheist Thomas Henry Huxley was so closely associated, as discussed later. Note in the following the preparation of a list of “approved” readers by the London School Board members who were supposed to be so “highly qualified to exercise supervision.” Ellis said (pages 95-96):
“A recommendation that the [London] board should issue textbooks of its own was rejected but a list of readers was compiled. An agent was appointed to supply and deliver items required at a standard rate of discount, but in order to effect economy in dealings with manufacturers and publishers, a Central Store was established by the Board in 1874....

“The report of the Cross Commissioners in 1888 represented a watershed in the attitude to books in schools. It was claimed that no case had been established for the prescription and recommendation by inspectors of particular books....

“The Commission was opposed to the introduction of a set of government approved textbooks but considered it useful to publish an extended curricular programme so that managers and teachers would be increasingly aware of the requirements of the syllabus and select their books accordingly.”

However, the atmosphere was freer after 1890 with the dropping of the rigid rule that financial support was dependent on the “Standard” test results. In this far more independent atmosphere, when government control on reading instruction greatly lessened, real phonics had begun to come back in English reading books by about the turn of the century. The record suggests that centralized control of beginning reading instruction through texts, tests, and teacher training had enormously lessened, even though centralized control of education in England was increasing.

The supposition can be made that most of the old “experts” pushing the “meaning” method in reading in the Victorian period in Great Britain had either retired or died. Yet when the swing back to sight-words appeared in Great Britain during the 1920’s and 1930’s, it apparently did so under a new crop of “experts.” They eventually “achieved” in England the same unhappy effect on beginning reading instruction as in America, through functioning as “experts” in teachers’ colleges and as “experts” on study panels. That the latter is so is suggested by publications to which Ellis referred, which he listed in his index (page 227). These texts would be well worth researching if time permitted. Note the ominous dates of 1928 and 1931 on the three which concern beginning reading:

“Hadow Committee Reports

“Books in Public Elementary Schools (1928)....
Education of the Adolescent (1926)....
Infant and Nursery School (1931)....
Primary School (1931)....”

However, before 1890, when the Standards and the tests were in effect, in tandem with teaching of reading by “meaning,” the record showed appalling reading failures.

A lengthy speech with statistics on school results was given on October 2, 1878, by Sir Charles Reed, Chairman of the London School Board. His talk was quoted in the American Circular of Information No. 2 for 1878 of the Bureau of Education, United States Department of the Interior, Washington, Government Printing Office: 1878. The circular was entitled Elementary Education in London and was compiled by John Eaton, Commissioner, and approved by C. Schurz, Secretary of the Interior. In his speech, Reed had referred to results from tests on the “standards.”

The “infants” or children under seven years of age were not tested, even though they may have been in school from the age of four or even three. At the close of the first year for the seven-year-olds, according to the first standard that had been in effect since 1871, children were expected “to read a short paragraph from a book not confined to words of one syllable...” The second standard was only expected
to do a little better. The fourth standard was supposed “to read with intelligence a few lines of prose or poetry...” The footnote describing the standards in the American report added the words, “selected by the inspector,” which phrase obviously must have been given to the compilers of the American report in 1878 by someone from England. Yet those words did not actually appear on the 1871 standards. As quoted elsewhere in this text, a microfiche copy of the actual 1871 English document in the New York Public Library does not contain that phrase.

It was another ten years before the “standards” were revised again in the Code of 1881 and the literature does not suggest that any alterations occurred to the standards in the meantime, though of course it is possible. The phrase was added to Standard IV in the 1881 standards but was removed the following year, at which time Standard IV was completely changed. (It should be noted that nine years had elapsed between the revision of 1871 and the original standards of 1862, and ten years had elapsed between those and the standards of 1881, but only one year elapsed before the changes of 1882!) Unless some alteration was possible in the formally adopted standards of 1871 before the next formally adopted standards of 1881, this 1882 change seems to be an implicit admission that something had gone awry with the appalling demand that the inspector select the text at the fourth standard. Children could not repeat from memory a random selection chosen by the inspector. Note that the requirements implicitly state that the first and second standards were to use reading texts selected by the teacher. These would almost certainly be practiced texts and very probably memorized texts, like those referred to by Colonel Parker in America in his 1900 anecdotes about New England practices before 1875, referred to elsewhere in this history.

Reed stated concerning the schools in London at the end of the 1877-1878 school year (page 16):

“...at the close of last year 41.5% were in the 1st standard, 25.8% in the 2nd, 16.1% in the 3d, and 16.6% in the 4th, 5th, and 6th.”

Percentages of children in each standard could logically only come from the numbers of children presented to the inspectors for actual tests in those standards. Reed must therefore have only been referring to the percentages of children tested in each standard, and not to the total children enrolled in the schools. If all children had been promoted annually, each standard tested would have contained 16.66%. Instead, the bottom Standard I contained 41.5%, and the three top standards all together, IV, V, and VI, which should have totaled 50%, instead totaled only 16.6%. Furthermore, these figures omit children who had failed the previous year and who were not ready to jump two standards in their testing, as re-tests could not be made on such failing children at the level on which they failed. Obviously, such failures from the previous years might have been a sizable group. However, even with those children eligible to be tested, which are the apparent source for Reed’s figures, two-thirds of the children who should have been at levels IV, V and VI had not reached them!

Children had to stay in school till thirteen years of age and had to be enrolled by the age of five. The London school board, according to Reed, had received plaudits at the Vienna Exposition of 1873 for its success in enforcing mandatory attendance laws. In London, therefore, most children by 1878 would have been in school since at least 1872. It is evident that the failure rate by the 1877-1878 school year was ENORMOUS. Again, it should be noted that these figures almost certainly only refer to the children eligible to be tested, which means those children would not have failed those particular standards previously. It is obvious that the only children who could really read in the compulsory government schools in London were some of the 16.6% eligible to be tested in the top three standards. The reading program in the London compulsory government schools by 1878 was therefore a dismal failure.

It is at this point that the “Figures cannot lie, but liars can figure” syndrome showed up, so dear to the hearts of educational statisticians. It is obvious that not all children were tested, since a child could not be tested in the same standard twice, if he had failed it previously. It is evident that most failures were
unlikely to jump past the standard they had failed to the standard above it in only one year, which is the only way they could be tested the following year if they had failed.

Yet Reed produced these seemingly fine figures (page 16-17):

“In standard subjects the percentage of passes last year in reading was 87, in writing 84, and in arithmetic 79.1. This compares favorably with the percentages for the entire country, which are given as 85.78 for reading, 78.99 for writing, and 69.97 for arithmetic.”

Some material quoted previously showed that, about 1870, 80% of the children never reached higher than Standard III of the six standards. An 87% “pass” rate is therefore obviously far too cheery. To show the possible effect of the education bureaucracy’s removing “failures” from its testing population, by its rule that children could not be tested twice at the same standard, consider the following “worst case” scenario. Obviously, failures should not have been continual for the same children, but the figures given below nevertheless demonstrate the worthlessness of the government’s statistics. The figures also glaringly illustrate the government bureaucracy’s defensive reason for its otherwise puzzling omission of previous “failures” from its testing population. Since the results of its tests became public knowledge, including “failures” in each subsequent year would have ENORMOUSLY increased the percentage of children failing, and that would have been very poor publicity each year for the activists!

The board schools were in operation in 1871. Assume that the first testing year for children in board schools was 1871-1872. Of course, the dreary statistics already cited on the massive failures on the Standards before 1870 in government-subsidized schools make it certain that a very, very large percentage of children in the new government board schools would have failed the first Standards test in 1872. Yet, for the sake of argument, assume that out of every 100 tested, 87 passed in reading in 1872 (since 87% was the figure which Reed said was the passing average in London at the end of the 1877 year). Only those who passed in 1872 could be tested the following year in 1873. If 87% passed in the next test of 1873, the 1873 total of “passes” would amount to 76 out of the original 100 tested. When that 1873 “pass” group was tested in 1874 with an 87% “pass” rate, the total would drop to 66 out of the original 100. When that 1874 “pass” group was tested in 1875 with an 87% “pass” rate, the total would drop to 57 out of the original 100. When that 1875 “pass” group was tested in 1876 with an 87% “pass” rate, the total would drop to 49 out of the original 100. When that 1876 “pass” group was tested in 1877, the total would drop to 43 children actually being tested out of every 100 children enrolled in school. In 1878, the total would drop to 37 out of 100. Two-thirds of the children would be omitted from these statistics issued by “experts” to tell the public that 87% of the London children were passing in reading. Does some intermediate case to this “worst case” scenario account for the tiny percentage of children, 16.6 per cent, who Reed specifically said were eligible to be tested in the upper three standards in London in 1878, instead of the 50 per cent of the children who should have been eligible to be tested in the top three standards?

Reed referred to more than test results in his report. He reported glowingly on the teaching staff. (A ratio of one teacher to about 75 pupils appears probable from his numbers, which is a mute testimony to ineffective schools.) He said (page 15):

“At Lady-day we had in our schools 2,378 adult teachers, of whom 406 held first class certificates and 1,283 second class. These were exclusive of 1,479 pupil teachers and 272 candidates....”

“Pupil-teachers” were a hang-over from the Bell and Lancaster influences, and were also subject to regulation, but note that the adult teachers held “certificates.” No dame school head had such a “certificate.” “Certificates” came from normal schools and courses, where teachers were taught all the
“correct” ways to teach. The correct way to teach reading, of course, was by “meaning.” Just as in America, the poison in education was coming from “certification” in “normal schools.” “Certification” represents pure, “expert”-ridden, institutionalized, bureaucratic “control,” permanently insulated from the corrective forces of reality.

The government schools in Britain were achieving the same dismal results in reading achievement as the American schools in the 1870’s because they also used the “meaning” method for teaching beginning reading. Furthermore, the “meaning” method used in the government schools had also arrived in the private schools after about 1826 because of the mindless following of “expert” advice. As discussed earlier, William James had referred to George James Romanes’ casual testing of the reading of adults in England, which Romanes had reported in his 1884 book, Mental Evolution in Animals. Romanes had said he found “an astonishing difference between different individuals with respect to the rate at which they are able to read,” and he had said further that the slowest readers were the weakest in comprehension, despite the fact that he had “tried the experiment with several highly distinguished men in science and literature, most of whom I found to be slow readers.” Romanes had simply turned up, with his testing in England, the reading disabilities that might have been anticipated from the “meaning” method that had been in use there since shortly after 1826.

Concerning the results of the “standard” examinations37, which concern only those children eligible for testing but which tell nothing about the proportion of previously failing children not eligible to be tested, Ellis stated (page 90):

“...in 1872 children in standard IV to VI comprised only 17.96% of the school population (Ed.: obviously of the TESTED population), in 1886 the proportion had risen to 34.68%. ...the proportion of scholars aged 10 and over presented in the lowest standards for examination purposes fell from 63.71% in 1872 to 36.33% in 1886.”

Since it was not possible for a child to be presented “for examination” in a standard which he had previously failed, this obviously does not indicate any provable improvement. Children aged 10 and over should all have been tested at Standard IV and higher, if they had moved up a standard each year. Yet at least two out of three had failed by 1872 since they were tested in a standard below that, and at least one out of three by 1886 for the same reason. Yet the improbable assumption cannot be made that all children aged 10 and over were tested because none had failed the previous year. It should also be remembered that all that Standard IV really asked in reading was that children had succeeded in memorizing poetry in a reading book they had been reading all year, apparently except for the year 1881 when the inspector chose the selection at Standard IV. It is highly illuminating that this demanding provision was removed after only one year, when the new Standard IV was issued in 1882.

The Superintendent of the Boston Schools until 1878, John Philbrick, referred to developments in England, in the Annual Report of the School Committee of the City of Boston. 1871, page 154:

“I have already alluded to the importance of comparisons in educational matters, and I shall take this occasion to make a practical application of the principle by quoting from the recent doings of the School Board for London. This body, consisting of forty-nine members, was elected on the 29th of November, 1870, in pursuance of a special provision of the Elementary Education

---

37 A sardonically humorous article from England is reproduced in Appendix A from the The American Teacher, (page 278, The New England Publishing Company, Boston, Massachusetts: 1884, probably May) concerning school inspections and testing in England for the “standards.” Although humorous, the article also demonstrates the worthlessness (and often downright cruelty) of government meddling in education, which, by its nature, belongs in the private sphere.
Act, which received the assent of the Queen on the 9th of August of the same year, and which is intended to secure to the people of England and Wales the advantages of a complete system of elementary schools. The great interest attaching to the doings of the London Board results not from the experience of its members in developing or administering a great municipal system of common schools, but from their exceptional character in respect to ability and learning, and from the fact that, unhampered by tradition or routine, they have availed themselves of the light derived from the experience and wisdom of foreign countries to an extent unknown in any similar undertaking. A special Committee of fifteen members, Professor Huxley being the chairman, was appointed to submit a scheme of education. This Committee has made its first report, which is evidently the result of the most careful and thorough study of the subject. This report classifies the schools into Infant Schools, for children below seven years of age; Junior Schools, for children between seven and ten years of age; and Senior Schools, for older children.... (page 155)

It is concluded that the period during which the children are under actual instruction in school should be five hours daily for five days in the week...

“The subjects of instruction recommended for the several grades are as follows: -

**INFANT SCHOOLS**

a. Morality and religion.

b. Reading, writing, and arithmetic.

c. Object lessons, of a simple character, with some such exercise of the hands and eyes as is given in the “Kindergarten” system.

“In addition, the general recommendations respecting music and drill apply to Infant Schools, in which singing and physical exercises, adapted to the tender years of the children, are of paramount importance.”

This, of course, was a performance solely on paper. The real results were appalling.

London children had been subject to local compulsory attendance laws ever since the 1870 education legislation had given local boards the option to command school attendance. Yet compulsory education for the country as a whole did not become general till later. Pamela Horn referred (page 52) to compulsory education legislation of 1876 and 1880 which concerned the whole country (though it was frequently unenforced):

“For although the completion of a specified number of attendances permitted children to work part-time once they had passed the minimum school leaving age of 10, a permanent severing of the links with school below the age of 13 depended upon the results of their annual examination.... Under local bye-laws, therefore, a minimum level of attainment was laid down - usually Standard IV or Standard V - and only when this had been achieved could the children legally leave.”

Pamela Horn said that if a child had 250 attendances a year (morning and afternoons being counted as separate attendances) for five years, that child could get a “dunce’s pass” before 13. Many parents, for economic reasons, were anxious to obtain permission for their children to leave school. Concerning this, Pamela Horn said:

“Yet, against the miserably poor family background of many labourers and their children, this anxiety is understandable. It is touchingly illustrated in the letter written by a labourer’s wife (a Mrs. Spray) from Magham Down, near Hailsham in Sussex which was sent to the Education
Department in 1886. It referred to her twin daughters, aged 12, who were seeking work as nursemaids and who, presumably, had not passed the appropriate Standard examination.”

The letter which was quoted was astonishingly accurate in spelling, since the wife of this labourer can be presumed to have had very little education herself. Presumably about forty years old in 1886 when she wrote the letter as the wife of a sixty-year-old laborer and mother of twelve-year-old twins, she would have been a five-year-old learning to read about 1851. In 1851, dame schools and the spelling book were still prevalent for poor children and the average attendance at school was less than two years, nationally. Yet this poor woman had learned to read and to write understandably (though not perfectly) with a minimum of schooling, while the vast majority of children forced to attend government schools for years in the 1870’s and 1880’s could not, according to actual statements made by responsible people at that time, which are quoted elsewhere in this history.

For emphasis, the misspelled words in Mrs. Spray’s letter have been underlined. Note how much they are in the minority. Note also that she misspells certain words consistently. She simply learned them wrong (there for their, his for is), but she is still literate in the real meaning of the word. However, she obviously had not attended “school” long enough to be taught punctuation or to perfect her spelling, although it is accurate on the great majority of words she used. It should be noted that Mrs. Spray’s spelling was even more “accurate” than that of the scholarly men in England in Henry VIII’s day, such as St. Thomas More, before the arrival of dictionaries! It is also evident she would be reading well above the 90% frustration threshold, since her spelling accuracy is certainly far above that level.

Concerning Mrs. Spray’s omission of punctuation, so was punctuation omitted by all the writers of all the classic literature of ancient Rome and ancient Greece - Virgil, Plato and the lot of them! However convenient we find punctuation and capitalization, neither existed in ancient Greece and Rome. Their efficient use represents different skills (conditioned reflexes) than the conditioned reflexes underlying basic literacy. What Mrs. Spray’s letter demonstrates is that she had excellent conditioned reflexes on “literacy,” but had not acquired those concerning punctuation and capitalization.

“I now write a few lines to you to ask you if my daughters can leave school I have sent you there own writeing and there age and figures because we cannot finde them in clothes and food and keep a home for them any longer without there help there Father his 60 years of age and he goes 4 miles every morning and 4 miles back that makes 8 miles a day and then if it his fine all the week so he can work on the farm he gets 14s. but if it his wet he cannot work on the farm he his paid for the days he does work so his earning never amounts to more than 10s. a week and very often under 10s. in the winter months... and this cruel cruel law of a school board it his too bad ... just ask yourselves how you could keep a family on 14s. a week for six month in a year and 10s. the other 6 and finde everything that his wanted will you please will you let me know because they must go for a nurse maide I know of two places and they would have gone only this school board nucence...”

Pamela Horn added (pages 52 and 53:)

“With Mrs Spray’s letter were some simple addition and subtraction sums produced by her daughters, plus quotations carefully copied from the Bible. Unhappily for her, this unusual method of approaching the authorities did not yield the result she was seeking. ‘Exemption depended not on poverty but on past attendance and the passing of the appropriate standard.’”

The tragic circumstances under which that poor family was forced to exist were directly attributable to the school mandatory attendance laws, which are nothing more nor less than involuntary servitude to the state.
With perhaps about a year of schooling, Mrs. Spray was “literate” enough to write a clear letter. Also, she probably either owned a Bible which she read or had excerpts from the Bible which she read, because she had her daughters copy from it. Yet by the time she wrote her letter in 1886, it had been freely admitted that four out of five children at the age of twelve leaving English government schools, which taught reading by “meaning,” could do neither. Those nineteenth-century children could not write an understandable letter, nor could they read and understand a text, which obviously meant they could not read the Bible. However, the daily oral reading of the Bible had been the norm in hosts of English and Scottish families in the eighteenth century. How the inability of so many English nineteenth-century children to read the Bible must have pleased the kind of activists described by Orestes Brownson! As quoted elsewhere in this history, those activists aimed to oppose religion without making a direct attack on it. For the “education” of four out of five children in the English government schools about 1880, the promotion of the “meaning” reading method had certainly filled those activists’ indirect anti-religion formula.

That it is, indeed, possible to achieve Mrs. Spray’s level of literacy with only one year of “sound” reading instruction is shown by the little story below written by a first-grader from Ashby-de-la-Zouche, Leicestershire, England, at the end of only one happy year in a good school in 1971. Both the impoverished Mrs. Spray who undoubtedly had little “schooling” about 1850 and the little first grader in 1971 had achieved the same level of competence after only a year of so of “sound” instruction. They were therefore overwhelmingly more competent than the children in the 1880’s who had attended English government schools which gave “meaning” instruction for many years.

On June 14, 1971, a small group of American teachers of which I was a part visited the “open classroom” school at Ashby-de-la-Zouche in England. The town had been named after a retainer of William, the Conqueror, and still had some old buildings from the 1500’s. We were told the town had been a Royalist stronghold in 1642 and that Ashby Castle had been blown up by Parliamentary troops except for its tower. Ashby-de-la-Zouche was the town in which the schoolmaster/author John Brinsley had taught until he was dismissed for anti-Royalist sympathies. Brinsley wrote the famous teaching guide, Ludus Literarius, published in London in 1612 which, interestingly, endorsed true phonics.

In such ancient surroundings, the school was new, having opened only two years before, in 1969. It was delightful and modern, with rooms opening on a central area, and with much display of the children’s very good art work. It was a happy, relaxed place with well-behaved children. Students at all levels were doing individualized subject matter work in the morning and in the afternoons considerable art work.

In this most modern of schools in this ancient town, it was the first-year students who interested me most. They were being taught beginning reading with the same “sound” efficiency that Brinsley had endorsed in Ashby-de-la-Zouche in 1612 and that the Scottish Schoolmaster had used in Scotland for thirty years before 1829. Although I was told the school had a 200-word basic vocabulary list for beginners, I was also told that the teaching of phonics was massive. The effect, obviously, was that children learned their list of high-frequency words and the rest of their “reading” by “sound” and not by “meaning,” just as had been the case with the eighteenth-century spelling books and with the Scottish Schoolmaster, whose students read anything fluently by the time they were seven. That the program’s emphasis on phonics worked even at upper levels was shown by the mention made to me of one transfer student who had arrived in September scoring at 4.5 years in reading but who reached 9.5 in June.

Since the first-graders also watched a reading instruction program on British television, it was very possibly one of the two BBC programs using the phonic materials of Dr. Joyce Morris. As discussed later, the first program, intended primarily for junior classes in 1965, was Look and Read, and the second program for beginners a few years later was Words and Pictures.
The first-graders’ independently written stories were reportedly hung up without correction, and they were remarkably advanced. I copied the following one, which had just been finished by a little girl, and I attempted to copy it precisely in the time available (although I unfortunately did not record her name). The following is therefore essentially her spelling and punctuation on this story which she had just finished writing in June, 1971, at the end of first grade.

The 200-basic word list she had been taught would obviously have been composed of high frequency words, and, with the emphasis on phonics, would have been as easy to learn as the lists in the old “sound” spellers. (I was astonished to find how quickly my first graders, taught with heavy phonics, learned to spell such high-frequency words correctly with very little or no study, particularly in contrast to the third-graders I had taught for 13 years. Those third-graders had been taught with the deaf-mute-method readers such as Ginn and Scott, Foresman in first grade, and their spelling of words they had not actually “studied” was very poor in third grade.) The little girl’s problems, which did NOT include spelling, were two: punctuation and proofreading (besides the use of “was” for “were”). Both punctuation and proofreading are normally emphasized in later grades. Two omitted words which she did not realize she omitted because of her trouble with proofreading are marked like this: ().

Only four words are misspelled and they are underlined below for emphasis. One of them, “jewels,” is correctly spelled at the end, so that misspelling is probably another proofreading error. So probably is the misspelling “oter” since “other” is correctly spelled at the end. That leaves two genuinely misspelled words: carefull (she obviously had not been taught that the spelling of “full” is different at the end of a word) and “watter” which is a phonetic misspelling. Yet the common words so often misspelled in elementary school came through perfectly, probably as a result of that 200-word list which must have been taught with much emphasis on “sound”: once, time, there, some, girl, sea, they, was, off, nice, good, against, people, one, day, saw, etc.

“Once upon a time there was some sailors they were going to the oter side of the sea to take a girl back to her mummy and So they set off. There was jewls and vases on the () and nice food there was a lot of rocks and they were very sharp rocks so the driver had to be very carefull but he bumped against a rock and sunk all the jewels and all of the vases and all of the food as the boat went over and over and all the people died one day a diver came in the watter and he saw the jewls and the vases and the ship and he took them () the other divers”

The disjointed plot is to be expected from a little girl who was probably only six-years old. Yet the spelling is vastly advanced compared to that obtained in schools using the “meaning” method. This can be easily confirmed by checking some of these words on the Iowa spelling scales of the 1950’s!

Notice, however, that the spelling level and punctuation level after one year under instruction is comparable to the achievement of the mother of the little girls who wrote the letter just quoted. That mother probably also had less than one year of schooling and probably spent it using a “dog-eared” spelling book since her spelling is remarkably accurate for a woman who probably had almost no schooling. Her spelling accuracy (and therefore reading accuracy) and the accuracy of the little first grader from Ashby-de-la-Zouche are what can be expected in less than one year from the majority of children taught beginning reading by “sound.”

Nor was the little first grader alone in her achievement in 1971. The walls of her classroom were hung with similar stories from her first-grade classmates. These were not the “fake” stories so often seen in “whole language” first-grade rooms where the teacher provides most of the spellings because the children are as incapable of spelling by themselves as they are of reading by themselves.
Yet the government schools in Great Britain about one hundred years before, in the 1870’s and 1880’s, which mandated that children should serve years in them even if it meant a family went hungry, produced an 80% failure rate after YEARS of “meaning” reading instruction!

Children such as Mrs. Spray’s daughters were being forced by law to attend government schools which could not teach the majority of them to read even after years of compulsory attendance. Appalling anecdotes concerning the cruel effects of these compulsory attendance laws can be picked up from the files of English newspapers in the early 1880’s. Others appear in an undated pamphlet in the New York Public Library, The Star Chamber on the Victoria Embankment. A True Bill Against The School Board for London, by John Hampden, Ratepayer, Extracted from the “Hackney and Kingsland Gazette,” With an Introduction by the Rev. J. DeKewer Williams, London: C. and A. Potter’s “Hackney and Kingsland Gazette” Office Steam Printing Works.

From internal dates, it would appear the pamphlet came out most probably in 1877 before a London school board election in November. Note Hampden’s equating Thomas Huxley’s famous London school board in 1877 with England’s historically infamous Star Chamber! (Huxley had been the Board’s principal founding member and established its character and nature, but he left it in 1872.) Although the author of the pamphlet had some ideas about class distinctions which are highly offensive, he also had some very persuasive arguments on other matters. In essence, he charged the government-school activists with persecution of the poor. It is interesting that the kind-hearted Brougham, that great promoter of government schools some fifty years before, had deserved the same charge!

The Reverend Williams’ remarks were in the Preface:

“...Then Centralization and Uniformity are alike contrary to the genius of this free people.... But the tendency of the School Board has been beyond all precedent and all reason to a slavish Uniformity and a fatal Centralization.... As for those visitors who violate the sanctity of English homes [etc.]... If then Britons are not to be slaves, they must, they should at once free themselves from the varied tyranny of the School Board....”

These were some of the comments in John Hampden’s letters:

“...The fact is that the London School Board has determined by all means, however foul, to get the education of London into their hands; and therefore have bought and broken up all Voluntary Schools where they could; and impudently brand all at which the parents fully pay for their children as ‘Private Adventure Schools!’....

“I will show you something worth seeing... the picture of the London School Board, taken by their own Artist, very properly in stone; approved by... the whole Board. It is on their noble School in London Fields, Hackney... On it you see an original and ingenious carving in stone, containing two men, the one knocked down by the other who kneels upon him, seizes him by the hair of his head, and thus, ‘taking the law into his own hands,’ seems to say: ‘I’ll be the death of you!’ In fact, the one is garotted by the other. To be sure the artist, according to instructions, has made the sufferer anything but prepossessing (and who would be so when murderously assaulted?) and has given the other wings, as though he were an angel, that is, the destroying angel. And lest the parable should be misunderstood he has labeled the one, ‘Ignorantia,’ and the other ‘Scientia.’ Do I like this thing? No, I loath it; it is unmanly, it is un English, it is ungodly - it is the last and lively illustration of the old proverb - ‘The Tender mercies of the wicked are cruel.’ But it is the Board’s own picture of COMPULSION.
“My least objection to Compulsion is, its great cost; nearly £25,000 in one year! This the ratepayers have to pay; and we have to add to this the various losses to the 7,000 parents summoned in the year; and the time of the Magistrates, who complain of the summonses coming in by the dozen, that is, from 23 to 47 in a day; one of whom sternly rebuked the representative of the Board for calling a respectable parent: ‘The Prisoner.’ Then the cost of the new Prison for Truants has yet to be estimated.

“My objection to Compulsion is that often it is very cruel.... A widowed mother wants her eldest girl to nurse the baby while she earns bread for the family. I hold it fragrant [sic] cruelty to send that girl to school and starve them all. A poor father says that if his son goes to school instead of his place, he must go hungry. I hold it very cruel to say: ‘Never mind whether he’s hungry; send him to school.’.... I hold it very cruel to drive a poor woman to such desperation that she shall come into Court and say ‘You are all a set of villains. Your School Board is ruining all the poor and parting man and wife,’ then throw her very wedding-ring at the Magistrate, saying: ‘Take that and pay yourself.’ A dangerous state of things that!

“But poor George Bevis, he did not send his child to school, as she had the ringworm, he was summoned and fined, and as he had not the amount with him he was taken to prison, had his hair cropped, and was clothed as a felon, and could not communicate with his bewildered wife till the next day. Is not this worthy of the old Star Chamber? I know that the case has been explained to the satisfaction of the irreverend member for Hackney and the Board generally. But I know that the Home Secretary admitted the facts and only promised to prevent a recurrence of them. Here, however, is a case which I leave to speak for itself: ‘John Speer, of Canute street, Rotherithe, appeared to an adjourned summons for not paying a fine of 6d. with 2s. costs, for not sending his son to school. The defendant, who seemed very feeble, said he could not pay. He was nearly blind and unable to work, and his wife had only just got up after her confinement. He had two other children, and that morning they had only a pound of bread and a pennyworth of tea and sugar among the whole of them for breakfast. In reply to the Magistrate he said it was impossible for him to name a time when he could pay. Mr. Patterson thereupon committed him to Horsemonger-lane gaol for five days.’ Alas for Mr. Patterson and his employer; what will their end be?

“Then those School Board Visitors, those detectives among honest people, how inquisitive they are, how inquisitorial they are! A member of the Board told me that through them he knew all about the homes and habits of the people! Surely as Sir Robert Carden well called the interference of the School Board with ragged schools ‘a piece of impertinence,’ this system of visitation, which none but the poor would suffer, is a grand impertinence [sic], and ‘the cottage homes’ should be as inviolate as ‘the stately homes of England.’.... And if one of these ‘rude unfeeling officers’ were to profane my threshhold I should certainly act like the Quaker who would not fight; but, when the vessel was boarded, calmly and firmly tumbled the enemy overboard, mildly and truly saying: ‘Friend, thee hast no business here.’

“What surprises me is that many ‘advanced Liberals,’ professing such jealous kindness for the working classes, are in favour of this piece of class legislation, this oppression of the poor - Compulsion. What surprises me is that many Nonconformists, who claim and clamour for civil and religious liberty, are in favour of this despotic rule among the poor - Compulsion. But they ask me whether, if a parent refused to give food or physic to his child, he should not be compelled? I say, of course he should; they are the necessaries of life, and Nature requires that they should be given to all. Well, he answers triumphantly, education is one of the necessaries of life. What, I answer, if there be only one school in the village, and that a church school? Well, he answers somewhat tremblingly, that is a peculiar case; and the right of conscience must be
respected; no child should be compelled to go to that school. Out upon such inconsistency and such dishonesty! in the name of conscience... Then there is after all the 5th Commandment, ‘the first commandment with promise,’ the Godgiven Magna Charta of all parents, poor as well as rich. And it is a crime for any people, or any police, to interfere between parents and children, except when the parents or the children are criminals. This is Divine Law. So I am dead against compulsion....”

The London school board by 1878 was carrying on a war with poor parents over “compulsion,” even though they could not teach the children of these parents to read. Knowing how to read is the irreplaceable foundation of education, but, as the statistics showed, the London reading program was a dismal failure.

The appalling failure of the London school board to teach children to read is never mentioned in the glowing encyclopedia reports on Thomas Henry Huxley’s “contributions” to national education in England as a result of his work on the London school board from its inception in 1870 to 1872.

The Encyclopedia Britannica, (1963), (Volume 11, pages 947 - 948) in its biographical entry on Thomas Henry Huxley (1825-1895), said he was born in England as the seventh child of the schoolmaster, George Huxley. He was described as an English biologist who speculated on philosophy and religion, and who became a strong advocate for agnosticism.

The article said further that he studied medicine and graduated in 1845, publishing a paper on his discovery of an inner sheath in hair. As a naval surgeon, his career was furthered by the naturalist Sir John Richardson, and Huxley received an appointment as surgeon on the surveying ship, H.M.S. Rattlesnake, where he studied the life at the surface of the seas in the tropics. His 1849 paper on this work was printed by the Royal Society to which he was elected as a fellow in 1851, and the next year he was elected to its council. He left naval service in 1854 and became a lecturer in natural history at the School of Mines.

The Encyclopedia Britannica article said that Huxley defended the theory of evolution, specifically against an attack on that theory that had been made by Samuel Wilberforce. Huxley gave that defense at the 1860 meeting of the British Association for the Advancement of Science. It was considered to be a victory for science over what was considered to be obscurantism.

It is true we have been conditioned to accept this sort of judgment, yet Huxley’s defense was hardly a victory for “science.” The philosophically loaded “theory of evolution” has lost credibility today with many reputable scientists. Even in its heyday it was embarrassed by insufficient supporting data. For a calm presentation of today’s abundant and highly scientific evidence effectively demolishing the theory, see Evolution: Theory in Crisis, by Michael Denton, M. D., Adler and Adler, Publishers, Bethesda, Maryland, and Burnett Books, Limited, The Hutchinson Publishing Group, Great Britain: 1985. Dr. Denton is a researcher whose field is molecular biology, but his painstaking book reviews the theory of accidental evolution in its relation to all sciences.

The Encyclopedia Britannica article said that, in Huxley’s “Essays” of 1892, he wrote that the theory of evolution was not speculation, but a generalization of certain scientific facts.

Yet the theory of evolution was never a generalization of facts but has always been speculation. It not only lacked enough supporting evidence to confirm it initially. Over the years since Darwin presented his theory, scientific evidence has been accumulating in surprisingly vast and constantly increasing volumes to refute it, as Dr. Denton massively and concretely documented. The quantity of such purely scientific
data (totally divorced from any metaphysical consideration whatsoever) which Dr. Denton presented and which refutes the theory of evolution is absolutely flabbergasting.

The Encyclopedia Britannica article reported that Huxley had served on at least ten royal commissions in the years between 1862 and 1883. He was the secretary of the Royal Society from 1870 to 1880, and its president from 1883 to 1885. He was a member of the new London School Board from 1870 to 1872. The article credited Huxley with having had a greater influence on national elementary education than any one else. Although he considered reading, writing and arithmetic of fundamental importance, he was opposed to memorization and believed that the study of simple physical science was a good intellectual discipline. Huxley did endorse teaching the Bible, partly because it was literature, but partly because, as he said in his Essays, he was:

“...seriously perplexed to know by what practical measure the religious feeling, which is the essential basis of conduct, was to be kept up, in the present utterly chaotic state of opinion in these matters, without its use” [and since the Bible is] “the most democratic book in the world.”

The Encyclopedia Britannica article said that, by 1872, Huxley had the equipment for a laboratory course in which he could expound his methods of instruction in biology to classes of elementary teachers. Through those classes, Huxley is considered to have had an indirect influence on the teaching of biology through the whole country.

Huxley’s expounding to classes of elementary teachers in 1872 his hands-on methods of instruction in biology are an almost direct parallel to what Agassiz did at Penekese in America in 1873, when Agassiz held a laboratory school in biology for educators connected with elementary schools. That parallel is surely curious, both in the timing and in the purposes and long-term effects of Huxley’s and Agassiz’s classes held for elementary school educators.

The article said that Huxley became a Privy Councilor in 1892. The Committee of Council which had charge of British elementary education was a part of the Privy Council. Therefore, by 1892, Huxley was in a position to have ultimate authority over British education, but he was a sick man at the time. His health had failed in 1885, according to the encyclopedia article, and he died in 1895.

The Encyclopedia Britannica article said that in the last years of Huxley’s life he wrote on philosophy and theology, and that he worked actively against orthodox religion. He wrote in “Life,” in 1887:

‘That there is no evidence of the existence of such a being as the God of the theologians is true enough’ (Life, ii, 162).[He wrote of] ‘the passionless impersonality of the unknown and unknowable which science shows everywhere underlying the thin veil of phenomena’ (Life, i, 239), [but] ‘...atheism is on purely philosophical grounds untenable.’ (Life, ii, 162).

What Huxley endorsed was agnosticism. He also wrote:

‘The cosmic process has no sort of relation to moral ends’ (Essays, ix, 83); ‘of moral purpose I see no trace in nature. That is an article of exclusive human manufacture’ (Life, ii, 268).

The Encyclopedia Britannica article said that Huxley believed that the evil in the moral life of man is the result of the cosmic process, and that the cosmic process would “resume its sway” when evolution began to wind down. (Essays, ix, 45).

Huxley had this conviction since his version of evolution was beset with “entropy.” Because of the principle of entropy in physics, the spring in the clock of time is supposed to run down eventually, since
there would be nothing to wind it back up again. This idea was used in 1895 in H. G. Wells’ novel, The Time Machine. When Wells’ time machine traveled to the most distant future, life was found to have disappeared.

Huxley’s grandson, Julian, became enamored of Pere Teilhard de Chardin’s theories because they seemed to provide a quasi-scientific reason for believing the opposite: the universe was not supposed to be running down but instead was supposed to be winding up, heading for the “Omega” point. This, of course, is current New Age reasoning. Yet Huxley had another grandson, Aldous, who approached New Age ideas differently: he wrote The Brave New World, painting a picture of a hideous “Utopia.”

Even though their grandfather, Thomas Henry Huxley, believed in eventual “entropy” for the universe, he may well also have conceived of a future New Age, but on his own terms, since his contemporary, Mathew Arnold obviously believed in a world yet “to be born.” Arnold spoke of himself in his highly unpleasant atheistic poem, “Stanzas from the Grand Chartreuse,” quoted previously, as:

   “Wandering between two worlds, one dead,  
    The other powerless to be born...”

Obviously, Arnold’s world which was still “to be born” would be a New Age, but it would be a world without religion, and that was the kind of world of which Huxley would have approved. It is not inconceivable that Huxley’s grandsons got some of their preoccupation with New Age ideas from their own grandfather.

The American parallels to Thomas Henry Huxley’s work are pronounced. Agassiz rejected Darwin’s theory, but other than that Huxley can be called the British Agassiz, or one could say that Agassiz can be called the American Huxley. (It complicates the analogy to admit that Agassiz originally came from Switzerland!)

Both Huxley and Agassiz concerned themselves with elementary education in 1872 and 1873, both were opposed to what they termed rote learning, and both were interested in teaching natural history to elementary teachers by actual laboratory work in 1872 and 1873. Furthermore, both had enormous influence at that time.

There probably was a difference between Huxley and Agassiz concerning religion. To the degree that Huxley had any beliefs at all, at the very most they can be called pantheistic. Agassiz’ religious beliefs are unknown, but he did refer to the glaciers he had studied so extensively as “God’s plows” and made other similar statements. Yet so might a pantheist have made such remarks. Hegel’s philosophy was enormously popular in that period, and Hegelianism is a form of pantheism, somewhat as expressed in Star Wars: “Let the force be with you.”

However, concerning the application of religious ideas, Huxley and Agassiz were not far apart. Except for their social utility, Huxley discounted the Ten Commandments which he considered to be man-made. Huxley must also have rejected free will, the Encyclopedia Britannica article stating that Huxley believed that the evil in the moral life of man is the result of the cosmic process.

Agassiz may also have discounted the moral law, as Huxley did, to judge from an amused comment in a letter William James wrote on April 7-8, 1871, which appeared in William James, A Biography, by Gay Wilson Allen, published by Rupert Hart-Davis, London: 1967 (page 174). Allen stated that James had commented in the letter that Agassiz had been ill but appeared recovered. James then said that James’ father had seen Agassiz at a dinner club a few days previously. Agassiz had told everyone there that he had gone to every one of Boston’s whorehouses over the past six weeks, because he had not felt able to
study and because of scientific curiosity. James wrote that he admired Agassiz because other Bostonians would lack the courage and physical spirits to entertain themselves in that fashion.

The great majority of American people in the 1870’s were religious and, unlike William James, would have taken a very dim view of Agassiz’ behavior. The great majority of British people were also deeply religious in 1870 and would have taken emphatic exception to Huxley’s amoral philosophy. How, then, did the “agnostic” (but more effectively atheist) Huxley reach such a position of influence on British education? Why was it he who was so highly visible on that most visible and most influential of the new school boards in 1870, the London School Board? If Huxley’s philosophical views had been publicized and a vote been taken on his appointment to exercise control over children’s education (and, in effect, over their minds), he would almost certainly have been overwhelmingly rejected by the British electorate of 1870.

Curriculum in government schools has consistently been under the control of such activists as Huxley and his admirers, and such activists as the followers of Agassiz. While their activism on the curriculum has been most visibly concerned with such lofty subjects as the sciences, literature and mathematics, the curious fact is that since shortly before 1826 activists have also always endorsed harmful “meaning” in beginning reading in opposition to helpful “sound.” In England in the 1870’s, the activists included men like Thomas Henry Huxley and Matthew Arnold, and in America Louis Agassiz and his followers, among whom the Adams brothers in Quincy almost certainly belonged. The damage the Adams brothers did to American education and to the teaching of beginning reading after 1875 through their agent, the superintendent of Quincy schools, Colonel Parker, has already been discussed. A quieter parallel existed in England after 1870 through the practices of the newly appointed school boards, and, in particular, the enormously influential London School Board to which Huxley belonged when it first began.

It was Huxley’s London School Board which first stringently enforced mandatory attendance laws in England, despite their enormous cruelty to the poor. At the exact same time that those mandatory attendance laws were being stringently enforced, those late-nineteenth-century London government schools were producing phalanxes of functional illiterates among the poor, because those schools taught beginning reading by “meaning” instead of by “sound.” That was in sharp contrast to the large numbers of truly literate London poor in the eighteenth century who had casually learned to read by “sound” from horn books and spelling books and who had then so enthusiastically bought great quantities of high-readability-level chapbooks.
Chapter 49
Some Evidence on Twentieth Century Developments in the Teaching of Beginning Reading in Great Britain

Two reliable guides on practices in the teaching of beginning reading in England from about 1900 to 1930 are provided by W. B. Winch and Mitford Mathews. W. H. Winch’s 1925 article endorsed phonics and was entitled, “Teaching Beginners to Read in England: Its Methods, Results and Psychological Bases,” Journal of Educational Research Monographs, No. 8, Chapter V, Public School Publishing Company, Bloomington, Illinois: 1925. Winch had been an English school inspector at least from 1905 to 1924, and gave extensive oral tests to children over those years. Another reliable guide was provided by Mitford Mathews in his book, Teaching to Read, Historically Considered, The University of Chicago Press, 1966. Mathews quoted and commented on excerpts from a 1929 work by Jagger which was very hostile to phonics. Both Winch’s and Jagger’s works, however, gave evidence on contemporary practices in England, and in that fact lies their utility for this history.

Besides having been an inspector in the London schools for many years, W. H. Winch had been for a time an instructor for graduate teachers in London. He was obviously an open-minded man and reported things as he saw them. His comments concerning the period from 1905 to 1924 seem to confirm that the teaching of phonics gradually improved over those years in English schools. Winch came to endorse the phonic method by 1924, but in 1905 had not done so. Yet he, himself, did not indicate that the phonic method had become more precise, and that its refinement was the reason for his change in attitude. Some English reading texts published over those years confirm that gradual improvement in the teaching of phonics. An improvement in teaching results may well have accounted for Winch’s changed opinion. Even though the same “Dale” phonic method of which he spoke in 1905 was still in use in 1924, the probability is that the manuals accompanying it had changed, just as the manuals accompanying the Blackie phonic texts in England, described elsewhere, changed sharply for the better over those years. Yet, to judge from Winch’s apparently uncritical acceptance of “phonic” lessons he described from 1914 which were particularly inept, Winch would not have been a competent judge of what constituted improvement (or deterioration) in phonic teaching.

What is particularly interesting about Winch’s tests, however, is that they were all oral tests. He referred also to another inspector, Ballard, who prepared an oral test, whose name has turned up nowhere else that I have seen, though he was obviously well known in 1925.

Winch spoke of Dumville, who produced test results that purported to endorse the teaching of sight-words, and Valentine who was a phonics advocate and who claimed to have disproved Dumville’s tests. Valentine’s tests are known to have been in 1913. Benjamin Dumville’s article, “The Methods of Teaching Reading in the Early Stages,” was published in School World, Vol. XIV, November, 1912, on pages 408 to 413. C. W. Valentine’s article, “Experiments on the Methods of Teaching Reading,” was published in the Journal of Experimental Pedagogy, Volume 2, pages 99-112, in June, 1913.

Winch then said:

“...about this time Ballard was making one of those more general observational surveys for which he is now so well known. By means of his One-Minute Reading Tests, he collected results from a whole district and found a phonic method (the Dale) the most successful. Criticisms were made that his one-minute test consisting of words, not sentences, did not test ability in reading....”
Of course, that is totally untrue. Connected oral reading is commonly more accurate than the reading of word lists for poor readers, because the readers can guess missing words in connected oral reading from the context of the selection. Yet word lists make such context-guessing impossible. Therefore, only word lists, not sentences, provide an adequate test of ability to read.

Winch had been talking about Valentine, so “about this time” when Ballard did his oral testing must have been about 1913. Ballard’s very interesting one-minute tests and their pro-phonic results have dropped from the literature, but they probably did much to increase the teaching of phonics in English schools.

In his chapter, “Observations in 1905-1906,” Winch said:

“...I tried to discover which of the prevailing methods of teaching reading to young children gave the best results in the infants’ school themselves, before the children were promoted to the senior departments.... From my own inspectorial knowledge, aided by that of one or two of my colleagues, I selected three infants’ schools, each of which had an extremely high reputation for the teaching of reading and whose successful results were well known. One taught exclusively by the “Dale,” an elaborate phonic system; the second by the “Sonnenschein,” a definite and well-worked out syllabic system; the third by the old Alphabetic, not phonic, spelling system. This last system was fast disappearing.... As to the social class.... They were all placed in good neighborhoods.”

Winch had, of course, twisted his results by picking only successful schools. He found the Dale system best, but the differences were not meaningful. He tested only children over seven years of age in reading Alice of Wonderland, and found they were very competent (but by his very vague standards). When he lectured on Pedagogical Methods in Schools from 1909 to 1913, he said the differences did not justify changing to any method. (Those lectures had been attended by Dumville, who disagreed and ran tests purporting to show the sight-word method best, after which Valentine ran tests which he claimed disproved Dumville and supported phonics.) Concerning Winch’s 1905-1906 results, Winch said:

“Such as they were, they came out thus: the Dale system first, the Alphabetic system second, and the Sonnenschein system third. But all the reading was of the highest order....”

Two unfortunate choices marred Winch’s results. The first was that he deliberately chose three highly successful schools, known for producing excellent results in reading. Why, then, test what is already known? One school claimed to use the Dale method, another the Sonnenschein syllable method, and the third the ABC spelling method. Yet Winch demonstrated from his later comments on the 1914 phonic lessons that he was not really knowledgeable on teaching methods. As Jean Chall said in her book, Learning to Read: The Great Debate (page 95):

“Imprecise terminology is another cause of difficulty in synthesizing research findings.... Seldom are... labels fully defined.... What W. H. Winch (1925) for example, called look-say is closer to the Bloomfield-Barnhart (1963) linguistic approach of today.”

Winch was not a good judge of reading methods. From comments he made, what he called phonics in his early work in 1905 sounds suspiciously like something else. He said, concerning his testing of seven year olds in 1905:

“In the Phonic school there were more errors than I should have expected in small words which the children really knew. I was not then aware that the child on any system apprehends a well-known letter and sound, and then ‘jumps.’ The Standard I class in this school had already
read from an ordinary reading book not arranged on the Dale system. I noted that the Grade III children who were 7 and upwards, only 8 in number, knew a few sounds only...."

Winch was describing children who had been taught whole words, no matter what “phonic” label had been put on the class. Seven-year-old children who make mistakes on small, familiar words, who guess from initial letter sounds, and who know “a few sounds only” are children who had sight-word instruction.

It is inconceivable that children taught real phonics competently, even the dullest, would know “a few sounds only” after they were seven years of age. As comments elsewhere in this history make clear, even mentally retarded children learn to read by real phonics.

Nevertheless, despite these remarks, Winch considered all three groups he tested in 1905 to be successful. Whether someone else would consider them successful is impossible to judge, because of the method he used to score, which was his second error. His choice for the test was good: a portion of Alice in Wonderland, which would be fairly demanding. However, Winch’s method of scoring made his results indecipherable. He based his total possible score of ten not just on accuracy but on fluency, and they are two totally dissimilar factors. As Alice herself had said, it is possible to say an uncertain thing in such a certain way (fluently!) and, as Quintilian said long before Alice’s day, in the beginning stage, reading should be at first sure, and only later quick. The problem with Winch’s study is that he did not really understand “reading” or how to teach it, despite his obvious good intentions.

The scores he reported were 6.7 for the Dale phonic group, 6.4 for the Alphabetic spelling group, and 5.8 for the Sonnenschein syllable group, out of a possible score of 10 for accuracy and fluency, but what that meant no one knows. It is not surprising, since Winch said he picked these schools to test because he knew they turned out good readers, that he summarized his test by saying:

“All these are very high marks for an examination based on Alice in Wonderland for children of this age.”

It should be remarked in passing that the old Scottish Schoolmaster in 1829 would have expected a 10 from all of them. He considered it normal for children of seven to be able to read fluently anything put in front of them, and Alice is not really terribly difficult.

Winch did add that on the Sonnenschein syllable group being tested, he had found one class in which “...there had been, contrary to the recognized system, some phonic building up of the syllabic bases in one of the lower classes; this was quite evident during my examination.” That was a discrepancy he managed to pick up. The probability is that the other groups were also not taught purely by one system.

Winch had said of his 1905-1906 test group (page 13);

“All the reading was of the highest order; and I frankly told the teachers who came to my lectures, that I should not recommend any of them to use effort and thought and expend municipal funds (for new books might have been necessary), to change their methods on the evidence of the facts supplied by me.”

Winch continued to test over the years, testing in 1914 in poorer neighborhoods, and continuing tests to 1924.

Concerning methods in use in 1924, Winch said:
“Many varieties of method are used... There are phonic methods, in which the sound-values of the letters are taught first; though nowadays, the names of the letters are not neglected. Of these the Dale System has earned, and rightly earned, many enthusiastic advocates... There are also syllabic methods, of which Sonnenschein’s is the best known, where the syllable is taken as the unit of language, and analysis stops short of the syllable. Again, there are look-and-say methods in which there is no analysis of the word at all, and in which the word is sounded as a whole....”

As Chall pointed out, what Winch called “look and say” were probably “linguistic” approaches.

As Winch continued his experiments over the years, his results came more and more to favor phonics, and finally, in 1925, he endorsed the Hayes Phonoscript method, which sounded like a reinvention of Leigh’s or Robinson’s pronouncing print materials. The point, however, is that Winch, himself, shifted to an endorsement of phonics, and that coincided with the improvement in phonic materials published. Poor phonic materials became good phonic materials, or at least better-taught phonic materials. Perhaps that was the case with the Dale phonic method, whatever that was.

Winch said, in conclusion on page 175:

“Over a period extending from 1905 to 1924, observations and experiments have been made in English schools on the methods and results of teaching beginners to read... The result is a victory for the phonic method”

Winch said, however, when a phonic method was compared to “Mr. Hayes’ Phonoscript” the latter was better.

Winch’s 1925 report seems to confirm the trends which are evident on some English reading series published after 1900 which I have been able to examine. Phonics had returned in some materials after 1900, and such materials became more strongly phonic with the passage of time. Whether English schools used the “supplementary phonics” charts so popular in America up to 1930 is unknown. (It seems very possible that they did. They had Reading Disentangled charts through much of the nineteenth century, and, across the Channel, France was using the Boscher phonics charts at that very time, as Elise Freinet remarked, to be discussed later.) To what degree phonics texts were in use in England by 1925, Winch gave no real clue. However, confirmation that the use of phonics was probably dominant in English schools by 1929 came from an opponent of phonics, Jagger.

In Teaching to Read, Historically Considered, Mitford Mathews referred on page 119 to Jagger and his use in England of the sentence method. Referring to a paper by Henry Bradley in 1913 on “Spoken and Written English” Mathews reported that Bradley had said that English writing “is well sprinkled with what Bradley called ‘ideographic devices,’ having at present no value at all in terms of sound.” Mathews said Bradley had cited such sentences as “The hair of the hare is commonly called fur.” Mathews said further:

“Bradley’s article made a great impression upon J. H. Jagger, an English student who later became well known in connection with his advocacy of the sentence method. In 1929 he published a book with the same title as Farnham’s much earlier work, The Sentence Method of Teaching Reading. About this identity of subjects, he wrote, ‘In 1887 a pamphlet bearing the same title as this book was published by A. B. Farnham at Syracuse, New York State. As far as the author is aware, no copy of this pamphlet reached the shores of England, and it does not appear to have exercised any influence on English education.’ Jagger explained that ‘The
Sentence Method has arisen spontaneously in some London schools, as a reaction against the mechanical tyranny that phonetic teaching has imposed."

Note Jagger’s apparent familiarity with the ideas contained in Suzzallo’s 1913 reading triangle, discussed elsewhere in this text. Yet the seemingly well-informed Jagger gave the wrong date, 1887 instead of 1881, for Farnham’s book, and he even gave the wrong initials in Farnham’s name, along with the claim that he had no knowledge of Farnham’s work on the sentence method when he started his own on the sentence method.

“Jagger quoted Bradley’s introductory paragraph, but disregarded the main portion of the essay. This was unfortunate, for Bradley might have saved him from saying: “Our system of written words, in structure and in the way that it is used by us, is mainly indicative of the sense; it is indicative of sound in a secondary degree. The written form of each word is associated directly with its meaning, and indirectly with its sound... To teach reading ideographically, without the interposition of sounds between written sign and meaning, is therefore in accord with the present character of English spelling as well as in accord with the historical development of writing.’

“Dr. Jagger apparently never lost the impression made upon him by Bradley’s introductory paragraph, nor did he assimilate the remainder of the article. In April, 1953, he wrote, ‘English writing today is an ideographic system - or, as those who regard it as a system intended to represent sounds would say, it is perfectly irregular. As a means of representing ideas it is unequaled; as a means of representing sounds, as a phonographic system, it is useless....’ He explained that ‘Reading is getting the meaning of printed and written symbols.’“

Mathews was quoting from Hunter Diack’s In Spite of the Alphabet (London, 1965.) Diack was an author with Daniels of a well-known phonic method in 1954, the Royal Road Readers.

Jagger’s 1929 disclaimer of any knowledge of the sentence method is reminiscent of Angell’s 1830 disclaimer of any knowledge of the 1826 Franklin Primer. Furthermore, Jagger expected it to be believed that the “sentence” method arose simultaneously in the minds of multiple London teachers in 1929, with no connection with other “experts,” such as the Americans who were busy dumbing down vocabulary in 1929 to pave the way for the 1930 deaf-mute readers. By 1932, England had Schonell as an expert, though, so Jagger and his friends had more company in pushing “meaning.” The books they wrote for the “meaning” method may have paid very well in England in the 1930’s Depression years, just as the deaf-mute method materials did in the United States. After all, in the world of government education, nothing succeeds like failure.

“Schonell, too, considers that [the phonic method] interferes with the idea of grasping words, phrases and sentences as meaningful linguistic units.”

For a time after the beginning of the twentieth century until about 1930, phonics had made a gradually increasing and naturally occurring comeback in both America and Great Britain, until it was once again attacked in the 1920’s by “experts” such as Gray and Schonell in both places. They succeeded in removing once again the rational “sound” approach from the teaching of beginning alphabetic reading and replaced it with the harmful “meaning” approach that is suited only to Chinese characters. Long
before 1940 in both countries, Gray, Schonell and their cohorts had succeeded in producing massive reading disabilities with their propaganda about “meaningful linguistic units.”.

In America, the teaching of phonics had returned to the classrooms when spelling books proliferated from the mid to late 1880’s, as a result of the massive failures in spelling that had come from following the lead of the Quincy schools after 1875. By the late 1880’s, spelling books for second graders which were heavily phonic were available in America, and the same sort of thing may have happened in England. The quotation cited by Pamela Horn from the 1880’s concerning the use of spelling books has already been given. Even though the Standards tested on sentences selected from the readers, the spelling books were apparently back in use in government-supported schools in Britain by the late 1880’s.

By the turn of the century in America, phonics had come back to first grade reading in supplementary phonics charts and occasionally even in the reading primers. Edward G. Ward wrote a phonic series, The Rational Method in Reading, published by Silver, Burdett of New York, Chicago and Boston, in 1894. However, it was not until after 1900 that other popular truly phonic readers were published in America and that “supplementary” phonics finally triumphed as the norm in American first grades.

The same move towards phonics showed up in England a year before the publication of Ward’s material, with the publication of the Albany Phonetic Readers by Laura Soames. Soames’ readers used the undesirable approach of phonetic respellings and were very poor, judging from a copy of the second reader in the Department of Education Library in Washington. It is entitled Albany Phonetic Reader No, 2, Soames’s Phonetic Method, and was published by Swan Sonnenschein & Co. in London in 1893. The following note was at the beginning:

“To the Teacher. This little book is Holborn’s Practical Infant Reader No. 2 transcribed phonetically, and [I thank]... the Educational Supply Association for allowing me to use it.... Brighton, May, 1893, Laura Soames. Teacher’s Manual in Preparation, the Child’s Key Shortly, Albany Phonetic Readers NO. 1, 2, 3,...”

The next page showed the “English Phonetic Alphabet” with phonetic respellings.

However, Laura Soames was clearly the author of the Albany Phonetic Readers and was listed as such in the contemporary American Catalogue: L. Soames’ Phonetic Method for Learning to Read, Nos. 1, 2, 3, published in 1894 by Macmillan. Macmillan was conceivably putting out American editions. However, the No. 2 reader published in 1893 by Sonnenschein which is now in the Department of Education Library in Washington is definitely by Soames. Therefore, it is puzzling to find that reader not listed in Early American Textbooks which was based on the Department of Education Library, and instead to find a title listed on page 77 which must be in error: Barnes Phonetic Method, Albany Phonetic Reader No. 3, published by Swan, Sonnenschein in 1893. There apparently is no such thing as “Barnes Phonetic Method,” since the Albany Phonetic Readers were by Laura Soames. They were a very unsatisfactory attempt to introduce “sound” in beginning reading.

Macmillan also published other phonic materials which I have not seen but which are listed in catalogs along with their multitudinous sight-word materials. As Winch discussed, Swan Sonnenschein were publishing a syllabic method by 1905, obviously a totally different approach from Soames’ phonetic print and undoubtedly meant as its replacement.

If A. Sonnenschein is the same person as the Sonnenschein in the publishing company’s title, the association of that company with efforts to return “sound” to reading instruction would go back to the unsuccessful efforts in the mid-nineteenth century.
On page 154 of Teaching to Read, Historically Considered, Mitford Mathews referred to the fact that a pro-phonic:

“...effort was made by A. Sonnenschien [sic] and J. M. D. Meiklejohn, whose English Method appeared in 1869. From what appears to be a competent and flattering review of it, it is clear that the authors proposed to start the child with the regularly spelled words and later to introduce him to those spelled in irregular ways.... The reviewer was the Rev. F. W. Farrar, Fellow of the Royal Society, writing in Macmillan’s Magazine, XXI (November, 1869-April, 1870) 445-48.

“The work of these two scholars did not gain the attention of influential educators. In 1879 Meiklejohn continued his efforts in a book called The Problem of Learning to Read. In this he pointed out that the beginner should be made familiar with only one function of each letter; his experience in learning to read should never contradict itself.... Dr. Reeder, an advocate of the New Education, pronounced Meiklejohn’s method entirely erroneous....”

Mathews was referring to the inept 1900 book by R. R. Reeder of Columbia University on the history of teaching reading, for which book Mathews made his contempt very clear.

The trend from sight-words to phonics in England is also suggested by the changing content of Blackie’s readers published between 1879 and 1914 and by the content of Nelson’s series published in 1922 in comparison to its earlier readers. Ellis had commented that both Nelson’s and Blackie’s readers had been widely used in the late nineteenth century, and they were obviously popular afterwards, so they might be cited for evidence on trends.

The Nelson’s material in the 1870’s and 1880’s has been described, and is clearly “meaning” oriented. Although the primer is not available, the First Reader of Blackie’s 1879 series certainly follows the Code 3 “meaning” pattern for a second book. It was entitled, First Reader, Comprehensive School Series, “London: Blackie & Son, 49 & 50 Old Bailey, E.C., Glasgow, Edinburgh, and Dublin,” and was stamped by the British Library, “December 4, 1879.” It followed the typical sight-word arrangement: a story, a picture, and a word list for the new words in the story. However, in Blackie’s 1879 First Reader, the list of new words came after the story, which suggests a large emphasis on context reading by the Blackie company in 1879.

A change had occurred by the time of the publication in 1908 and 1909 of Blackie’s Model Primers, First Primer (British Library reference 12981 ds. 1908-1909). The title page read, Blackie’s Model Primers (Phono-Syllabic Method) First Primer, London; Blackie & Son Ltd., 50 Old Bailey; Glasgow & Dublin.

The First Primer carried the following comment:

“Notes to the Teacher. The system of Reading adopted in this Infant Series is for the best part a combination of the ‘Phonic’ and the ‘Syllabic’ methods. Occasionally, where words of irregular formation are required, the ‘Look and Say’ method is employed.

“Interest and Perfect Gradation are aimed at throughout and the simple words adopted cover the difficulties usually encountered in a Standard I Reader of the average order.

“The First Primer is, in the main, devoted to words based on the short sounds of the vowels, but a few words of two and three letters (essential in the construction of interesting sentences) are introduced in Section III, having the long vowel sounds... Teachers adopting the method
suggested above should consult elementary Phonetics by Scholle and Smith, published by Blackie & Son, Ltd., 2s 6d.”

Colored pictures appeared on the top of the pages. The first picture was of a girl inside a piece of furniture, a chest, and a boy outside. Lesson 1, on page 2, was like the old sight-word approach:

“1. I am in. 2. is he in? 3. no, he is by.”

On the next page was Lesson 2:

“1. I am on. 2. is he by? 3. no, he is in.”

Up to page 41, the book progressed from two-letter to three-letter words, and there was no sign of phonics at all in the text proper. Yet page 42 showed the supplementary lessons that had been given from the very beginning pages.

Each of these supplementary lessons was divided into three parts: Section 1, Section 2, and Section 3. In the first supplementary lesson appeared, “Word Drill, Section 1.” “Easy words.” Short vowels were shown down the side of the page in red, followed by words with those vowel sounds: for “i,” “if it in is,” for “e,” “egg,” etc., for “a,” “am at an as,” for “o,” “on or ox og,” and for “u” “up us.”

Section 2 covered simple words based on these vowels: The first line began with “it” followed by “pit bit fit lit sit kit hit.” The next line began with “in” followed by “pin bin win tin din.” Next was “is” followed by “his this,” and then “am” followed by “jam ram sam ham,” “at” followed by “pat bat mat fat vat fat sat cat hat,” and “an” followed by “pan man fan van dan nan ran can ann.”

The next page had consonants instead of vowels in red, the first line reading “as and has gas was,” then “or for,” then “ox box fox,” then “up sup cup,” then “og dog.” The use of red for vowels and then red for consonants is a clear indication that the sounds of the letters were being taught, and not just two-step analytic phonics, comparing one whole word to another.

Section 3 was titled, “Simple words with long vowel terminal.” On one side of the page appeared “i e o y” on the side. Arranged next to them appeared such words as “be me we he the she bee wee see, no not so go got shot, y by my, to too do.” The children were being taught varied vowel sounds in words in a systematic (though far from ideal) fashion.

At the bottom appeared:

“The words in sections 1 and 3 should be studied before lessons 1 - 8 are read. These lessons are composed of two letter words with the exception of ‘the box egg bit jam dog,’ and the majority of the words in Section 2 will become familiar to the children by association with the pictures.... All the words in Lessons 1, 2 (and ) 3 should be regularly drilled from the blackboard. None but these are used in lessons 1-16.” (The book has 35 lessons.)

Obviously this was mixing “sight” and “sound” treatment of words, but that the children should have had phonetic lessons before even beginning reading lessons one to eight was a great shift from the emphasis at the end of the nineteenth century.

The exercise for Lesson 28 was “Short Vowels with Terminal B,” for Lesson 29 with M, for Lesson 30 with T, for Lesson 31 with D, for Lesson 32 with N, and for Lesson 34 with G. Lesson 35 concerned
forming a plural with f (as in scarf, scarves), and “er” in “her,” “or,” and “s” as “s” and “z.” The phonic arrangement was far from ideal, but it was, at least, a phonic arrangement.

At the book’s end appeared, “August 10, 1908 British Library.”

The second primer, stamped June 2, 1909, seems a reasonable phonic follow-up to the first primer. It was certainly not a very effective phonics series and had too much emphasis on sight words, but rates a Code 7.

The question of phonics in reading was a concern in Great Britain at this time, as shown by C. W. Valentine’s 1913 research, reported on pages 105-106 of Jean Chall’s 1967 Learning to Read: the Great Debate, and in other sources. W. H. Winch also carried on phonic research in England over a period of many years, his most famous material being printed in 1925 (reported by Chall in her 1967 book, and by Rudolf Flesch in his 1955 book, Why Johnny Can’t Read).

The First Primer of Blackie’s weak phonic series had been stamped by the British Library on August 10, 1908 and the Second Primer had been stamped June 2, 1909. Presumably they had just been published. It was only five years later that Blackie’s produced an excellent, truly phonic series, as shown by the British Library stamp of April 25, 1914. Blackie’s obviously produced that more heavily phonic material in response to market demand. The first book was titled, Blackie’s Practical Phonic Primers and Infant Readers. First Primer, Blackie and Son, Limited. The British Library catalog number is 12985 ff 18.

The twenty-four page 1914 primer did have three sight words: “the, to, do.” However, the arrangement of its materials was excellent, and it was printed in big print, which, of course, is very desirable for beginners. The series had a Second Primer, Infant Reader I and Infant Reader II. The primer carried the following comment:

“Explanatory Note: The aim of this Primer is to enable the child to visualize the letters of the alphabet, and produce their sound, without employing their names. To further this aim all ‘Parrot’ rhyming of words has been avoided. The letters are so arranged that the child must look at each one before he sounds it.”

“Parrot” rhyming of words is necessary, of course, in two-step phony phonics, and it was being explicitly rejected in this book, the emphasis being placed on individual letter sounds.

“From the very beginning words are used instead of separate letters, not (for) the purpose of naming the words, but merely to familiarize the child with the word form.

“Later on, when the sounds have been mastered, it will then be possible to combine them into words; but it is not advisable in any part of this primer to name the words. Sounding them will be quite sufficient. If stress be laid on the vowel sound...(in) combination with the consonants...the child will have little or no difficulty in recognizing some of the words he is familiar with. C-at is sufficiently like cat to enable him to know that this book tells him not about c -at, but about the animal he sees so often. By degrees he recognizes other words he is in the habit of using in his every day speech and thus incidentally learns to read.”

The Second Primer, which was stamped April 25, 1914, carried this “Explanatory Note:”
“In the Second Primer simple modifications of the vowels, both by consonants and by other vowels, are introduced; while at the end of the book will be found examples of words similar to those in use in the lessons. Many other examples of the same kind will occur to the teacher.

“In this primer it is intended that the child should still continue sounding the words as a means of discovering their names; but it will not be necessary now to sound any of the small words which are constantly recurring in the lessons. Considerable practice of all exceptions and modifications, which are new to the child, should be given on the black board, preferably before the lesson is begun at all.

“Phonetic spelling should be continued throughout the greater part of this book.”

The fourth book of the series, the Infant Reader II, carried this “Explanatory Note”:

“In this book the greater number of the diphthongs have been introduced and should, like the modifications of the First Infant Reader, form the subject of study preparatory to the lesson.

“The chief aim in the construction of the sentences is to teach modulation of voice as well as fluency....

“Sounding the words may now be dropped altogether, except as a means of discovering any word the pupil does not recognize when reading.

“Words for spelling can be selected from the lesson....”

This last book in the Blackie series, stamped by the British Library April 25, 1914, contained more good phonics. It was advanced in the content of its text because of this good phonics. Infant Reader I, also a very good book and also stamped April 25, 1914, had also said that sounding could be dropped at that level.

From the Blackie texts alone, it would appear that the approach to beginning reading in England had totally changed between the 1880’s and 1914. Yet the most startling change was that in the Nelson texts I saw, which were a totally sight-word, Code 3, approach in the 1870’s and 1880’s, and a Code 10 phonic approach by 1922. (It is, of course, possible that the very large Nelson company was also publishing some sight-word materials in 1922.) Obviously, like their fellow publishers, the Blackie company, the Nelson company was responding to market demand which had obviously changed radically.

Under call number WP 6292, the British Library has a copy of the Teacher’s Handbook to Nelson’s Phonic Series. “Thomas Nelson and Sons, Ltd., London Edinburgh and New York. By Isabel Geddes.” It is stamped February 20, 1922. The following appears on page 6:

“When beginning to join sounds to make (a) word known, the pupil... (should know) that in order to get the name of a word they must “say the sounds.” The reason for sounding out is to find the names and sounds of the words. Be sure that the pupils understand this, so that they may take an intelligent interest in the exercise. Always make them say the name of the word after sounding the letters.

“It is better not to give books to begin with. For six weeks or two months let the reading lessons consist of drill from the blackboard and sheets. By the end of that period, every child should know the letters and be able to join two or three sounds.
“The first primer can then be read without much difficulty. After another two months, the class should be ready for the second primer.

“Give as much drill in syllables as possible. This is begun with joining three sounds. After about six months, ...practice sounding words of two syllables from the blackboard, then gradually three or more. Give the name or sound of each syllable before proceeding to the next. At first, always separate the syllables with a hyphen. After some practice, the pupils will recognize the syllables at once and will be able to say them without sounding. As soon as this can be done rapidly, stop separating the syllables and allow the pupils to syllabize the words for themselves. Whenever they are able to do this, they will be able to read anything at sight.

“It is not necessary, though desirable, that the pupils should know the meaning of the words they are sounding, but an explanation now and again of some word that would come within their understanding, and that would be profitable for them to know, adds to the interest of the exercise.

“Some teachers think that an exercise like this is so uninteresting that it should not be inflicted upon the pupils. This is a mistake. It is a fact that children take great pleasure in sounding out big words. A few minutes drill now and again is all that is required, but it is most necessary if good sight reading is aimed at. The pupils find that all words are simple when divided into syllables, and soon they will be found trying to read any sort of literature they come across. Drill in irregular syllables should be given both in reading and spelling, until the children are perfectly familiar with them.”

It is abundantly clear with this 1922 series published by Nelson that the pendulum had swung back from “meaning” to “sound” in England. The phonic sequence which Geddes outlined is somewhat awkward and disorganized, but it still rates a Code 10, as her introductory comments indicated it would.

It has been said that the Beacon phonic readers, so popular in America before 1930, were popular also in England. They were reportedly available there until after World War II, though I have not personally confirmed that fact. The comments of Dr. Morris, referred to later, tend to suggest they went out of use before World War II.

Great Britain eventually went back to the sight-word approach for beginners once again, just as America did after 1930. The sentence method was being promoted in 1929, not only according to Mathews’ interesting material which has been quoted. It is also shown by the publication of these three texts listed in The Cumulative Book Index, 1928-1932:

“Clark, A. G. Sentence-method of teaching reading, pa. 1s ’29 Arnold, E. J.”

“Jagger, J: H. Sentence method of teaching reading, 3s 6d ‘29 Grant educ co.”

“Luke, E. Teaching of reading by the sentence method. 3s 6d ‘31 Methuen.”

Dr. Jeanne Chall in her 1967 landmark book, Learning to Read: The Great Debate (1967) had referred specifically to some of the work of a well-known psychologist from England, Dr. Joyce Morris. Dr. Morris, who is highly qualified to comment on developments in England in the teaching of reading, has written a paper in which she included comments on reading instruction practices in England since before World War II in the late 1930’s until 1993. Her September 18, 1993 paper, is entitled “Phonicsphobia,” and was presented at the “Literacy 2000” conference at Roehampton Institute of Higher Education in England. The conference was reportedly organized by Dr. Beve Hornsby and Longman publishers. For the purposes of this history, excerpts quoted below from Dr. Morris’s comments are greatly illuminating
concerning the history of the teaching of reading in England from the late 1930's until 1993. Since she was a young beginning teacher during World War II (about 1943?), but had received no training from her college tutors in phonics, it appears evident that the teaching of phonics must have been “officially” gone in England by the late 1930’s. The theme of Dr. Morris’s paper was the existence of intense and irrational opposition to the teaching of phonics, which she labeled, “phonicsphobia.” The excerpts below begin from page 2 of her paper:

“Causes of Phonicsphobia

“I first encountered irrational attitudes to phonics when I was a newly qualified teacher in a London primary school during World War II. I had not been trained to develop initial literacy in English by any method or materials, and phonics had not even been mentioned by my college tutors. Consequently, I was totally unprepared to meet the needs of my first class of 40 children aged 7 to 10, none of whom could read or spell more than two words.

“In a traumatic state which I shall never forget, because it affected the course of my professional life, I explained my predicament to the headmaster. He uttered a few words of encouragement with reference to my academic and school practice record and, after handing me some tatty copies of The Beacon Readers (Fassett, 1922), advised me to study the teacher’s manual carefully. He then explained that the scheme had originally been used successfully in the feeder infant school on the same site. But it was discarded by the headmistress and her staff after she had taken a university course which had persuaded her that Beacon phonics had no place in the ‘modern’ infant school she aspired to create. Henceforth, ‘activity’ methods and a ‘look-and-say’ approach to reading were to be the order of the day.

“As the headmaster used professional terms which were new to me, I simply asked him whether these changes had made a difference in terms of the intake to our first-year, junior classes. He simply replied that it was ‘not as good as it used to be’. Therefore, he was very pleased that the A and B streams were taken by experienced, infant trained teachers who used ‘traditional’ methods and a predominantly ‘phonic’ approach to reading.

“Soon after that particularly memorable day, I learned that our school was due for a general inspection, and I could expect an observer in at least one of my lessons. I trembled at the thought that it might be in one of my trial-and-error reading lessons when I was trying to get to grips with my pupils’ difficulties. In the event, I need not have worried because an inspector came to my classroom during a scripture period when we were dramatising the fall of Jericho. He approved of this activity and of the class library I had formed from my own and donated books. In short, as a preserved note from my headmaster testifies, I passed some sort of informal test of competence even though in my heart of hearts I knew it was largely due to chance.

“At lunchtime, the same inspector sat next to Miss ‘B’, the infant-trained teacher responsible for the first-year, junior B stream. I sat opposite but did not take part in their discussion which began something like this:-

“Inspector: Which methods do you use to teach reading, Miss B?
Miss B: Phonic mainly and systematically.
Inspector: Surely not the old-fashioned c-a-t and all that’!!!
Miss B.: Certainly!
Inspector: But c..a..t sounded out does not make ‘cat’!
Miss B: It does in my class.
Inspector: How do you manage that?
Miss B: I use the ‘nip behind the knee’ phonic method. A smart nip behind the knee when a child stands by my desk going ‘c.a.t, c.a.t’ soon joins the sounds together to make ‘cat’.

“ Needless to say, I was astonished by this exchange and the ding-dong battle of words which continued until lunch was over. Moreover, I could hardly wait to ask Miss B privately why she had responded to the inspector’s questions in a manner which could result in a black mark on her professional record. She replied that such an outcome was hardly likely because it was well-known that she was very successful in raising the reading, writing and spelling standards of children who came to her almost as retarded as those in my backward class. In any case, she was not professionally ambitious except to be regarded as an outstandingly effective class teacher. Therefore, she felt in a strong position to challenge those in authority like the inspector and infant school head who advocated ‘fashionable’ untested methods and, albeit unwittingly, deprived children of their basic human right to literacy by denigrating the role of phonics.

“Monitored methods vs. emotion

“Not long after the war ended, our junior school became oversubscribed and I was allocated a spare room in the contributory infant school for two years. This gave me plenty of opportunities to observe activity methods at close quarters, and to study the possible reasons for the failure of so many of the school’s pupils to make a successful start on the road to literacy.

“I discovered that the headmistress had made phonics a taboo subject and got very emotional if anybody questioned the methods used in her school. I also discovered that below the surface some of the staff were uneasy about what she expected them to do and not to do. In fact, one of them, Miss S, who was a friend of Miss B, confessed to me that she was glad to have the excuse of getting married to resign her post as she was afraid that, if she stayed much longer, she would openly flout the head’s wishes especially about phonics.

“I found a similar emotional cauldron bubbling away in the Surrey secondary school to which I was appointed after deciding that I needed to broaden my professional experience. The main problem there was a headmistress who had led a sheltered life, and knew virtually nothing about how to cope with the behaviour of teenagers from deprived backgrounds. There was also a problem of illiteracy amongst those pupils which I was expected to help solve because, by then, I was an experienced teacher of ‘late’ beginners in reading and a graduate in psychology to boot.

“No member of that school was phonicsphobic, and I was encouraged to persist in trying to find a more motivating, published scheme than The Duncan Readers (Duncan 1947) which, at that time, was the only remedial reading resource available in the school. Having done so without success, I wondered why educational publishers generally had not catered to the needs of retarded, older readers especially for phonic resources. I realised that it was probably because it is not profitable in commercial terms to provide for minority groups. Later on, when I was responsible for reading investigations at the National Foundation for Educational Research (NFER), I discovered that this was not the only reason. Some school book publishers had irrational attitudes towards phonics and feared that their ‘progressive’ image would be tarnished if they published phonic resources. Consequently, to my knowledge, even a much-needed research-based resource like Stott’s Programmed Reading Kit (Stott. 1962) was rejected by many publishers before, at long last, being accepted for publication by Holmes.

“Phonicsphobics became more visible during the mid-1950’s when Daniels and Diack headed what became known as the ‘phonics revolt’ by publishing in the News Chronicle (Daniels and Diack, 1954a), the rationale of their ‘Phonic-word Method’ as incorporated in their Royal Road
Readers (Daniels and Diack, 1954 b). They subjected both men to the most appalling verbal abuse and on one astonishing occasion in London, Dr. Daniels was physically attacked for daring to give a lecture challenging the ‘ultra-progressive’ methods of teaching reading advocated by members of the anti-phonic movement.

“In 1958, for the first two issues of the NFER journal Educational Research, the Foundation’s Director asked me to write articles summarising research into the effectiveness of different methods of teaching reading. At his suggestion, the first article was about ‘The place and value of phonics’ because, being such a highly controversial subject, it was the most likely to attract readers for the new journal. It certainly did so and revealed cases of phonicsphobia I would never have suspected or expected to meet. For example, soon after publication of that article (Morris 1958), I spent a day in the University of London library checking research references for my second article, “The place and value of whole-word methods’ (Morris 1959 a), and for my first report on the Kent Reading Inquiries called Reading in the Primary School (Morris 1959 b). Having skipped lunch and wanting to avoid a tube journey home in the rush hour, I decided to have a light meal in ‘The Restful Tray’ then at the Lyons Corner House in Tottenham Court Road.

“In the event it was one of the least ‘restful’ meals I have ever had. For I had no sooner sat down with my tray when into the restaurant came Miss K, a former colleague in the junior school where I found my vocation for the cause of literacy. I had got to know her well during fire-watching in the evenings when there was no enemy activity over London. But we had lost touch during the intervening ten years or so. Consequently, as she came to sit at my table I greeted her with, ‘It’s good to see you again. How are you these days?’ To my amazement she stabbed a finger at her open copy of Educational Research and replied, ‘Very angry! If I ever meet the Joyce Morris who wrote this article on phonics, I shall give her a piece of my mind.’ Then, almost without pausing for breath, she launched into a diatribe about phonics which was so irrational and emotionally charged that I realised that my old colleague had become ‘phonicsphobic’, apparently incapable of distinguishing between fact and opinion about a subject, the mere mention of which disturbed her equilibrium.

“If further proof of this was needed it came when, eventually, I managed to get a word in edgeways and explain that I had got married since our last meeting and my surname was now Morris. At which point, visibly shocked to find that I was the author she had so decried, she simply said in a manner I shall never forget, ‘Oh Joyce, how could you? You used to be such a nice person!’

“i.t.a.

“About six months after my fall from grace in Miss K’s phonicsphobic estimation, I was appointed reading research adviser and NFER representative on the London University Committee supervising the first experiment with Pitman’s initial teaching alphabet (i.t.a.). I suggested that the experiment should allow comparisons to be made between i.t.a. and both phonic and look-and-say methods of teaching infants to read. Unfortunately, partly because vociferous phonicsphobics tended also to be anti-i.t.a., the late Sir James Pitman persuaded the Steering Committee that it would be best to confine experimentation with his alphabet to a comparison with look-and-say using the then most popular infant reading scheme, The Janet and John Books (O’Donnell and Munro 1949) as the main published resource. This caused a good deal of critical comment, especially after the results were published, and prompted Dr. Haas, Professor of Linguistics at Manchester University, to write a critique for The Times Educational
Supplement entitled, “From look-and-say to i.t.a.” (Haas 1969) in which he pointed out that, if phonics had been included, the results in favour of i.t.a. might have been very different.

“Be that as it may, experimentation with i.t.a. had several important bonus effects. For example, it focused widespread attention not only on the intrinsic difficulties of English orthography for literacy learners but also on its alphabetic nature and, hence, on the basic reason for including phonics as an essential ingredient of educational provision for literacy. It encouraged scholars like Professor Haas to contribute contemporary linguistic knowledge and fresh insights to the task of teaching children to read and write as in his book Phonological Translation (Haas 1970). Moreover, experimental i.t.a. teachers naturally acquired a more explicit, detailed understanding of the orthography than was generally expected of primary school teachers when one considers the content of their pre-service courses. Consequently, they had a better foundation for giving effective phonic instruction when subsequently teaching reading and spelling in traditional orthography and, because of that, were very unlikely ever to develop phonicsphobia. Moreover, some i.t.a. teachers such as Sue Lloyd have helped to change attitudes to phonics in recent years and, in her case, by publishing the results of her considerable classroom experience as a resource for teachers called The Phonics Handbook (Lloyd 1992).

“Despite these and other favourable consequences of i.t.a. experimentation, I believed in 1959 (and still do) that, instead of orthographic innovations, what was really needed was a radical reform of teacher-training which would put language and literacy at its very heart and give phonics its rightful place in the teaching and learning of initial literacy. Sadly, as explained in my ‘mini-autobiography’ (Morris 1989), I also had reason to believe from my experience as a professional researcher at the NFER that such a reform, if it ever came to pass, was light years away. Therefore, with strong support from Professor Dennis Fry, Head of the Department of Phonetics and Linguistics at University College, London, I decided to carry out linguistic research with the object of providing a more informed base than hitherto available for the phonic ingredient in initial literacy provision.

“At first the linguistics-informed system developed from this research was known simply as “new” phonics and, in 1965, it was incorporated in the pioneering BBC television series, Look and Read. To my knowledge as consultant/writer for the series over the next twelve years or so, it was warmly welcomed by teachers of the poor readers in junior classes for whom it was primarily intended, and there was no opposition to its use in schools by LEA advisers and HMI. With only a few objections from educationists opposed to phonics for infants, there was also a similar favourable response when my system was subsequently incorporated in the television series for infants called Words and Pictures, and in the research-based scheme for four- to nine-year-olds called Language in Action (Morris et al., 1974-83), whose core storybook titles are mnemonics for the basic spelling patterns and main sound-symbol correspondences of English.

“Frank Smith and Kenneth Goodman

“All this caused me and like-minded colleagues to be hopeful that the influence of the anti-phonics movement, which naturally attracts phonicsphobics, was petering out. Alas! It proved not to be the case. If anything, the movement began to grow stronger in 1978 with the publication in Britain of Reading by Frank Smith, and the dissemination by enthusiasts, mainly among teacher-trainers, of Kenneth Goodman’s notion of reading as a ‘psycholinguistic guessing game’ and his “Whole Language, top-down’ theories which provide a foundation for the ‘real books, apprenticeship approach to reading’.

974
“On my professional visits to the USA in the mid 1970’s, prominent researchers in the reading field told me that they were alarmed at the growing influence of Smith and Goodman in American schools and teacher-training institutions. They warned me that it could spread to Britain as it had done to New Zealand. But I did not take this warning too seriously because, like them, I could not find any evidence to support the disturbing statements of the two theorists and, besides my own in the major research series of the NFER, I knew of much to refute them.

“In face-to-face discussion with each theorist, I had been similarly disappointed in my quest for evidence. For example, in May 1975, I met Frank Smith with his publisher in New York mainly because the latter admired the first wave publications of Language in Action (Morris et al., 1974-83), was contemplating a collaborative project with me, and wanted to witness Frank’s reaction to the scheme and my response to his radical views.

“It was an extraordinary meeting during which Frank admitted that he had never been a school teacher. Nevertheless, he made confident assertions such as ‘Reading cannot be taught’ and ‘Phonics is unnecessary’, knowing full well that his publisher and I thought otherwise, and believed that American children and their teachers would benefit from using a research-based, motivating resource like Language in Action for the development of initial literacy in English. Then, politely ignoring our request for scientific evidence to support his views, he introduced me to his then latest publication, Comprehension and Learning: A Conceptual Framework for Teachers (Smith 1975) with its declared theme, ‘Children know how to learn’. Finally before leaving us to digest all this, he handed me a copy of the book in which he had written, ‘For Joyce Morris - on an afternoon of mutual comprehension and learning’.

“That polite, diplomatic inscription and afternoon meeting should have warned me not to underestimate Frank’s charismatic power to influence the teaching of reading when, three years later, he came to Britain to lecture and publicize his book Reading (Smith 1978) which includes the above extraordinary assertions unsupported by research evidence. I also should not have overestimated the importance of scientific research in education. For, without any real evidence that Smith’s and Goodman’s ideas are effective in classroom practice generally, Liz Waterland’s translation of their ideas into her own practice (Waterland, 1985) has found widespread acceptance among British teachers, teacher-trainers and LEA advisers. This has led to what Margaret Donaldson calls the ‘minimal teaching movement’ using an apprenticeship approach to reading with ‘real’ (trade) books and a ‘generalised rejection of anything that can be called a reading scheme.’(Donaldson, 1989).”

Rudolf Flesch wrote a best-selling pro-phonics book in America in 1955, Why Johnny Can’t Read, but I never heard that Flesch was asked to publicize his book in Great Britain, even though it created an uproar in America at the time. The phrase, “Why Johnny Can’t Read,” has even become a part of American linguistic culture, just like “Don’t give up the ship,” or “Of the people, by the people, and for the people.” Why, then, was Frank Smith obviously given an obviously very large expense account to publicize his anti-phonics book in Great Britain, when it obviously was far less successful as a salable book than Flesch’s had been?

I strongly suspect that very few people in the general American public were buying Smith’s books in 1978. Speaking personally, I find Smith’s books to be quite dull reading. Yet Flesch’s “Johnny” is actually entertaining. I have no memory of any of Smith’s books ever having been best-sellers, as was Flesch’s. Furthermore, as an American primary-grades teacher in 1978, I have absolutely no memory of even a single fellow primary grades teacher ever mentioning any of Smith’s ideas or any of Smith’s books, no less buying one. The only time Goodman’s name came up was when a fellow teacher who knew my convictions about phonics handed me a brochure from Scott, Foresman, containing his ideas,
which brochure she probably picked up at the New Jersey teachers’ annual convention. Yet Goodman’s Scott, Foresman reading series was in wide use in New Jersey schools at the time, but not in our school. Even if it had been, most teachers’ “interest” would have been limited to reading and following the teacher’s manual that came with the reading series.

Smith’s “professional” books were being promoted and bought in America largely by people other than the general American public, whose children were in the schools, or by the American teachers who were teaching the children of the general public. Yet Goodman’s and Smith’s fallacies have been massively promoted all over the English-speaking world for the past fifteen or twenty years, while Flesch’s book, which initially aroused great interest, has been belittled or ignored.

Dr. Morris continued:

“Fortunately, Beve Hornsby and others working in the dyslexia field have not been unduly influenced by these developments, if at all. They have remained steadfast in using and advocating systematic phonic teaching and multisensory techniques to help children build a sound foundation for literacy. So have Montessori-trained teachers who work mainly in the private education sector. Significantly too, members of both groups are in the [vanguard] of progress in that they use and recommend phonic resources which have a linguistically-sound base such as Alpha to Omega: The A-Z of Teaching Reading, Writing and Spelling (Hornsby and Shear, 1974) and The Morris-Montessori Word List (Morris 1990) which is the latest publication to incorporate Phonics 44.

“For obvious reasons, there are no phonicsphobics among those two groups, whereas, to my knowledge, there are some with influence working in the state education sector. They are largely responsible for the hostility amounting to hatred towards psychologist Martin L. Turner who reported in Sponsored Reading Failure (Turner, 1990) that reading standards fell during the previous five years or so, and suggested that this was due to increasing widespread acceptance of the ‘real books philosophy’ and a corresponding decrease in systematic phonic teaching in infant classes.

“Thus, phonicsphobics nowadays are as hostile to reading researchers who dare to challenge anti-phonic orthodoxy by their findings as Miss K was to me 35 years ago. It could also be argued that they are even more so. For instance, the American psychologist Marilyn Jager Adams, author of the scholarly report Beginning to Read: Thinking and Learning About Print (Adams, 1990) has been subjected to a great deal of harsh criticism for even accepting the task of carrying out an extensive, detailed review of what research tells us about the place and value of phonics. In reply to her critics (Adams 1991), she states, ‘People told me that I would lose old friends and make new enemies. People told me I would be shot.’ She also points out that, although phonics advocates appreciate the value of whole language, whole language advocates do not reciprocate, and she is apprehensive of their ‘strong-arm tactics’.

“It will be interesting to see what the critics and phonicsphobics make of a new book edited by Roger Beard and entitled Teaching Literacy: Balancing Perspectives (Beard 1993), for it contains chapters which critically examine and highlight the weaknesses of the Smith and Goodman theories and the practices of their disciples....”

At this point, Dr. Morris discussed seven possible causes for what she labeled, “phonicsphobia.”

“Like all phobias, phonicsphobia is learned behaviour and therefore can be unlearned albeit with varying degrees of difficulty. However, unlike agoraphobia for instance, phonicsphobics are
not usually consciously aware of their condition and, consequently, do not seek treatment. Indeed, those I have personally encountered over the years would probably not consider that they are phobic or even that they belong to an anti-phonemic movement, most of whose members I must stress are not so irrationally prejudiced against phonics as to be classed as phonicsphobics. Yet despite all the research evidence against their views, phonicsphobics persist in making fallacious statements such as ‘Phonics is discredited’ and, like Miss K, reveal that the mere mention of the word ‘phonics’ has the power to render them emotionally unbalanced.”

Dr. Morris listed seven possible categories as causes, including unhappy childhood or professional experiences. She also mentioned noisy classrooms, where the teacher found it difficult to work with children individually so that they could learn letter sounds.

At some point in the twentieth century, probably in the late 1930’s and afterwards, whole class instruction was largely dropped in England. Despite the wonderful utility of individualized instruction in some areas, individualized instruction is, in my opinion, totally inappropriate and wasteful for beginning reading instruction (and for most arithmetic instruction and in some other areas). Children cannot be expected to learn phonics if it is not directly taught to them. Yet how can one teacher possibly give such necessary instruction to forty little children if she has to teach each one separately, so that she is giving each lesson forty times instead of once? It is hardly surprising that teachers might fail with phonics teaching under those circumstances and develop a great dislike for it. Such teachers are, of course, to be profoundly pitied.

Dr. Morris stated under the seventh cause:

“...phonicsphobia can be caused by circumstances in which, for instance, class teachers conceal their support for phonic instruction like the previously mentioned Miss S. But, in their case, they do so nowadays because they fear that they will be labeled ‘reactionary,’ ‘right-wing’, or even ‘not politically correct’, and thereby ruin their chances of promotion to headships. Moreover, as I have also stated elsewhere (Morris 1990 b), ‘so great is this fear that, on certain memorable occasions, it has been confided to me literally in whispers by inservice course members, who agree with me about the place and value of phonics, but dare not say so publicly.’

“In this context, it is also significant that, before his Birmingham primary school won the L100,000 Jerwood Award in 1992 for educational excellence, headmaster Kevin Cassidy wrote a Guardian article anonymously about how all his staff provided children with systematic phonic instruction on a daily basis with outstanding results in terms of literacy acquisition. He did so because he too feared the unfavourable reactions of ‘experts’ opposed to phonic methods and materials”.

It is suggested that an eighth category might be added to the causes that Dr. Morris gave for Phonicsphobia. It concerns a type of human (male, female, of any age or ethnic origin), which is familiar to us all. Teaching phonics - or teaching almost anything of real value - requires a great deal of effort from teachers, the vast majority of whom are well intentioned and hard working, and more than happy to make the effort. But some few teachers (like some few plumbers and even some few kings) have a powerful distaste for doing anything they do not happen to feel like doing at the moment. For such teachers, it is therefore very convenient to endorse “natural” methods in which the child tries to teach himself how to read, while his “teacher” is left free to do something that he or she finds more entertaining, such as teaching the child how to make crepe paper dolls.

Dr. Morris continued:
“Consequences of Phonicsphobia

“Literacy is a political subject and never more so than in the last few years. Even if pro-phonics supporters have no political affiliation, they are considered to be ‘ultra right-wing’ by the anti-phonics movement and especially by its influential, phonicsphobic members. Yet, strange to relate, when Dr. Daniels led the ‘phonics revolt’ in the mid-1950’s, and was verbally and physically abused for his efforts to apply research findings and restore phonics to its rightful place in the teaching of initial literacy, he was known to be an admirer of Chairman Mao and his Little Red Book.

“Besides the abuse suffered by researchers from influential phonicsphobics and their followers, some of the consequences of phonicsphobia may be summarised as follows:-

“l. Despite the findings of reputable research about phonics, the vast majority of basal reading schemes available in Britain today are predominantly look-and-say. If they do include phonics, the resources provided for teaching and learning are only a relatively small proportion of the whole scheme and, as in the case of the currently popular Oxford Reading Tree (Hunt et al., 1987), are advertised as ‘optional’.

“Older basal phonic schemes such as the Royal Road Readers (Daniels and Diack, 1954) are out of print or have been brought into line with what some ‘experts’ (including phonicsphobics) refer to as ‘modern’ thinking about the reading process. For example, Gay Way (Boyce 1949) has been given some new content and renamed New Way. More recently published basal schemes for systematic phonic teaching and learning have also gone out of print. They include Language in Action (Morris et al., 1974-83) which ceased to be available as a whole scheme in July 1989, largely because of the influence of the ‘real books philosophy’, and despite the fact that its core story books are by authors of ‘real’ (trade) books writing to linguistic briefs.

“It is hoped that as a result of urgent requests from many teachers, a reprint of at least these core books will be available in the near future. However, much depends on the economic situation, and whether the publishers feel that the time is ripe to ignore the advice of phonicsphobics and meet the need for motivating, linguistically-informed phonic resources. To my knowledge, a few publishers believe this to be so, and they are looking around for authors able to prepare such resources. Meanwhile, they cautiously await reactions to the consultation document for the revised National English Curriculum which will largely determine whether they go ahead with their tentative plans.

“2. Phonicsphobics appear to have influenced Key Stage 1 of the original National English Curriculum because it contains only two references to phonic cues in reading. There is also reason to believe that they influenced the choice of authors for some of the chapters in The LINC Reader (Carter et al., 1990), i.e. the Reader which Ronald Carter, the Editor, says is ‘related organically to the LINC (Language in the National Curriculum) Project’. For example, Chapter 7, ‘The Development of Initial Literacy’ is by Yetta Goodman, wife of Kenneth Goodman. Not surprisingly, it endorses his whole-language, top-down theories and decries the use of structured reading programmes. Chapter 8, “What do we know about reading which helps us to teach?” by Margaret Meek, restates her well-known view that it is the texts by children’s writers of ‘real’ (trade) books which really teach children to read. Moreover, she criticises orthodox reading research because, in her opinion, it ‘breeds its own brand of evidence’, and then goes on to make the extraordinary statement, ‘The consequent problem is that reading specialists are bound to ignore the evidence that arises spontaneously in classrooms because it isn’t generalisable.’
“3. Statements about research like that of Meek, quoted above, certainly do not persuade
other teacher-trainers to encourage their students to read the published reports of ‘professional’
reading researchers who appreciate the importance of scientific method in their work and,
naturally, do not accept anecdotes as evidence that a particular theory works in practice as some
phonicsphobics do. On the contrary, to my knowledge, such fallacious statements have helped
some teacher-trainers to continue ignoring generalisable evidence about the crucial role of
phonics in teaching initial literacy and they, in turn, have managed to persuade their students also
to do so. In other words, it is reasonable to suggest that ignorance of ‘real’ research evidence
about phonics is a contributory cause of phonicsphobia and, hence, one of its consequences is that
student teachers are not trained to understand research methods and/or to teach phonics. This of
course also accounts for the fact that the book lists given in the NFER report, What Teachers in
Training Read about Reading (Gorman 1989) do not include any research reports or how to use
phonic methods and materials.

“4. Experienced teachers who do read research reports, and are enthusiastic, successful users
of Language in Action, not least because it is research-based, have drawn my attention over the
years to how some English advisers and inspectors have tried to persuade them to abandon the
scheme. Clearly, what they have suggested after acknowledging the above-average standards
achieved by using the scheme does not make sense. For instance, the head of a delightful
suburban infant school I visited told me that, despite receiving that kind of acknowledgement, she
was recently advised not only to have a less structured reading programme, using children’s
literature as the main published resource, but also to provide opportunities for more ‘sand and
water’ activities in her school. From this one may justifiably conclude that phonicsphobia is a
cause of inappropriate advice, and one of its consequences is that Language in Action is now out
of print after the generally favourable response to it previously mentioned. Moreover, as already
indicated, another related consequence is the failure of all but a few educational publishers even
to contemplate following the lead given by that scheme and bring phonics into the modern age, in
other words, to make available the carefully-researched, linguistics-informed, motivating phonic
resources which many children need to make a successful start on the road to literacy....”

Dr. Morris’s paper is considerably longer than the sections quoted here, and discusses cures for what
she so interestingly calls, “phonicsphobia.” As a true expert, Dr. Morris’s experiences since she began
teaching during World War II, and remarks made to her by reliable people about practices from shortly
before that time, are almost irrefutable testimony about developments in the teaching of beginning
reading in England from shortly before 1939 right up to September 18, 1993, the date she gave her talk
from which these excerpts are taken.

As an American visitor to English schools in 1971, I was able to observe some practices in the
teaching of beginning reading at that time. From June 14 to June 21, 1971, some Wayne, New Jersey,
teachers, of which I was one, visited Open Classroom schools in Oxfordshire and Leistershire, England.
Our fairly large group of Wayne teachers were separated into groups of four for pre-scheduled visits to a
number of schools in each of these areas. During those visits, I took notes, and, after returning to the hotel
each evening, expanded the notes from my memories of these visits. I was particularly interested in the
teaching of beginning reading, but since we visited classrooms at all grade levels from infant through
junior, and observed in all subject areas, my observations on reading were very limited. In contrast, in
1977-78, when I visited first grades in this country and Europe, the visits had been arranged ahead of time
so that I could observe the teaching of beginning reading.

Two commercial programs were particularly evident in the English schools in June, 1971. One was
the Ladybird high-frequency sight-word series (Code l or 2) and the other was the i.t.a. series which was
still popular. i.t.a. is potentially Code 10 material, but it sometimes is taught just like a sight-word series,
which drastically reduces its code. In one school, the Breakthrough reading program had just been introduced. In the Breakthrough program, high-frequency printed sight words were filed in little individual folders for each child. Children took out words and then inserted them in little individual sticks to compose a sentence, which the child then copied and illustrated. Later, the child could use a folder which had only letter cards to build words. Breakthrough is an extension of the experience chart approach, which we did see widely used in the very youngest classes. Commonly, a child who was a beginning reader dictated a sentence which his teacher wrote out. The child then copied the sentence and illustrated it.

After returning to this country, I made a brief summary of my daily comments. Those which concern reading from that final brief summary are given below. In the first school listed, I had noted at the time, “Made use of BBC,” and more specifically, “Primary... children pulled together for television show.” After reading Dr. Morris’s comments, I strongly suspect the children in that highly-achieving school may have been watching her phonics BBC material in 1971. In any event, I was told the entire school made massive use of phonics and had brought a transfer student from September to June from 4.5 years to 9.5 years on tests.

Each entry below concerns a different school.

June 14, 1971

Massive phonics on 200-sight-word list. Excellent results.

June 15, 1971

i.t.a. “We have no reading problem at all.” Use T.O. for spelling (traditional orthography).

June 16, 1971

Dropped i.t.a. 5 or 6 years ago. Head claimed improvement. Some infants couldn’t read that I saw. Uppers couldn’t spell. Don’t know if they could read. New teacher for remediation in reading.

June 17, 1971

This was a junior school. Head said children with i.t.a. were 2 years ahead. A teacher said i.t.a. produced more fluent writers.

June 18, 1971

First grade: said formal phonics plus sight words. Formal reading schemes. SRA upper grades. 1st grade made word dictionaries.

June 21, 1971

Head said, “You must teach phonics from beginning,” but no sign of it. Reading: Janet and John, Through the Rainbow, Ladybird. Poor readers observed.

June 22, 1971
Remedial teacher stated at lunch, “We have very great need here for remedial reading.” They teach from speech to writing to reading. He said in Birmingham where he taught before, i.t.a. used and no such problem as here but Birmingham was dropping i.t.a. Head said they used “several reading schemes but hardly ever need phonics.”

June 23, 1971

No sign of phonics but it may be there. Ladybird and Key Word Cards. Reading and spelling seemed OK for 10-year-olds but one little boy [close to that age] could not read any words at all in a simple reader. Could not read the second, “up” of “up and up.” [Note: The teacher had read the first “up” to him.] No sign of word attack. Children had dictionary pages. [“Dictionaries” were personally written notebooks.] Main page copied from Ladybird word list. Add words to pages as required.

June 24, 1971

Starting to use Breakthrough.

June 25, 1971

Saw some phonics on board in one room. No other information on reading. Integrated day, apparently, based on remark: “If you let a child paint for day ending day, very often he will come up to you with his reader and ask to read. Phonics on board in one room: cat - mat - bat. Children quizzed in auditorium on who had done writing and numbers and who had made something.

Most of these schools were delightful, happy places with very well behaved students. Yet the first school - and possibly the best- Ashby de-la-Zouche - taught heavy phonics and made great use of whole-class lessons on television, and it was possibly Dr. Morris’s phonic material. Ashby-de-la-Zouche was turning out highly literate little students by the end of first grade, as demonstrated by the “essays” that I witnessed the little ones writing, one of which has been quoted verbatim in an earlier chapter. Yet, in another school, in which little children were copying from reference works, I was saddened to find they could not even read what they were so laboriously copying.

Why, then, did not all the other schools do the same as Ashby-de-la-Zouche and teach heavy, successful phonics? Presumably those schools which did not use heavy phonics were under the baleful influence of highly placed, influential “experts,” just as in America.

In summary, although I personally have seen very few post-1900 texts printed in Great Britain, the evidence suggests that developments in the teaching of beginning reading there after 1900 roughly paralleled those in America, and are continuing to do so today. That is despite the fact that the reading texts actually used, except apparently for Beacon, were usually different. Great Britain had a post-1900 period of gradually increasing and heavy phonic use, which developed apparently from the grass roots without much “expert” input except for a few people like Dumville (pro-meaning) who was disproven by Valentine (pro-sound). Shortly after 1930, Great Britain began to go back to “meaning” as a beginning approach largely because of works written by “experts” such as Jagger and Schonell, whose views could be spread through training colleges for teachers.

I met an Englishwoman one evening in Washington who told me how appalled she had been as a student teacher in the late 1940’s with what she thought was the new emphasis being given to sight-word teaching. Yet Dr. Morris’s comments certainly indicate the emphasis was in place almost certainly well before the beginning of World War II in 1939. That is because the old Beacon readers that the headmaster
gave Dr. Morris as aids during the war (about 1943?) were already in tatters, and the “juniors” in her class who had not been taught to read would have started school three or more years earlier.

The teachers’ colleges in Great Britain, like the teachers’ colleges here, apparently continue to be a fountain of disinformation on the subject of beginning reading instruction. I have wry memories of a useless conversation I carried on with one of their teachers’ college professors on the topic about 1973, when on a commercial camping trip to Iceland. She was appalled at my opposition to the sight-word approach.

Despite the passing interest since the 1950’s on i.t.a. print and other phonic approaches such as Daniels’ and Diack’s The Royal Road Readers (1954), the reading emphasis in Great Britain is still on “meaning” for beginning reading, just as it is in America. Dr. Morris’s comments confirm that fact. Furthermore, England appears to be beset with the same “accountability” testing philosophy which threatens the future of education (and even freedom itself) in America since it will be used to shape a rigid curriculum (which could become “thought control”). In this connection, part of a letter on this topic which I wrote to the editor of the Wall Street Journal on July 26, 1990, a portion of which they later printed, is given below:

“Increased parental control of British schools, discussed in David Brook’s article, ‘British Schools Declare Independence,’ (page A16, July 26), is anything but the unalloyed good news it seems to be.

“The whole point of education is curriculum. Yet it is in choice of curriculum that British parents are reportedly losing out. In the name of efficiency, a standardized curriculum is reportedly being promoted in British schools. The state is to decide instead of a child’s parents what should be the ‘standard’ curriculum (i.e., the ‘standard’ truth). That good Englishman, George Orwell, would tell his fellow countrymen to LOOK OUT! The prospect of a curriculum standardized by the state is nothing short of terrifying....

“In America, as in England, parents will have no choice over curriculum. The ‘choice’ of school buildings now being offered only disarms parents and makes them foolishly think they are in charge of their children’s education. Instead of parents choosing their children’s curriculum (which would be REAL ‘choice’), America’s future curriculum will be shaped by such non-governmental agencies as foundations. They will be only too glad to help by underwriting national ‘achievement’ tests, most probably in concert with government-related agencies such as the National Assessment of Educational Progress. It will be such national ‘achievement’ tests which will define and drive future curriculum in American schools.

“If parents in American and British schools promoting ‘choice’ demanded that laws be passed to confirm their right to choose ALL textbooks and ALL tests in such ‘choice’ schools, they would be surprised at how quickly the illusion of ‘choice’ would fade like fog before the sun.”
PART 7
More on Twentieth Century Developments
Chapter 50
The Background on the Arrival in 1930 of a True Deaf-Mute Method in American Schools

Just as today, some people survived the “meaning” method which had been in almost universal use in American first grades from about 1826 until the arrival of supplementary phonics, or “sound,” in first grades about 1900. Exceptions to the almost universal use of “meaning” in America in those years were those places from about 1865 to about 1880 where some phonics materials made temporary inroads, and those Midwest areas where the 1879 phonic McGuffey series was dominant. Also, by about 1890, phonics had returned at second grade and above in the teaching of spelling, and it resulted in a great improvement in reading ability.

James McKeen Cattell, born in 1860, showed the effect of the “meaning” method in his weak spelling. Weak spelling is characteristic of such Americans as Cattell who were born between 1826 and 1880, as can easily be confirmed by checking surviving handwritten materials.

All of these psychologists - James, Hall, Dewey, Cattell, Judd and Thorndike - who learned to read before 1890 were probably taught to read by the sight-word “meaning” method. Since they stayed in school for many years after the third or fourth-grade level at which real phonics, or “sound,” was finally introduced in elocution or in spelling, they apparently managed to overcome some of the effects from beginning with sight words. Yet they undoubtedly remained “subjective” readers for the rest of their lives, and many of them remained poor spellers. However, their early exposure to the “meaning” method may help to explain their bias in its favor.

A clear split had been present in the 1880’s and 1890’s between the followers of the psychologists and “experts” who favored teaching reading for “meaning” in the first grade, and the followers of people like Rebecca Pollard, an elocutionist, who favored phonics, or “sound,” in first grade. The conflict can be followed in the activists’ publication, The Public School Journal, from 1889 to 1893. The non-“expert,” Rebecca Pollard, had said the two reading methods of sight-words and phonics were contradictory, and could never be combined. She was, of course, resoundingly correct.

Pollard’s belief was confirmed by Oskar Messmer’s 1903 German experiments, discussed in E. B. Huey’s The Psychology and Pedagogy of Reading (1908). Messmer turned up two kinds of readers: those who read by syllables, automatically, and those who read by whole words and guessing. He named the two kinds, very appropriately, objective and subjective readers, obviously representing “sound” and “meaning,” although Messmer apparently felt they only stood for different stages of development.

In my sabbatical research from September, 1977, to January, 1978, I observed and rated the teaching of reading in first grades on a scale from Code 1 for straight “meaning” to Code 10 for straight “sound,” most schools falling somewhere in between. I then personally tested individually the oral reading of

---

I postulate that a further analysis in a graphic form may be possible to describe reading programs. The method by which I described them was on a horizontal scale from 1 to 10, representing the move from “meaning” to “sound.” However, a different analysis is possible, the one commonly used, from the “analytic” to the “synthetic.” If the “analytic” to the “synthetic” approach formed a vertical scale, numbered like the horizontal scale from 1 to 10, but intersecting the horizontal “meaning” to “sound” scale about mid-point (Code 5), it would produce a graphic grid on which it would be possible simultaneously and visually to place programs, not only for their “sound” or “meaning” emphasis, but for their “analytic” or “synthetic” emphasis. This might be useful, because some
about 900 second-grade children in these same schools in their own languages in this country and Holland, Sweden, Germany, Luxembourg, Austria and France. I used for the oral reading test a 144-word portion of a copyrighted speed silent-reading text for 10 and 14 year olds, which I obtained the permission to use from IEA (International Association for the Evaluation of Educational Achievement) in Sweden in 1977. I had the 144-word English portion translated into German, Dutch, Swedish, French and Icelandic by a commercial translating firm at my own expense, which permitted me to test in languages with the same Germanic and Latin roots from which English was derived. (It was not possible for me to observe and test in Iceland as I had originally arranged to do as a general strike in Iceland was called just as I arrived at the New York airport to go to Iceland. The flight instead went straight to Luxembourg, where I instead received permission to observe and test.)

The great “discovery” of my oral reading research, as discussed in my previous unpublished writings such as my books, Why Jacques, Johann and Jan CAN Read (1979), The Case for the Prosecution (1981) and A Counter Report (1985) and my papers, one of which was The Wary Reader’s Guide to Psycholinguistics: Subjective vs. Objective Readers (1982), was the fact that there are two distinct and opposite types of readers of alphabetic print. One type reads by true phonics, “sound,” automatically, (Code 10) and the other reads by sight-words and conscious guessing, “meaning,” (Code l) (plus those types with a conflicting mixture of the two reflexes, “sound” and “meaning,” who fall between these extremes). It is not just a question of one type’s reading more facilely than the other, but of one type’s being distinctly different from the other.

Higher codes consistently showed a different pattern of scores when compared to lower codes. The pattern even appeared when the low score of Code 3 was compared to Code 2.

Shortly before writing my 1981 book, I was astonished to find that my 1978 “discovery” of two opposite types of readers was no discovery at all, and that Oskar Messmer had turned up the two kinds of readers by 1903. Messmer named them “objective” readers (who obviously have “sound” reflexes), and “subjective” readers (who obviously have “meaning” reflexes). Yet Messmer’s remarkable work had almost totally dropped from the literature in English except for a brief discussion in E. B. Huey’s 1908 book, The Psychology and Pedagogy of Reading, and a paper by Myrtle Sholty in the February, 1912, issue of the Elementary School Teacher, published by the University of Chicago, which reported on her own experiments. (I later found that Messmer’s research had been mentioned in passing in Franz Biglmaier’s article on reading instruction in Germany, in Comparative Reading, 1973, John Downing, Editor, The Macmillan Company, New York. The chapters in Downing’s book were contributions from people from various countries. As discussed elsewhere, I also found before writing my 1981 book that Henry Suzzallo had discussed different types of readers in his 1913 article on teaching reading in the Cyclopedia of Education, although he had curiously made no mention of Messmer.)

It was when I saw Sholty’s paper in the Library of Congress in December, 1980, while routinely checking the materials in the bibliography to W. S. Gray’s 1917 doctorate, that I first learned of the real nature of Sholty’s research. That is because Gray’s description in his bibliography had obscured its nature. In Sholty’s paper, she said her research had confirmed earlier work by Messmer, which she cited. It was from Sholty’s 1912 article that I found that my 1979 “discovery” had been reported by Messmer seventy-six years earlier, and had been confirmed by Sholty over sixty-seven years earlier.

The fact that Sholty’s work, as well as Messmer’s, has virtually dropped from the literature was discussed in my unpublished 1981 book, The Case for the Prosecution. A probable reason exists for the fact that both reports have effectively vanished. William Scott Gray, the principal author of the Dick and

“meaning” programs use some synthetic emphasis, and some “sound” programs use considerable analytic emphasis.

986
Jane deaf-mute-method readers, published a summary of reading research to 1925, and that has unfortunately been the foundation for all “histories” of “reading research” ever since, since Gray was such a leading “expert.” In his summary of previous research to 1925, Gray “naturally” omitted Messmer’s German work, and “accidentally” misrepresented Sholty’s research so that it was unrecognizable concerning either its nature or its conclusions. (Sholty’s research was even more badly described in Gray’s 1925 summary than in his 1917 bibliography, which means that somebody by 1925 had to have given conscious attention to that erroneous new description of Sholty’s research. Yet, in no way could that even faultier 1925 description have resulted from a review of Sholty’s actual research.) After Gray had dropped both Messmer’s and Sholty’s research into his poisoned historical well, which well carried such an “expert” label, no English-speaking person was likely to find either report again.

In the Elementary School Teacher of the University of Chicago in February, 1912, Sholty had reported on her tests with three little girls half-way through second grade, so the tests must have been done before 1912, probably after February, 1911. Of the three second-grade girls, two demonstrated that they could read words in parts, (Messmer’s “objective” type, referred to in this history as “sound,”), but one demonstrated she could read only whole words (Messmer’s “subjective” type, referred to in this history as “meaning.”). However, all three little girls at the University of Chicago experimental school were “helped” by context guessing, which was obviously necessary because of the small amount of phonic training used at the experimental school. Sholty specifically referred to Messmer’s research and noted that her research results were in line with his conclusions.

It was in 1911-1912 that Cattell’s and James’ close friend and ex-student, Thorndike, taught for the first time his course at Columbia Teachers College in New York, “Psychology of the Elementary School Subjects” (according to A.I. Gates in the February 1926, Teacher College Record.) Thorndike’s giving such a course for the first time certainly suggests a sharply increased interest in the subject of the psychology of elementary reading. It is probably anything but coincidental that Thorndike began his ten-year-long search for the 10,000 commonest words in 1911, and the academic year of 1911-1912 was probably the next academic year after Sholty did her research at the practice school of Judd’s University of Chicago. It was that work of Thorndike’s, begun in 1911 (according to Arthur I. Gates in Gates’ paper in the February, 1926, issue of Teachers College Record honoring Thorndike) which first made it possible to write reading books with strictly controlled vocabulary up to the fourth grade level for children with normal hearing, using only whole-word phony-phonics and context guessing from memorized sight-words. With such books (actually an inferior deaf-mute method), all children could be trained to read only whole words for “meaning” like Sholty’s third little student, instead of reading words in parts for “sound” like Sholty’s first two students.

The record suggests that it was Sholty’s research, probably done in 1911, which inspired Thorndike in 1911 to begin his work to identify the 10,000 commonest words, which list could (and did) make it possible to turn American students into Messmer “subjective” readers. The record also suggests that both Messmer’s and Sholty’s research were then carefully buried after 1911, for public relations reasons. The public certainly would not approve of teaching its children to read like badly taught deaf-mutes, by sight-words and context-guessing, just because the “experts” thought it would help the children’s so-called “reading comprehension.” That a decision was made very early to bury Sholty’s research (and by extension, Messmer’s) is strongly suggested by the fact that the nature of Sholty’s research was completely obscured by Gray’s description of it in his 1917 bibliography listing all previous reading research. Yet Gray was obliged to include at least some mention of Sholty’s research in his bibliography because the number of reading research studies in 1917 was so small that an omission of even one study would have reflected very badly on his “competence.”

Reading books based on Thorndike’s list of high frequency words did away with real phonics at all grade levels since the children could use the whole words learned up to fourth grade to piece together
words at higher levels with the help of guessing from the context of the selection. That is two-step phony “intrinsic” phonics. Even the words used at higher levels would preferably be chosen from the list of the 10,000 commonest words since they would be more “useful.” The net result, obviously, was the ultimate impoverishment of vocabulary and the ultimate lowering of the nation’s verbal intelligence.

Since no such extensive list as Thorndike’s had been available before, even sight-word programs for hearing children had been forced to introduce some real phonics above the first grade level. Yet, with such a list as Thorndike started to prepare in 1911 and which he published in 1921, real phonics would no longer be “necessary” for most hearing children. Even as high as the fourth grade level, new whole words could be memorized solely by visual comparison to known whole words to see like parts (two-step, visual, phony phonics - the deaf-mute approach).

Two-step phony phonics is an aspect of the age-old deaf-mute method that the Reverend Gallaudet brought to America from France in 1816. The teaching of straight sight-words solely for “meaning” rates Code 1, and Gallaudet started his instruction with straight sight-words learned for “meaning.” Later, known sight-words were compared to unknown words to see likenesses and differences, as an aid to remembering those new words. That is visual phony-phonics, or the Code 3 method. Therefore, Gallaudet’s deaf-mute students used both the Code 1 meaning initially, and later the Code 3 method to expand their visual vocabulary. Yet none of Gallaudet’s deaf-mute students, of course, could know anything about the “sound” of the words whose “meaning” they were learning, or of the “sound” of the letters in those words.

Thorndike’s list of the 10,000 commonest words could (and DID) make it possible to turn almost all American hearing students into whole-word context-guessers, or “subjective” readers like Sholty’s third little girl. The benighted Government report, Becoming a Nation of Readers, on page 11, unwittingly confirms that most Americans today are “subjective” readers just like Sholty’s third little girl, guessing unknown whole meaning-bearing words by mental comparison to remembered whole meaning-bearing words, aided by the use of context meaning.

In the academic year 1913-1914, William S. Gray came to Columbia Teachers College from the University of Chicago where Thorndike’s friend, Judd, was located, to prepare oral reading accuracy tests directly under Thorndike’s supervision. Thorndike himself by then was testing one of the very first silent reading comprehension tests for school children.

The bibliography to William S. Gray’s doctoral thesis at the University of Chicago in 1917, where he had returned to work with Judd in 1915 under a grant from the Rockefeller-supported General Education Board, and which listed Sholty’s article, is very helpful to trace the history of these reading comprehension tests and other reading research, despite the following important omissions.

Binet tested intelligence with oral reading comprehension in France in 1908, but Gray did not mention this.

As already mentioned, Oskar Messmer, whose work was discussed by Edmund Burke Huey in his 1908 book, The Psychology and Pedagogy of Reading, tested oral reading in Germany in 1903 and found two kinds of readers, the objective and the subjective. Other Germans did other reading experiments, such as Julius Zeitler (“Tachistoskopische Versuche Uber das Lesen,” Wundt’s Philosoph. Studien, Bd. XVI, H. 3, pp. 380-463, 1900, also discussed by Huey.)

Also, as Carlo Cipollo told on page 12 of his 1969 book, Literacy and Development in the West, Penguin Books, 1969, the Swiss military examined recruits in all subjects after rules established by the Federal Council on 15 July, 1879, and the tests included oral reading and understanding in reading.
Scores ranged from Grade 1 for excellent to Grade 5 for total insufficiency. Grade 1 in reading was “good reading with good accentuation, and correct understanding of the piece read.” Grade 4 was “defective reading with no understanding of the material read.” Grade 5 meant “inability to read.” In arithmetic, Grade 4, next to failing, meant “easy performance of the four operations with numbers up to 1,000,” while the highest grade was described as “easy performance of the four basic operations both with numbers and fractions and knowledge of the metrical system and correct solution of corresponding problems.” Grade 1 in Swiss geography and history was described as knowledge of the map of Switzerland, of the major points of Swiss history, and of the Constitution. Grade 5 was defined as total ignorance of those subjects. Cipolla reported the following statistics on the tests from 1891 to 1900 which had been given to a total of 256,000 Swiss recruits:

<table>
<thead>
<tr>
<th></th>
<th>Reading</th>
<th>Arithmetic</th>
<th>Swiss Geography and History</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grade 1</td>
<td>48%</td>
<td>34%</td>
<td>21%</td>

</tbody>
</table>

These astonishingly high results on 256,000 young Swiss men certainly contrast most horribly to the disgraceful test results we are getting today from American government school students.

Note that the vast majority of Swiss recruits scored in Grade 1 and Grade 2 in reading and arithmetic, and that the reading and arithmetic scores piled up toward the highest end, with the greatest number receiving the highest score. The piling-up of scores at either end is characteristic for graphs produced from any material which predominantly concerns a learned skill. In contrast, note that the geography and history scores, which required a considerable use of judgment (intelligence) and considerably less of conditioned skill, would form a distinct bell curve if graphed. The highest score is the middle score, and other scores decrease as they move in either direction, towards the beginning and towards the end. That is characteristic when inborn traits such as intelligence are measured.

Yet our “reading comprehension scores” also produce bell-shaped curves, as mentioned elsewhere, instead of skill curves like the above Swiss reading scores, so our reading “tests” are not testing “reading” but primarily intelligence (and degree of attention). In contrast to American reading comprehension tests, the probability is that the content of the Swiss reading tests was simple, so that the Swiss tests effectively were only testing accuracy in reading, which is a learned skill, and not comprehension in reading, which is the product of native intelligence.

However, Gray did not include the Swiss tests in his bibliography and may very well not have known of them.

It is interesting that the first public written “reading comprehension test” in this country was paid for by John Quincy Adams, Jr., at Quincy, Massachusetts, when fourth and eighth graders in the whole of Norfolk County, Massachusetts, were tested in 1878-1879 on various subjects, including oral reading quality (not percent accuracy) and eighth graders were required to give written comprehension summaries on silent reading material. The intent of the test, of course, was to show the success of the Quincy schools under Colonel Parker, who was installed there in 1875 with the help of two of the Adams brothers, compared to the other schools in Norfolk County. Colonel Parker commented about the tests in the School Journal of April 28, 1900, page 451:

“Many of you recall the Norfolk county examination. George A. Walton (no better man could be found) under the direction of the Norfolk county school committee, examined the schools of
the county, town by town. The examination was in the so-called essentials, the three R’s, geography and history. John Quincy Adams gave $500 to have specimens of penmanship, number work, and composition lithographed. The results were published in a pamphlet.”

However, since the eighth graders in Quincy had started school four years before Parker arrived, and the fourth graders were in first grade the first year he was there before changes could have been firmly established, the reportedly superior Quincy scores were doubtful. The study was titled Report of Examinations of Schools in Norfolk County, Massachusetts, by George A. Walton, and it was printed in Boston in 1880. These students, however, are in the age group which had benefited from the increased phonic emphasis spreading in the Massachusetts schools from the 1860’s until the late 1870’s. Their high results (and sample papers were reproduced in the report which certainly confirm the high results) should be compared to the 1845 testing mentioned below. (Gray omitted both the 1879 and 1845 tests from his bibliography.)

Then and Now in Education, written by Stuart A. Courtis and Otis W. Caldwell in 1924, told of the 1845 tests. (Professor Otis W. Caldwell and Jesse H. Newlon were in charge of the experimental Lincoln School founded in 1917 at Teachers College, Columbia, according to Elwood P. Cubberley in Public Education in the United States, Houghton, Mifflin Company, 1919, 1934, page 548. The background on Courtis of Detroit and his Columbia associations are given in Appendix C of this history under the entries for World Book.) Courtis’s and Caldwell’s book compared scores obtained in tests given in Boston, Massachusetts in 1845 with those obtained in 1919. Not surprisingly, the “sound” oriented 1919 students enormously outscored the “meaning” oriented 1840’s students, and did so in almost all subjects, not just spelling. “Reading comprehension” was not tested, but spelling accuracy is a highly reliable indicator of reading skill. The fact that the 1919 students scored higher in all subjects is undoubtedly because reading proficiency enables a student to achieve in all his studies. Correspondingly, reading disability cripples a student in all his studies.

According to Cubberley (page 332):

“There were questions in history, geography, arithmetic, grammar, defining, natural philosophy, and astronomy. The questions and the answers have been preserved, and in 1919 the examination was repeated in the eighth grade of the Boston schools, and later in the eighth grade in numerous other cities, but with this significant difference: in 1845 in Boston the only pupils examined were those picked by the masters as superior, comprising, as the Examining Committee reports, ‘the flower of the Boston Schools,’ where in 1919 all eighth-grade pupils were given the tests and the results made by all entered into the comparison. The outstanding conclusions from the repetition of the tests are that present day children ‘tend to make lower scores on pure memory and abstract (skill?) questions, and higher scores on thought and meaningful questions. In spelling present-day eighth-grade pupils make only one fourth to one third the errors made by the pupils of 1845. The 1919 results in parsing and punctuation were high. In natural philosophy, the 1919 children did much better without instruction than did the 1845 children after study of the subject from a textbook. In arithmetical problems the 1919 children did not do so well.”

There is a probable reason that the 1845 children did well in arithmetic. In 1821, Warren Colburn wrote beginning arithmetic texts which taught mental arithmetic, and he achieved apparently spectacular results, judging from an article written in 1881 by a woman who had been taught from Colburn’s materials. Though she had hated them when she was first learning Colburn’s methods as a child, she was grateful ever afterwards, and noted the great drop in skills in younger pupils after Colburn’s materials had been chased out of the schools by later “experts.” (See the entries on Colburn in Appendix E, and also Appendix B.)
Cubberley included this footnote concerning the 1845 Boston tests:

“The following statements are quoted from the 1845 survey of Boston’s schools:

“1. It is very difficult to believe that, in the Boston schools, there should be so many children in the first classes (eighth grades) unable to answer such questions, that there should be so many who try to answer and answer imperfectly, that there should be so many absurd answers, so many errors in spelling, in grammar, and in punctuation.

“2. There is another sad reflection suggested by these answers. They show, beyond all doubt, that a large proportion of the scholars of our first classes (eighth grades), boys and girls of fourteen or fifteen years of age, when called upon to write simple sentences, to express their thoughts on common subjects, without the aid of a dictionary or a master, cannot write without such errors in grammar, in spelling, and in punctuation as we should blush to see in a letter from a son or daughter of their age. And most of these children are about finishing their school career: they are going out into life.”

Another such comparison from the 1840’s which was not in Gray’s bibliography was described on pages 312-313 of Cubberley’s Public Education in the United States. For part of his data, his source was a 51-page pamphlet, The Springfield Tests, 1846-1906, by J. L. Riley, Holden Patent Book Cover Co., Springfield Massachusetts, 1908. Riley’s pamphlet was a reprint of the results of the two tests, with comparative results in spelling, arithmetic, writing and geography. Cubberley reported on that written examination which had been given in 1846 to 86 ninth grade pupils in the Springfield, Massachusetts, schools. Some forty years later, all the papers were found in the high school building attic. The same tests were then given to 245 ninth grade pupils in Springfield in 1906, and then to Minneapolis seventh and eighth graders in 1926. Each period, of course, represented a different emphasis in reading and spelling. The 1846 group would have been largely “meaning” trained, the 1906 group would have probably been trained by “sound” from the second grade and above with spellers, and the 1926 group would have learned by “sound,” most probably with supplementary phonics in first grade. Twenty spelling words were given to all groups, the same 20 difficult, low frequency words. Spelling proficiency is the best single indicator of oral reading proficiency. Here are the spelling results for the 1846 and 1906 ninth graders and 1926 eighth graders:

<table>
<thead>
<tr>
<th></th>
<th>1845 Springfield 9th</th>
<th>1906 Springfield 9th</th>
<th>1926 Minneapolis 8th</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percent of 20 difficult words spelled correctly</td>
<td>40.6</td>
<td>51.2</td>
<td>60.1</td>
</tr>
</tbody>
</table>

The figures speak for themselves: “sound” outscored “meaning.” Note that the 1926 scores are FIFTY PER CENT HIGHER than the 1845 scores! What is also very suggestive is that the scores rose in all subjects in the 1906 and 1926 retests, and not just in spelling, tending to confirm the belief that if spelling (reading) skills are damaged, so is the rest of a child’s education. These tests should be given again today, in 1994, to contrast the results to those of 1845, 1906 and 1926. Such tests should confirm the disgraceful failure of today’s education.

In his book, Introduction to Educational Measurement, Houghton Mifflin Company, Boston: 1951, Victor Noll wrote of the test given to thirteen- to fifteen-year-olds in the Boston Schools in 1845, which test has been discussed previously. Noll said:
“Below are some typical questions, chosen at random, from the examination:

“(a) What do you understand by the Norman Conquest?
“(b) What is the square root of 5/9 of 4/5 of 4/7 of 7/9?”
“(c) Name the principal lakes in North America.” [Obviously, more than the Great Lakes were to be named!]
“(d) Define Monody.”
“(e) What is the difference between an active and a neuter verb?”
“(f) Explain the hydrostatic press.”
“(g) What causes an eclipse of the sun?”

If Noll’s selection of questions were truly random, then that 1845 Boston test was a lot more demanding than the comments about it which have been previously quoted would suggest. It is hardly surprising that the 1845 Boston pupils did not do very well, but it is almost equally surprising if the 1919 eighth-grade students, about whom Otis and Caldwell wrote, did much better on such questions!

Noll then said (pages 18 and 19):

“Although there seems to be no record of anything like the Boston Survey in the United States for nearly fifty years thereafter, we are told of an English schoolmaster, one Reverend George Fisher, who reported having constructed what he called a Scale Book. The account of this is given in an article published in 1864 by E. B. Chadwick. In his Scale Book the Reverend Mr. Fisher included a scale of handwriting against which samples of children’s handwriting could be graded, a standard list of spelling words, and questions in mathematics, navigation, Scripture knowledge, grammar and composition, French, general history, drawing, and practical science. Thus he provided examinations by which any pupil could be tested and graded, not only in each subject or area, but also on the total and the average of all, or any combination of, subjects.

“The work of Fisher, as in the case of Mann and the Boston School Committee, made no great impression....”

In a footnote on page 18, Noll gave the following citation for the information on Reverend Fisher:

Reverend Fisher’s tests can possibly be dated to the early 1860’s but I have no further information concerning them. W. S. Gray probably knew of these tests since they were discussed in this 1913 article which was published while Gray was Thorndike’s 1913-1914 graduate student. Presumably Gray thought the circa-1860’s tests from England did not concern reading skills in any way, which would explain why he did not include them in his 1917 bibliography.

The 1879 Swiss reference is the earliest I have found to the formal testing of oral reading, but it was preceded by the earliest formal test I have found of silent reading comprehension, that of Quincy, Massachusetts, in 1878-1879. However, subject matter was tested in the 1840’s as mentioned above, but no formal reading tests were done.

Gray’s omission of the preceding items from his 1917 bibliography is actively helpful, because his incomplete list clarifies the frame of reference in which the psychologists of the 1913-1914 period were
Gray’s earliest “comprehension test” mentioned is, not surprisingly, very illuminating. It was that given by G. J. Romanes in England, reported in Romanes’ Mental Evolution in Animals in 1884. (James had quoted Romanes extensively in his Principles of Psychology.) As discussed previously, Romanes tested adults on silent reading speed and comprehension. While Cattell was in England in 1886 and 1887, he must have known Romanes from the Aristotelian Society, at which both Cattell and Romanes gave addresses. (See Michael M. Sokal’s An Education in Psychology, James McKeen Cattell’s Journal and Letters from Germany and England, 1880-1888, the MIT Press, Cambridge, Massachusetts: 1981:., pages 230, 234 and 239.) Cattell’s continued interest in the topic is suggested by the fact that a few of Cattell’s students later did “rate” research, as shown by Gray’s bibliography.

Gray listed the first silent reading “rate and comprehension” test ever done in America, and it was apparently done by an undergraduate girl at Wellesley, to judge from letters in the Cattell manuscript files in the Library of Congress from Mary Whiton Calkins to Cattell in the summer of 1894. Cattell apparently had questioned the value of such undergraduate research as Calkins was carrying out in her classes at Wellesley. At any rate, as Gray’s bibliography showed, Educational Review, October, 1894, published Adelaide M. Abell’s study on 41 Wellesley students, “Rapid Reading: Advantages and Methods.”

Mary Whiton Calkins’ initiation into psychology had taken place only four years before, as she said on page 31 of her short autobiography in A History of Psychology in Autobiography, Volume I, edited by Carl Murchison, originally published in 1930 apparently by Clark University Press and republished by Russell & Russell, New York, in 1961:

“I began the serious study of psychology with William James. Most unhappily for them and most fortunately for me, the other members of his seminary in psychology dropped away in the early weeks of the fall of 1890; and James and I were left not, as in Garfield’s vision of Mark Hopkins and himself, at either end of a log but quite literally at either side of a library fire. The Principles of Psychology” was warm from the press....”

This clearly places another tie between William James and reading theory: that his solitary 1890 student should, only four years later, have one of her students perform the very first silent reading rate and reading comprehension test in this country, and apparently only the second one on record in the world. The first was Romanes’ some time before 1884. In his 1890 psychology book, James had quoted Romanes at length concerning that test, so James obviously considered it to be of importance. James obviously also considered Cattell’s 1880’s reading experiments to be important, since he discussed them at length in his 1890 psychology book. It should be mentioned again that, by some time before 1893, the two very early “experimental” psychologists, James and Cattell, had become close personal friends, as demonstrated by the intimate tone of the 1893 letter mentioned earlier.

But it was not until 1914 that the first real silent reading comprehension tests appeared in print, as shown by Gray’s 1917 bibliography. The tests were coming from a tightly knit group associated with the early experimental psychologists. Daniel Starch of the University of Wisconsin produced one. The head of the psychology department at the University of Wisconsin was Joseph Jastrow, one of Cattell’s reading experiment subjects while a fellow student at Johns Hopkins in 1883. (See Sokal’s reference.) S. A. Courtis, who had worked on the Hanus New York school survey about 1911 and who studied under the psychologist, Thorndike, in 1919, wrote another reading comprehension test. The famous Thorndike, of course, was James’ and Cattell’s ex-student and friend, Karl D. Waldo did a master’s thesis on reading comprehension at the University of Chicago in 1914, probably under the psychologist, Judd, who had been Thorndike’s fellow student at Wesleyan. (See the February, 1926, Thorndike honorary issue of the Teachers College Record for the 1919 paper Courtis did under Thorndike, and the May issue for Judd’s anecdotes concerning his relationship with Thorndike.)
Significantly, it was also in 1914 that a report on Thorndike’s silent reading comprehension test first appeared in print, and it included a report on Gray’s oral reading tests prepared as Gray’s master’s thesis at Columbia directly under Thorndike. That material is listed in the annotated Thorndike bibliography in the February, 1926, Teachers College Record. It was titled “The Measurement of Ability in Reading,” by E. L. Thorndike, and had appeared in Teachers College Record XV, September, 1914.

Obviously, with Gray’s oral reading tests and Thorndike’s silent reading tests given to the same children, it would be possible for the first time efficiently to compare oral reading accuracy to silent reading comprehension. It was most probably that same academic year, 1913-1914, under Thorndike, that Gray formed the opinion about oral reading accuracy that he expressed in Chicago many years later, about 1940. Gray’s comments, as reported by Mitford Mathews, have been cited earlier.

Before these tests were given, it seems likely that the “experts” would have expected consistency in the testing: the sight-word children would score lower on oral word accuracy, but consistently much higher on silent reading comprehension, while the phonics children would score higher on oral word accuracy and consistently lower on silent reading comprehension. The psychologists were apparently anticipating nice, neat relationships. Yet it should be clearly noted that their method, up to this point, might be presumed to be justified by Cattell’s objective scientific experiments from 1883 to 1885. It was only the psychologists’ interpretation of these experiments that was wrong. Their philosophical and religious biases seemed to have had no bearing on the deaf-mute reading method they were endorsing. In 1913 and 1914, it seems apparent that James’ disciples, Thorndike, Judd and probably Cattell (James had died in 1910) truly thought they could improve reading ability with their deaf-mute approach. (At that point, Dewey does not seem to have shared Thorndike’s, Judd’s, and probably Cattell’s aims in reading instruction, since Dewey discounted the relative value of literacy itself as early as the turn of the century, considering “socialization” to be the primary purpose of the schools.)

However, it is evident that by 1915 these movers and shakers in education had stumbled across what could be called the Miss Middleton Effect. They obviously misinterpreted it, not on scientific grounds this time, but on narrow philosophical and religious grounds, exactly the kind which the United States Constitution establishes as out-of-bounds in such places as government schools. (However, the Constitution, of course, never authorized the existence of government schools.)

Miss Middleton had a combined third- and fourth-grade class, which was tested on silent reading comprehension in the fall of 1913 and in the spring of 1914. What makes her scores so interesting is that they were reported individually by Karl Douglas Waldo in the January, 1915, Elementary School Journal (previously called Elementary School Teacher) of the University of Chicago, so that it was possible to compare each child’s fall score to his score in the spring. (Children could read orally with great accuracy at that time, as later quotations will show, and as can be confirmed by the extraordinarily high spelling scores the Ayres’ scale registered in 84 American cities in 1914 and 1915.)

Some of Miss Middleton’s children who scored very high in “reading comprehension” in the fall scored very low in the spring, and some who scored very low in the fall scored very high in the spring. Almost none scored the same, but either went up or down, often way up or way down.

Any reasonable person might conclude that those high-scoring children in Miss Middleton’s class who later scored very low in “reading comprehension” were simply not paying attention, as we can sometimes read the newspaper vacantly and not know what we read.

But you have to believe in consciousness before you can believe in true attention, because it is consciousness that pays attention. Furthermore, you have to believe in a free human will before you can
decide that anyone can voluntarily choose to pay attention. Yet neither consciousness nor free will existed for most of the turn-of-the-century psychologists. Therefore, on philosophical and religious grounds, they had to reject the explanation for the Miss Middleton Effect which would have satisfied most other Americans. That satisfactory explanation would be that the reading comprehension tests had confirmed that children taught by phonics could, indeed, read very well when they concentrated, and they therefore had no need for the deaf-mute method to improve their reading comprehension.

How could presumably educated persons deny the existence of consciousness and free will? The answer, of course, is to be found in their materialistic “education.” All of these psychologists had been enormously influenced by the materialistic psychology of Wilhelm Wundt of Germany. James was the first to seek him out in 1868. Quoted on page 93 of the biography of Thorndike, The Sane Positivist, by Geraldine S. Joncich, Wesleyan University Press, Middletown, Connecticut: 1968, was a letter that James wrote on May 5, 1868. James wrote that letter while he was traveling in Europe, during which time young 26-year-old James apparently imagined himself to be sick. In 1868, Wundt was still the famous Helmholtz’s assistant, although Wundt had already published his first book on psychology in 1862, based on his university lectures. It is probable that James had seen Wundt’s 1862 book. In his 1868 letter, James said he was going to Heidelberg, since both Helmholtz and Wundt were there. James then said that he thought that, without too much physical effort, he might find out from Wundt something about psychology in relation to the senses, which knowledge James might later use.

G. Stanley Hall followed, studying with Wundt when Wundt had gone on to Leipzig, and before Hall received his Ph.D. under James at Harvard. As discussed earlier, Hall had been an instructor at Harvard in 1876 and a friend of James just before going to Leipzig in 1877. Immediately after returning, Hall continued his studies under James to receive his doctorate from Harvard in 1878. Hall had studied in Germany previously but not under Wundt. Therefore, it seems probable James sent Hall back to Germany to study under Wundt before Hall received his Harvard doctorate.

From 1883 to 1886, James McKeen Cattell studied with Wundt in Leipzig. In Leipzig, Cattell continued the reading perception experiments he had begun at Johns Hopkins in Baltimore on St. Patrick’s Day in 1883, in which both his professor, G. Stanley Hall, and fellow graduate student, John Dewey, were two of his subjects. Cattell’s experiments have been cited ever since as the classic “proof” that sight-words are the correct approach for teaching beginning reading. Cattell’s experiments were obviously inspired by the reports of Cattell’s professor at Johns Hopkins, G. Stanley Hall, concerning Wundt’s similar perception experiments. Hall had been a subject in Wundt’s perception experiments while studying under Wundt in Germany.

Anthony C. Sutton reported a curious fact concerning Wundt’s paternal grandfather, who died many years before Wundt’s birth. Sutton wrote the following on page 86 of his book, America’s Secret Establishment, published by Liberty House Press in Billings, Montana in 1986:

“Wundt’s grandfather on the paternal side is of significant interest: Kirchenrat Karl Kasimir Wundt (1744-84) was Professor at Heidelberg University in the history and geography of Baden and pastor of the church at Wieblingen, a small neighborhood town.

“The Illuminati Order documents show that ‘Raphael’ in the Illuminati is identified as this same Professor Karl Kasimir Wundt and is referred to in the Illuminati Provincial Report from Utica (i.e., Heidelberg) dated September, 1782.”

Sutton cited as his source for this information page 269 of Der Geheimbund Der Illuminaten, by Richard van Dulman, Stuttgart, 1977. Sutton said that Wilhelm Wundt (1832-1920) was the son of Maximilian Wundt who was also a minister like his father and Wilhelm Wundt’s grandfather, K. K.
Wundt (1744-84). Wilhelm Wundt of Leipzig was born in 1832 long after his “Illuminati” grandfather’s death in 1784, so there was no contact between them, but he may have inherited activist traditions.

Many other American students after James, Hall and Cattell also made the pilgrimage to Wundt. Even those who did not themselves go to Germany were indirectly influenced by Wundt, such as Thorndike who studied with James and Cattell. What Wundt endorsed was pure materialism.

William James, Thorndike’s professor about 1896 at Harvard, had been ambivalent on the subject of pure materialism, but eventually wrote a famous essay in 1904, “Does Consciousness Exist?” and concluded that it did not. William James wrote in 1904:

“The word consciousness is just a loose way of indicating that certain sensory occurrences form part of my life history.”

Concerning free will, for a 1908 book, Essays Philosophical and Psychological in Honor of William James, Thorndike wrote a chapter, “A Pragmatic Substitute for Free Will.” Thorndike discussed free will in terms of instinctive responses and habits built on them.

Obviously, these views should be filed under “religious beliefs” and not under “education,” and should not, as said before, be allowed to have any influence on curriculum meant for government schools, where sectarian religious beliefs can have no place, according to the Constitution.

These psychologists more or less agreed with one another. In Cattell’s journal on March 22, 1886 at the age of 25, while in Leipzig studying under Wilhelm Wundt, Cattell wrote, as recorded in Michael M. Sokal’s book, An Education in Psychology:

“I am at the foundation a sceptic - the whole of my philosophy is 0. In the first story I have some metaphysical ideas, but don’t think them worth working out. The sum of them is God, the world and I are one and the same. I really live in the second story and call myself a scientist. Here I am an atheist, a fatalist and a socialist, and make the world a logical whole albeit built on nothing.”

In his “first story,” Cattell was obviously a pantheist, but he “lived” in the “second story,” as an atheistic materialist and socialist. All of these views were very fashionable, intellectually, in the 1880’s. Many people, particularly students, have toyed with such silly philosophies in their youth but then rejected them as they matured and grew wiser. Yet Cattell apparently did not change his views with age. Cattell was President of the International Congress of Psychology at Yale in 1929, an exceedingly influential meeting to which the famous psychologist, Pavlov, of the Soviet Union and luminaries from other countries came. The New York Times reported on September 3, 1929:

“Dr. J. McKeen Cattell in his presidential address (said the) objects of the sciences were more ideal than the objects of the churches.... The practices of the scientists, he added, are more Christian than those of the churches.... ‘When in the fullness of time there is a family of the nations, when each will give according to its ability and receive according to its needs... this will be due in no small measure to cooperation among scientific men of all nations in their common work. And it may be that psychology...shall lead them. It is the object of psychology to describe, to understand, and to control human conduct....’“

The phrase, “to control human conduct,” sheds considerable light on Cattell’s probable views on free will. It should also be noted that the socialist Owenites in 1826 believed, as Karl Marx and Cattell did later, that “each” should “give according to its ability and receive according to its needs,” and the
Owenites also shared Cattell’s conviction that “science” could save the world. Yet to hold such a belief about “science” today would be ingenuous - or even simple minded.

It is worth while at this point to give some background on Cattell and on those of his contemporaries who were like him. They were trying to influence American education. Yet their world-view, including their materialistic philosophy, was very much out of step with mainstream America. Despite that fact, it was the children of mainstream America they were trying to influence through what they euphemistically called “education.”

Many of these “educators” were associated with the General Education Board, funded by the Rockefeller fortune. Rockefeller money was to a very large extent the cause of the mushrooming growth of Columbia and the University of Chicago from about the turn of the century. These two universities have had an enormous influence on American education ever since, and were the home bases for Cattell, Thorndike, Dewey, Judd, and hosts of other change-agent “educators.” The General Education Board and the Carnegie group were under scrutiny in the Congress in January and February of 1917. Abraham Flexner’s paper, A Modern School, published by the General Education Board in New York in 1916 (Occasional Papers, No. 3), had resulted in this editorial in The New York Times on January 21, 1917:

“Unblushing materialism finds its crowning triumph in the theory of the modern school. In the whole plan there is not a spiritual thought, not an idea that rises above the need of finding money for the pocket and food for the belly.... It is a matter of instant inquiry, for very sober consideration, whether the General Education Board, indeed, may not with the immense funds at its disposal be able to shape to its will practically all the institutions in which the youth of the country are trained.

“If this experiment bears the expected fruit, we shall see imposed upon the country a system of education born of the theories of one or two men....”

The above quotation appeared on pages 80 and 81 of the late Lance J. Klass’s critically important book, The Leipzig Connection, which he wrote with Paolo Lionni and which was published by Heron Books, Portland, Oregon, in 1981. The book documented the enormous influence of Wundtian materialistic psychology on American education. The influence was achieved by Wundt’s American students and their proteges who used almost bottomless foundation moneys from the Carnegie and Rockefeller foundations. This also appeared in The Leipzig Connection by Klass and Lionni, in connection with the above comments from The New York Times:

“The dam broke into a national outcry against the General Education Board and its attempts to control and alter American education.... The debate continued onto the floor of the United States Senate, with Senator Chamberlain of Oregon leading the attack on the General Education Board.”

For the record, the late Lance Klass wrote me that in his original book he had found fault with the sight-word method, but that, when the book was revised with Paolo Lionni, the objection was removed. Klass published a newsletter, Save Our Schools, for a period of time, but he found the financial cost overwhelming and had to cease publication. The newsletters were remarkably informative.

The following was not in Klass’s and Lionni’s book, but is from about page 2928 of the Congressional Record about February 8, 1917. Chamberlain said:

“Mr. President, I desire to disclaim any opposition to the Carnegie Foundation or to the Rockefeller Foundation. I have no objection to their private and charitable activities.... What I
objected to the other day, and what I object to now, is that they should become so aligned with the Government itself that emanations from their brain and from the brains of their agents shall have, as it were, the Government’s stamp upon them so that they go to the people as the doctrines and principles enunciated by the Government itself.

“There are some men connected with these institutions, Mr. President, who do not respect the American ideals at all. They are far out of touch with the opinions... of the people of this country and expressions that come from them ought not to go out with the stamp of governmental approval.”

As shown below, Judd was one of the Government’s dollar-a-year men and was also carrying out long-term research funded by the General Education Board. It is worth mentioning here that the work from 1915 to 1918 described in Judd’s highly influential 1918 report on reading, which included William Scott Gray’s doctoral work on oral reading tests, was funded by the General Education Board. The report was titled, Reading: Its Nature and Development, Supplementary Educational Monographs Vol. 2, No. 4, by Charles Hubbard Judd et al, and was published by The University of Chicago Press in 1918.

Obviously it was the intent of Judd and the group including Gray who prepared that report to influence the teaching of reading in America, although no one had ever given them the authority to do so. It was only after the publication of Judd’s 1918 report funded by the General Education Board that American literacy began to drop again. It did so catastrophically after Gray’s 1930 Dick and Jane deaf-mute-method readers blanketed America.

Page 2843 of the 1917 Congressional Record printed a long list of these dollar-a-year-men, the kind of outside agents about whose educational activities the Congressional inquiry was taking place. It included some very familiar names: Appointed on January 15, 1914, was Charles H. Judd of the University of Chicago. Those appointed on March 25, 1914, included Ellwood P. Cubberley, the “expert’s” historian of education; Paul H. Hanus of Harvard; G. D. Strayer, possibly at that date at Columbia Teachers College; and Frank Ellsworth Spaulding, then Superintendent of Schools in Minneapolis and co-author with Catherine T. Bryce of the massively used 1907-1909 Aldine “sentence-method” readers.

Spaulding, born in 1860, had been a superintendent of schools in Ware, Massachusetts, in 1897, and in Passaic, New Jersey, from 1897 until 1904, where he had written The Passaic Primer with Bryce, the precursor to the enormously influential Aldine readers. Spaulding went on to become superintendent of schools in Newton, Massachusetts from 1904 until 1914, in Minneapolis from 1914 to 1917, and Cleveland from 1917 to 1920. In addition, Spaulding participated in many of the school surveys of the period, such as the massive Cleveland survey. He had studied in Leipzig, presumably under Wundt, in 1891-1892 and received his Ph. D. there, and studied at the Sorbonne in 1892-1893. He ended his highly influential career as a graduate professor of education at Yale from 1920 to 1939. Spaulding went from being one of the dollar-a-year men from 1914 to 1917 who were under fire in the United States Congress to become a member of the General Education Board from 1917 to 1920.

Page 2827 of the Congressional Record concerned the comments in the Senate on February 8, 1917, in opposition to the influence on the United States Government of such people as the dollar-a-year-men whose main salaries were paid by the General Education Board. Senator Kenyon of Iowa proposed an amendment to an agricultural bill, specifically referring to the General Education Board or others like it:

“Nor shall any person paid in whole or in part by any such corporation for services rendered by him be employed by the Government or become or remain an officer of the Government. Any person violating this or any or either of the terms of this provision shall be deemed guilty of a
misdemeanor... punished by a fine of not less than $1,000 or by imprisonment as the court may determine.”

Senator Kenyon had raised this question in a resolution as long ago as 1914 and said:

“A large number of those who were on the rolls of the Department of Agriculture were paid a nominal sum by the department and their main salaries were paid by the General Education Board, which is a part of the Rockefeller Foundation.”

Page 2928 had the following comments by Senator Works:

“Mr. President, there is something a good deal more important involved in this question than the mere matter of money or the use of the franking privilege.... We are permitting these outside influences to come into the departments and bureaus of the Government and absolutely control its policies, and the doctrines that go out from the departments. I think it is an evil that ought to be curbed, an evil that ought to be suppressed. I am very glad that the Senator from Oregon has raised the question. We have attempted to do that heretofore in connection with another bill, where an attempt was made to influence education in a strict sense in this country, which I think ought not to be allowed.”

Therefore, testimony on the floor of the United States Senate establishes beyond any possible doubt that some United States senators in 1917, and at least one senator as early as 1914, were convinced that some activists had made illicit attempts from at least 1914 to 1917 to shape American education. One senator even introduced a bill in 1917 to CRIMINALIZE some of those activities. I wonder what those old senators would think today if they could return to see the influence the unelected Carnegie foundation is presently exerting on American education.

However, America went into World War I in the spring of 1917 and the Congressional inquiry most naturally was stalled concerning the presumed illicit influence on American education of the Carnegie and Rockefeller foundations. Yet it is surely of interest that William Scott Gray, the father of the 1930 Dick and Jane deaf-mute-method readers most responsible for plunging America into the sea of functional illiteracy, was working with Judd on reading under a grant from one of those foundations at the exact time of that Congressional inquiry in 1917.

It was also in 1917 that Arthur Irving Gates, who wrote the other deaf-mute-method reading series introduced in 1930, received his doctorate from Columbia Teachers College. For a time in 1917, Gates lived with the Cattell family in Garrison on Hudson, while working with James McKeen Cattell. As Geraldine Joncich stated in her biography of E. L. Thorndike, Gates lost his draft exemption in the fall of 1917 presumably because of his close association with Cattell, but E. L. Thorndike had Gates’ exemption re-instated.

Cattell made the New York Times headline only about six months after the 1917 Congressional inquiry into what were believed to be the illicit activities in American education of foundations like the Carnegie and Rockefeller groups. The New York Times headline (of October 2 or 3, 1917) reported that Cattell had been fired from Columbia for opposing the draft during wartime. The Times headline read:

“Columbia Ousts Two Professors, Foes of War Plans.”

The other professor was young Henry Wadsworth Longfellow Dana, the grandson of the poet, Longfellow, and the journalist, Dana.
Presumably, it had been to people like Cattell and Dana that Senator Chamberlain had referred the previous February, when he said in Congress that some men did not have American ideals and were out of touch with the opinions of the people of this country. For instance, there was almost no sympathy in America in late 1917 or 1918 for Lenin’s Bolsheviks. Yet the socialist Cattell was clearly in sympathy with the Bolsheviks in late 1917 or 1918 as shown, among other things, by his handwritten article in the Manuscript Division of the Library of Congress, entitled “The Red Flag.” It was apparently intended for the New York Post and it objected to their coverage of the Bolshevik revolution in Russia, presumably being written either late in 1917 or in 1918. In it, Cattell said:

“The red flag is for socialists the symbol of the brotherhood of the world’s workers. Its suppression is exactly comparable to the suppression of the cross by the Roman Empire. Empires may again fall to ruin, while a symbol conquers the world.”

There have been as many varieties of socialists as there have been of any other intellectual point of view. Moderate twentieth century socialists would be very startled by Cattell’s statement, and would hardly agree with it. Cattell’s view is, of course, radical. Young Dana, who was fired with Cattell, was presumably also a radical socialist at that time as he was apparently a leftist radical many years afterwards, when a Harvard professor in 1932. That Dana was a leftist radical at that time is implied by his having been a scheduled speaker at a Soviet-sponsored “peace” rally in 1932, referred to on pages 467-470 of On A Field of Red, by Anthony Cave Brown and Charles B. MacDonald, G. P. Putnam’s Sons, New York, 1981.

That “peace” conference in Amsterdam, The World Conference Against War, opened August 27, 1932, and its real sponsor was the Soviet Union. (Presumably, there were many other “educators” from various countries, since August was a time when universities and schools were generally closed.) The authors, Brown and MacDonald, quoted a report telling of what had obviously been a staged emotional announcement at the conference. The announcement was of the arrival of a seaman who was supposed to have risked dangers to bring greetings from his fellow workers and to tell of their support of the conference. Concerning the atmosphere of this extravaganza to which Dana of Harvard lent his name and his talents, after the seaman’s emotional announcement, the source that Brown and Macdonald quoted said:

“Instantly the Congress was on its feet as one man, and the Internationale rang out from thousands of throats.”

A reference by President Nicholas Murray Butler of Columbia to “Bolsheviks” was apparently directed at Dana and Cattell, among others. An article in the New York Times about December 11, 1917 (I do not have the exact date on my photocopy) was headed, “Butler Condemns College Bolsheviks,” and quoted the following from Butler’s annual report of 1917:

“That economic determinism which is confuted every time a human heart beats in sympathy and which all history throws to the winds has in recent years obtained much influence among those who, for lack of a more accurate term, call themselves intellectuals. These are for the most part men who know so many things which are not so that they make ignorance appear to be not only interesting but positively important. They abound just now in the lower and more salable forms of literary production, and they are not without representation in academic societies.

“The time has not yet come, however, when rational persons can contemplate with satisfaction the rule of the literary and academic Bolsheviks or permit them to seize responsibility for the intellectual life of the nation.”
Since Butler’s 1917 report was issued only about a month after Lenin and his Bolsheviks hijacked the Russian Revolution, Butler’s comment probably made Dana and Cattell the very first Americans to have been accused in print (by inference, it is true) of being fellow travelers. It was shortly after the Times headline about the firing of Cattell and Dana that Gates lost his draft exemption, presumably because of his close association with Cattell. However, as has been mentioned, Thorndike had Gates’ draft exemption reinstated, as stated in the biography of Thorndike, The Sane Positivist, by Geraldine S. Joncich, Wesleyan University Press, Middletown, Connecticut: 1968, page 379.

Concerning Dewey’s world view, he was reportedly also a socialist. Dewey made a pilgrimage to the Soviet Union with Cattell and apparently others in 1928, Cattell having made the arrangements with the Soviet government. (The source for this information is partly correspondence from Dewey to Cattell in the manuscript files of the Library of Congress. Cattell later referred to their 1928 trip to the Soviet Union in a talk he gave at a dinner in Dewey’s honor at the Aristogenic Society in 1933. Cattell’s talk at this dinner is also in the manuscript files of the Library of Congress.) In John Dewey, His Thought and Influence, edited by John Blewett, S. J., on page 34, Blewett told of Dewey’s account to a friend, sixty years after it happened, of what could best be described as an emotional conversion experience to materialism. Dewey had said,

“I’ve never had any doubts since then,... nor any beliefs. To me, faith means not worrying.”

These “experts” had a Constitutional right to their beliefs or lack of them, including a right to their socialism, and a right to their devotion to Wundtian materialism. Yet, as said before, they were forbidden by the Constitution to shape a curriculum in reading or in anything else which was based on specific religious beliefs and then to promote such a sectarian program through government schools. This is, unfortunately, exactly what they appear to have done. No longer was their motivation for backing the deaf-mute reading method for hearing children to be based solely on perception experiments. To continue to endorse it, they would have to explain away the “Miss Middleton Effect.” That meant they were now building their case on philosophical and religious grounds, and not on scientific ones, by rejecting consciousness and free will as the probable explanation for the fluctuating scores.

Nor should this be considered a too-extreme view of their behavior, unless William James be considered too extreme in his views. On page 291 of his Principles of Psychology written in 1890, before he dismissed the possibility of true consciousness, James wrote the following. I have capitalized the most pertinent portion. However, like Dugald Stewart, William James was wrong in equating the will with attention, but he nevertheless clearly stated that the discussion of free will belonged in the “metaphysical” and not “scientific” category, since it concerned the possibility of “such a principle of spiritual activity.” Therefore, William James himself identified the discussion of free will as a religious, spiritual question.

“...when we see (as in the chapter on the will we shall see) that volition is nothing but attention; ......we must admit that the question whether attention involves such a principle of spiritual activity or not is metaphysical as well as psychological, and is well worthy of all the pains we can bestow on its solution. It is in fact the pivotal question of metaphysics, the very hinge on which our picture of the world shall swing from materialism, fatalism, monism, towards spiritualism, freedom, pluralism, - or else the other way....

“WHOEVER AFFIRMS EITHER CONCEPTION TO BE TRUE MUST DO SO ON METAPHYSICAL OR UNIVERSAL RATHER THAN ON SCIENTIFIC OR PARTICULAR GROUNDS.”
The foregoing, however, should not be considered an openness by James to traditional religion. On page 653, in his chapter, “The Perception of Reality,” he said in a section headed, “The Influence of Emotion and Active Impulse on Belief”:

“The reason of the belief is undoubtedly the bodily commotion which the exciting idea sets up. ‘Nothing which I can feel like that can be false.’ All our religious and supernatural beliefs are of this order.”

In this second statement, William James defined faith as the product of a “bodily commotion” only different in its type from severe indigestion. It is also curious that, in this second statement, James contradicted his first statement. “All our religious and supernatural beliefs...” obviously fall into a “metaphysical or universal” category, and not a “scientific or particular” category. Therefore, as such, according to James’ first statement concerning “metaphysical or universal” categories, the subject of “religious and supernatural beliefs” cannot be treated “scientifically” as he so ineptly attempted to do. Yet by the time James got around to making his second statement on page 653 about “bodily commotions” and “supernatural beliefs,” he had forgotten all about his first statement on page 291 which had outlawed, in principle, the making of that second statement.

These early materialistic psychologists such as James, Dewey, Cattell and others are presented in the literature as the most rational of men. To understand them properly, however, they should be identified as implacable (and irrational) enemies of religion. Grave Constitutional questions are raised because of the enormous influence they and their followers have had on American school curriculum in all areas. This enormous influence has affected captive government school populations required by law to attend government schools in the absence of government-approved private facilities.

Metaphysical categories, however, should have been a problem for James on other grounds, since he had said:

“Truth happens to an idea. It becomes true, is made true by events.”

In referring to the kind of philosophies on which James built that conclusion - the philosophies of men like Comte, Taine, Spencer, and Mill - Walter F. Cunningham, S. J., said on pages 67 and 69 of Notes on Epistemology, Fordham University Press, New York, 1930:

“There is a certain phase of Relativism which is at variance with our conception of truth, the phase, namely, that the human intellect cannot know anything that is fixed or absolute....

“Relativism, therefore, destroys all certitude and leads to universal scepticism; for it denies the absolute value of any principles; even metaphysical principles. Hence, no certitude, for all certitude, metaphysical, physical and moral, is based upon metaphysical principles or laws.... Consequently, Relativism is destructive of all science.”

But William James, the Pragmatist, had said “Truth happens to an idea. It becomes true, is made true by events.” Yet by James’ time, in the late nineteenth century, Descartes’ seventeenth-century sentence, “I think, therefore I am,” had atrophied so badly that the only thing left for William James in that sentence was “think.” From it, James built his idea of the undulating “stream of consciousness” that contained both the ideas to be proven true and the “events” to be used to prove the idea true.

James clearly did not understand attention, either, any more than he did “truth.” S. J. Samuels has pointed out that research has shown the brain to be a “single channel processor,” which means that our attention can only be on one thing at a time. In other words, consciousness is indivisible. That this
consciousness, or attention, can be free-floating, however, and is not determined, or automatic, or machine-like, has been quite clearly demonstrated by the results of research by Eric Klinger of the University of Minnesota. He has done research on what people are concentrating on at any given time, and done it in an ingenious way. His students carried “ beepers” which, when they sounded, signaled the students to write down whatever they happened to be thinking about at that instant. A Discover article of November, 1980, stated:

“After analyzing hundreds of questionnaires, Klinger concluded that a great deal of thought is unrelated to the task at hand. It ranges from fantasy... to mundane considerations.... ‘If you define daydreaming as undirected thought, you could say that a third of our waking time we daydream,’ notes Klinger. ‘In fact, as I read the evidence, it may be our normal mode of thought. When we direct our thoughts, the remaining two-thirds of the time - that is, work with our heads in some deliberate, goal-oriented fashion - we have to make a special effort to do so,”

So, we have to make a special effort, something we do with our wills, to direct our attention!

Yet these early twentieth-century psychologists denied free will and the possibility of free attention. When these psychologists had to produce an explanation for the startling and, apparently, unexpected scores like Miss Middleton’s wildly gyrating “silent reading comprehension scores,” they could not conclude that careless voluntary attention was the cause. If there were no such things as consciousness and free will, there could be no such thing as VOLUNTARY attention. They did discuss involuntary attention - simply the response to stimuli.

Dismissing the possibility of voluntary attention, they must have concluded the Miss Middleton Effect involved such involuntary attention. Their explanation for the effect most probably was that it happened because of two contradictory sets of materialistic “bonds” for printed words. The defective set of “phonic” bonds was the result of “unfortunate” phonic drill when the children were first taught to read, but the “correct” set of “meaning” bonds had also been established in the beginning, depending on how much time was spent on “reading for meaning.” Because of these mutually contradictory “bonds,” the children’s involuntary attention at upper grades while reading was presumed to be alternating between reading words sometimes for their meaning but sometimes only as sound. The “experts” would have had a scientific explanation for this: Thorndike was supposed to have shown that there is no such thing as “transfer of training,” so that all of the phonic drill in the early grades would not have “transferred” to reading for meaning, but would only spasmodically rear its head at upper grades to short-circuit reading whole texts for their meaning.

Therefore, to cancel the “Miss Middleton Effect” of this constantly alternating attention which presumably interfered with “silent reading comprehension,” the “experts” would have to guarantee constant attention to meaning by using their deaf-mute method which forced attention to meaning by context-guessing from whole, meaning-bearing words, and which never dealt with isolated sounds.

39 Thorndike wrote three articles in 1917 on reading comprehension. Reading them is to some extent like reading warmed-over James: James had said on page 184 of his Principles of Psychology, in his chapter, “The Stream of Thought,” “(Consciousness) is always interested more in one part of its object (thought) than in another, and welcomes and rejects, or chooses, all the while it thinks...” Thorndike’s 1917 article, “The Psychology of Thinking in the Case of Reading,” sounds much like the above quotation from James after “bonds” took the place of their out-dated concept of consciousness: “These welcomings and rejectings, retainings and letting go are, however, themselves nothing more than situation-response bonds, when the response is attending to or turning from, cherishing, repeating, saying yes or no to, or the like...” Note that both men used variations of the words, “welcome” and “reject” and used the same idea of selection when thinking. Wrongful selection is Thorndike’s explanation for low reading comprehension and is the theme of all three articles. The articles are obviously refinements of ideas he originally learned from James.
Unfortunately for them, some phonics had to be used at that time even in the University of Chicago experimental school. That was because new vocabulary in reading books above the beginning level could not be reduced enough to do away with the need for phonics. For the method to be perfected, the vocabulary would have to be reduced enough so that true phonics could be dropped. It would be necessary to use only whole sight-word comparisons (“intrinsic phonics”) at least through the first three grades until a sufficient sight vocabulary was established of one or two thousand of the highest frequency words, but first they would have to identify those highest frequency words. Even at that time, it was known that a relatively small number of words probably composed the bulk of almost any selection.

It was confirmed by 1915 that only one thousand words compose about ninety per cent of most common material. The following is from Leonard Ayres’ 1915 work, A Measuring Scale for Ability in Spelling, (pages 10-11) published by the Russell Sage Foundation and recently republished by Mott Media, Milford, Michigan:

“Thus the first of these figures shows that the 50 commonest words are repeated so frequently that with their repetitions they constitute nearly half of all the words we write. The first 300 words make up more than three-fourths of all writing of this kind and the 1,000 words with their repetitions constitute more than nine-tenths of this sort of written material.”

Therefore, anyone who knows the thousand highest-frequency words as “sight words” can score at 90%, or above the frustration level, when reading almost anything orally, even if incapable of reading any other words.

Mitford Mathews, in his book, Teaching to Read, Historically Considered, University of Chicago Press, 1966, page 155, referred to word frequency studies. His source was a 1959 article, “Spelling As A School Subject: A Brief History,” National Elementary Principal, XXXVIII (May 1959), pages 8-23, by Jean S. and Paul R. Hanna, which I have not been able to locate. Mathews said:

“From these studies there resulted a basic list of about three thousand words which comprise ninety-eight per cent of those used by children, and by adults in writing.”

The fact that only a surprisingly few words, out of the approximately half-million or so in English, compose about 98 per cent of most texts should have become very evident to Thorndike long before he completed his personally conducted, painstaking and boring ten-year-long count of words in literature, which resulted in his book of the ten thousand commonest words in 1921. The Hanna material, referred to earlier, showed that about 3,000 words compose some 98 per cent of most texts. Thorndike’s material when analyzed shows that some 9,000 words compose about 98 per cent of most texts, although Thorndike in no way openly referred to that fact. Yet, in comparison to the approximately half-million words in English, the difference between the Hanna 3,000 figure and the Thorndike 9,000 figure is relatively small.

It must also have been obvious to the “experts” like Thorndike and his clique, long before 1921, that only 2,000 words of those 3,000 (or 9,000) words could provide more than enough context for readers to “guess” the meaning of the remaining words in almost any reading selection. After all, that same “guessing” method had been used in the deaf-mute method for centuries but with a far smaller sight-word vocabulary. The remaining printed words, of course, from the half-million or so words in English above the level of the first 2,000 sight-words with the highest frequency, would have to be memorized later and gradually for their meaning to the extent that they were “important.” (The preface to Thorndike’s The Teacher’s Word Book of 30,000 Words, prepared in 1944 with Irving Lorge and published by Teachers College Press, New York, referred to teaching words on the basis of their “importance.”)
Thorndike wrote an article, “Improving the Ability to Read,” for the Teachers College Record of October, 1934, which actually made the general intent of the “intrinsic phonics” method very clear, although he made no reference to that term. Thorndike said children entering fourth grade should:

“...see words as totals composed of such and such sequences of letters, so as to identify them and distinguish cart from cast, came from come, its from sit, hard from hark, bleed from bled, curtain from certain, and the like, with certainty and reasonable speed.”

Thorndike said beginning fourth-graders should:

“...know two thousand or more printed words in the sense that they are able to say the words when they see them and to understand their meaning and to understand the meaning of any printed sentences restricted to these words which they could understand when heard. They can, when they see a word, outside these two thousand or more, infer its approximate sound well enough to enable them to say it with few exceptions, if it is a word which they already know as a heard word. The exceptions are of course words whose spelling [gives] very little help or is actually misleading concerning their [composition] or sounds (ache, acre, aid, anchor, and so forth). This ability to infer the meaning of words not seen before is the product not only of phonic habits but also of all sorts of experiences, habits and analogies dealing with words, sounds, and meanings.”

The “phonic habits” he was talking about were nothing more nor less than Gates’ “intrinsic phonics,” or two-step whole-word phony phonics with context guessing. Note Thorndike’s illuminating reference to words as “totals.” The right side of the brain handles “totals” or “wholes” which are spatial, but it is the left side of the brain which handles language, and language is sequential. Long before 1934, psychologists certainly had that information about the right and left brain. Notice further that Thorndike said fourth-grade children should be able to distinguish its from sit. Phonically-trained children can do that before Halloween at the end of October in first grade, unless they are dyslexic. Incredibly, Thorndike said the word “aid” was difficult for fourth graders! Long before Christmas of first grade, phonically taught children can read pages of such regularly formed long vowel words like “aid”! Nor should “ache” or “anchor” give much difficulty to first graders by winter, once they have been taught the three sounds for “ch” (chin, Chicago, Christmas). For instance, exceedingly few phonically taught first-graders cannot read the word “Christmas” by Christmas and many of them can spell it, as well.

Therefore, Thorndike outlined “skills” for fourth graders who had “intrinsic phonics” which would have been barely passing at the first-grade level for properly taught synthetic phonics classes. (The great majority of children in good phonic first-grade programs have learned to read 2,000 words by June, and have the decoding abilities to read almost anything in print, unlike Thorndike’s fourth-graders, who would only have acquired about 2,000 words.) Yet Thorndike scrupulously avoided any reference to the teaching of reading in the first three grades, actually opening the article with the sentence, “This discussion is not concerned with the teaching of reading in Grades l to 3.” This was, to say the least, exceedingly strange, particularly since his two ex-students, Gates and Gray, had written the first-grade deaf-mute-method readers which by that time, 1934, were blanketing the entire United States.

That the Columbia-based “experts” were consciously working after 1911 for a change in methods to teach beginning reading is confirmed beyond any question by Henry Suzzallo’s remarks quoted below and by H. A. Brown’s remarks to be quoted shortly. Suzzallo had been Thorndike’s admiring graduate student at Columbia Teachers College about 1901, as he stated in his talk contributed to the February, 1926, Thorndike honorary issue of Teachers College Record. Suzzallo received his doctorate at Teachers College in 1905. From that time (or possibly only from 1909), Suzzallo taught at Teachers College, being
Professor of the Philosophy of Education there from 1909 to 1915, when Suzzallo became president of the University of Washington, until he was fired by the Governor of the state of Washington in 1926, reportedly for too-aggressive fund-raising, according to Oehles’ biography. After that, Suzzallo was associated with the Carnegie foundation until his death in 1933.

Suzzallo wrote the article, “Teaching Beginners to Read,” in the 1913 Volume III of the Cyclopaedia of Education. In it, he illustrated and discussed the “reading triangle.” (That is my term, however. Suzzallo’s illustration of that triangle is reproduced in Appendix A.) Suzzallo’s illustration and his article establish that by 1913 his associates and he had a clear understanding of a fact which was later buried. That fact is that there are two different kinds of readers, one of whom uses the direct (subjective) approach, and the other the indirect (objective) approach to decoding the meaning of alphabetic print. The terms, “objective” and “subjective” were used by Oskar Messmer in Germany in 1903 to describe the types he had found through his perception experiments. One type read alphabetic print by the meaning of whole words and conscious guessing (subjectively), and the other type read alphabetic print by its syllables, without guessing (objectively).

Suzzallo’s triangle had its points labeled: the lower right hand corner was labeled, “visual,” the lower left hand corner, “sound,” and the top of the triangle was labeled “meaning.” Suzzallo made no reference to Messmer, but it is obvious Messmer’s “subjective” readers made only one step from “visual,” the sight of the print, directly to “meaning,” and only later made a second step to sound. (Of course, badly taught deaf-mutes do not make the second step to sound, but stop at “meaning.”) However, Messmer’s “objective” readers would make two steps: one from “visual,” the sight of the print, to “sound,” the sound of the syllables, and only then make a second step to “meaning,” obviously using an indirect approach.

Suzzallo felt that “meaning” was impaired by the longer, indirect, objective route (visual to sound to meaning) but protected by the shorter, direct, subjective route (visual to meaning, with sound appearing afterwards as an afterthought). The direct route, of course, is the deaf-mute sight-word method, where “sound” does not have to appear at all. Gallaudet’s students all read that way, picking up sight-word meanings, but never producing any sound.

Suzzallo was a professor at Columbia in 1913, at which time its faculty included the psychologists, Dewey, Cattell and Thorndike. Their close friend, the psychologist, William James who taught at Harvard, had died in 1910. Similar diagrams to Suzzallo’s “reading triangle” had appeared in 1890 in William James’ psychology text to illustrate other sequences of thought (associations, in which one thought triggers another). Therefore, the reading triangle is obviously a psychological diagram. The 1913 “reading triangle” must have originated with the early psychologists such as James, Cattell, Dewey and Thorndike. Those four early psychologists, James, Cattell, Dewey and Thorndike, were closely associated for years, and it was apparently through his association with them that Suzzallo received the “reading triangle” theory.

Suzzallo said in his 1913 Cyclopaedia article on reading:

“The most active battleground in the reform of school teaching is found in the primary grades, particularly in the first school year where beginners are taught to read.... A discussion of the problem of teaching beginners to read is, therefore, crucial.”

By 1911, Thorndike had already begun work on the uncontrolled vocabulary problem which had made true phonics (“sound”) necessary above first grade. When Thorndike completed his almost ten-years-long study to identify the 10,000 commonest words in English in 1921, it was possible for the first time to write the first true deaf-mute “meaning” readers to grade four with strictly controlled vocabulary for hearing children. Such reading books to grade 4 used only about two thousand of the
highest frequency words, plus a scattering of words above that level. Additional words above the 2,000 level could be introduced beginning at about grade four to the extent that the words were “important” (i.e., generally among the 10,000 commonest).

In 1911-1912 at Columbia, Thorndike had given for the first time his course, “Psychology of the Elementary School Subjects,” and it was on June 13, 1912, that H. A. Brown received his master’s degree from Columbia. It seems highly likely that Brown had been Thorndike’s graduate student, and Thorndike is known to have worked very closely with his graduate students, as shown by the bibliography of Thorndike’s work in the February, 1926, issue of Teachers College Record. Brown’s comments in the June, 1914, Elementary School Teacher concerning silent reading comprehension tests in New Hampshire strongly suggest a tie to Thorndike. That is particularly so since 1913-1914 was the first school year that Gray’s oral reading tests, prepared under Thorndike’s direct supervision, and Thorndike’s silent reading comprehension tests were ever used. It is interesting that what is probably the most famous paragraph from Thorndike’s 1914 silent reading comprehension test, Paragraph J, seemed to suggest possible heavy snowstorms in a town called Franklin, and Franklin in Brown’s New Hampshire is certainly subject to snowstorms. Paragraph J read:

“In Franklin, attendance upon school is required of every child between the ages of seven and fourteen on every day when school is in session unless the child is so ill as to be unable to go to school or some person in his house is ill with a contagious disease or the roads are impassable.”

In one of Thorndike’s 1917 articles on reading comprehension, he said of this paragraph:

“Thus Franklin in the paragraph quoted (J) varies from its exact meaning as a local unit through degrees of vagueness to meaning a man’s name....”

So the Franklin of this paragraph where the roads might be “impassable” must be a place where it snows very heavily in the winter, a place like Franklin, New Hampshire. Also, Thorndike obviously expected the children taking this test initially to perceive Franklin at the beginning of the paragraph in “its exact meaning as a local unit.” It is unlikely that San Francisco would be perceived as a “local unit” for children reading its name in New York City. The children taking the test must have lived in or near a place called Franklin where it snowed so heavily in the winter that the roads could be impassable. That certainly sounds like Franklin, New Hampshire.

It is this writer’s contention that the Columbia experts, Thorndike and his graduate student for the 1913-1914 year, W. S. Gray, who returned to Judd’s University of Chicago the following year, first worked out their new oral reading and reading comprehension tests in 1913-1914 in an “experimental” town. It is contended that this was probably a school district in which the printed word, “Franklin,” could be perceived by children as “a local unit,” in comparison to the names of other towns. The 1915 tests by Currier and Duguid to be described later strongly suggest that school district was either Tilton or Franklin, New Hampshire.

By 1914, Brown was Deputy State Superintendent of New Hampshire and wrote the following concerning the results of his own reading comprehension tests that had been given in many school districts in New Hampshire:

“It is entirely evident that these children are the kind so often seen who can read readily as far as mere word pronunciation goes but who do not apperceive, assimilate and retain the content of what is read in anything like an efficient manner.... The writer recently visited a school in which the reading appeared to be highly efficient. The children could stand and read a page with the utmost APPARENT ease and fluency.... It ... often happens that reading of this kind is in reality
of low grade.... It cannot be pointed out too often that reading is more than mere word-pronunciation. It is feared that some of our prevailing methods of instruction in primary reading are faulty for the reason that undue emphasis is placed on too rapid and too complete mastery of the difficulties of word pronunciation in the earliest stages of reading... this type of teaching produces a confirmed habit of reading words instead of thoughts... which the pupil never completely outgrows....

“...The data which have grown out of these tests suggest emphatically that the prevailing pedagogy of primary reading is in need of thoroughgoing reconsideration.... a new and more correct pedagogy of primary reading must be constructed, based upon the known laws of the learning process.”

On the opposite page from the end of Brown’s article in that June, 1914, issue of the Elementary School Teacher of the University of Chicago was the review of Thorndike’s book on educational psychology, which was, of course, full of “known laws of the learning process,” the kind to which Brown had so approvingly referred. The placement of the Thorndike review hardly seems accidental.

Brown had referred to “The data which have grown out of these tests.” That data certainly sounded interesting, since it was presumed to have suggested so emphatically a necessity to make a change in methods for teaching beginning reading. So I went to look for a later article from Brown which might have included such fascinating data. If it had existed, Gray should certainly have included it in his 1925 research summary. Gray’s 1925 summary did show Brown’s 1914 article, but nothing further from Brown on that topic. Brown apparently never wrote a further article with that fascinating “data.”

Still wishing to see this “data,” I called the New Hampshire State Library. There was no such “data” there, either, though they did have a copy of Brown’s 1915 reading test, and sent me a photocopy.

Then I called the New Hampshire state archives. Did they have anything on tests given in 1912-1913, and 1913-1914? The archives also had nothing, but referred me to an administrator in another office, where they would have annual bound volumes on shelves with the title, New Hampshire School Report. There, I was assured, they would have the books lined up on the shelves reporting on New Hampshire education - one book for each year.

Apparently, I had found the right source. I telephoned that office and asked about the volumes for the academic years 1912-1913 and 1913-1914, the apparent years of Brown’s testing activity. The very kind woman on the other end of the phone offered to check the shelf for me for the years 1912-1913 and 1913-1914 to confirm those volumes were there before I traveled to New Hampshire to consult them. Yet I knew what she was going to tell me before she came back to the telephone, because it had happened to me often before in my research. She reported that the annual volumes for 1911-1912 and before were there, and so were the ones for 1914-1915 and afterwards. But the two volumes in between those years that I had asked for were missing.

Actually, I considered their absence to be a confirmation that really big events concerning reading instruction DID take place in New Hampshire in those years. I had received that same negative confirmation before in my library research, that I had turned up a reference to some critical material. The most notable instance was the missing Ayres scale in the Library of Congress, on which only the cover remained, inside which other material had been inserted.

The occurrence of New Hampshire, and, in particular, Franklin in connection with the names of the Columbia Teachers College experts in the years from 1912 to 1914 is the reason a famous article in the Elementary School Journal in 1916 is of particular interest. Lillian Beatrice Currier and Olive C. Duguid
of Franklin, New Hampshire wrote the 1916 article, “Phonics or No Phonics?” concerning first-grade classrooms in Tilton, New Hampshire, adjacent to Franklin, New Hampshire. Children in those Tilton first grades:

“...had no knowledge whatever of phonics. Words were developed by quick-perception and sense-content methods.... the classes having no phonics were found to enjoy reading.... From the story they got the sense-content. They were less careful and less correct than the phonic classes in regard to word pronunciation. Keeping the sense in mind, they often substituted words from their own vocabulary for difficult or unfamiliar words in the text.... Fatigue was reduced, because curiosity in the story held the interest and caused the attention to be focused upon the outcome of the story....”

Those Tilton first-grade classrooms about 1915 were following the “expert” reading methods endorsed by the “experts” like Thorndike, Suzzallo and Brown. The psychology in use in those Tilton first grades was to take over most reading instruction in America by the early 1930’s. It eventually produced a massive functional illiteracy problem in America. It also produced, beneath that visible obvious functional illiteracy, a severe crippling of literacy in much of the rest of the population, resulting in a widespread inability to profit adequately from higher education.

It certainly does not seem accidental that Thorndike’s two graduate students, William Scott Gray and Arthur Irving Gates, with both of whom he had worked on a close, personal basis, produced the deaf-mute-method readers based on “correct” pedagogy in 1930. That was only 16 years after Thorndike gave one of the first silent reading comprehension tests in the world and was able to compare his scores to Gray’s oral reading accuracy test scores. Gray had prepared his oral reading tests under Thorndike’s direct supervision. Not long after the Gates and Gray deaf-mute-method readers appeared in 1930, they and their imitators made a clean sweep of American schools. It should be clearly recognized that this is something that NO textbook, including Webster’s and McGuffey’s, had ever done before that, which, of course, raises questions on the improper and massive use of “influence.”

There are additional unanswered questions concerning the interval between 1915, when the psychologists’ apparently misinterpreted the Miss Middleton Effect, and 1930, when the true deaf-mute-method readers triumphantly arrived.

In the interval from 1915 to 1930, sight-word methods which were, however, forced to use some supplemental phonics above the first-grade level were adopted with increasing frequency all over the United States, although they remained in a minority. The many massive city school surveys carried out from about 1911 to 1920 which have themselves dropped into oblivion must have turned up distressing test data on the relative failure of such heavily “meaning”-oriented programs in comparison to the heavily “sound”-oriented programs. Certainly, by the 1920’s, reading failure was rampant in places in Iowa which were using sight-word “meaning” methods, and it was these failures which caused the neurologist, Dr. Samuel T. Orton, to become involved in the reading controversy.

As the history demonstrates, the early psychologists were intimately associated originally with the deaf-mute sight-word “meaning” method, but their names are never associated with beginning reading instruction in the literature published after about 1920. That is why so much of the data in this history has had to be drawn from original sources.

It seems apparent from William Scott Gray’s comments about 1940 in a Bloomfield-method first grade classroom, which comments were cited by Mathews in Teaching to Read, Historically Considered, that Gray retained his belief in the correctness of the deaf-mute method. However, it seems very unlikely that Gray’s more sophisticated associates could have retained such a belief after 1920. (It was in the
The early psychologists Cattell, Thorndike, Dewey and Judd (all close friends) drew back after 1920 from public discussion of the sight-word method. (The psychologist, William James, had died in 1910.) Yet the evidence makes it clear that Cattell, Thorndike and Judd actively promoted the method through their students and later associates, Gates, Gray, Courtis, Buswell and others. (It is presumed Buswell had been Judd’s student at the University of Chicago, where Judd and Buswell worked together for years.) Dewey had promoted the sight-word method implicitly by his writings before the turn of the century. Dewey denied the need to teach beginning reading formally, calling the emphasis on reading in the primary grades a “fetich.”

Cattell, Thorndike, Dewey and Judd remained strangely silent on the deaf-mute sight-word method when it made a clean sweep in American schools after 1930. Nor did they speak out against the deaf-mute sight-word method when it became clear by the late 1930’s that it was plunging a once-literate America into semi-literacy. Their silence raises questions beyond the scope of this history.

Three important questions, however, do need to be considered here. Did Cattell, Thorndike, Dewey, and their associates actually have enough influence to have altered the methods of teaching in American schools; were they, actually, very close associates; and, lastly, was their thinking so very much out of step with mainstream America at that time?

The record gives a clear “yes” to all three questions.

The last question can be considered first, concerning whether their thinking was very much out of step with mainstream America at that time. Cattell and John Dewey visited Russia in the summer of 1928, as previously mentioned. At a dinner for John Dewey at the University Club, New York, given by the Aristogenic Society on May 17, 1933, Cattell said:

“At the invitation of the Soviet government I was asked to organize and lead a party to visit that modern purgatory, half way between heaven and hell. When we got there I was nowhere for St. John was worshiped everywhere.” [Ed.: meaning John Dewey].

How many Americans in 1928 would have been asked by the Soviet government to do anything? How many would have been willing to go to the Soviet Union, particularly if invited to do so? (It is true that Will Rogers, the beloved actor, made what was probably an unofficial visit, but he was an unusual man.) How many Americans, for instance, would have visited Hitler’s Nazi Germany in the 1930’s if they received a formal invitation from Adolf Hitler? To mainstream America, an officially-sponsored visit to Soviet Russia in the 1920’s was, emotionally speaking, very like an officially-sponsored visit to Nazi Germany in the 1930’s. By visiting the Soviet Union in 1928 “at the invitation of the Soviet government,” Cattell and Dewey certainly demonstrated they were out of step with mainstream America, because mainstream America greatly disapproved of the Soviet Union. It was many years before the United States even granted diplomatic recognition to the Soviet Union, obviously because of public opinion.

The second question concerned whether the people who are charged with having jointly shaped American education to their liking were actually closely associated with each other. Three of the most influential were Cattell, Thorndike and Dewey. Cattell is generally acknowledged to have been one of the principal founders of experimental psychology in America, and to have been an influential publisher. Thorndike has generally been acknowledged as the leader in American educational thought in the
psychological sense for most of the fifty years in the first half of the twentieth century. Certainly Dewey was the educational leader in the philosophical sense in the first half of the twentieth century.

According to Sokal in his fine book on Cattell, An Education in Psychology, both Thorndike and Dewey visited Cattell at his home after Cattell had been fired from Columbia in 1917, when Cattell was in great disrepute with the general public because of his opposition to the draft in wartime. (Opposition to the war was a characteristic position of radical socialists at the time.) However, Thorndike’s and Dewey’s emotional support for Cattell at this very difficult time for Cattell is understandable and even praiseworthy, but it also confirms that a close personal relationship existed among the three of them in 1917. They all, of course, had been on the faculty of Columbia for many years.

Dewey’s move from the University of Chicago to Columbia had been arranged by Cattell in 1904, as Cattell stated on the draft copy of his Aristogenic Society talk on Dewey in 1933, although Cattell had crossed that comment out on that draft copy which is now in the Library of Congress manuscript files. Cattell and Dewey had been friends since 1883 at Johns Hopkins University, where Dewey had been one of the subjects in Cattell’s famous but ill-starred sight-word experiments (also cited by Sokal). Thorndike had been Cattell’s student at Columbia before the turn of the century, immediately after having been William James’ student at Harvard, where Thorndike kept his experimental chickens in the basement of William James’ home, proving an exceedingly close relationship with James. (Jonzich cited that last fact in her biography of Thorndike.)

The first question concerned whether these people had enough influence to have altered the methods of teaching in American schools. Cattell must have had enormous influence as Chairman of the Executive Committee of the American Association for the Advancement of Science from 1924 to at least 1941, and possibly to his death in 1944. Of course, he owned their magazine, Science from the 1890’s until his death. He founded and published the major educational magazine, School and Society, and published many other materials, including the directory of leaders in science and the directory of leaders in education, both of which latter publications he also founded. (For men to be listed or omitted, and the type of listing given, obviously affected their subsequent careers in both science and education.) As has already been mentioned, Cattell was President of the International Congress of Psychology at Yale in 1929, an exceedingly influential meeting to which the famous psychologist, Pavlov, of the Soviet Union and luminaries from other countries came. Cattell was a cofounder of the Psychological Corporation (and probably the prime mover). The very large Cattell manuscript files in the Library of Congress, containing most of his correspondence and other papers, confirm that Cattell was an organizer and a wielder of influence, par excellence. Obviously, the Library of Congress does not accept the overflowing file drawers of just any deceased American but only accepts manuscript material which has great historical significance.

For instance, a most interesting series of letters in the Library of Congress are those from Edmund Burke Huey to Cattell. The first powerfully suggests that Huey was recruited to psychology by Cattell himself and possibly was his protege at Clark University under G. Stanley Hall. Huey’s famous and enormously influential 1908 book, The Psychology and Pedagogy of Reading, may have been written in payment of such a debt to Cattell for his help in furthering Huey’s career in psychology. After writing that 1908 book, Huey immediately dissociated himself from any further connection with reading instruction, which strange occurrence has been noted by many. The first letter in the manuscript files from Huey to Cattell was dated June 8, 1897, and was from the academy at which Huey taught Latin, where he said he had just handed in his resignation:

“I have finally decided to try to begin in earnest with psychology next fall.... I will only have about $150 to begin with next fall. If it seems possible for me to earn my way at Columbia I
would like to begin there.... Is it possible for me to get a scholarship at this late day? I did not feel free to apply for one before. Am afraid I cannot enter if have tuition to pay.

“If I am not troubling you too much, would you let me know about the possibilities for a scholarship, and what would be the best (or a possible) means of earning money in the University? Am willing to do anything.

“Have been much interested in the little book by Jastrow and hope you will pardon me if I keep it just a little longer.”

Jastrow had been one of Cattell’s subjects in his reading experiments in 1883, and was later at the University of Wisconsin (from which Starch came, who worked on reading comprehension tests in 1914). The book may have been Jastrow’s Aspects of Modern Psychology, part of a publication, Epitomes of Three Sciences, 1890. The reference to Jastrow’s book which Cattell had obviously lent to Huey suggests Cattell was recruiting the Latin teacher to the field of psychology. Huey had graduated from Lafayette, Cattell’s alma mater and the school where Cattell’s father had been president for years, but apparently before Huey arrived. When Huey had said in 1897, “Am willing to do anything,” was the “anything” ultimately the writing of the famous 1908 book implicitly endorsing “meaning” in the teaching of beginning reading, which endorsement was based partly on Cattell’s experiments?

In Lance Klass’s book written with Paolo Lionni, The Leipzig Connection, he said on page 67 that the first contact between the newly formed General Education Board in 1902, largely funded by Rockefeller money, and the “educators” came with a request for funds from Dr. James E. Russell, Dean of Columbia University’s Teachers’ College. Yet a considerably earlier and probably successful contact between the “educators” and the almost bottomless Rockefeller money had occurred before, and it was initiated solely by Cattell. The Cattell manuscript files in the Library of Congress show this interesting typewritten letter from Cattell to John D. Rockefeller, dated February 3, 1899, written from Cattell’s home in Garrison-on-Hudson on the letterhead of “Columbia University in the City of New York, Department of Psychology”:

“I venture to ask you to endow a chair on a lectureship in psychology in Columbia University. I do this assuming that you may be interested in our work in psychology owing to Mr. Strong’s connection with it.... I should prefer not to have it mentioned to Mr. Strong.”

Cattell had met the American, Strong, at Cambridge, England, in 1887 and had said, “He is one of the best men I know,” in a letter of May 14, 1887, quoted by Sokal. Strong later became John D. Rockefeller’s son-in-law. Strong obviously would have been embarrassed to have his father-in-law asked, in effect, to pay his salary at Columbia. Yet Cattell used the relationship anyway, without Strong’s knowledge, and probably succeeded at that time in raising a considerable sum of money for Columbia. John D. Rockefeller, Jr., answered Cattell on February 6, 1899, on a letterhead with only 26 Broadway, New York printed at the top. Rockefeller said that Strong was still out of the country, but that he did not want to deal with the matter until Strong returned, although he would not mention that anyone from the university had been in contact with him on the subject.

Cattell answered on February 8 and said:

“I am therefore grateful to you for the assurance that my name will not be mentioned in this connection....”

More correspondence, not to be seen by Strong, took place. Then, more than thirty years later, on January 17, 1931, Cattell wrote John D. Rockefeller, Jr., once again:
“You may remember that some thirty years ago, after a conversation we had in your office, Mr. Rockefeller gave $100,000 to Columbia University to enlarge the work in psychology.”

In Cattell’s 1931 letter to John D. Rockefeller, he claimed he had not again asked for money after that $100,000. The Cattell manuscript files show that Cattell approached Rockefeller for some financial support for the Psychology Department in 1901 and 1902, so the $100,000 he referred to in 1931 must have been received in answer to those requests. By that time, presumably the initial support for Strong had also been received. The probability is that foundation moneys after the advent of Rockefeller’s General Education Board in 1902 made any further direct request from Cattell for funds unnecessary, which would explain why he did not again ask for money.

Yet Cattell presumably got what he asked for in 1899, and managed to use Strong without Strong’s knowledge. Cattell seemed to like to operate like that, in the shadows. A very curious letter of February 6, 1899, was sent to Cattell by Alexander Graham Bell, who sincerely congratulated Cattell on the success he was having with the magazine Science, which Bell had much earlier managed with a “Mr. Hubbard,” presumably Bell’s father-in-law. Cattell’s ownership of Science is clearly indicated in reference works today as dating from the mid-1890’s. With that fact in mind concerning the date of Cattell’s actually acquiring ownership of Science, note Alexander Graham Bell’s confusion as late as 1899 concerning the question of who actually owned Science. That was despite the fact that Bell and Hubbard had run the magazine just before Cattell. Note also that Bell not only exhibited no hostility to Cattell but actually sent Cattell $500 for a bill Bell was supposed to have owed for many years, of which debt Bell had absolutely no knowledge! To be able to have any degree of influence with Alexander Graham Bell, as well as the John D. Rockefellers, senior and junior, was no ordinary accomplishment. This achievement is underscored by the fact that, at the time of these activities in 1899, the 39-year-old Cattell had no particularly high standing, but had just been a psychology professor at Columbia for less than ten years and was a budding publisher. Even Thorndike’s letters to his wife, (quoted in Joncich’s biography) before the Thorndikes’ marriage, concerning his contacts with Cattell when he first arrived at Columbia in 1897, suggest that Thorndike viewed Cattell as just one of the professors, and not a notable.

Bell’s remarkable letter of February 6, 1899, to Cattell read:

“Your note of the 3rd instant received. I have never fully understood the arrangement under which Science passed under your management. I simply had an understanding with Mr. Hubbard that I would help the Journal “Science” in such ways as he recommended. I don’t remember of receiving any letter from him on the subject, and we never discussed the matter personally, so that it is a surprise to me now to know that any promised subscription of ours had not been paid. I have been under the impression for the last few years that the Journal had been taken over by the American Association for the Advancement of Science, and that any further contributions towards its support on our part were entirely unnecessary. Indeed I feel quite mortified at the discovery that an obligation on our part of five hundred dollars towards the expense of “Science” has been standing so long unpaid, and I hasten to enclose a check for the amount.

“I do this the more readily because I recognize that Science has been very ably conducted since it passed into your hands, and that it has become, under your management, the representative American journal for which Mr. Hubbard and I worked.

“As the matter has heretofore been entirely in Mr. Hubbard’s hands and I do not know the condition Science is in, don’t know who owns it, how it is supported or anything about it, I would be very glad of any information.
“Wishing you and Science every success, I am, my dear sir,

“Yours sincerely,
Alexander Graham Bell”

Whether “Mr. Hubbard” was the same Hubbard who had worked on founding the first deaf-mute school in Massachusetts which taught the deaf to speak, and who was later Bell’s father-in-law, is not confirmed but appears probable.

It was only after Cattell’s death that the ownership of Science went to American Association for the Advancement of Science.

Some impressive testimony was given in 1902 that Cattell knew how to get contributions from such foundations as the General Education Board. That testimony came from a highly reliable source, considering the history of education in America in the twentieth century. The Cattell manuscript files contain a remarkable letter of July 17, 1902, from John Dewey, then Director of the School of Education at the University of Chicago. It is interesting that directly under the words, “The University of Chicago,” on Dewey’s letterhead with Dewey’s title appeared the words, “Founded by John D. Rockefeller.” Furthermore, Dewey’s typewritten letter had Cattell’s name misspelled as “‘Cattel” at the top and at the bottom. According to Cattell in the talk he gave at the Aristogenic Society in Dewey’s honor in 1933, Dewey read very rapidly. Dewey was probably a psycholinguistic reader incapable of proofreading his typist’s work. He certainly should have known how to spell Cattell’s correctly name since Dewey had known him at least since 1882, twenty years before at Johns Hopkins.

Dewey’s July 17, 1902 letter asked Cattell about Dewey’s chances for getting a grant from the Carnegie Institute Funds for work on anthropology for someone he would recommend, and that work on anthropology was meant to be applied to the education of children. Dewey enclosed a letter from a Miss Dopp40, who had just received her doctorate there, and who was the one he had in mind to do the work. Her letter outlined its nature. Dewey said he was also interested in applying for a grant himself to work with several people on a child psychology topic. He said he felt it was somewhat forward of him to send these proposals to Cattell to review, but he then made the remarkable comment that he felt Cattell would be better able to evaluate his chances on these research proposals than any other person he knew. Dewey obviously recognized Cattell’s abilities on the profitable use of “influence.”

Those letters from Huey, the Rockefellers, Alexander Graham Bell, John Dewey, and Cattell himself really do seem to make quite a court case to the effect that Cattell knew how to make very effective use of influence. The letters establish that, in the early years of the twentieth century, the movers-and-shakers around him, his close friends Dewey and Thorndike, could be the beneficiaries of Cattell’s talents in exerting influence through organizing and publishing activities. Thorndike and Dewey are generally acknowledged today in reference works as primary authorities in education in the first half of the twentieth century. I suspect that Cattell’s activities, particularly in publishing, probably had a great deal to do with establishing the reputations of Thorndike and Dewey.

---

40 An advertisement for Venezky’s fairly recent microfilm collection of primers, (which I have not seen), showed a text which also appeared in the Cumulative Book Index, 1928-1932. It was also reviewed and dated to 1916 by W. S. Gray in the 1917-1918 Elementary School Journal, page 382. The text was entitled Betty and Bobby at Home, A Primer, by Katharine Elizabeth Dopp. Dopp is an uncommon name. If she were the “Miss Dopp” to whom Dewey referred, that fact would place a possible tie between Dewey and the preparation of beginning reading materials. Dopp’s materials are discussed in Appendix C, under Rand, McNally.
The first question can therefore be answered in the affirmative: these people certainly had enough influence to change the course of American education.
Chapter 51
The Baleful Effects of the 1930 Deaf-Mute Method Could Have Been Revealed by the 1915 Ayres Spelling Scale, So It Disappeared, Just as the Primary School Records in Boston Mysteriously Disappeared Over the Summer Vacation of 1878, Six Months After the “Meaning” Activists Had Grabbed Control of the Boston Schools Which Had Been Using Highly Successful Leigh Phonics.

After 1930, children could no longer read with that “utmost ease” which had so displeased Brown in 1914, but, because their attention was involuntarily forced by the sight-word “guessing” method of reading, silent reading comprehension scores stabilized. Silent reading comprehension scores no longer fluctuated with the wild abandon that is sometimes seen when children possess truly automatic conditioned reflexes and have free, not forced, attention. The school administrators apparently thought the stable scores proved how bad phonics had been and how good the deaf-mute guessing method was by comparison, even when phonics classes which had been encouraged to pay close attention to reading comprehension tests scored far better than the deaf-mute-method sight-word classes.

The “experts” saw to it that, after the arrival of the deaf-mute-method readers in 1930, group tests of oral reading accuracy and group tests of written spelling accuracy were no longer used. Obviously, such tests would have made public the catastrophic drop in real achievement. The damage the deaf-mute sight-word method was doing was therefore conveniently hidden. The fake reading comprehension tests which took the place of the meaningful oral reading tests and written spelling tests do not really test reading, as discussed elsewhere. The French psychologist, Binet, used a reading comprehension test in 1908 to test basic intelligence, and so the early psychologists certainly knew that reading comprehension tests are a test of intelligence. Curiously, Thorndike implicitly admitted that fact in a famous series of articles he wrote on reading comprehension in 1917, listed in Appendix E, a bibliography of general reference materials on education history.

That such reading comprehension tests largely do, indeed, test inborn intelligence instead of learned skills is demonstrated by the kind of graph produced when large numbers of individual reading comprehension test scores are graphed. A bell curve usually results, which is the characteristic curve when inborn qualities in a population are measured. In contrast, a skewed curve is usually produced when taught skills in a population are measured.

Of course, psychologists such as Thorndike had such a flawed conception of the nature of the human mind that they undoubtedly could not properly handle the distinction between inborn and learned behaviors, although they certainly knew of their existence. The failure to handle that distinction properly arose because those psychologists made no distinction between the mind and the brain. They saw the intellect simply as an enormous collection of stimulus-response bonds embedded in the brain’s tissue, with consciousness resulting as a kind of accidental emanation.

That view is still very much with us, as demonstrated by the movie, 2,001 - A Space Odyssey, with its fascinating and malevolent character, Hal, who is nothing more nor less than a computer with consciousness; by Star Wars, and its amusing robot character, R2D2; and by Isaac Asimov’s numerous and highly entertaining robot stories. Such imaginative tales about conscious computers and conscious robots are a great deal of fun, but they are in the same scientific category as Cinderella with its fairy godmother, or The Wizard of Oz with its Wicked Witch of the West.
That such science fiction is also in the same literary category as well as in the same scientific category is emphasized by the fact that the same people who like fantasy, such as fairy tales or The Twilight Zone TV series, also like "scientific" Star Trek episodes and "scientific" robot stories. I am numbered among such enthusiasts and so speak from experience. Yet psychologists such as Thorndike saw nothing "unscientific" about their conviction that consciousness is some accidental kind of thing that somehow leaks out from the brain's machinery. Nevertheless, it is that "unscientific" idea that has been the rationale for "robot" stories. The concept of the genie leaping out of Aladdin's lamp, and only when the lamp has been rubbed, is, narratively speaking, based on a far more recognizable cause-effect foundation.

Nothing would have revealed the drop in reading achievement more than Leonard P. Ayres' A Measuring Scale for Ability in Spelling, Russell Sage Foundation, 1915, which was still in print in 1928, according to The United States Catalog, Books in Print, January 1, 1928. From the 1928 price of 10c, this probably was the large paper scale itself, which sold for 5 cents when it was published in 1915, and not Part I, the book, which explained how the scale was made. The scale was the product of written spelling tests on the 1,000 commonest words in English, which tests were given to 70,000 children in grades 2 through 8 in 84 American cities during 1914 and 1915. The 1915 Ayres' spelling scale demonstrated the astonishingly good spelling of American children in 1914-1915 (which also means astonishingly good reading). In addition to the fact that phonically-based spelling had come back to most American schools at second grade and above by the late 1880’s, since about 1900, American children at first grade had been taught to read by "sound" through heavy supplementary phonics drill. That was despite the fact that the first-grade reading books, like the apparently dominant Aldine readers, were usually sight-word sentence-method books. As a result of learning to read by "sound," American children in 1914-1915 could read - and therefore spell - very well indeed. The fact that American children could spell and read very well in 1915 is scientifically confirmed by the existence of the Ayres spelling scale.

In 1914, a year before A Measuring Scale for Ability in Spelling was published by the Russell Sage Foundation, New York, the same foundation published The Public Schools of Springfield, which reported on a school survey in Springfield. One of the volumes contained Ayres' report on the use of his spelling tests in 1914 in Springfield from grades two to eight. Ayres said:

"In all, 3,612 children were tested with words that children in other cities on the average spell 70 per cent correctly, and the result was that the final average for the Springfield children was also 70 per cent. It was found, however, that there was variation in the results for the different grades and schools."

However, even the greatest differences between these smaller groups in Springfield in 1914 were not large, results varying roughly only about fifteen per cent above or below the 70 average.

Ayres' spelling tests were used in other cities after his scale was published, and those results not only confirmed his 1914-1915 data, but suggested spelling might even be improving. Such tests were mentioned in an article which appeared in the Elementary School Journal in 1918 by Joseph P. O'Hern, who was Superintendent of Schools of Rochester, New York. O'Hern quoted the Ayres average of 70 for Springfield and then reported for comparison that Rochester averaged 82; Butte, Montana, 80; Oakland, California, 77; and Salt Lake City, Utah, 86.

Four copies of Part I of the 1915 Ayres work, the book, all of which copies probably originally included the folded Part II sheet, which is the scale itself, are currently available at the University of Chicago library. (Part II is apparently no longer in the library, unless I missed seeing it. All the statistical data is, however, also in the book.)
Guy T. Buswell (presumably a psychologist) and the psychologist Charles Hubbard Judd taught at the University of Chicago and were prominent reading “experts” along with William Scott Gray of the University of Chicago. Judd had been Thorndike’s classmate and was Cattell’s correspondent and close associate for many years (as shown by letters in the Library of Congress manuscript files). After Gray received his master’s degree under Thorndike at Columbia in 1914 for his work on oral reading accuracy tests, at which time Thorndike did his first work on silent reading comprehension tests, Gray went to the University of Chicago for his doctorate in 1917, which he received on the oral reading accuracy tests he had begun under Judd’s ex-classmate, Thorndike. From about 1915 to 1918, both Judd and Gray (and others) did research at the University of Chicago on oral reading accuracy and reading comprehension, which work had been funded by the Rockefeller’s General Education Board. That work was reported in Charles Hubbard Judd’s 1918 book, Reading: Its Nature and Development, The University of Chicago Press. Judd later worked closely with Buswell, publishing joint works with Buswell, as he had done with Gray.

Guy T. Buswell (1891-?) received his doctorate at the University of Chicago in 1920, and taught there from October, 1920, until October, 1949, after which he went to the University of California. Buswell became the principal author of the nationally used Ginn arithmetic series for elementary grades from at least 1938 into the 1960’s. The Library of Congress has over 50 cards for Buswell in its card catalog. Buswell’s writings concerned for the most part the teaching of reading and arithmetic, as well as the teaching of foreign languages and other topics, Yet apparently NONE of the Buswell entries were on spelling, despite Buswell’s (and Judd’s) great use between January, 1935, and 1947 of the four surviving copies of the Ayres scale at the University of Chicago.

To judge from the list of people after 1932 who signed their names at the back of the Ayres copies when borrowing those copies from the University of Chicago library, the greatest users by far of those four copies of the Ayres’ book (from which the inserted paper scale is now missing), were Buswell and Judd (or their subordinates who signed the materials out under Buswell’s and Judd’s names). After 1946, (Buswell left in 1949), Buswell’s name no longer appeared on the check out sheets. (Judd had left, apparently, in 1938, and his name last appeared in 1937.)

The check-out entries from 1930 to 1947, and the long gaps of time with few other names appearing besides Buswell’s and Judd’s, (or their students/subordinates, who entered Buswell’s and Judd’s names followed by their own initials) suggest that these University of Chicago copies may have been held in reserve by Buswell and Judd, or their associates. (Some other names also show a recurring pattern, such as Irene Carpenter from 1930.) If so, copies of the Ayres scale would not have been on the University of Chicago open library shelves from after 1930 until about 1947.

Furthermore, these copies were numbered. Copy 2 is dated 1929, so Copy 1, which is missing, must have been purchased earlier. Copy 3 shows its first probable date as 1932. Copy 5 shows its first date as 1935. Therefore, Copy 4 which is missing was dated between 1932 and 1935. The unnumbered copy is the last one, and is dated to the beginning of 1939. It seems apparent that the library had difficulty retaining copies, and so put new copies on the shelves over the years. Yet the actual use of the copies, which tabulation is given below, was relatively light. Therefore, why did the library find it necessary over a period of some ten years to buy six copies of a publication which had such light use, unless those copies kept eluding the librarians during shelf checks so that they kept ordering more?

Even if the copies were on the open shelves and not held in reserve for use only by Buswell and Judd or their students/subordinates or associates, their check-out dates confirm, almost beyond the slightest shadow of a doubt, that both Buswell and Judd had to know that American spelling achievement had plummeted to an absolutely astonishing degree after 1930, after the spread of the Dick and Jane
deaf-mute-method readers, in comparison to the excellent spelling achievement that had been scientifically obtained by Ayres all over America in 1915 and then recorded on his scale.

The four surviving copies in the University of Chicago library in the summer of 1985 were Copy 2, Copy 3, Copy 5, and the apparently newest copy which carried no number. Copy 1 and Copy 4 must have disappeared. A few of the entries were blurred and difficult to read. The check-outs on Copy 2 read:

Copy 3 had an undecipherable entry which suggests it was first used by someone whose name cannot be read on April 23, 193-, probably 1932. That entry appeared only on the dark-colored card apparently retained by the library, but not on the white card which apparently remained in the book. The white card had only these three entries, terminating in 1935:

The check-outs on Copy 5, which must have arrived in 1935, read:

The check-outs on the unnumbered copy which must have arrived in 1939 read:

Therefore, at least four copies survive at the University of Chicago Library, where they were used most by Buswell and Judd.

However, at Teachers College, Columbia, where Judd’s ex-classmate E. L. Thorndike had been located (and J. M. Cattell’s ex-classmate John Dewey had been at Columbia), no copy of the 1915 Ayres scale was available under its proper name when I requested it by interlibrary loan. One copy was finally located filed under a wrong title, and with 1934 the first date shown on the check-out sheet pasted in the back of the book. The book, therefore, was presumably new to the library there in 1934. That was the only copy of the Ayres spelling scale which survived at Columbia Teachers College. That was despite the fact that Dr. Burdette Ross Buckingham of Columbia Teachers College, who had written Spelling Ability, Its Measurement and Distribution, published at Teachers College, Columbia, University in 1913, presumably his doctoral dissertation, had published a sequel to the Ayres’ scale in 1919. That certainly
indicated a real interest by some people from Columbia Teachers College in Ayres’ work as late as 1919. So the library there must once have had copies earlier than 1934.

That Columbia Teachers College Library surviving copy with the pasted-in check-out sheet showing the first date of check-out as August 2, 1934, also had a check-out card in the pocket at the back of the book. However, both the check-out card, which presumably at one time was retained in the library when the book was checked out, and the pocket to hold the card, showed that they had been erased and mislabeled. They both read incorrectly Ayres’ Spelling Scale instead of A Measuring Scale for Ability in Spelling, and neither showed the author’s name, Leonard P. Ayres. The call number had also been erased and written in as 370.8, R. 91, No. 139. It seems very possible that a discarded check-out sheet and card for some other book were re-used for this book.

“No. 139” was the Russell Sage Foundation number for that publication, so possibly the copy had been made part of Columbia Teachers College Library’s total Russell Sage collection in 1934. However, why did the check-out card and the card pocket not show the correct title, and why did they omit the author’s name? The local librarian who requested the inter-library loan for me told me that the Teachers College Library had trouble finding the copy, which is hardly surprising.

Furthermore, no user’s name appeared on the erased and re-labeled check-out card to correspond to that August 2, 1934, first check-out date on the pasted-in check-out sheet opposite the card’s pocket. That copy remained unused for another year and so therefore may not have been on the shelves of the Columbia Teachers College library for that year. The next check-out dates on the card in the pocket at the back of the book did show the names of the users, which they wrote in themselves, to correspond with the check-out dates stamped on the pasted-in check-out sheet opposite the card’s pocket. Those dates were August 12, 1935; July 28, 1936; August 32, 1938; and January 16, 1939, followed by occasional use until 1971, when the library apparently stopped using that check-out sheet and card system but left the old check-out card with the record of the book’s use in the pocket at the back of the book, along with the corresponding check-out sheet pasted on the leaf opposite it.

Since a card for the library’s card catalog, if it existed, would presumably match the check-out card in the back of the book, it would therefore not have been filed under the correct title, A Measuring Scale for Ability in Spelling, nor under the author’s name, “Ayres, Leonard P.” Therefore, it could not have been turned up by checking the card catalog under those correct entries. It is my opinion that the surviving copy of the Ayres spelling material at Columbia Teachers College which was put on the shelves under the wrong name some time after 1934 was very probably put there to defeat someone else’s prior efforts to remove copies of the Ayres’ material from the Columbia Teachers College Library.

In this connection, in Charles F. Heartman’s third edition of his Bibliographical Check-List of the New England Primer which was published in 1934, he remarked on the:

“...most curios fact [that some primers could no longer be located] probably due to the crime wave which spread, a few years ago, over all the libraries in the country.”

Similar disappearances of library books had not, however, registered as a crime in the Soviet Union. In Robert H. McNeal’s biography of Lenin’s wife, Krupskaya, Bride of the Revolution, The University of Michigan Press, Ann Arbor, Michigan: 1972, he told of her penchant for carrying out such periodic sweeps of Soviet libraries in the 1920’s to remove “objectionable” books.

To obtain the Ayres spelling scale today in the New York Public Library, the card catalog states, “Copy only words underlined and classmark.” This produces only the following on the call slip: “SA (Russell) Russell Sage Foundation Recreation (and Education) Departments. (Publ.) No. 139.” That is
also what appears on the binding of the book, and that also means that is how it is filed. Therefore, the only surviving copy of the Ayres scale in the New York Public Library is part of their complete Russell Sage Foundation set of publications. An internal stamp on that copy shows they received it in 1915, and it presumably was bound and added to the previous 138 Russell Sage Foundation publications, or was received in that unusual bound fashion directly from the foundation to add to an existing set. That copy would presumably be placed on a shelf with all the rest of the Russell Sage material instead of being placed with other spelling texts on a shelf for spelling material. Without the use of today’s card catalog listing Ayres, the actual contents of the New York Public Library copy could only be found by either knowing the call number, SA (Russell) No. 139, or by opening all 139 plus volumes in the series on the shelves, since the binding tells nothing of the contents beyond the call number. Yet presumably, at one time, the New York Public Library must have had another copy or copies of the Ayres spelling scale filed under spelling.

When I requested the Ayres spelling scale at the Library of Congress in Washington, the only thing the clerks could find to send down to me was the cover of the Ayres spelling scale with the Ayres handwriting scale inserted instead of the spelling scale. I was therefore later permitted to look myself at the shelf stacks in the Adams Building of the Library of Congress to see if I could locate the spelling scale. I found that only that cover of the Ayres spelling scale was on the shelf assigned to it. Ayres’ handwriting scale was inside that cover, not his spelling scale, and its binding showed where the original material had been ripped out, leaving several broken stitches. Multiple copies of Ayres’ handwriting scale were on shelves nearby. Someone obviously had meddled with the Library of Congress material some time in the past. Since multiple copies of the Ayres’ handwriting scale are in their collection now, it is reasonable to assume they should once have had multiple copies of his spelling scale, and not just its cover, with a copy of the Ayres handwriting scale inserted to fill it up to make it look natural during any shelf checks.

No copy of the Ayres scale is available at the British Library in London, or any of Leonard Ayres’ work at the Russell Sage Foundation, but other writings of Ayres are listed in their card catalog.

Harvard’s wonderful collection of textbooks is unparalleled in America, so it is not surprising that they also have copies of the Ayres’ scale, as well as copies of Gallaudet’s primer, Worcester’s primer, Keagy’s primer, the Franklin Primers (all three versions) and much other rare material so essential to an understanding of the history of the teaching of beginning reading in America. After the death of William James in 1910 and despite Dana’s presence there as a professor in 1932, Harvard seems to have been somewhat outside the “experts’ circle and more immune to their meddling than many other universities. However, the filing system that Harvard used at that time may also have provided some protection. It is my understanding that education materials were not handled in a separate library building at Harvard in the early 1930’s as they are now, but were mixed in with Harvard’s vast collections, so presumably education materials would have been less accessible at that time. As an auditing student in the summer of 1986, I had regular access to most of Harvard’s huge stacks spread over many library floors in the main library, (and they have other libraries, as well, including the education library) and found that the vastness of Harvard’s collections is breathtaking.

The Union Catalog shows a few copies of the Ayres’ book and scale in some other American libraries. It should also turn up from time to time in used book stores since the book, Part I, was in print for years from 1915 to some time before 1928, and the paper scale itself, Part II, was still on sale in 1928. The book with the scale included (in a different printed set-up than the original separate paper scale) has recently been republished by Mott Media, Inc., Milford, Michigan. However, their preface attributed to me was not written by me. It was their attempt to digest a long history I sent them at their request to be used as a preface, and it is inaccurate in some places.
It seems apparent that an effort was made by persons at the University of Chicago and Columbia Teachers College to remove the 1915 Ayres book and scale from open circulation about 1932 because they could be used to demonstrate the drop in achievement caused by the deaf-mute method readers that were in use after 1930. The drop in achievement must have been becoming very evident in the primary grades by 1932. If publicity had ever appeared comparing the spelling scores from the deaf-mute-method readers in 1932 to Ayres’ second-grade scores in 1915, that could have been a death blow to the deaf-mute-method readers. Therefore, the “experts” certainly had a powerful motive to bury the Ayres’ scale by using all the influence available to them.

Ayres had demonstrated elsewhere that children were seldom more than two years below grade level in 1909, and city children had to stay in school till about fourteen years of age or older in 1914 and 1915. Therefore, spelling scores for fifth-grade city children in 1914 and 1915 represented spelling scores for almost ALL American children of fifth-grade age or older. Ayres’ scores on his scale therefore provide irrefutable proof that virtually 100 percent of American city children of fifth-grade age or older were literate in 1915, including Blacks and foreign-born. No “adult illiteracy” resulted in those years for children attending American schools because they were taught to read by “sound.” The Ayres 1915 scores would have provided a startling contrast to the kind of results achieved by the 1930 deaf-mute-method readers, and such results must have already been showing up at second and third grade in 1932.

Perhaps no group has been hurt by the deaf-mute method more than Blacks, as, in contrast to today, city Black students in America demonstrated virtually no illiteracy in 1915, as proven by the Ayres scale. Since so many Blacks are gifted in music and speech (“sound”), they appear to have been hurt worse than other people by the 1930 deaf-mute beginning reading method which dispensed with true phonics (“sound”). Yet, not surprisingly, as demonstrated by Marva Collins’ extraordinary results in teaching true literature to city Black children today after having taught them to read by true phonics, Black children achieve better than average results on literature and language when they are taught by true phonics. (I remember the comment of my dear cousin-in-law, the late Duryea Breslin, who went to school in Jersey City in the 1920’s, when phonics was the norm: “The Black kids were always the smart ones.”) A slogan for a group supporting scholarships for Black students is, roughly, “A mind is a terrible thing to waste.” The waste of so many minds, particularly Black minds, since the arrival of the deaf-mute beginning reading method in 1930 is so enormous that it is incomprehensible.

Students who scored so high on the 1915 Ayres’ scale are quite a contrast to the flood of adult illiterates we have today who were taught how NOT to read by the deaf-mute “meaning” method after 1930 in our benighted government schools. That method was introduced in 1930 by Arthur I. Gates of Columbia Teachers College and William Scott Gray of the University of Chicago, the proteges of the psychologists, Thorndike and Judd of those universities. It was in the libraries of those schools that the Ayres’ scale was so curiously mishandled, after about 1932, and in the University of Chicago by Judd himself.

The suggestion that activists of various and unrelated species may have had hidden game plans for a very long time is rejected by liberals and conservatives alike, being regarded as a delusion of the mentally unbalanced. That attitude has served as a great protection for some activists, as when President Harry S. Truman rejected as madness the idea that the United States Government could have been infiltrated with any subversives. Yet J. P. Morgan’s remark, quoted previously, “A man always has two reasons for doing anything - a good reason and the real reason.” certainly applied to some people who were in the government at that time. Alger Hiss was not the only subversive.

The “real reason” for the disappearance of the Ayres scale from libraries and from the literature was almost certainly not a gradual loss of interest in that material. It is far more probable (in fact, almost
certain) that there was a coordinated effort to bury the incriminating testimony so baldly given by the Ayres scale concerning the drop in literacy caused by the deaf-mute-method readers.

The burying of past history may well have concerned other materials besides the Ayres scale. The huge catalog at the New York Public Library entitled American Book Publishing Record - Cumulative 1879-1949, R. Bowker, Co., 1980, lists many pre-1879 texts which almost certainly were not in print in 1879. This is puzzling but helpful to a researcher. (I may have missed some explanation on why pre-1879 texts were included.) However, this massive catalog is grossly defective, showing signs of tampering. It could obviously have been subject to such tampering by the employees charged with preparing it without the knowledge of its publishers, R. Bowker Company. (Presumably, there were earlier editions used to prepare the 1980 edition, so that the tampering might have been done many years ago.)

For instance, while the catalog lists various school texts of the very large and important Appleton company in the nineteenth century, it leaves out the highly important Appleton reading series of 1878. Furthermore, of the three authors who compiled the Appleton reading series, no listing of the series is given under their names. One was William Torrey Harris, superintendent of schools in St. Louis in 1878 and later United States Commissioner of Education; another was Mark Bailey, professor of elocution at Yale University; and the third was Andrew J. Rickoff, Superintendent of Schools in Cleveland, Ohio. The series’ principal author, the enormously important figure in education, William Torrey Harris, has only ONE entry shown under his name, on something he wrote concerning Hegel, although Harris was a prolific author.

The highly successful Appleton series of 1878 with its phony phonics was the series which crowded out Leigh pronouncing print which had begun to take over American schools in the 1870’s. Edwin Leigh and his pronouncing print introduced in his 1864 book were once so famous that most popular reading series in America by 1875 had available editions in Leigh print for their beginning reading books. Leigh won a prize at the world’s fair in Vienna, Austria, in 1873. Yet Leigh is almost anonymous in The American Book Publishing Record, the only entry for Leigh being a very obscure one in 1872, The New Guide to Modern Conversation in Various Languages Edited in Pronouncing Orthography. (The catalog does show that some earlier reading series than Appleton’s were available in Leigh print, however.)

Nor can the critically important 1873 Franklin Primer be tracked down in The American Book Publishing Record. Under titles, an entry does appear for the Franklin series, but I could not locate it in the section given. Under the name of one of its authors, Campbell, no mention was made of the series. Unless I missed something, under the name of the senior author, Hillard, only his first series and the first series he wrote with Campbell are listed, but not the Franklin series.

If the history were known concerning the widespread use of the Appleton readers (as well as the Franklin readers) and concerning Leigh and the nature of his print, the McGuffey Myth would be destroyed. That is the probable reason for the tampering which appears to have been done at some time in the past on The American Book Publishing Record. If the true history were known, the blanketing of America after 1930 with the deaf-mute-method “Dick and Jane” readers would have appeared as weird as it actually was, instead of being in the fake “tradition” of McGuffey’s. That fake “tradition,” manufactured by November, 1927, with the publication of the Saturday Evening Post article, “That Guy McGuffey,” was that eight out of ten (and later nine out of ten) Americans in the nineteenth century were supposed to have learned to read with the McGuffey Readers. (A secondary reason, as mentioned in the discussion of Reeder’s history and elsewhere, was probably to erase the Quincy/Boston/Cambridge and Franklin series/Appleton series 1870’s story concerning the organized opposition to Leigh’s phonics.)

Furthermore, the truly phonic 1879-1881 McGuffey’s edition is often cited to show that America learned largely by phonics in the nineteenth century. Yet the original McGuffey’s before 1879, with
completely different books up to the fourth grade level, was published in Leigh print in the beginning books from the late 1860’s. If the nature of Leigh print were widely known, the publishing of these earlier McGuffey books in Leigh print would certainly be questioned, since they were supposed to be phonic books and therefore would have had no need for special phonic editions. (They were, of course, not phonic texts.)

Nila Banton Smith in her so-called “history,” written originally about 1932 at the height of the promotion of the deaf-mute method readers, mentioned neither Appleton’s nor Leigh print, although she gave great prominence to the McGuffey Myth, quoting the “nine-out-of-ten- Americans” figure published by Sullivan in 1928. (In her much later revision, she did mention the use of a phonetic print in St. Louis, apparently because a much later article by John Downing, the promoter of ITA print, had done so, but she did not identify it as Leigh print. Yet, on the same page 394, she listed Leigh print as among expanded alphabets used between 1870 and 1920: Leigh, Shearer, Funk and Wagnell, and Ward.) As previously discussed, she produced an absolute hash of confusion concerning the Franklin Primers, “accidentally,” of course. This tends to confirm that “experts” about 1932 were dropping the Appleton series, the Franklin series and Leigh print into education’s black hole in order to safeguard the McGuffey Myth. This was in addition to obliterating the Ayres’ 1915 scale and its scores, which scores would have been very embarrassing if compared to the results obtained with the 1930 “Dick and Jane” readers.

Besides the omission of the Appleton readers and much else that is meaningful in that massive catalog of many volumes, American Book Publishing Record - Cumulative 1879-1949, something else is noticeable about the series. Anyone wishing thoroughly to research reading instruction history would find those volumes virtually useless unless he knew ahead of time the names of the books and authors he wished to research. Yet no reliable list has ever existed of reading books published in America.

All such gross defects, of course, are shrugged off by most sane people like Harry Truman as coincidences. Are they coincidences, or do they represent conscious tampering?

As mentioned earlier, I once held in my hands the cover of the sole Library of Congress copy of Ayres’ A Measuring Scale for Ability in Spelling. That cover had once held the book, Part I, and probably the scale, Part II. With my own eyes, I saw the broken stitches on its inside binding where the original contents had been ripped out.

A loose copy of Ayres’ handwriting scale material had been inserted to fill it up. Many Ayres’ handwriting scale texts were on a shelf nearby. While it is possible, it appears highly unlikely that a librarian found a handwriting scale text which inexplicably lacked its binding and then mindlessly inserted it into the inexplicably empty binding which had once held the sole remaining copy in the Library of Congress of the Ayres spelling scale material. I personally do not consider it to be mindless vandalism or simple theft that the Ayres’ spelling scale material was ripped out of that only surviving copy in the Library of Congress and that Ayres’ handwriting scale material was inserted in its place, where it was then returned to the shelves to masquerade as the Ayres’ spelling scale material with no one the wiser, even when the librarians made periodic shelf checks.

If it were simply theft, would a thief have gone to the trouble to insert Ayres’ handwriting material in place of Ayres’ spelling material? No check is made at the Library of Congress when books are returned. An empty spelling scale cover after the scale was ripped out could therefore have been placed on the return shelf in the middle of a pile of other books or simply left in a pile of books on one of the hosts of readers’ desks. No clerk would have noticed that the cover was empty until the thief had safely disappeared. Yet it was obviously not such a simple theft of the scale that the thief was attempting, but a deliberate subterfuge. By inserting the handwriting scale which was very similar in appearance inside the spelling cover, the clerks would not be aware that anything was actually missing. After all, the Library of
Congress certainly could not attempt to replace the missing spelling scale if its clerks did not even know that it had been stolen.

Beyond any possibility of doubt, those missing spelling scale contents had given massive statistical proof that American students had been almost universally literate in 1915. My conclusion is that it was no ordinary thief who ripped the contents out of that sole surviving copy in the Library of Congress of Ayres’ A Measuring Scale for Ability in Spelling and then inserted a handwriting scale to hide his theft from the clerks who were returning the books to their shelves.
Chapter 52
A Discussion of “Expert” Reference Works in Contrast to More Reliable Texts

Almost the only periodical education publications available after 1900 in most libraries are Columbia’s Teachers College Record and the University of Chicago’s Elementary School Journal. As publications of the very universities where the baleful “experts” were located, these materials most naturally must be consulted with the greatest of caution. Another periodical source is James McKeen Cattell’s School and Society, the title for which Cattell took from one of the books of his close friend, John Dewey. Needless to say, anything published by Cattell should be carefully examined.

About the turn of the century, a society of the Herbartians had turned into the National Society for the Study of Education. Paper never refuses ink, and a lot of paper and ink were used up printing the Yearbooks of the National Society for the Study of Education, the worst of which was probably the 24th in 1925, to which Gray contributed. The Yearbooks are of interest because whatever confusions the “experts” were peddling in any given year seem always to turn up in the Yearbooks for that year. Therefore, these Yearbooks are an excellent resource for twentieth century education in America.

Since American education has been dominated by “experts” for about one hundred and seventy years, it is to be regretted that such historically useful Yearbooks only date from the twentieth century. Those of most interest are shown in Appendix D. Appendix D is a heavily annotated listing of all the texts I have been able to locate concerning reading instruction which were published from the early nineteenth century until about 1930. It is intended as a guide to actual classroom practices in the teaching of reading during those years.

However, probably the single most reliable indicator to teaching methods in actual use are the reading texts published during any period, but, as indicated elsewhere, such texts cannot be considered in isolation. Appendix B to this book is a heavily annotated list of American reading texts known to me from the seventeenth century to 1880, listed in chronological order. In addition, the attached Appendix C to this book is a very long and heavily annotated bibliography of reading texts known to me published from 1880 until today, but arranged chronologically under publishers’ names, and not simply chronologically. The publishers’ entries themselves are arranged chronologically, with the oldest appearing first, and the others in the order of their appearance in the records. The oldest publishers, of course, also had books published before 1880, and therefore such materials are listed again under the publishers’ names in Appendix C, even though they had already been listed in the purely chronological entries in Appendix B which ended at 1880.

Even though incomplete (and I believe it would be an impossibility to compile complete appendices), Appendices B, C, and D should provide a usable background on the history of reading instruction in America. Although Appendix B and Appendix C to this book only list reading texts known to me, the very bulk of its nineteenth century material should make evident how ludicrous is the McGuffey Myth, with its claim that nine out of ten Americans in the nineteenth century learned to read with the McGuffey readers.

Appendix E lists many publications which provide useful information concerning the history contained in this text, many of which were drawn upon in the writing of this text.
The appendices certainly are not presented as complete, but simply as an honest effort to prepare a representative list of materials which is, so far as I know, available nowhere else. To depend instead on presently available reference works concerning reading instruction history results in misunderstanding. Histories of reading instruction are generally very faulty, particularly Nila Banton Smith’s “history,” on which so many other writers have depended, even initially Rudolf Flesch, himself.

However, Nila Banton Smith correctly listed some “supervision” texts, and the titles she gave are also included in Appendix D since they concern methods. After all, the “new” methods after 1925 would have to be “supervised.” After 1930, it has been said that grade school teachers sometimes closed their doors and pulled down their window shades if they wanted to teach real phonics. Dr. Hilde L. Mosse reported on page 121, Volume I, of The Complete Handbook of Children’s Reading Disorders, The Human Sciences Press, Inc., New York, 1982:

“I have myself experienced how much fighting rages about the whole-word method. In May 1960, I attended the Congress of the International Reading Association. Teachers, reading specialists, school principals, and administrators were present in our discussion group. But no discussion got started. I finally said that as a psychiatrist I felt I could discuss something they seemed so anxious to avoid. I spoke about the whole-word method as a cause for reading, writing, and spelling disorders. The reaction was astonishing. It was as though a floodgate had opened, and teachers and others spoke freely, openly and passionately. They described how they (especially the older teachers) had been aware of the great harmfulness of the whole-word method for a long time, but that they had been completely helpless and powerless since they were being forced to use this method. Those teachers who in desperation had the courage to teach phonetics had to do so secretly. Some even had to tell the children to do something else quickly whenever someone entered the room.”

Beyond any doubt, however, most teachers accepted the psychological jargon justifying the deaf-mute-method readers when they first arrived. If there had been a mass rebellion among primary grade teachers at that time, the materials would have failed. Those primary grade teachers who saw through the snake-oil sales talk were obviously in the minority, just as Mae Carden was a tiny minority among the graduate students at Columbia Teachers College in the early 1930’s. Also, it is apparent that virtually none of the school administrators about 1930 were able to anticipate the harm the materials would do, because nothing appears in the records concerning any opposition to the deaf-mute-method readers from school administrators. Of course, the readers were not called the deaf-mute-method readers as they should have been because that would certainly have aroused grave suspicions among the administrators. Instead, they were described as readers using the new “intrinsic” phonics.

I began teaching in September, 1963, at the age of 37. Yet the teachers in my building were almost all younger than I, so that they had themselves learned to read well after 1930 by sight-words, and they had heard about nothing else in their teachers’ colleges. That is because they had only been exposed in their training and subsequent professional literature to reference works by “experts.” I therefore found no such reaction with these younger teachers as Dr. Mosse found in the 1960 discussion group she described which was composed probably of older teachers. Although these younger teachers were required to use the same Scott, Foresman and Ginn readers which outraged me, they seemed completely unaware of the appalling, non-phonic nature of the materials. I gravely doubt that any of these younger teachers had ever read Rudolf Flesch’s 1955 Why Johnny Can’t Read and most probably had never heard of it.

Those few teachers who had trained as reading specialists accepted unquestioningly the whole sight-word philosophy, and had been conditioned to reject anything concerning phonics. I remember one reading specialist who said, in real sincerity, that the thing to read were the reviews on Dr. Chall’s book, Learning to Read: The Great Debate, instead of the book, itself! Another reacted with distress at the very
mention of the word, “Carden.” Yet Mae Carden was astonishingly successful with her phonic materials. See The Saturday Evening Post article of September 9, 1961, “These Children Love to Read,” by Frances Rummel, about Mae Carden’s enormous success in teaching reading by phonics.

There was no malice on the part of these teachers and specialists, of course. They were themselves simply the victims of thought-control exercised through the teachers’ colleges which had “certified” them to teach reading. When I took courses at William Paterson Teachers’ College in Wayne, New Jersey, in 1976, I found the library did not even have a copy of Rudolf Flesch’s famous 1955 Why Johnny Can’t Read, and Jean Chall’s Learning to Read: The Great Debate was never available, despite repeated requests at the desk and despite the fact that, unlike Flesch’s book, it was at least in the card catalog. No student there who relied on the library could be “damaged” by the heretical views in either book.

As a salesman for Dr. Walcutt’s phonic Lippincott readers said to me about 1986, “The phonics battle has been fought and lost.” It was fought and lost a long time ago, because thought control works, particularly when it is tied to “certification” of teachers by the government. Therefore, Nila Banton Smith’s “supervision” texts for teaching of sight reading are not needed any more, because the phonics battle in the government schools has been over for a long time. Except for a very few mavericks, teachers do what they were “certified” to do. They follow the sight-word manuals written by “experts.”

Nila Banton Smith’s “history” is almost totally misleading, despite its inclusion of some actual titles of textbooks and manuals for teachers after 1900 which are helpful. Yet her “history” remains the standard reference work on the history of the teaching of reading in our country, where the teaching of reading has been under the rigid control of wrongheaded “experts” since 1930.

The meddling with the teaching of reading by these wrongheaded “experts” originated primarily at two universities after the turn of the century: Teachers College of Columbia University, where Nila Banton Smith’s “history” was her doctoral dissertation, and the University of Chicago, the home base of William Scott Gray, whose 1930 Dick-and-Jane readers turned a once-literate America into a semi-literate nation. Thorndike produced and supervised “expert” writings from Columbia Teachers College, as his and Cattell’s close friend, Judd, did at the University of Chicago. The superfunds used to promote the errors of these men were foundation moneys.

Judd produced the report, Reading: Its Nature and Development, at the University of Chicago in 1918. A major contributor to Judd’s 1918 report was the father of the 1930 “Dick and Jane” readers, William Scott Gray, who had been Judd’s and Thorndike’s graduate student. The cost of that report was underwritten by a foundation supported by Rockefeller money, the General Education Board. That 1918 report, based on work for three years, was a critically influential one. As already discussed, the activities of such foundations as the General Education Board and the “experts” associated with them became so suspect just before World War I that an outcry against them came up in Congress but the inquiry foundered because of the advent of World War I.

For the period from 1910 to 1935, Nila Banton Smith said:

“Nowhere else is the emphasis upon silent reading more marked than in the professional books which came from the press during this period. J. A. O’Brien was the first to make a contribution of this type. In 1921 he published his Silent Reading, with Special Reference to Speed.”

The “literature” emphasis in reading books which dated back to Henry Cabot Lodge’s collection of chapbook stories for the Boston schools in 1879 had dominated reading series until the enormous re-emphasis on silent reading began about 1918. However, the silent reading emphasis was for all grade
levels after 1918 (not 1910), not just for beginners as had originally been the case. Silent reading for
beginners had, of course, originated with Farnsworth’s sentence method in 1870 and had spread widely
through Colonel Parker’s influence after 1875, but its emphasis faded after 1900. Yet silent reading after
1918 was used through all the grades, not just in the first grade, and oral reading in upper grades was
sharply reduced. The result, of course, was to mask reading failures because the teachers could not hear
the children stumbling over words. In Appendix D, that change in emphasis in teachers’ literature to silent
reading about 1918 is evident.

However, the literature-emphasis or silent-reading-emphasis reading series for children were NOT the
materials with which those children were usually being taught to read after 1900. Such reading series
simply provided the proper curtsy to “meaning” which children used after they finished their
supplementary “sound” lessons. It was these supplementary phonics lessons which actually taught the
children to read. It was in order to displace all such supplementary “sound” materials that the “intrinsic
phonics” deaf-mute readers were published in 1930.

Note the built-in disability mechanisms in the two “expert” methods being promoted for beginners
after 1918: silent reading and speed reading. “Silent reading” for beginners is lethal to the development of
proper “sound” conditioned reflexes. Furthermore, emphasis on “speed” for children who do not yet have
proper conditioned reflexes can turn out permanent skimmers instead of readers, and speed reading, like
silent reading, was encouraged after 1918. (However, having taken a course in speed reading at New
York University in the late 1950’s without any permanent change in my reading habits, I gravely doubt
the long-term utility of speed reading courses for older readers.)

I was amazed recently to hear a comment on TV that speaking speed is usually about 120 words a
minute, but that we can “listen” at about 475 words a minute. If true, what does that say about speed
reading at a thousand or more words a minute? What good can speed reading be at 1,000 words a minute
if a reader cannot really “listen” to what he is reading at a speed greater than 475 words a minute?
(Although the early psychologists thought otherwise, modern research has shown that we are, indeed,
turning print into words even in silent reading.)

What is most peculiar in Nila Banton Smith’s “history” is that she omitted her OWN 100 Ways of
Teaching Silent Reading, as well as her Picture Story Reading Lessons, both still in print by World Book
Company in 1928, (who published Thorndike’s spellers in 1929). Yet she wrote copiously in her
“history” about the use of silent reading by OTHER authors in the 1920’s and mentioned other material
she, herself, had written.

Why did she choose to do these things? William James was the apparent fountain-head for Farnham’s
silent reading method of 1870, publicized as the “new improvement” after 1918. The explanation may
therefore very well lie in the fact that to list her two early works revealed a close connection between
Thorndike, James’ one-time student and friend, and the move after 1918 to silent reading.

Nila Banton Smith and S. A. Courtis had been the first to make use of Thorndike’s list of the
commonest words in 1920 in the writing of Picture Story Reading Lessons (the deaf-mute method for
beginners), and Courtis had collaborated on an arithmetic text with Thorndike just about that time. Since
Nila Banton Smith came up with 100 ways to teach silent reading some time before 1925 (and “silent
reading” is the way little deaf mutes are often taught), it suggested that the “new methods” were, indeed,
coming from a particular tiny group of people and were anything but a “natural development.”

Thorndike’s prize students, Gates and Gray, were making great waves in the 1920’s in favor of the
“new” methods. Yet, in the literature, it is rare to find any mention made of the connection between Gates
and Thorndike, and impossible to find any mention made of the connection between Gray and Thorndike,
even though Gray was closely associated with Thorndike as his student in 1913-1914 and wrote his original oral reading tests under Thorndike’s direction. The Scott, Foresman “Dick and Jane” series written by Gray of the University of Chicago was more widely promoted than the Macmillan series by Gates of Columbia Teachers College. That may have been a deliberate attempt to deflect attention away from the source of the “new” method: the psychologist, Thorndike, of Columbia Teachers College, and, before him, the psychologists, Cattell and James.

Therefore, for Nila Banton Smith to distance herself from Thorndike might be expected. In Smith’s second edition in 1965, she did not hesitate to mention other materials which she had written, including a reading series, but omitted her two earliest works concerned with silent reading and high-frequency sight words. She apparently attempted to distance herself from the “movers and shakers” and at the same time to suggest an aura of objectivity which her history clearly did not have.

Other standard reference sources than Smith’s book are also unsatisfactory. An example is the inadequate treatment of the Heart of Oak series in Early American Textbooks, 1775-1900. It was not shown under “Readers” or “Primers” but under “English Language Studies,” and then only the second and third books were listed. Yet Book One was in the Department of Education Library in Washington, the source for Early American Textbooks, when I visited there in 1981 but was overlooked in the 1985 summary. Admittedly, it was not the intent of Early American Textbooks to show every book in the Department of Education library but only representative examples of the most important. Yet Book One of Heart of Oak was very important, and Heart of Oak was very important in reading history. Neither of these facts could be picked up from this inadequate 1985 Government source.

Another example of the inadequacy of standard research sources on reading instruction comes from this Government publication. Only one text written by James H. Fassett appeared in Early American Textbooks, 1775-1900, Office of Educational Research and Improvement, U. S. Department of Education, Washington, D. C., 1985. Under “Primers,” on page 69, this source listed Fassett’s The Beacon Primer, but wrongly gave its date as 1875. Yet the Beacon reading series was published first in 1912 and was revised in 1921-1922. It was also a very important series, even having been used in England and Canada. It therefore certainly should also have been shown under the section, “Readers,” with the correct dates as were other important series. The inadequate treatment of the Beacon series in this source, Early American Textbooks, would mislead a researcher not only into thinking the Beacon texts were of little importance but that they were in use some fifty years earlier than was actually the case.

Experimental reading research summaries held an important place in the “experts’” literature, and still do so today. Information from experimental reading research is seldom used effectively, although Dr. Patrick Groff of San Diego University certainly has done so with that reading research which has value. However, much of the vast amount of experimental reading research done since 1917 is worthless.

William Scott Gray, in the bibliography to his doctoral dissertation at the University of Chicago in 1917, included all previous research in reading in which he knew. The list was small, indeed, and effectively only dated from 1914. Yet by 1925 research in reading had exploded. Gray compiled a report in that year on all such research to 1925, but in his 1925 report altered his admittedly vague 1917 description of the critical Sholty research of 1911 into a false and misleading description. By doing so, he effectively buried the critical Sholty research. (Sholty’s research confirmed that beginning reading instruction can, in fact, turn out two different kinds of readers. It was Gray’s clearer description in his 1917 report which led me to look up the critical Sholty report, but I would not have done so if I had only seen the false description he gave in the 1925 report.)

Gray’s 1925 report on research studies was periodically updated in later years to cover the massive quantities of reading research carried out after 1925. The reports were meant to function as a guide to
such research. The worthlessness of most of the research before about 1975 is disturbing but hardly surprising, although in more recent years there has been some improvement, as Dr. Groff’s excellent research summaries demonstrate. (Dr. Jean Chall’s excellent book, Learning to Read: The Great Debate, summarizes a good portion of the valid research before 1967.) Yet it has largely been the pro-sight-word “experts” through their influence at universities and in foundations who have been in control not only of most experimental reading research but of most summaries of reading research.

One research finding from the early 1920’s is referred to even today. That is Grace Fernald’s work on “kinesthetic” approaches. Even dedicated phonics proponents endorse “multi-sensory” approaches to the teaching of reading, but I powerfully suspect such approaches are wrong, if “multi-sensory” means simultaneously using several senses on the same object to achieve a single impression. That sounds powerfully like the establishment of conflicting conditioned reflexes. After all, we do not normally “look” at music, or “listen” to a picture, except for a few unusual people whose sense impressions “leak” from one to another, and who describe some fascinating and pleasant subjective impressions, until their unusual “gift” fades with aging). I certainly do not “see” the keyboard as I touch type.

The facts certainly suggest that single-sensory activities should be taught as single-sensory activities, and not as multi-sensory activities, despite the almost unanimous endorsement of Fernald’s findings that reading should be taught by touch as well as by sight. Reading does have to be taught by touch as a single-sensory activity in the case of one class of unfortunate persons, the blind, but seeing children certainly should not learn to read through the avenue of touch.

Obviously there is a sequence in reading: from the sight of the syllables to the sound of the syllables, and in writing, from the sight of the letters to the manual forming of the letters, involving different senses in turn, but apparently such necessary “sequence” is not what most people mean when they speak of “multi-sensory.” They apparently mean that individual steps, such as letter recognition, should be taught by SIMULTANEOUSLY using several senses, and this is certainly what Grace Fernald meant, and, apparently, what was meant even by Dr. Samuel Orton, one of the greatest of crusaders for the teaching of real phonics.

Grace Fernald wrote a paper on kinaesthetic factors in reading which was published in the Journal of Educational Research, Volume 4, No. 5, December, 1921. It was the first of a three-part series. No. 2 was on first-grade children and No. 3 was on spelling. In Fernald’s work on “kinaesthetic factors,” she had children trace letters manually, and “touch” was heavily used in the teaching of reading. Fernald’s work has been spoken of approvingly for many years by “experts.”

Yet writing (which is obviously a “kinaesthetic” activity) can manifestly be a different goal from reading since some aphasics retain the ability to write while losing the ability to read, and presumably vice-versa. Such writing is apparently not “multi-sensory.” I know from my own experience in typing that “touch” did not transfer to “sight.” My typing has been anything but “multi-sensory” since I was amazed to learn after some forty years as a rapid typist that I did not know much of the keyboard “visually” and had to “reach” for a letter with my fingers before I could “remember” visually where it was on the keyboard. Montessori schools teach children to remember letters visually by sandpaper touching at age 3. Yet Bender-Gestalt norms show the majority of three-year-olds have not matured enough to distinguish visually between these letters which they are memorizing by touch. I think this sandpaper “touching” practice may well result in establishing life-long “touch” reflexes when reading, and these reflexes may conflict with proper “visual” reflexes. The rather weak spelling (but good reading) I saw at a post-Montessori school at the third-grade level may have resulted from such interference. I later heard of other Montessori-trained children who had some difficulty with spelling (but not reading).
It may well be true that it is harmful to use “multi-sensory” approaches in teaching an activity that is meant to be performed primarily by one sense only (presuming no disability exists in that sense mandating the use of some other avenue). If such “multi-sensory” approaches can develop harmful conflicting reflexes in healthy persons, then our attention is called once again to the early psychologists. Fernald’s “kinaesthetic” work which was so respectfully received dates from the early 1920’s, the Pavlov/Thorndike era. Did these early psychologists know whether or not using multi-sensory drill on an essentially single-sensory activity can develop harmful conflicting reflexes?

The academic niceties of footnotes are used in such “expert” references as Smith’s to establish scholarly auras and to give the impression of objectivity. Their wide use has already been cited in connection with the McGuffey Myth. In Nila Banton Smith’s footnote on page 164 of her “history,” she referred to page 6 of Harry Grove Wheat’s The Teaching of Reading, Ginn and Company, Boston, 1923, and said:

“‘Society insists that reading be taught in order to meet certain definite social needs....’ Wheat then asks, ‘What are the needs of society with respect to the teaching of reading and the outcomes of reading instruction?’

“Following this question, he gives Professor S. C. Parker’s answer and his chief arguments.

“(1) The social needs of former days required the teaching of expressive oral reading; (2) the social needs of the present require the teaching of effective rapid silent reading.

<table>
<thead>
<tr>
<th>The Former Need for Expressive Oral Reading</th>
<th>The Present Need for Effective Rapid Silent Reading</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Reading material was scarce.</td>
<td>1. Reading material is abundant.</td>

<tr>
<td>2. Only a few were able to read.</td>
<td>2. Reading is universal, only a few are unable to read.</td>
</tr>
<tr>
<td>3. Communication was very slow.</td>
<td>3. Communication is very rapid.</td>
</tr>
<tr>
<td>4. Spoken language was the chief means of communication.</td>
<td>4. Written language is the chief means of communication.</td>
</tr>
</tbody>
</table>

Smith stated further:

“After discussing these contrasted social needs for reading, Wheat states as his conclusion that ‘the aim of reading instruction which should now prevail is to develop ability in effective rapid silent reading.’

Note the admission by three “experts” in 1923 that almost everyone in 1923 was able to read, and, furthermore, to understand what they read! This was before the “experts” created our massive adult functional illiteracy problem with the deaf-mute-method readers published in 1930.

The famous professor, S. C. Parker, thought he knew enough to write copiously about teaching reading. Harry Grove Wheat chose to quote Parker and also thought he knew enough to write a book about teaching reading. Nila Banton Smith is commonly presumed to have known enough to write a history of reading. Yet these people were totally ignorant of (or chose to veil) the almost universal literacy
in America before 1830, as well as the massive distribution of printed materials in America in those years. John Adams, who was later our highly respected President, said in 1765:

“(A) native of America who cannot read or write is as rare an appearance... as a comet or an earthquake,” (quoted in Parents’ Rights by John W. Whitehead, Crossway Books, Westchester, Illinois, 1985, page 78).

Some other original source material confirming the virtually universal literacy in America before 1830 (but obviously excluding the unfortunate people in the South who were still in slavery) has already been quoted elsewhere in this history. Yet all these “experts” accepted the mindbogglingly ignorant statement that in the past in America, “Only a few were able to read.”

It was during the literate 1920’s in America that the “experts” laid the groundwork for the change from almost universal literacy to American functional illiteracy. The “Preface” to Everyday Reading Book One (an advanced reader for fourth grade) published by American Book Company and copyrighted in 1927, helped to show how “expert” all the work was:

“Recent investigations and scientific studies show that reading is a highly specialized process; that there are numerous types of reading, for the best development of which special training is necessary; and that fully ninety per cent of all reading is done silently.”

Yet there are not “numerous types of reading.” At least less is heard of that fallacy these days, on which Gates spent so much of his time. E. L. Thorndike’s son, R. L. Thorndike, demolished that fallacy, as described in Albert J. Harris’ and Edward R. Sipay’s How to Increase Reading Ability, Sixth Edition, 1975, David McKay Company, Inc., New York (pages 472-473). That text said that in 1969 and 1971 F. B. Davis had decided, through factor analysis studies on reading comprehension, that there were separate subskills which could be identified: word meanings, inferences, details, etc. R. L. Thorndike worked over that data and decided it showed the existence of a word-knowledge factor but that all the rest of the skills could simply be called “reasoning in reading.”

Since reasoning cannot be taught, R. L. Thorndike’s work also confirmed that reading comprehension cannot be taught, apart from knowledge of the language being read and knowledge of the subject matter on which a reading selection is based.

Also, no one ever needed any “scientific studies” to find out that most reading is done silently. My impression is that considerably more than ninety - perhaps over ninety-nine per cent of all reading is done silently.

But the “expertise” was just so much snake-oil sales talk. “Recent investigations and scientific studies” had done no such things as those listed in that 1927 book, though such “studies” were being ground out with increasing regularity. It is scandalous and disgraceful that “experts” such as those Nila Banton Smith quoted were and are permitted to shape American education.

E. L. Thorndike wrote an article in 1920 stating that we should have ALL our thinking done by such “experts.” In this article, Thorndike referred to eugenics. One of the nastier enthusiasms of J. M. Cattell and E. L. Thorndike (and probably John Dewey) was eugenics. Adolf Hitler later carried eugenics to its hideous logical end, but it should be noted that the early twentieth century American eugenicists were reading the same philosophies as those on which Hitler built his hideous delusions. E. L. Thorndike made a bow to eugenics - the calculated breeding of human beings like dogs and cattle - in the following comment:
“Pseudo-thinking must probably be endured to a considerable extent until a far better human race is bred. Some of it, however, can be cured. The cure is twofold, consisting of the displacement of pseudo-thinking by real expertness on the one hand or by intelligent refusal to think on the other.”

These comments of Professor Edward L. Thorndike of Teachers College, Columbia, appeared in his article, The Psychology of the Half-Educated Man, Harper’s Magazine, 1920. Thorndike concluded that almost all of us were half-educated! He said:

“In the face of the details and complexities of modern science and technology and art, it is the fate of all to be half-educated in the sense of having large areas of mind uncultivated, many problems answered only by a question mark. And such has always been the fate of the great majority of men. There is nothing new, and no great public danger in this. We have only in such cases to turn to the doctor, lawyer, engineer, priest, or other specialist who does know.”

Thorndike said, though, that the man who has an incompetent mind “is likely to try (and fail) to understand the specialist instead of obeying him. He does not ‘know his place’ intellectually....”

That was a curious expression: “obeying....” Speaking for myself, as an adult, I only “obey” the laws of religion and government. I do not “obey” anyone for whose services I pay. Any “specialist” who does not satisfy me intellectually concerning his competence and treatment has lost a client.

Thorndike said further:

“Expert thinking cannot be expected of many men outside of a limited field.... In his special field, the size and character of which will vary with his talents, a man may be made a competent thinker. The educated man should be taught to think with approximately 100 per cent efficiency in his share of the world’s job.

“Outside that field the intelligent procedure for most of us is to refuse to think, spending our energy rather in finding the expert in the case and learning from him. That is what sagacious men already do almost universally in matters like surgery, chemistry, mathematics, or seismology. They are doing it widely in such less recognized fields of expertness as building construction, philanthropy, advertising, and education. They are beginning to do it in fields that not long ago were supposed to be problems anybody could properly think out, such as the selection of one’s employees, the choice of occupation for one’s children, the planning of a city’s government, the tariff, the expenditure of public money, or the regulation of public morals.

“Wherever there is the expert - the man or woman who has mastered the facts and principles on which the best present practice in a certain field is based, and who can adapt this best present practice to special circumstances ingeniously - should we not let him be our guide? Should we not, in fact, let him do our thinking for us in that field? Thought is too precious to be wasted in dilettantism; the issues of the twentieth century are too complex and difficult to be played with by amateurs. The general common sense that was admirable for the tasks of the town meeting of our fathers is hopelessly inadequate for the municipal problems of to-day. It is likely to be an easy prey to the selfishness of politicians, the seductiveness of salesmen, and the enthusiasm of fanatics. Our thought, if we trust it too far, will in fact not be our thinking, but only the ready-made conclusions that have been sold to us by somebody. The question is whether we shall buy from somebody who will play on our vanity and prejudices or from a reputable dealer. The educated man should know when not to think and where to buy the thinking he needs.”
Where was the “educated man” to “buy the thinking he needs”? Obviously, he would “buy” it from someone who had what I have heard described as “impeccable credentials.” (At the time that phrase was used in a conversation with me, the apparent intended inference was that I did not have such “impeccable credentials.”) “Impeccable credentials” had to come from from an accrediting institution such as Teachers College, Columbia, where Thorndike and his cohorts decided what was needed for accrediting in education. Only those they “accredited” moved on to positions of real influence, and American education went down the drain.

The point is that “impeccable credentials” can be only be obtained from some group which thinks it has the necessary wisdom to grant credentials, but it is logically impossible to confirm that any group DOES have the wisdom it claims to have. Before that could be done, a special group of “experts” would be needed to certify the competence of the credential-granting “experts,” and then a higher group of “experts” would have to approve that special group of “experts” who were certifying the credential-granting “experts,” and so on infinitely.

E. L. Thorndike commented that people turn to doctors, lawyers, engineers and priests when they need specialized help, but he failed to add that they turn to PARTICULAR doctors, lawyers, engineers, and even particular priests. “Public acclamation,” the kind of thing on which the confirmation of sainthood was largely based for about the first thousand years of Christianity, is still very much in operation when people choose their doctors, their lawyers, their engineers, and even their priests. Normally, they do not choose them because they are graduates of particular law or medical schools or universities. Even if people do so initially, they quickly move on to other professionals if they are dissatisfied with the work done. “Doctor So-and-So did a wonderful job with Uncle Willie…” is the kind of reason that Doctor So-and-So has a jammed waiting room, not the fact that Doctor So-and-So graduated from Impeccable Credentials Medical School.

Where there is no open market in which choice freely operates, it is highly probable that abuses will enter. Yet no open market has existed in American education since shortly after 1826, and control has been greatly intensified since the end of World War I. American education has been infested with “experts” who have been given a free rein in our government schools. The poisoned well fallacy has completely taken over American education, and the reason it has is that people accepted the argument that they should depend on “experts” to do their thinking about education for them. These “experts” have been the only ones authorized to grant “impeccable credentials” in education, and they certainly did not grant them to anyone who questioned their expertise, like Mae Carden at Columbia in the early 1930’s. Because so many of the “experts”’ opponents lack “impeccable credentials,” anything such opponents have to say is automatically dropped into logic’s poisoned well from which nothing can be drawn. The arguments of most of the “experts”’ opponents therefore are never heard by those who follow Thorndike’s rule: “The educated man should know when not to think and where to buy the thinking he needs.”

With his 1920 article, E. L. Thorndike helped to legitimize the Plague of Experts and their reference works under whose control American culture has been ever since. America has been very like Gulliver at the low point in his Travels. Gulliver was held immobile, flat on the ground, by a multitude of little threads put in place by the tiniest of midgets. That kind of imprisonment is what America has received for refusing to depend on its own common sense.

A remark made by William F. Buckley can be applied to this situation very nicely, since it is anti-“expert” and shows Buckley’s faith in the balanced common sense of ordinary people, those Thorndike would have called “half-educated men.” Buckley said that he would rather be governed by the people listed on the first two pages of the Boston telephone directory than by the whole faculty of Harvard.
When consulting reference works, therefore, the “expertise” of authors is not the issue. The quality of the works, themselves, and the reader’s evaluation of that quality are the only things that matter.
Chapter 53
Bypassing the “Experts” to Get at the Facts

“Expert” writings and activities, taken alone, can be misleading as an historical source concerning actual reading methods in use, and the degree of literacy which resulted. For instance, in Germany in the 1970’s, the overwhelming majority of “experts” favored the global sight-word approach, as shown by Franz Biglmaier’s article in John Downing’s Comparative Reading, The Macmillan Company, New York, 1973. Yet, when I spoke to eight first-grade and second-grade teachers in Hamburg, Germany, in November, 1977, seven of the eight favored a strict Code 10 analytic-synthetic approach to the teaching of reading, used in the excellent German text, Bunte Fibel.

In France, the first-grade book, Remi et Colette was a “mixte method” global-plus-phonics approach in 1977, and not a straight phonics approach. Yet I saw a first-grade Avignon teacher adapt it to a heavily phonic syllabic approach. Germany and France, therefore, had teachers who were using real phonics (“sound”) even though their experts and, in the case of France, even their textbooks favored “meaning.” To evaluate first-grade reading approaches and their relative degrees of success, additional information is usually necessary besides copies of the children’s readers. The prefaces to such books, the teacher’s guides, the comments of contemporaries, and the comments on the resultant literacy are all needed to clarify actual practices.

Evidence on the resultant literacy can sometimes come from surprising sources. One such American source is the fact of the enormous popularity of the silent movies until 1930. American children at second grade and above from about 1889 to about 1900 had learned to spell by “sound,” and not by “meaning,” and, at first grade from about 1900 to 1930, American children had learned initially to read by “sound” and not by “meaning” through supplemental phonics lessons. As a result, America had become a very literate place once again after the beginning of the twentieth century, and the popularity of the silent movies with their written subtitles proved it.

In America before 1930, the silent movies’ sub-titles narrated the story line and reported the conversations of the actors. Therefore, to go to the silent movies was almost an implicit admission of literacy. Yet silent movies were contemptuously regarded by “intellectuals” as very “low-brow” and so did not cater to “intellectuals” of the period but to the mass audience: the ordinary people in mainstream America. The businessmen running the movies were acutely aware of public likes and dislikes, and tailored their productions accordingly so that their movies would be sure to sell tickets. The first movie with some soundtrack, which still for the most part used written subtitles, was Al Jolson’s Jazz Singer in 1927. Below is one of its subtitles which those realist movie producers felt was not above the reading abilities of the average American teen-agers or adults in 1927 who were jamming the movie houses:

“Grief, stalking the world, had paused at the house of Rabinowitz.”

It would be interesting to try that allegorical sentence, those low-frequency words, and those phonically difficult spellings on the average American today who was trained in the “Dick and Jane” type of deaf-mute-method readers after 1930. Also, what percentage of Americans who learned to read after 1930 could sound out “Rabinowitz” with their “intrinsic phonics?” Notice also the complex poetic syntax: the phrase inserted between the noun and the verb. America was obviously a very different place, culturally speaking, before 1930.

Because of the need for reliable facts instead of “expert” smoke, I obtained some comments from teachers who were actually in American schools in the late 1920’s and early 1930’s. Two of these
teachers specifically mentioned supplementary phonics charts. The Education Mafia (someone else’s happy phrase, but I don’t recall whose) recognized the real nature of supplementary phonics charts. They knew such charts were concentrating on “sound” with their unmeaning word lists, and not on “meaning.” That is why Gates invented “intrinsic phonics” to replace supplementary phonics so that “meaning” could never be omitted in beginning reading instruction. That is why the supplementary phonics charts (such as were distributed by the state of New Jersey) were gone from most classrooms by about 1932 after the Gates and Gray deaf-mute-method readers with “intrinsic phonics” had entered the classrooms.

Two retired Lyndhurst teachers who taught in the 1920’s told me of the standard use of supplementary phonics charts before 1932. Sometimes the chart was mounted inside a window shade. In first and second grade, the shade was pulled down each morning, and the children recited from the chart. Such supplementary phonics charts were blissfully empty of “meaning.”

About August 17, 1982, I telephoned these two retired teachers who had taught in Lyndhurst, New Jersey, and asked them for their memories concerning methods for teaching beginning reading about 1930. The first retired teacher was the late Ann Kohler Wimmer, who said, concerning practices about 1930:

“Every room had a phonics chart, published by the state. When you started your phonics you gave a phonics drill.... (However) when I (began) in 1928, all the schools did not have them, but you were required to give sounds. You had an alphabet around the room and you had to make sounds.”

Mrs. Wimmer left teaching in 1935 for a period of years, and said:

“... that would make it 1935, that I think it was, you were not demanded the phonics deal any more....”

The late Jean Crankshaw Ferrara also referred to the phonic “chart on the window shade.” She remembered that as a child she had been taught phonics, and said, “When I was a child I can remember having to go through a lot of words: the ‘at’ family,” etc. She mentioned there still was a Winston Reader in her family. (As shown in Appendix C, the Winston series was a low-code phony phonics series, but so much heavy supplementary phonics was used in classrooms at that time that the phony phonics effect was dissipated.) She said she originally had taught second grade in Franklin School and River Road School in Lyndhurst. Since she started teaching in 1926, probably at about twenty years of age, that would have placed the date of her beginning school, and getting “the ‘at’ family” at about 1912, indicating phonics was used at that time. Mrs. Ferrara said:

“I taught primary (in) 1926. As I recall, we had a great deal of phonics in 1926... I was more interested in supervision and administration and I was especially interested in supervision of special education.... As I went into special education... I went to Newark to teach, and we used the Brinkerhoff method... we had a great big chart and the children learned the words and... could go to the chart - sound c a t and put them together. Children with IQs of 60 (or) 70 learned to read with that method... “

The Blumenfeld Education Letter, November, 1991, page 8, carried an interesting corroboration of Mrs. Ferrara’s last statement. That issue published a letter dated October 2, 1991, from Jeanette Metzger of Goshen, Indiana, to Samuel Blumenfeld, the author of the reading program, Alpha Phonics:

“Thank you for Alpha-Phonics!
“We have a 14-year-old son who has Downs Syndrome. He began his formal ‘education’ at age of three. After 10 years of special education in the public school system, he had a reading vocabulary of 76 words. His teachers used a sight-word recognition system and considered that a ‘good score.’ He was very frustrated with his inability to read, so he would copy his siblings by pretending to read.

“I began to search for a reading program. In reading through the home-school book section at the library, I found a recommendation for the book How to Tutor. After reading that book, I started our son on the phonics program immediately. Within one month, he could read over 100 words - more than he had learned in 10 years of schooling!!! I was thrilled and so was he.

“We spent about a half hour a day after school, and he continued his progress slowly, but surely. Many of the words were unfamiliar to him, such as ‘rap’ and ‘jab,’ so I explained the meanings and his vocabulary expanded. We have seen a remarkable change in his articulation. When he learned the ‘th’ sound and saw that ‘bath’ ended with ‘th,’ he stopped saying ‘baf.’ His speech is much clearer and his sentences are more complete.

“It has been a year since we started the Alpha-Phonics program and he is finishing the last pages. He is so pleased to be able to read library books, sing along with the hymns at church, and inform the driver what the signs along the road say. Our son does not have a very high I.Q., but he was able to learn to read using phonics. I am sure there are many children in special education programs that could also learn using this system, and I would highly recommend it to other parents.

“Thank you for Alpha-Phonics!”

When children start to take pleasure in reading aloud the signs along highways, that is a highly reliable indication that the point has been reached at which they are really beginning to read. The parents of my first-grade students often told me how delighted they were that the little ones were reading highway signs aloud as they passed them in the family car. When I taught real phonics to my third graders who had been in sight-word basal readers since first grade and so presumably had already been taught how to read (but had not) , some third-grade parents told me the same thing. Their children were just beginning to read highway signs aloud to them! These children obviously had been unable really to read before then, despite their having been “successful” in their first- and second-grade deaf-mute-method sight-word readers.

Retired teachers who were actually in the schools at the time the deaf-mute method was introduced, like the late Jean Crankshaw Ferrara and the late Ann Kohler Wimmer, were unassailable witnesses to changes in methods. Because of this fact, I surveyed in 1982 members of the New Jersey Schoolwomen’s Club who might have been teaching about 1930. I sent out fifty questionnaires to women whose dates for joining the Club, given in the membership roster which I received when I was a member at that time, suggested that they might have been teaching about 1930. I was aware, of course, that the majority would not have been in the primary grades. Of the fifty questionnaires I sent out, twenty were returned. That was a fairly large return for a questionnaire from a stranger like me, who was simply an unknown member of a large organization. Ten respondents disqualified themselves as they said they had no knowledge of methods in the primary grades, but ten said they did have such knowledge. Those ten provided the answers for my survey, which I report below in percentages. However, two of those who disqualified themselves from answering my specific questions did make some general comments of interest, which are also mentioned below.

The first item on my 1982 questionnaire to teachers who might have been teaching about 1930 read:
“Were you personally aware that there was a change in the method of teaching beginning reading after 1930?”

Ninety percent answered, “Yes.”

The second question read:

“Were you aware that the 1930 and 1931 Scott, Foresman and Macmillan readers dispensed with traditional phonics?”

Eighty per cent answered, “Yes.”

The third question read:

“Were you personally aware or have you heard of any coercion on the part of the administration forcing teachers to use the new 1930 and 1931 “improved” method or to face disapproval or disciplinary action? Please explain.”

Eighty per cent said, “No.” The two who answered that they knew of coercion had both answered “Yes” to questions one and two. One of them said:

“I have heard of insistence to use the ‘new method.’ Some teachers still taught phonics. As an upper grade teacher I was not yet involved.”

The other said:

“Yes, teachers were definitely told not to stress phonics, but instruct as needed.”

My fourth question asked for any information they had on promotional methods. One said Scott, Foresman gave several demonstrations of the new method. Another said:

“I really have no information on the promotional methods used. I recall that they were ‘high powered.’ I do not recall when we started using the Scott, Foresman books but it was soon after I started to work in N. J. (1934)... In 1930 I was working in my home state - Vermont. I have tried to recall what we used as a basic primary reader - believe it was the old Aldine. I do recall a heavy emphasis on phonics.”

My fifth question asked in part:

“Can you recall (or have you heard about) the reactions of either teachers or parents concerning the drop in spelling ability?”

Eighty percent answered “Yes.” Yet when I asked if they had any information on the dropping of objective dictated spelling tests like Ayres’ 1915 scales, eighty percent answered “No.” One teacher commented:

“I do recall a drop in spelling ability.... As I recall we began to hear about serious disabilities in the late forties and early fifties - about the time results from the intrinsic method began to show up.”
The sixth question asked:

“When did you first hear about... serious reading disabilities?”

Answers were varied from “always” to the last ten years, but most clustered about the 1950’s. One teacher of French who did not feel able to answer the questionnaire volunteered the information that about 1956 an exchange teacher from California was entertained at her college club:

“She insisted that she was very happy to find that her students in Hoboken grades knew how to read!!! What about California!!!”

Another said:

“A whole sixth grade class could not read. About 1950. I’m not sure of the date.”

One teacher who also felt not qualified to answer any of the questions nevertheless wrote:

“I’m sorry I’m not of much use to you during this period as I did not teach at that time. When I taught up to 1927 we used the so called sight method. I was not very happy with it because results were so poor.

“When I resumed teaching in 1940 our system was still using the same method with continued poor results. As far as I know teachers used the method introduced by their Boards of Education whether they approved or not.”

She certainly had given testimony, after all, on why there were “remedial cases” before the arrival of the Gates and Gray readers! Yet the bulk of the testimony established that phonics was dominant before 1930 but effectively gone shortly after 1930.

Yet not all the teachers implied dissatisfaction with that change. For instance, one wrote:

“Scott, Foresman gave several demonstrations of the new method. Accent - to develop the ‘love for reading.’ Highly acceptable. (My own system 1960 - coercion to return to phonics, exclusively.)”

These teachers were dedicated, trusting women, trying to do their best. When some of them, such as the woman just quoted, willingly promoted the “meaning” method over the “sound” method after 1930, they did so because the “experts” told them it was superior. Such teachers were very badly misled by giving unquestioning trust to “authorities” instead of depending on their own common sense.

Other sources may provide additional documentation for the switch in reading methods after 1930, by contrasting children’s pre-1930 reading materials to post-1930 reading materials.

One such source is listed at the Library of Congress which might be very illuminating although I was not unable to locate it on July 19, 1989. My request slip was returned, like so many others for old books concerning beginning reading, with the too-familiar notation, “Not on Shelf.” The book I was trying to find concerned children’s books in libraries at the time the switch in methods was made in beginning reading. Its reference is call number Z 5817.A52, Easy Reading Books of the Reader and Primer Type and Readers for the First Three Grades, American Library Association, Chicago, 1933. Another potentially very interesting item which I was not able to locate at the Library of Congress was the list on which this material had been at least partially based. That earlier material, apparently listing 31 such texts,
had been compiled for the ALA Catalog for the period 1926-1931 by Marion Horton, on which publication Gladys English was listed as Chairman.

Surviving copies of reading textbook requisitions still in Boards of Education files across the country could also provide interesting documentation for the wholesale move to “Dick and Jane” and their companions after 1930.

Dr. Hilde L. Mosse wrote the two-volume The Complete Handbook of Children’s Reading Disorders, The Human Sciences Press, Inc., New York, 1982, and it is a matchless source for real information on the teaching of reading and on true reading disabilities. It also includes anecdotes about the actual state of reading instruction in America for over fifty years. Dr. Mosse wrote on page 266:

“As early as 1950 experienced teachers and psychologists who had been teachers told me that all the children they had personally taught years ago used to be able to read by the age of 8, except for those who were definitely mentally defective, and that this had changed. They related it to the deormalized program which had been started in the New York City public schools and in most other school systems throughout the nation in about 1935. This new curriculum brought with it the sight-word method of teaching reading....

“Evidence of the decline of school children’s reading ability came to me also from other sources. Librarians and teachers responsible for ordering books told me that third- and fourth-year books were being requested for sixth-graders. Schoolbook salesmen reported that publishing companies had done their own research about reading levels on different grades and had found that they were declining.

“A department chairman of an exclusive Eastern prep school told me that remedial reading specialists were being employed for the first time in the school’s history because too many 14-year-old freshmen could not read properly. This was in 1954....”

The onset of reading disabilities from the deaf-mute method readers, however, considerably preceded the 1950’s. Personal anecdotes, too long to cite here, demonstrate that the reading problem showed up shortly after the deaf-mute-method readers reached first grade in force about 1931. The first large group of children to be harmed by them reached second grade in 1932 and third grade in 1933 (and eighth grade in 1938). However, many upper-grade teachers and parents were more adept at helping children overcome that harm for some ten years or so after 1931 than they were later, when the memory of how to teach reading properly began to fade and when the pre-1930 materials for teaching reading properly simply fell apart from old age.

Dr. Mosse also reported that she had encountered coercion. She wrote the following on page 273, under the heading, “Suppression of Critical Studies”:

“The mere mention of the fact that the teaching of phonics had helped one of my patients, for instance, was cut out of an article on “Creativity and Mental Health,” a curriculum journal had asked me to write in 1959....

“Another example is the experience of a guidance counselor and an assistant principal with special expertise in reading disorders. They were charged with investigating the reading difficulties of all the children who attended special remedial reading classes during the summer. They found that all of them had one reading defect in common: they did not know phonics. Their report was never published. They were called to their supervisors and asked how they dared go against the theory of the Associate Superintendent.”
Dr. Mosse said on page 261:

“Statistical evidence is overwhelming that millions of American children, including those graduating from high school, cannot read. When a disorder affects so many people, one calls it an epidemic. An epidemic is always caused by external forces, not by defects in the individual. This applies to psychologic disorders as much as to physical diseases. When so many children are affected by the same disorder, the explanation cannot possibly be individual psychopathology. Adverse social forces must be investigated, as the common cause....”

Dr. Mosse also provided a scientific description for children such as Memorus Wordswell, the little human reading machine who was belittled in a story in the Introduction to the American Common-School Reader and Speaker, by William Russell and John Goldsbury, Boston: Charles Tappan, 1845, which was quoted at length by Nila Banton Smith on pages 102 and 103 of her “history,” American Reading Instruction. William Russell, of course, was the famed Scottish elocutionist/activist who had been the first editor in 1826 of the change-agent American Journal of Education. That journal had no connection with Barnard’s later highly important American Journal of Education published for so many years in the nineteenth century, which, astonishingly, is not even mentioned in Nila Banton Smith’s bibliography!

However, Smith took the time to quote William Russell’s belittling of “sound” in the teaching of reading, from the last volume in Russell’s reading series in 1845. Smith said the story “points out rather vividly the new trend of paying some attention to meanings, and withal has a refreshing touch of humor.” Paying attention to meanings in 1845 certainly represented no new trend. Almost twenty years before, that activist, William Russell, had successfully promoted the “meaning” method in his 1826 American Journal of Education, as quoted earlier. Yet Smith credited the 1845 period with having dominantly a phonic emphasis and what she called an “ABC” emphasis, even though “sound” had been traded in for “meaning” in America long before, by 1830.

The excerpt from Russell’s (and Goldsbury’s book) read in part:

“The most extraordinary spelling, and, indeed, reading machine, in our school, was a boy whom I shall call Memorus Wordwell. He was mighty and wonderful in the acquisition and remembrance of words, of signs without the ideas signified. The alphabet he acquired at home before he was two years old. What exultation of parents, what exclamation from admiring visitors! ‘There was never anything like it!’ He had almost accomplished his Abs before he was thought old enough for school. At an earlier age than usual, however, he was sent; and then he went from Ache to Abomination, in half the summers and winters it took the rest of us to go over the same space.”

The author was not referring to a single list of “A” words at the beginning of the speller, as a reader today might surmise. Instead, the author meant Memorus went from the beginning of the speller which dealt with one syllable words like “Ache” to the end of the speller which dealt with five-syllable words like “Abomination.” Russell continued:

“Astonishing how quickly he mastered column after column, section after section, of obstinate orthographies!... Memorus might have said, in respect to the hosts of the spelling-book, ‘I came, I saw, I conquered.’ He generally stood at the head of a class, each one of whom was two years his elder....

“At the public examination of his first winter, the people of the district, and even the minister, thought it marvelous, that such monstrous great words should be mastered by ‘such a leetle mite
of a boy!’ Memorus was mighty also in saying those after-spelling matters, the Key, the Abbreviations, the Punctuation, &c. These things were deemed of great account to be laid up in remembrance, although they were all very imperfectly understood, and some of them not understood at all.

"...I would have my readers of the rising generation know what mighty labors we little creatures of five, six, and seven years old were set to perform."

The author’s remark, of course, confirms that by 1845 the practices that were standard before 1826 had become obsolete, and also confirms that children before 1826 could read the whole of Webster’s speller by the time they were seven years old!

"...But all this was nothing, as it were, to Memorus Wordwell. He was a very Hercules in this wilderness of words.

"Master Wordwell was a remarkable reader too. He could rattle off a word as extensive as the name of a Russian noble, when he was but five years old, as easily as the schoolmaster himself. ‘He can read the hardest chapters of the Testament as fast ag’in as I can,’ said his mother.... But I have said enough of this prodigy. I have said thus much, because, although he was thought to be surpassingly bright, he was the most decided ninny in the school.

"The fact is, he did not know what the sounds he uttered meant. It never entered his head, nor the heads of his parents, and the most of his teachers, that words and sentences were written, and should be read, only to be understood....”

Note the offensively sneering tone the author used in putting the words in the mouth of the defective child’s poor mother, and the author’s arrogant dismissal of the intelligence of the mother’s neighbors. Yet he was clearly writing about the kind of rural New Englanders who had more than earned the title, “Yankee Horse Traders.” It would probably be hard to find a shrewder group.

In the museum in the old seaport of Salem, Massachusetts, can be seen the piercing, alert eyes in the portraits of the old ship captains. Those old Yankee captains must have been very formidable men. Yet they came from the same kind of people and had been pupils in the same kind of schools as those in Russell’s anecdote. For the Scot immigrant, Russell, to characterize any group of old Yankees as a group of fools is terribly unconvincing.

However, Russell was propagandizing the same idea in 1845 that he had been busy selling in 1826: the presumed desirability of teaching beginning reading by “meaning” instead of by “sound.” Russell therefore found it necessary to belittle past practices associated with teaching by sound and to belittle the people who had endorsed those practices. With Russell’s last sentence about reading for understanding, his 1845 material clearly emerged as change-agent rhetoric.

It is inconceivable that “meaning” was of no importance to those people. The probability is that the parents of poor Memor/us and their neighbors knew very well that something was very wrong with Memor/us long before he reached five years old. However, the intent of Russell’s change-agent rhetoric was to promote “meaning” over “sound” in the teaching of beginning reading, so his rhetoric fitted in very nicely with Nila Banton Smith’s biases, which is undoubtedly why she quoted Russell at such length.

Dr. Hilde L. Mosse, a psychiatrist/physician, who wrote The Complete Handbook of Children’s Reading Disorders, described children like Memor/us. The following excerpts from her books concern two
different types of aphasias, or language disorders. Although Dr. Mosse did not say so, from other literature I have seen, it seems to me that one of the two types she described may result from some defect in Broca’s area in the left brain which is concerned with the making of syllable sounds. The other type of aphasia she described, it seems to me, may result from some defect in Wernicke’s area in the left brain which attaches learned meanings to syllable sounds. Poor Memorus may have had a Wernicke’s-area type “meaning” aphasia so that he could not learn the meaning of words although he could make (Broca-area) syllable sounds perfectly. The other aphasic type cannot make syllable sounds so can never learn to speak (and so presumably has a Broca-area type of aphasia), but potentially can learn word meanings (Wernicke’s area) through non-speech avenues, and so can develop normally mentally.

Dr. Mosse said that childhood aphasias had been reported by the neuropathologist and psychiatrist, Lise Gellner, based on her clinical and pathological observations in England and America (Mosse, p. 95, and 381, following). A portion of Gellner’s childhood aphasics fell into two distinct groups. Gellner found one of those two groups of child aphasics with what she termed “word-sound deafness.” Although their hearing was normal, they could not distinguish differences in word sounds. The other of those two groups had what she called “word-meaning deafness.” Although they could hear sound, they could not understand speech.

Concerning some of the word-meaning deaf children, Dr. Mosse said:

“They learn to speak very early and have an excellent rote memory. They can pronounce and remember the most difficult words that children normally do not use. They learn to recite passages from Shakespeare and other poets long before they are of school age, and their parents understandably think that their child is a genius. It soon becomes clear, however, that the child does not really understand what he says. He does not answer even simple questions and only repeats what is said to him. These children belong to the group called “idiots savants.” (page 393)

“Word-meaning deaf children are so severely handicapped that they need supervision and care all of their lives. They seldom can be taught to read because they need a visual approach that has not yet been developed.” (page 394)

Yet Dr. Mosse made it clear that some of this group did learn to read, as well as to speak. Poor Memorus fell into that category. However, most probably he was not so totally disabled as any of the children Dr. Mosse described, since Memorus apparently was able to function at least to some degree in a normal fashion.

Dr. Mosse described those in a group of aphasics who had been studied who could only read, and a few who could read and speak:

“A small group of children have a peculiar reading symptom that we do not yet understand. Their disorder certainly belongs to the aphasias. Their cerebral speech and reading apparatuses are disordered in such a way that they can read but cannot speak spontaneously. They only speak when they read. Some such children read very early, before the age of 3, and no one remembers ever having taught reading to them. They often read words, including foreign words, that they could not possibly have heard their parents or other people use in their conversations. They pronounce these words, which are sometimes long and complicated, correctly. It remains a mystery what organic and psychologic mechanism enables them to do this.” (page 396)

“An important study involving the largest number of hyperlexic children ever recorded was done by the neurologists Mehegan and Dreifull (1972). They studied 12 children (11 boys, 1 girl) ages 5 to 9; two of these children read before the age of 3, 10 by the age of 5. Only three of the

1045
children had any spontaneous speech, but only one of these could use words meaningfully. Two children also had hypercalculia.... The authors observed further that most could handle material from The New Yorker and Newsweek with 60 to 70 percent accuracy.” (page 396)

These children had somehow acquired the conditioned reflexes necessary to turn print into sound, and were doing so with something approaching the efficiency of my 99% accurate First-Byte software on my Tandy computer. However, just as my Tandy computer cannot understand what it is saying, neither can these pathetic little reading machines understand what they are saying - nor what anyone else is saying.

It is a very different matter with the second group of aphasics Dr. Mosse discussed, the word-sound-deaf children, because they can be trained. (There is nothing wrong with their hearing, but just their ability to distinguish between sounds.) Dr. Mosse considered those children with word-sound deafness to be the only class of children who should be taught with the pure sight-word method, reading “by meaning.” since distinguishing between syllable sounds was impossible for them, even though they could hear them as noises. Such children can, with the “meaning” sight-word method, learn to read whole words for “meaning” and eventually be taught to speak through visual lip-reading methods (and presumably to lip-read the speech of others, obviously again bypassing any need to distinguish between heard syllable sounds). Therefore, such children can become self-sufficient. However, it is of great interest that Dr. Mosse obviously did NOT endorse the “meaning” method for teaching beginning reading to the truly deaf!

So it is possible to bypass the “experts” to get at the facts, if a source like Dr. Mosse’s work is consulted. However, with the mania for “whole language” afflicting American education today, it is depressingly clear that our government school administrators are certainly not reading Dr. Mosse’s two enormously scholarly and professional volumes.

It is also possible to get at the facts by consulting testimony given by some of the teachers who were in the schools in the 1930’s, and by checking Board of Education requisition files. Such historical sources are reliable, unlike the vast majority of books which pass as “expert” reference works today.
Chapter 54
The Reduction of Vocabulary, Oversimplification of Syntax, And Banishing of True Phonics

The record of reading texts which were published after 1925 confirms that the push after 1925 was emphatically on first grade and primary reading, and on the enormous reduction of vocabulary in primary-grade reading books. Of the seventeen series Smith listed as post-1925 series, eight covered only the first three grades. As Smith was not the slightest bit embarrassed to make very clear, the size of the vocabulary lists in those books had dropped sharply after 1925. It is an astonishing fact that, by 1934 when her book first appeared in print, the reduction of vocabulary in primary-grade books of which she boasted had actually been sold to gullible government school administrators as an “improvement.”

When the teaching of real phonics had returned to American first grades after 1900, the need to control vocabulary had largely vanished. Therefore, the size of the vocabulary in reading books had become considerably greater by 1918 than it had been in 1900 when rigid vocabulary control was still customary except in “natural” method readers like Heart of Oak. The syntax in such “natural” method readers had also been more complex. With the increase in vocabulary after 1900 came more complex syntax in other readers as well, although little conscious attention seems to have been directed to the subject of syntax in children’s reading texts. However, the vocabulary in first grade books had often been printed at their ends in the early 1900’s, except in books based on the “natural” method. Those vocabulary lists demonstrated that heavy vocabulary control at first grade had still been in place in the early 1900’s.

After 1918, a systematic attempt was again made to reduce vocabulary. In addition, real phonics began to be downgraded by “experts” like Gates and Gray, and the sight-word method appeared in some places like “dyslexic” Nelson Rockefeller’s first grade in Columbia’s Lincoln School and in Dr. Orton’s Iowa. It was followed immediately after with rampant “reading disabilities.”

Was Nelson perhaps the little fellow Gates told about who “hid behind the piano,” and blurted, “‘I hate that old game’“ when his teacher tried to give him sight-word reading lessons? Of course, Gates said the teacher knew how to overcome that little fellow’s reluctance, if you can believe Gates, in his article, “The Supplementary Device Versus the Intrinsic Method of Teaching Reading,” from the Elementary School Journal in June, 1925. That is the article in which Gates first introduced the “intrinsic” phonics of the deaf-mute readers which succeeded in throwing real supplementary phonics out of almost all American classrooms after 1930.

By 1930, vocabulary at first grade had been enormously reduced in the rash of new series appearing after 1925. Such series made the Gates and Gray deaf-mute readers with their vocabulary paucity not too startling when they finally arrived in 1930.

After 1921, the reduction of vocabulary had been largely based on Thorndike’s The Teacher’s Word Book, Teachers College Press, published in 1921, which provided the first guide to the ten thousand highest-frequency words. For the first time, with the use of that book, it was possible to reduce vocabulary systematically in reading texts through the third or fourth grades. (Gates used Thorndike’s list and a few other sources shortly afterwards to produce his own “authoritative” list for the early grades, as described in Gates’ article, “The Construction of a Reading Vocabulary for the Primary Grades,” in the March, 1926, issue of Teachers College Record.) Thorndike had spent ten years counting words in children’s literature to determine the ten thousand most frequent. Eventually, only about the two thousand words with the highest frequency of occurrence were taught by fourth grade in the deaf-mute-method.
basal readers put out by Thorndike’s ex-students, Gates and Gray, and their followers. (Naturally, texts had to use a sprinkling of some words with a lower frequency, but such words were not to be given the same emphasis in “teaching.”)

It was this use only of sight-words and phony-phonics context-guessing through third grade which turned most Americans into subjective, psycholinguistically guessing readers, instead of objective, automatic readers. It also produced America’s huge and tragic crop of functional illiterates.

Complex syntax was also removed from materials, but very deliberately in the 1920’s, in the name of reducing “readability” levels. Without exposure to such complex syntax in reading materials to provide necessary practice in its use, the ability of American students to handle complex syntax has dropped. This is demonstrated by their weak written compositions.

On page 216, Smith referred to the sharp reduction of words in primers and first readers between 1922 and 1928, and the even greater reduction by 1931. In 1922, nine of twelve had vocabularies ranging from 377 up to 630. In 1931, none ranged that high. Instead, the highest of the seven was 333, and the lowest 274.

That the reduction of vocabulary was a major aim of the “experts” is shown by the inclusion of the topic in The Twenty Fourth Yearbook of the National Society for the Study of Education, Part I, Bloomington, Illinois, Public School Publishing Co., 1925. This “spontaneous” publication engineered by “experts” to serve as a sounding-board for their ideas included an article by H. W. Kircher, “Analysis of The Vocabulary of Thirty-Seven Primers and First Readers,” which was shown in Smith’s bibliography (page 434).

It was critically important to have succeeded in reducing vocabulary greatly before the 1930 arrival of the true deaf-mute-method reading books. Since these books were to use a total vocabulary of less than two thousand words by the fourth grade, their nature would have been too great a shock if the way had not been paved for them ahead of time. The work on word reduction for beginners first began in earnest in 1922 with E. Selke’s and G. A. Selke’s study counting the different words in each of twelve primers (“A Study of the Vocabulary of Beginning Books in Twelve Reading Methods,” Elementary School Journal, University of Chicago, June, 1922). That the propaganda favoring vocabulary reduction was well under way by 1925 is shown by Kircher’s article in the 1925 Yearbook.

It is absolutely mind-boggling that the harmful proposals of vocabulary reduction, oversimplification of syntax, and the removal of real phonics from first grade instruction were actually sold to ingenuous government school superintendents as improvements! If the authority for curriculum had rested with American parents in the 1920’s and 1930’s instead of the government school superintendents who were taking courses that amounted to brainwashing at places like Teachers College, Columbia, the “experts” never could have succeeded in pushing out true phonics from first grade reading. Nor could they have succeeded in reducing vocabulary and syntax to a moronic level (or, more probably, to far below a true moronic level).

The deaf-mute method of 1930 was still firmly in place in America in 1962. On page 350 of the revised edition of her “history,” Nila Banton Smith referred to the Columbia-Carnegie Study of Reading Research and Its Communication by Allen Barton and David Wilder, as discussed in Proceedings of the International Reading Association in 1962 (pages 172-174). The Barton and Wilder study had confirmed that basal readers were used by ninety percent of first grade teachers on all or most days of the school year. As Jean Chall’s bibliography to Learning to Read: The Great Debate (1967) shows, none of the basal series in 1962 were phonics series and all used the sight-word method. Using that fact in
combination with the Barton and Wilder study indicates that at least ninety percent of first grade teachers in America were using the deaf-mute method to teach beginning reading about 1962.

Concerning the question of when the learning of letter sounds or phonics should begin, the International Reading Association article reported that first grade teachers about 1962 replied as follows:

11% “before they start learning actual words”
40% “at the same time as they learn their first words”
41% “after they have learned to recognize 50-100 words as wholes”
4% “after they have learned to recognize several hundred words as wholes”
0% “not at all during the primary grades”
4% were undecided or made no answer

This study was carried out about seven years after Rudolf Flesch’s 1955 best-seller which endorsed true phonics. Therefore, it might seem something like cause/effect that 40% of the first-grade teachers approved of teaching letter sounds along with the first sight words by about 1962 (and 11% before the introduction of whole words). Of course, teachers would have had to teach those letter sounds outside the basal-reader materials, by using specially purchased workbooks or material they had made themselves, since no reading series at that time taught letter sounds until after a basic sight-word vocabulary was covered. (The Lippincott phonic series was not published until 1963, and the phonic Open Court series also was published in 1963.)

Most such teachers would have used commercially prepared workbooks that they bought themselves. Yet almost all of the so-called phonic workbooks available in 1962 did not teach isolated letter sounds, which is true phonics, but instead used the approach of comparing meaning-bearing whole sight words to each other (bat to boy, but never pronouncing “b” in isolation). That is what “teaching letter sounds” would have meant to the teachers in this study. That is the same kind of phony, two-step, “echo” phonics as eventually turned up in the basal readers, dealing only with meaning-bearing whole sight words, and absolutely never with isolated letter sounds. Yet learning isolated letter sounds is mandatory for the use of one-step sounding-and-blending, Pascal-type, synthetic phonics. With the use of such phony phonics workbooks, teachers would obviously not have been using real phonics. Any positive effect on the practices of such teachers from Dr. Flesch’s 1955 book would be non-existent.

The IRA article which Smith was quoting put the above comments in quotation marks, so the comments obviously were from the original Barton and Wilder report. However, the following comments after the above which Smith quoted were not in quotations so obviously were the IRA article’s own comments on the Barton and Wilder report.

“Furthermore, the advocacy of starting phonics without first developing a sight vocabulary was higher among the more recently trained teachers.

“There does not seem to be any trend in the textbook literature which matches the trend among teachers; the books in all periods but the earliest are overwhelmingly in favor of developing an initial sight vocabulary (about half specifying 50 or more words, the rest vague things like ‘an adequate number’).”

The Barton and Wilder study confirmed that about 1962, despite the influence of Rudolf Flesch’s Why Johnny Can’t Read published in 1955, the vast majority of American children were still learning to read by the deaf-mute, whole-word, jig-saw-puzzle-pieces, phony-phonics method in sight-word basal readers, and most probably by phony-phonics workbooks.
The claims for the use of phonics made for such basal reading series are commonly ridiculous. For instance, on page 358 of her reading history, Nila Banton Smith claimed that the 1965 Macmillan series on which Albert J. Harris was senior editor introduced phonics from the very beginning, with directions for children “to find significant likenesses and differences” between the first two words. Yet the comparing of two whole sight words is manifestly a jig-saw-puzzle, sight-word-pieces, phony-phonics approach, and not real phonics!

A remark I heard a first-grade teacher make concerning the Macmillan series about 1978 in the early fall confirms that it was being used as a true sight-word approach. She spoke, very unself-consciously, of asking her first-graders to study the whole words at home so they could tell them apart, because the children were having so much difficulty.

On October 21, 1983, I made the following note in my records, concerning a second grader I had taught a few years before who had attended first-grade in another town which used Harris’s Macmillan series, in contrast to my first-graders whom I had been teaching with true phonics for about six weeks:

“My little first graders can’t read yet, but they can sound out and spell words. They (most of them) easily handle ‘frog.’ Yet at second grade, I had a boy trained in Macmillan, with excellent scores on their tests, who read fluently in its ‘controlled vocabulary’ materials. Yet he looked at the word, ‘frog,’ and said he could not read it, as it was too hard. Indeed, it was - for a Macmillan-trained child.”

The boy had been taught no real phonics, despite the phony phonics in first grade in the Macmillan series.

Also, not long before that, I had another little second-grade transferred student whose mother was appalled by the reading difficulties the little girl had as a result of having been given Harris’s Macmillan series in first grade. By using real phonics, I taught the little girl to read very successfully in second grade.

That little girl’s first-grade school had recently thrown out the Open Court truly phonic Code 10 series, apparently because the assistant superintendent of schools was concerned by what he considered unsatisfactory “reading comprehension” scores at fourth grade.

The fallacy of using “reading comprehension scores” as an index of reading ability has been discussed elsewhere in this history, but it is worth repeating at this point. Stable, fairly high reading-comprehension-score averages for classes at fourth grade and above are a strong indication that the children in those classes have not achieved automaticity in reading but instead are disabled readers. Such stable class scores suggest an artificially controlled attention. The attention of disabled sight-word, context-guessing readers is not free but must be used to figure out the print or they cannot read at all. Their attention switches back and forth between figuring out the words and getting the message of the selection. However, because it is not free it cannot wander and produce accidentally scores.

By contrast, children who have attained automaticity in their reading do not need to pay attention to figuring out the words. They can read very accurately (“recite,” silently or aloud) with or without any attention at all to the message contained in the selection. Their comprehension scores can therefore fluctuate wildly, since their attention to the message can fluctuate wildly, depending on whether or not they feel like concentrating. However, they also can read with maximum reading comprehension when they do they freely choose to pay attention to the message, and can then score very well.

Yet, since the disabled readers have a constant but divided attention, part to figuring out the words and only what is left over to getting the message, they can never read with maximum reading
comprehension. Therefore, the truth is that the “meaning” method permanently damages the ability to read with maximum comprehension, while the “sound” method protects that ability.

The following confirms the success of the previously used phonic program in the school the little girl attended which had switched to Macmillan because of the assistant superintendent’s concern about reading comprehension scores in the fourth grade. The librarian who had been in that school when it used the Open Court series told me that virtually all the children in the school when it used the Open Court phonic readers learned to read extremely well! As a librarian who constantly witnessed the children’s taste in independent reading from grade one through grade six, and who was in constant contact with all the teachers of all the children, that librarian certainly was in a position to evaluate reading achievement, far more so than the “standardized” California or Iowa “reading comprehension tests.”

Nila Banton Smith’s claim that the 1965 Macmillan series used meaningful phonics at the beginning of first grade is simply false. Second-grade children who are unable to read “new” words like “frog” certainly have not been given real phonics. The cruelty to little children which is the result of such sight-word materials should also be duly noted.
Chapter 55
The Banishing of Real Tests Based on Real Learning (Conditioning) and Their Replacement by Fake Tests Which Could Be Passed By Intelligent Guessing, Masking Massive Failures

If second-graders were routinely tested on their oral reading accuracy on progressively more difficult word lists, the failure of series like Macmillan’s to teach children by second grade to read simple “new” words like “frog” would become very evident.

I witnessed that kind of failure for years at third grade when children tried orally to read material other than their sight-word basal readers. One bright third grade girl, for instance, was absolutely flabbergasted by the new but phonically regular word, “picnic,” and spluttered unrelated sounds. To pronounce the phonically regular new word, “pencil” independently was absolutely beyond third graders, unless they had been taught it previously.

The specific problems on these two words (“picnic” and “pencil”) for children who had been taught to read only whole words for “meaning” were their inability to use short vowels except in memorized parts of whole-words, their inability to syllabicate, and their inability to apply the knowledge of the two sounds of “c” as in cat and cent (if, indeed, they even had such knowledge). Yet most first graders taught with good phonic programs possess these abilities before spring of first grade. Most such first-graders can read AND SPELL words like “picnic” and “pencil” with ease.

Almost endless examples could be given of simple words which the great majority of phonically-taught first-graders read with ease, but which almost all “meaning” taught third-graders are incapable of reading. I remember how my third-graders in the so-called “top group” were incapable of “reading” the phonically regular poem in the Ginn reader which began:

“Timothy Tiggs and Tomothy Toggs both got stuck in the bogothy bogs.”

Phonically taught first graders handle such materials easily, since it concerns “sound” and not “meaning.” Of course, most third graders learned to recite the poem eventually, apparently by auditory memory, not by “reading” it.

Yet most third grade teachers do not even know there is a real problem. If a child stumbles over a lower frequency word which has not already been taught, the teachers pronounce it and think the problem is solved, because most children can read their controlled-vocabulary sight-word reading books very well and score very well on the phony standardized “reading comprehension” tests given annually. That is, of course, because only 1,000 words of the highest frequency compose about ninety per cent of most reading materials. Once children know those 1,000 highest-frequency words (which account for about 90 per cent of almost any material), they are automatically reading above the frustration level on most reading comprehension test materials. They are therefore able to guess the meaning of most of the unknown words in the remaining 10 per cent from the context of the selection, particularly if those words are already in their spoken vocabularies, and they can therefore guess the answers to the questions.

Their inability to read independently only shows up on oral word list tests which lack a written context from which to guess the words, or on demanding materials which contain difficult unknown, low-frequency words, well beyond the 10,000 commonest words. Such reading disabled children (and most American elementary school children are reading-disabled) cannot pronounce, and therefore “hear,”
low-frequency words because they are not already in their spoken vocabularies, even when they can guess the “meaning” of low-frequency words from the context of a selection.

The sounds of words are really only labels for the ideas being named. If the sound of a word cannot be resurrected from memory when it is needed, then the idea behind that word is rendered useless. When reading-disabled children encounter unknown low-frequency words, they may be able to guess their meanings, but the low-frequency words will lack a “sound” hook with which the children could have filed the word in their memories for future use, and with which hook they could have retrieved the word in the future. As a result, instead of accumulating their vocabulary through their reading, as healthy readers can do, reading disabled children cannot increase their vocabulary in a normal fashion, any more than badly taught deaf-mutes can. The stunted vocabularies of reading-disabled children are the real reason for the low so-called “reading comprehension” scores that show up so consistently today at the high school and college levels.

If the assistant superintendent in the school system which switched from the phonic Open Court reading series to the sight-word Macmillan reading series had meaningful oral reading test results available in his central office instead of “silent reading comprehension tests,” he would very quickly have seen the rank failure produced by the Macmillan “meaning” series when the Open Court “sound” series was thrown out. Yet such oral word tests are almost non-existent today.

In the 1928 U. S. Catalog and the Cumulative Book Index, 1928-1932, no listing is shown under reading for the Gates or Gray oral reading accuracy tests (or for any oral reading accuracy tests). This proves, of course, that group oral reading accuracy tests went out of use in America before 1928, since they were not even in print by 1928, though “silent reading comprehension” tests were massively in print, including Gates’, such as the Gates’ Primary Reading Tests and Gates’ Silent Reading Tests. Yet, anyone checking this 1928 source would receive no hint of the history concerning the suppression of group oral-reading-accuracy tests. Such researchers would not receive even a hint that such tests had once existed, or the astonishing fact that oral reading accuracy tests had been written and had been massively used by the very first deaf-mute-method reading textbook authors, Gates and Gray. It is self-evident that group oral-reading-accuracy tests were suppressed by “expert” consensus by 1928. Gates, Gray and the whole Education Mafia knew very well that oral reading accuracy tests would have statistically revealed in the most glaring manner the failure of the deaf-mute reading method to be foisted on America in 1930.

However, since the U. S. Catalog in 1928, a primary research source, could give no background on oral reading tests, it might mislead an uninformed researcher so that he was ignorant of the existence of oral reading tests and would believe that the “reading comprehension tests” which replaced them were valid.

“Oral reading” can be done with nearly 100% accuracy by an inexpensive computer with very inexpensive software. If this paragraph were typed using Firstbyt Smoothtalker software, my Radio Shack Tandy computer could read it back to me with perfect or near perfect accuracy. The human-sounding voice even has intonation, and it pauses at commas and periods. Yet the computer and its software obviously have “zero” comprehension of the paragraph’s meaning. However, the computer and software are only doing what the human brain does when “reading” has become an automatic conditioned reflex, which is what healthy reading should be.

The part of the brain which “stores” such conditioned learning, very much as it is “stored” on software, has no consciousness. The famed neurosurgeon, Dr. Wilder Penfield, in his book, The Mystery of the Mind, Princeton University Press, Princeton, New Jersey: 1975, called that part of the brain the “automatic sensory motor mechanism.”
Dr. Penfield said the “automatic sensory motor mechanism” is connected at the higher brain stem with the part of the brain holding our consciousness, which portion of the brain he called the “higher brain mechanism,” occupying very roughly the front portions of the two halves of the brain. Research has shown that attention can be focused on only one thing at a time. Research has also shown that consciousness, which must also be unitary since its attention is unitary, arises from below the two halves of the brain at the unitary higher brain stem and then spreads into the front part of the two halves of the brain, where all reasoning takes place. Much talk lately of the brain’s containing “two consciousnesses” obviously only came because of the differences that result when unitary consciousness looks out at reality from either the left or the right side of the brain. By analogy, using the right side might be compared to looking out at the churchyard through a pink glass window, and using the left side might be compared to looking out at the same churchyard through a blue glass window. It is the same churchyard, and the same solitary observer, but the impressions are different because different mediums are used.

According to Dr. Penfield, a connection between the brain’s computer, the “automatic sensory motor mechanism,” which occupies very roughly the back part of the two halves of the brain, is situated at the higher brain stem. It is through the use of something like a “switch” at the higher brain stem that consciousness calls on the brain’s computer, the “automatic sensory motor mechanism,” as needed. Consciousness can either listen to the computer’s activity, change its activity, or permit it to operate on “automatic” while consciousness thinks about other matters.

According to the psychiatrist/pediatrician, the late Dr. Hilde Mosse, author of The Complete Handbook of Reading Disorders, healthy reading is an automatic conditioned reflex, which means it can be done with or without conscious attention focused on the actual decoding of the print. She said that, for comprehension to be maximum, no conscious attention should be focused on the reading act itself, so that consciousness is left totally free to concentrate on the meaning of the material. This obviously rules out anything which approaches “psycholinguistic guessing” in reading. Since “psycholinguistic guessing” of words in a selection is done with consciousness, and not automatically, consciousness is NOT left totally free to concentrate on the meaning of the material. Attention is divided, switching back and forth from word identification to the message of the selection, and real “comprehension” must therefore drop accordingly.

However, the very term, “reading comprehension,” is an oxymoron. Healthy reading should be a conditioned reflex, taking place in that part of the brain which has no comprehension, the brain’s computer. Comprehension takes place in that part of the brain which cannot be conditioned and which holds consciousness, and to be maximum should focus no attention whatsoever on the act of reading. Therefore, since the higher brain mechanism cannot be conditioned or taught, it is obviously impossible to “teach” reading comprehension.

Yet the strongest arguments against the validity of “reading comprehension” tests are not just the facts that the very term, “reading comprehension,” is an oxymoron, and that “psycholinguistic reading” makes it impossible, by definition, to concentrate totally on the meaning of the material being read. The strongest argument comes from the kind of statistical curves produced by “reading comprehension” tests, which prove that what is being tested is not learned material but inborn ability.

Any inborn trait in a population produces what is called a “bell curve.” Taking the case of women’s shoe sizes, if a graph is produced of the sizes of women’s shoes of perhaps ten thousand women in a New Jersey town, some few will have tiny feet with size four shoes, and some few will have very large feet with size twelve shoes, but most of the ten thousand will cluster around shoe sizes seven, eight and nine. If a line is drawn from the top of the tiny column over the size four, over the increasingly larger columns for sizes five and six, to the top of the very large columns for sizes seven, eight, and nine, and then dropped to the increasingly smaller columns for sizes ten, eleven and twelve, it will be seen that the
connecting line over the top of the columns forms the shape of a bell: curved on each side and very high in the middle. The same kind of bell curve is produced on intelligence tests, which, with some exceptions, largely measure inborn intelligence.

Neither shoe sizes nor inborn intelligence have anything to do with the kind of graphs produced by conditioned reflexes. Conditioned reflexes are nothing more nor less than learning. Something which has been learned, or “conditioned,” in that group of ten thousand women in a New Jersey town is the Pledge of Allegiance to the American flag, recited daily in New Jersey schools and learned by heart by most American children. (However, the laudable addition some years ago of the words, “under God,” makes it more difficult for older people to recite the Pledge from memory without some slight stumbling at the point of that addition.) If a graph is produced of how much of the Pledge is still known by those ten thousand adult women, some tiny portion (probably foreign born) would know none of it, some slightly larger portion who are perhaps mentally defective would know almost none of it, some would remember increasingly larger portions of it, but the largest number would know it perfectly. The columns would therefore be very tiny over those who knew 0%, very slightly increasing over those who knew 10, 20, 30, 40, 50, 60 and 70 percent, and increasing considerably more over those who knew 80 and 90 percent. But probably a large majority of the ten thousand would know 100 percent of the Pledge, and the column for 100 per cent would be very high.

That kind of piling up of scores at the end of a graph is typical for any learned or “conditioned” material. When a line is drawn over the top of such scores, it produces a very gentle rise until the very end, when it abruptly shoots up to a huge cliff. If the same test were given to ten thousand women in London, the curve would be reversed: the vast majority would know zero percent, but some few American expatriates would know 100 per cent. The scores in London would pile up at zero percent. Whether the scores pile up at one end of the scale or the other, such piled-up scores are produced when any “conditioned” or learned material is tested.

Yet American “reading comprehension” scores do not pile up, as is normally true when learned or “conditioned” material is graphed, but instead produce a beautiful bell curve. Therefore, something inborn is obviously being measured. What is being measured is inborn intelligence, since it has to be used by sight-word trained people in “psycholinguistically guessing” the answers to “reading comprehension tests.” Ergo, reading comprehension tests do not primarily test “learning” but primarily test the inborn trait of intelligence. They are fallacious as shown by the curves produced by their statistical results.

“Reading comprehension tests” cannot even measure much of inborn intelligence for those who were severely disabled by the sight-word approach since they cannot read enough sight words to guess accurately, nor can they score well on ordinary intelligence tests because such tests require some ability to read. This severely disabled group would probably include most people who are pronounced auditory types, as are probably many Black people, instead of visual types. As mentioned elsewhere in this history, since many Black people show great talent in music and speech, the deaf-mute method may be more lethal for such Black people than other people and the phonic method correspondingly more beneficial for such Black people than other people. That this is so is suggested by Marva Collins’ extraordinary results with Black inner city children. She teaches heavy phonics and then follows it with teaching true literature. The writing abilities her Black students show later on their compositions are breathtaking.

What is curious is that the bell curve, reflecting inborn intelligence, is also sometimes distorted when children who read phonically are tested. This is because such children can read WITH attention to meaning or WITHOUT attention since reading has become, for them, an automatic conditioned reflex. Two things are therefore being tested: their degree of attention, and their ability to read with understanding. When they choose to pay attention, they read with maximum reading comprehension, far exceeding the crippled psycholinguistic readers who have divided attention, reading by guessing, and who
cannot read at all without paying attention. Yet, when phonically-trained children take “reading comprehension tests” in school, they may let their attention wander and read thoughtlessly, something the “guessing” deaf-mute-method readers are incapable of doing because they read with forced attention.

This was the cause of the sometimes lower reading comprehension scores from the Open Court readers about which the school administrator was “concerned.” He could not recognize that such scores confirmed that, at fourth grade in that school, Open Court texts had produced truly automatic conditioned reflexes. To improve the meaningless “reading comprehension scores,” the administrator moved out the successful Open Court program and moved in the harmful Macmillan program. In the central office, he only dealt with computer print-outs of standardized reading comprehension test scores and never listened to little children trying to read out loud, and stumbling because of Macmillan’s inadequacy. He was probably congratulating himself on the statistical “improvement” on the “silent reading comprehension tests” from the use of Macmillan’s series at the very same time that the mother of the little girl in my second grade class was frantic with worry about her child’s failure because of that series.

In Nila Banton Smith’s American Reading Instruction, (page 190), she said that such school superintendents from about 1920 to 1924 were “appalled to find that large numbers of children were deficient in reading” when they first gave standardized silent reading tests. Almost all school superintendents were and are astonishingly naive and have been led around by “experts” since the turn of the century, possibly because they lack confidence in their own judgments. (If school superintendents were not so astonishingly naive, they could not have been manipulated so easily today into their almost wholesale acceptance of the “whole language” juggernaut. Its relatively sudden size and intensity, blanketing America, Australia and elsewhere in the English-speaking world, should certainly have aroused their suspicions that it was the public relations work of some largely behind-the-scenes group of “experts” with massive influence.)

When children’s reading comprehension scores in 1920 to 1924 produced something like a bell curve, with 50 percent of the school population scoring below “average,” school superintendents should have KNOWN they were not testing a teachable skill (“reading”) but only something inborn and essentially immune from schooling. If, instead of a bell curve, they sometimes got the totally random scores produced by Miss Middleton’s class in 1915, they should equally have known they were not testing a skill, because, if they were, scores would have piled up toward 100% (if taught) or toward 0% (if not taught). Her bizarre scores resulted from the testing of TWO things: intelligence and the degree of wandering attention.

Yet silent reading comprehension scores were used as the rationale for moving the deaf-mute-method readers into American schools. They have been kept there by abandoning oral reading and spelling accuracy tests which could reveal their failure and by continued use instead of the fallacious “silent reading comprehension tests.” Those “comprehension tests” have splendidly masked the failure of the deaf-mute reading approach for over sixty years.
Chapter 56
Since It Was the “Experts” Themselves Who Wrote New Spellers After 1928, Phonics Could Not Return Once Again Through the Spelling Door As It Had in the Late 1880’s

“Experts” had been writing on spelling for a very, very long time before 1928, as this history has shown, probably beginning with Andrew Bell’s “improvements” in India and Great Britain described in his 1808 text. The work by American “experts” after about 1900 has already been discussed, but it did not stop there. For instance, in 1918, Dr. Leta Stetter(?) Hollingworth (1886-?), who received her training as a psychologist at Columbia, wrote The Psychology of Special Disability in Spelling. She was mentioned in Cattell’s article in the 1926 Thorndike honorary issue of Teachers College Record:

“Thorndike established a colony in view from my house where, among others, have lived in the summer or through the year Woodworth, Woodbridge, the Hollingworths, Poffenberger, and Keppel....”

It was in this article that Cattell said:

“My relations with Thorndike have been more intimate than with any other, except (perhaps) Boas and Woodworth. Our interests and viewpoints... have coincided to an unusual degree....”

The point, of course, is that Dr. Hollingworth’s “viewpoints” on the psychology of spelling probably also “coincided to an unusual degree” with the mutually-held viewpoints of Cattell and Thorndike.

The following remark appeared on an entry on E. L. Thorndike in Current Biography, H. W. Wilson Co., New York, 1941:

“A colleague at Teachers College remarked that Thorndike has always been a center of controversy.”

However, not joining Thorndike in controversy, presumably, were the men who received their doctorates, presumably under Thorndike, at Columbia Teachers College. Many contributed reviews or articles to the February, 1926, Teachers College Record Thorndike honorary issue. Contributors included J. F. Hosic, who received his Ph. D. from Columbia in 1920, Henry Suzzallo, who received his from Columbia Teachers College in 1905, Arthur Irving Gates, who received his at Columbia Teachers College in 1917, and many others. Gates wrote the tome mentioned below on the teaching of spelling, but Suzzallo, Hosic and Thorndike all wrote spelling books which were meant to be used directly by little children.

In 1922, Arthur I. Gates, who had been Thorndike’s student and was Thorndike’s and Cattell’s associate, wrote The Psychology of Reading and Spelling, at Columbia Teachers College, New York. Dr. Burdette Ross Buckingham had written Spelling Ability, Its Measurement and Distribution, published at Teachers College, Columbia, University in 1913, and it presumably was his doctoral dissertation. In 1919, he wrote the Buckingham Extension of the Ayres Spelling Scale. Much other material undoubtedly could be cited, such as E. L. Thorndike’ article on spelling about 1900 in Teachers College Record, Henry Suzzallo’s article on spelling in the 1913 Cyclopedia of Education, and O. P. Cornman’s Spelling in the Elementary School, Boston, 1902. Cornman’s work is available at the Library of Congress and is cited by
Suzzallo and elsewhere. These materials concerned “theory,” of course, and were not intended to reach the hands of children.

Studies of the most frequently used words in spelling, reading and speech date back many years. Dr. O’Mathuna referred to Father Bathe’s word studies in the seventeenth century, mentioned elsewhere in this history. Word frequencies must have been of some interest by the mid-nineteenth century in America, as established by the high-frequency words listed in Leavitt’s reader, quoted previously. In 1925, the National Education Association’s Department of Superintendence produced a summary of 33 more recent studies concerning what words were suitable for spelling study (Research in Constructing the Elementary School Curriculum, Third Yearbook, Department of Superintendence, 1925, pp. 110 - 151).

Ernest A. Horn also produced in 1926 A Basic Writing Vocabulary, University of Iowa Monographs in Education, First Series, No. 4, University of Iowa. In Germany in 1898, a man named Laeding sampled a large amount of German literature, 10,910,777 running words and 238,173 different words. The NEA publication cited word studies by Chancellor in 1910 on the commonest words used in writing, and by Ayres in 1913 on words used in personal and business letters. Ayres’ 1913 samples totaled about 24,000 running words with about 2,000 different words. In 1914, Ayres compiled his list of the thousand most common words in writing, based on four previous studies, and described his work in doing so in his 1915 text. Thorndike’s study of the 10,000 commonest words appeared in 1921, and more minor word studies continued for some years after that.

Spelling had obviously been a great subject for “study” also in the years immediately before 1932, as the Cumulative Book Index, 1928-1932, showed that bibliographies had been prepared on such spelling studies. The entries below were given in the Index at the end of the “Spelling” entries, under “Bibliography” and “Examinations”:

“Foran, T: G: and Rock, R. T: Annotated bibliography of studies relating to spelling; supplement no. 1. pa 35c ‘30 Catholic educ.?’”

“Saelinger, Sister Mary Irmina, and others. Annotated bibliography of studies relating to spelling. pa 35c ‘28 Catholic educ. press”

“Foran, T: G: Form of spelling tests. pa 35c ‘29 Catholic educ. press”

If these three works could be located today, they might make interesting reading.

However, what is most startling about the change-agents’ work on spelling after 1928 is the extent to which they concerned themselves with writing the actual spelling books the children were to use. Numbers of spelling texts by “experts” are listed in the Cumulative Book Index, 1928-1932.

The numbers of “expert” psychologists and other “experts” who appear as the authors of children’s spellers between 1928 and 1932, the critical change-agent dates, includes B. Skinner, (with L. F. Cowan), Horn and Ashbaugh, Hosic and O’Shea, W. C. Bagley (with James H. Smith), Daniel Starch (with G. A. Mirick), H. Suzzallo (“and others”), E. L. Thorndike (and J. H. Wohlfarth, 1929) and even F. J. Schonell, England’s sight-word expert, who wrote a book on spelling published by Macmillan in England in 1932, two years after Macmillan41 in America began publishing Gates’ 1930 deaf-mute-method readers.

---

41 The 1965 Macmillan series was by Albert J. Harris and Mae Knight Clark. Harris was also the author of How to Increase Reading Ability, a standard work for postgraduate courses in the teaching of reading. First copyrighted in 1940, it had a revised sixth edition written with Edward R. Sipay and published by David McKay Company,
A background check on leading “experts” who wrote spellers between 1928 and 1932 is in order: Skinner, Horn, Hosic, Bagley, Starch, Mirick, Suzzallo, Thorndike and Schonell.

Henry Suzzallo (1875-1933) had written with Henry C. Pearson (1871-?) what was probably a change-agent speller about 1911, since Suzzallo’s views on reading and spelling in his articles in the 1913 Cyclopedia of Education endorsed “meaning” in opposition to “sound.” At that time, Suzzallo taught at Columbia where he had studied under Thorndike about 1901. As discussed elsewhere in this history, Suzzallo’s spellers published by American Book Company had been adopted by the state of Texas and were involved in a textbook bid scandal in 1925. Shortly afterwards, reportedly for too aggressive fund-raising according to Oehles’ biography, Suzzallo was fired from his position as President of the University of Washington by the Governor of the state of Washington. Suzzallo then went to work for the Carnegie Foundation, and died in 1933.

Suzzallo had apparently been the first well-connected “expert” to write a speller long before 1928, as early as 1911. It is true, however, that Dr. Joseph Mayer Rice had written a spelling program in the late 1890’s, and Henry F. Harrington wrote a spelling book in 1880. School superintendents like Harrington not infrequently wrote textbooks, but Rice and the school superintendents (and possibly, but not probably, Harrington) were not insiders in the change-agent cliques. Yet Suzzallo most certainly was an insider, and so were many of those who wrote the spellers after 1928. Some were well-known psychologists.

With publication dates of 1931 and 1936, the New York Public Library catalog shows Henry Suzzallo (1875 - 1933) as a co-author of Everyday Spelling for Boys and Girls, First Book and Second Book, written with Henry Carr Pearson (1871-?) and Milo B. Hillegas (1872-?) and published by American Book Company. The 1936 edition appeared three years after Suzzallo’s death. The 1931 and 1936 speller was apparently a revision of Suzzallo and Pearson’s earlier material. It is of interest that Nila Banton Smith in her “Preface” thanked Dr. Milo B. Hillegas, presumably still at Columbia and who had worked on Suzzallo’s last speller, for Hillegas’ “encouragement, helpful advice, and aids of many kinds” in the writing of her “history.” No matter where one turns in researching the history of reading and spelling misinstruction in this country after about 1900, all roads seem to lead back to people at Columbia Teachers College in New York City.

In February, 1982, I requested the First Book of the Suzzallo speller at the New York Public Library, since I felt it would confirm a “meaning” instead of a “sound” approach. The First Book was not available, but only the Second Book. That was the pattern to which I had become accustomed in my library work on reading series. In the minority of cases when any part of a series was available at all, the beginning books in reading series were almost always not available, but only the upper-level books. In February, 1982, I had also tried to get the beginning book of Suzzallo’s 1930 reading series, written with others and published by American Book in 1930. All the New York Public Library could find to send down to me was Book 4 of that series.

The same thing had been true at the New York Public Library a year or two before when I requested the 1924 Bobbs-Merrill Readers, written by George Herbert Betts, Clara Belle Baker and Edna D. Baker. All that the New York Public Library clerks could send down to me was an upper-level book. Later, in 1986, I found the first-grade manual of the Bobbs-Merrill series in the Harvard Library, where I found most of the rest of the material on reading series which I have used to write this history. If it had not been for Harvard’s remarkable collection of textbooks, which appears to have been free from outside influences, I could never have written this history.

Inc., New York, in 1975. In my opinion, both the 1965 Macmillan series and the Harris and Sipay teacher’s 1975 text are unacceptable.
The famous name, Skinner, was listed as the co-author of a speller between 1928 and 1932, appearing as “B. Skinner.” This may well have been B. F. Skinner, the controversial psychologist who recently died, and who wrote the book, Beyond Freedom and Dignity, Bantam Books, New York: 1971, 1980. Its thesis was that we can no longer afford freedom but must submit to rule by “experts,” presumably of which he would have been one. I once read (I believe in a newspaper article, and possibly in Skinner’s obituary, but unfortunately I made no record at the time) that Skinner reported that at his very advanced age he found pornography to be therapeutically stimulating. Most civilized people would not have selected a man with a mentality like that as an “expert” guardian even of the town dump.

James F. Hosic was another author of a speller published between 1928 and 1932. Hosic had received his Ph. D. in 1920 and was at Columbia Teachers College in February, 1926, when he was one of those working on Professor E. L. Thorndike’s annotated bibliography in the February, 1926, issue of Teachers College Record honoring Thorndike. (Among others contributing essays or reviews honoring Thorndike for this special issue in February were Cattell, Courtis, Gates, Stone, Suzzallo and Briggs. Briggs wrote a book in 1911 on teaching reading, referred to in Appendix D. He had received his doctorate in 1913 and was a professor of education at Columbia Teachers College in 1926. Judd also contributed an article honoring Thorndike, but it was not published until the May issue.)

Of all the experts, Thorndike was one of the most important and influential, so the fact that he was among those “experts” writing spellers between 1928 and 1932 is very interesting, indeed. Thorndike was one of the authors on a speller published in 1929 by World Book Company. That was the same company which had published Nila Banton Smith’s and Courtis’s Picture Story Reading Lessons based on Thorndike’s list of the commonest words, and which used the pure deaf-mute-method to teach beginners to read.

So many of Thorndike’s ideas were disturbing. In the February, 1926, honorary issue of Teachers College Record, one bibliographical entry showed Thorndike had written an article in November, 1906, “A Sociological Theory of Education.” The review stated that the article:

“Criticizes Professor Ward’s advocacy of all knowledge for all men. Suggests that more rational than increasing opportunity haphazardly for all, would be giving added opportunities to the gifted, training the less gifted in the arts and industries, and improving society through eugenics.”

Who would decide who was “gifted” and what “improving society” should entail (leaving out of the discussion the outrage against human freedom and dignity which is implicit in the very idea of human eugenics)? Presumably, it would be men like Thorndike who would set up this nightmare rule by those who presume they are more intelligent than the next man. (As mentioned, the psychologist, B. F. Skinner, actually had the audacity to make a similar recommendation for rule by “experts” in his 1971 book, Beyond Freedom and Dignity.)

As a footnote concerning psychologists’ deciding who is “gifted,” it should be added that Thorndike’s followers “estimated” his IQ at 200, but his biographers recorded that Thorndike spent many free hours trying unsuccessfully to master calculus, which every graduate engineer in America has had to do or he would have failed to graduate. The estimate of an IQ of 200 sounds more like the expression of a sycophant than a professional.

What strikes me when reading anything written by these “experts” is that none of them seems to be very intelligent, particularly in comparison to their opponents. Yet I have read (though I cannot locate it now) that about two-thirds of America’s superintendents of schools for a long period of time either
received degrees from Columbia Teachers College, where some of the most prestigious “experts” were located, or from those who had themselves received degrees from Columbia Teacher’s College.

W. F. Bagley of Columbia Teachers College was another author with James H. Smith of a speller, Mastery Speller. (It was not available in either the Library of Congress nor the New York Public Library, so I have not seen it.) Bagley was a major member of the Education Mafia, and was an editor for James McKeen Cattell on one of his publications for some time. It would be difficult to find any man who was more of an insider with the change-agents than W. F. Bagley.

England had its own crop of reading “experts” after 1930, but no name seems to recur more frequently in the literature than that of F. J. Schonell. It is very interesting that Schonell was one of those writing a new speller between 1928 and 1932, listed in the Cumulative Book Index for those years. (Schonell’s 1946 guide to the teaching of reading is listed at the end of Appendix D in this history.)

Professor Daniel Starch was a co-author of a speller published between 1928 and 1932. Starch was from the University of Wisconsin, where J. M. Cattell’s and John Dewey’s fellow graduate student at Johns Hopkins University, the psychologist, Joseph Jastrow, had been located for many years. Jastrow and Dewey had been among the subjects in Cattell’s benighted sight-word experiments, used for almost a century to justify sight words (An Education in Psychology: James McKeen Cattell’s Journal and Letters from Germany and England, 1880 - 1888, Edited by Michael M. Sokal, The MIT Press, Cambridge, Massachusetts: 1981, page 70).

These initial sight-word experiments involving Cattell, Dewey, Jastrow, G. Stanley Hall, and others were done on St. Patrick’s night, March 17, 1883, the same date the more auspicious Brooklyn Bridge was completed. Starch wrote one of the first “reading comprehension tests” in 1914, The Measurement of Efficiency in Reading, Writing, Spelling and English, College Book Store, Madison, Wisconsin. Quantz’s material, referred to earlier, was also prepared at Jastrow’s University of Wisconsin. Starch’s co-author on his Test and Study Speller published between 1928 and 1932 was G. A. Mirick.

According to Nila Banton Smith (page 124) George A. Mirick, the co-author with Starch of a speller between 1928 and 1932, wrote Teaching to Read. N. J. State Course in 1914. Mirick’s book was out of print by 1928.

The fact that an “expert” who shaped New Jersey’s official government reading course in 1914 collaborated with Starch, an “expert” with shining credentials, to produce a “speller” at the very time that American spelling ability was being sabotaged, suggests how pervasively the content of American education was being quietly manipulated by a tiny group of wrong-headed people. Consider the numbers involved and the clear indication of control from the top: In a nation of close to 123,000,000 people in 1930, which without control from the top would have produced numerous and unrelated “spellers” from each section of the country, a large number of the “new” spellers came from a tiny, interlocking group of “experts.” They had the authority through their university positions to decree what was “right” and what was “wrong” in teaching reading and spelling in government schools in America.

To “get along” in that climate, one had to “go along.” Mae Carden, who opposed the “experts” at Columbia Teachers College in the 1930’s, was ostracized and made no appreciable impact in the early 1930’s, any more than did the neurologist from Iowa, Dr. Samuel T. Orton, who had dealt with the reading problem in Iowa by the 1920’s which was caused by the sight-word method. (Concerning Mae Carden’s incredibly successful reading program and the baffling opposition to it, see the article by Frances V. Rummell, “These Children Love to Read,” from The Saturday Evening Post, September 9, 1961.) The sight-word method had been promoted in Dr. Orton’s Iowa by George Herbert Betts, who had studied under John Dewey about 1904 and who wrote Outlines for Schools in Iowa in 1915. The rampant
reading disabilities in Iowa by the 1920’s from the sight-word method suggests a possible cause-effect relationship with Betts’ influence.

Horn wrote one of the spellers listed above which were published between 1928 and 1932. Horn was at the University of Iowa and also wrote a text on reading referred to elsewhere in this history. Betts’ and Horn’s Iowa is where Orton began to fight the sight-word method.

Both Carden in the East and Orton of Iowa had produced remarkably effective reading programs but were unable to exercise influence because the plague of “experts” had produced a dictatorial academic “machine” which silenced opposition through control of academic careers. With their control of American education, the “experts” dictatorial “machine” managed to turn a literate America into an America where a large percentage are “functionally illiterate.” (i.e., they cannot really read).

The “experts” had made sure by writing new spelling texts by 1932 that teachers would not be able to use old phonic spelling texts to compensate for the harm caused by the 1930 new deaf-mute-method readers. Therefore, no longer would teachers be able to use phonic spelling texts to overcome reading disabilities, as had been done once before in America, in the 1890’s. The record certainly suggests that the “experts” knew their reading instruction history very well indeed.
Chapter 57
The State of Reading Instruction After 1930

The blanketing effect of “expert” influence in the United States after 1930 appeared to leave very few areas of the country untouched. Some few areas may have existed. Certainly an entry under “Readers” in the 1928-1932 Cumulative Book Index suggests some part of the American South may have escaped. Instead of obscuring history, the book may have clarified history:

“Robinson, R. R. Two centuries of change in the content of school readers. pa $1.60 ‘30 George Peabody college”

George Peabody College was comfortably far away from Columbia Teachers College and the University of Chicago. Possibly its students and faculty were marching to a different drummer in 1930.

However, at the end of the section, “Readers,” in the 1928-1932 Cumulative Book Index, appeared “About readers,” a very unusual section, and it contained these entries which were very possibly influenced by the “experts”:

“Saelinger, Sister Mary Irmina. Evaluation of the vocabulary content of twelve series of primary readers. pa 35c ‘29 Catholic educ. press.”

As discussed elsewhere, Minnich’s book appearing in 1928 was a convenient prop to the McGuffey Myth, so necessary if America were not to question the unprecedented and almost wholesale invasion of American schools by the “Dick and Jane” deaf-mute-method readers after 1930. (If the invasion had not been wholesale, all the “Dick and Jane” jokes and cartoons over the past fifty years or so would have fallen awfully flat.)

What Sister Mary Irmina Saelinger thought about vocabulary content and control is unknown, but she should certainly have questioned the very concept of control, though it is very unlikely that she did so. Almost all of America was marching to the superbly publicized drummers of Columbia Teachers College, and she probably agreed with them. Sisters frequently were “certified” by attending schools run by “experts,” so they often (at least initially) were no more immune than government school teachers. It is doubtful that she reflected at all on the fact that no one had worried about the “vocabulary content” of the Psalms a thousand years or so before, at which time little seven-year-old beginning readers started the task of memorizing the Psalms in Latin, and not even in the vernacular.

It is almost impossible to find any area in America from about 1932 to the late 1960’s in which Gray’s “Dick and Jane” Scott, Foresman series was not at least one of the series in use. In most places Gray’s series appears to have been the primary series. A. I. Gates deaf-mute-method 1930 McMillan series may have been the secondary series until after World War II, at which time other “meaning” series were published in considerable numbers. The blanketing effect on the teaching of reading by the W. S. Gray “Dick and Jane” deaf-mute-method series is something that had never occurred before in the history of America.

The fables on the use of The New England Primer and McGuffey’s have been discussed elsewhere in this work. Even the vastly used Webster’s speller never achieved the blanketing effect at the first grade
level before 1826 that was achieved by “Dick and Jane,” because at no time did Webster’s speller control most of the market. After 1826, when spellers were no longer used for beginning reading, the continued wide use of the Webster speller at higher levels above the beginning level was apparently largely due to the fact that it was so cheap.

Nila Banton Smith omitted mentioning other reading series in the 1930’s, probably because Gates and Gray had little competition through the 1930’s, although Mae Carden’s phonic texts date from the 1930’s. Smith did what is probably an adequate job of describing sight-word series from 1940 to 1960.

The extent to which W. S. Gray’s Scott, Foresman was used in American schools between 1930 and 1967 has never been treated statistically. (This astonishing fact should cause future historians to shake their heads in near disbelief.) Yet, as late as 1967, Jean Chall recognized Scott, Foresman as the dominant series in America, when she used this phrase in a footnote on page 23 of Learning to Read: The Great Debate, referring to the 1962 Scott, Foresman edition:

“The 1962 edition of the leading basal-reading series (the Scott, Foresman Reading Series....”

“Sound” or phonic alternatives to the “meaning” series were almost unavailable until long after 1930, apart from Mae Carden’s phonic materials. However, Reading With Phonics by Julie Hay and Charles Wingo became available in 1948. It was published by the J. B. Lippincott Company in 1954, and possibly also in 1948. When Dr. Rudolf Flesch wrote Why Johnny Can’t Read in 1955, he said:

“To my knowledge, it is the only available American phonetic primer. (You can also get the Beacon materials from Ginn & Company in England....”

Dr. Flesch was almost right about the unavailability of phonic materials in America in 1955, although he obviously did not know that Mae Carden’s excellent phonic materials were still on the American market in that year, and they were still on the market in 1994, although they may no longer be. However, it is very doubtful that the Beacon materials were still available in England as late as 1955. However, apparently as a result of Dr. Flesch’s best-selling 1955 book, phonic materials began to arrive on the market by 1963. Yet none of the post-1930 materials which endorsed “sound” to a greater or lesser extent ever had an appreciable portion of the market.

Linguistic readers appeared in the 1960’s. Their results were poor, because, as Pollard said back in the 1880’s, “meaning” and “sound” cannot be successfully taught simultaneously to beginners, and linguistic readers attempt to do precisely that. The i.t.a. phonetic print was briefly successful in the 1960’s, but reportedly largely disappeared for the same reason as the earlier Pitman print: it interfered with spelling. Charles C. Walcutt’s Lippincott readers, which he wrote with Glenn McCracken, arrived in 1963. Although they were weak phonic readers, they were far better than the basal reader series then on the market. The Open Court readers arriving in 1963 did a superb job with phonics at first grade. Other series with phonic books in the lower levels, but with readers for grades one to about grade six or eight, appeared after 1963. Yet at no time did such phonic reading series capture more than a small fraction of the market, nor did they ever receive the approval of the vast majority of professors at teachers’ colleges. Most such reading series have now largely disappeared or have been “revised” into phonic uselessness, except for Open Court and a few others.

However, some fine phonic materials meant only for the critical first grade are still on the market. Sing, Spell, Read and Write of St. Petersburg, Florida, can do an excellent first-grade job in the 1990’s, as can Professor Phonics Gives Sound Advice by Sister Monica Folzer, Charlotte Lockhart’s fine program, Samuel Blumenfeld’s fine program, Phyllis Schlafly’s excellent First Reader System, and some few others. Mona McNee’s is a fine program from England. (All are listed in Appendix C.)
Information on Mae Carden and some other supporters of “sound” in reading, including J. C. Daniels’s and Hunter Diack’s English series, The Royal Road Readers, can be obtained from Jean Chall’s Learning to Read: The Great Debate, McGraw Hill, New York: 1967 (second and third editions 1983 and 1996, Forth Worth, Texas: Harcourt Brace). Chall’s book also covered most major reading series in use by 1967 (except Open Court), and, together with Nila Banton Smith’s listing of post-1940 series, provides a listing of most major American reading series for the period 1940-1967. Information on many reading programs available in 1967 can also be obtained from “The Cooperative Research Program in First-Grade Reading Instruction,” written in 1967 by Guy L. Bond and Robert Dykstra, in the Reading Research Quarterly, 2, International Reading Association, Newark, Delaware. Excellent information on reading series available in 1973 can be obtained from Samuel Blumenfeld’s The New Illiterates (1973). To bring the listing up to 1981, Rudolf Flesch’s Why Johnny STILL Can’t Read provides a listing of the major series in print in 1981. Also in 1981, The Basal Reader Approach to Reading by R. C. Ackerman was published by John Wiley, New York. According to Dr. Patrick Groff on page 167 of Preventing Reading Failure, An Examination of the Myths of Reading Instruction, National Book Company, Portland, Oregon, 1987, Ackerman’s book analyzes the content of basal readers up to 1981. I have not seen Ackerman’s book, but it is obviously an excellent guide to relatively recent reading series. Dr. Patrick Groff has himself written many excellent books in which he discussed current reading materials and recently has discussed “whole language” materials at length. In 1988, The New Big Book of Home Learning, The Basic Guide to Everything Educational for You & Your Children, (Revised Edition) by Mary Pride was published by Crossway Books, A Division of Good News Publishers, Westchester, Illinois. This remarkable encyclopedia of presently available general educational materials also lists and describes many fine “sound”-oriented reading programs.

In 1993, the Office of Research of the U. S. Department of Education, Washington, D. C., published The Beginning Reading Instruction Study, an evaluation of costs and contents of many materials on the American market in 1993. While it does contain much helpful current information and information on many current programs, its users should be aware that it omits many widely used programs such as IBM’s computer-assisted materials, the widely used Scribner revision of Charles C. Walcutt’s old Lippincott phonic series, Samuel Blumenfeld’s phonic materials, Sister Monica Folzer’s phonic materials, Charlotte Lockhart’s phonic materials, Mae Carden’s phonic materials, the Coleman’s phonic materials, and even the unsatisfactory but massively advertised Hooked on Phonics.

It is true that many phonic programs do not contain reading books to practice the decoding skills in the order in which they are introduced, and do not include general reading books above that beginning level. Nevertheless, the 1993 study’s conclusion that no program does it “all,” teaching decoding and providing reading books, is clearly wrong. Open Court’s, McQueen’s, Mae Carden’s, the Coleman’s Homestead Readers and probably a few others provide excellent decoding instruction while also providing basal readers through most of the grade school. The 1879 phonic edition of McGuffey’s is reportedly still on the market, and that certainly does it “all.” Sue Dickson’s Sing, Spell, Read and Write provides decoding instruction plus 17 little basal readers to practice sequential phonetic skills. The 17 little books are meant to be read in the critical first grade, after which children can (and should) be moved into real literature, so “basal readers” are unnecessary anyway above the first grade. Phyllis Schlafly’s new material also provides the necessary practice reading materials at first grade, after which basal reading books are no longer necessary, and children can be given real literature.

However, the beautifully illustrated “meaning”-approach basal readers for grades one to eight which are on the market, and which the 1993 study implies are worth while, should NEVER be used for children in isolation (and it would be better not to use them at all). Children are dependent on their reading for most of their vocabulary growth and their growth in the ability to handle complex syntax. Yet the
“meaning”-approach reading books are so grievously flawed by their use of controlled vocabulary and unnaturally simplified syntax that they stunt the normal language development of children.

Furthermore, the content of these readers is all too often disagreeable and objectionable, so that these reading books are hardly likely to promote healthy character-formation. Yet the wish to promote healthy characters in children of school age by giving them wholesome materials to read is absolutely NOT limited to religious-minded people. Even the ancient Roman, Quintilian, suggested that little children practice their handwriting by copying famous moral maxims as an aid in developing their characters. Quintilian even stated that the content of such materials would stay with the little children into their old age!

Despite the availability of relatively cheap and successful phonic “sound” reading materials for first grade, phonic reading materials are not used in the vast majority of American government schools. The vast majority of government schools are using those “meaning” reading series which damage or destroy children’s decoding abilities as well as stunt their normal language development, thereby lowering the children’s functioning intelligence. In addition, the reading series do little or nothing to enrich children’s characters, and are sometimes actually harmful to healthy character development.

Error in reading instruction, and in many more areas as well, has become institutionalized in government schools. Those schools are firmly under the control of “experts,” whose “literature” is all that virtually 100 per cent of school superintendents and their supervisory staffs ever read, if they read even that much material. A very large possibility exists that numbers of school superintendents and their supervisory staffs may themselves be so reading disabled that they are forced to limit the quantity and quality of their own reading, just as Nelson Rockefeller and so many other reading-disabled people have done.

At present, the market is saturated with whole-language abominations, and the “how-to” texts concern “whole language” and the “spontaneous” growth of interest in it. “Whole language” is an utterly stupid and halfwitted phrase, worse even than “psycholinguistic reading,” but it comes from the same change-agents. They are, admittedly, magnificently successful propagandists who obviously have great financial resources and powerful influence at their disposal, since the “whole language” method has criminally (and I DO mean criminally) damaged beginning reading instruction in England, New Zealand and Australia, as well as America, and has done so in an extraordinarily short period of time. Samuel Blumenfeld told of the great harm done in Australia in his September, 1991, The Blumenfeld Education Letter. After a five-week tour of Australia, he devoted the entire issue to his article, “The Scandalous State of Reading Instruction in Australia.”

The current plague is “whole language.” Reading the recent press releases of its highly publicized gurus in so-called educational journals should help to bring any interested reader up to date on its tidal-wave progress, if the reader has the constitutional grit that it takes to wade through such stuff.

However, this history is not primarily concerned with American reading materials published after 1930 since most are covered very well in the reference texts listed above. It can be said in summary that, despite hard work by phonics advocates since Dr. Flesch’s book was published in 1955, most school personnel today still agree with the “reading experts,” that reading should be taught by William James’ “meaning” and not by Noah Webster’s “sound.” The latest lunacy, “whole language,” and the eighty-year-old fakery of the silent reading comprehension test remain triumphantly in place, not only in the United States, but all across the English-speaking world.
Chapter 58
The War Between “Sound” and “Meaning” Damaged European and South American Schools, Has Affected the Teaching of Chinese and Japanese Scripts, Has Affected the Teaching of the Deaf, and Has Even Appeared to Have Affected the Teaching of Typing and Shorthand.

The emphasis in this history has been on the teaching of reading in English. The teaching of reading in English has world-wide importance, as English has become a second language the world over, and it is now the customary language by which people from different countries communicate. The crippling of the teaching of reading in English, therefore, potentially affects not just literacy in English-speaking countries, but literacy all over the world.

However, although the emphasis in this history is on the roots and the status of teaching of reading in English, it is very pertinent to mention the European use of the global sight-word “meaning” method, which the intellectual H. I. Marrou praised, as mentioned earlier. Because of the global method, many Europeans have been crippled in the reading and writing of their native languages.

Before 1920 and since early in the century, a modified “global” or whole-word “meaning” method had some small use in Europe by followers of Ovide Decroly of Belgium, a medical doctor who had originally used the method with retarded children. An analysis of his work (The Decroly Class, by Amelie Hamaide, E. P. Dutton, New York: 1924?) shows children had been taught all the sounds and were working with syllables only three months after the beginning of first grade, so his was not a true sight-word approach, but almost the German analytic/synthetic approach. Decroly also used an “experience chart” whole-word “meaning” approach, (such as “Today we visited a farm and saw...”). The “experience chart” whole-word “meaning” method probably spread through European visitors to the 1893 Chicago world’s fair. Such visitors would have had the chance to see the “experience chart” approach used at Colonel Francis W. Parker’s famous Chicago school. Yet it was only after World War I that the true “global” sight-word method was really promoted in Europe, and it was a disaster.

William Scott Gray in The Teaching of Reading and Writing, 1956, page 107, refers to J. E. Seegers’ La psychologie de la lecture et l’initiation a la lecture par la methode globale. Anvers, De Nederlandsche Boekhandel, 1939, pp. 360-362:

“Seegers makes the following comments: ‘As already pointed out by Simon, the results of children who have learned to read by the global method are completely different from those who learn to read by the synthetic method. We even admit that we have frequently been most embarrassed to evaluate these results, and we have preferred not to point out those referring to time spent and pauses during reading. Here are the reasons - our subjects used to recognizing known words by their ensemble (general configuration, gestalt) make little effort to decipher meaningless syllables and words alien to their vocabulary. During the reading of sentences they omit unknown words.... One could consider this fact as a grievance against the global method, but we think with Vaney that the child learns to read only after several years.’”

The Simon he referred to was Dr. Theophile Simon who wrote Pedagogie Experimentale, Librairie Armand Colin, Paris, 1924, and who had worked with the French psychologist Alfred Binet earlier. In his 1924 book, Simon compared the two methods of “meaning” vs. “sound,” and, like a typical intellectual of the period such as Marrou, endorsed the global “meaning” method. Vaney had published a scale for oral reading in 1907, referred to on pages 114 and following of Simon’s 1924 book.
Since Vaney’s scale had implicitly agreed with Quintilian, that reading should be accurate before it is fast, Seegers’ citing a remark by Vaney that it took years to learn to read (when learning by “sound” is rapid) would suggest that Vaney had changed sides in the meaning-sound war, joining W. S. Gray’s erroneous “meaning” side.

In 1965, Robert Dottrens of Switzerland wrote Au Seuil de la Culture, Les Editions de Scarabee, Paris, defending the global method as he understood it (which was with heavy analytic phonics), and as he claimed to have used it in the experimental school at Mail in Geneva, where he eventually became the director. He said, however, the global method had not been authorized in Geneva since 1955. Dottrens admitted a real difference existed in the two methods (global whole-word “meaning” vs. synthetic phonics “sound”), and said, with his version of the global method, a “danger” could be avoided which was present in others:

“...the temptation the children have to invent when they do not know. Some of them are past masters in this art.

“To avoid this fault, which is grave, it is absolutely necessary that the exercises with sight words and the work of analysis be executed in a rigorous manner and that - I could not repeat it enough - the inspection of all that the children read orally be impeccable and without any laxity.”

Concerning the “awful” effects of straight phonics, however, he went on to say:

“To have learned to read by the letters and the combinations of syllables is to have acquired a mechanism in which comprehension (has no part - rough translation) and it is probably the most grave reproach that one can address to the synthetic method. A child can learn to read rapidly without understanding.” (p. 136)

Both Dottrens in 1965 and Seegers in 1939, therefore, joined Gray about 1940 (quoted by Mitford Mathews in his Teaching to Read, Historically Considered) in admitting that children who are taught by phonics learn to read far faster than children who learn by global (“whole”) sight-words. The Boston school report of 1883 which has been discussed earlier made the same admission. Yet these are the ONLY admissions I have ever found in the literature except by defenders of phonic programs about this fact which was so evident to me in teaching primary grades: that children with true phonics learn to read far faster and to read far more accurately. The very tests which could prove it (large group dictated spelling and oral reading accuracy tests) have been abolished in taxpayer-supported testing programs like that of the National Assessment of Educational Progress (NAEP).

Dottrens was obviously endorsing the analytic phonics “global method,” not Kenneth Goodman’s and Frank Smith’s psycholinguistic guessing which reduces the reading of printed words to Chinese-like characters, and which currently has been recycled as “whole language,” usually with the addition of a few teaspoons or so of “phony phonics.”

The most famous European “global” sight-word promoter, however, was Celestin Freinet, a French socialist and school teacher who ran an open-classroom-like school beginning in 1920. Freinet made a great fuss over the children’s use of a printing press, but, according to Elise Freinet, the “Boscher” phonics charts were left in a corner showing the “contempt” in which they were held. (Mathurin Boscher [1875-1915], wrote Methode Boscher, a 1946 copy of which is listed in the Library of Congress catalog as published by Loudeac, France. It was not available when I requested it in 1980.)
One of Freinet’s books was La méthode naturelle, I. L’apprentissage de la langue, published by Delachaux & Niestle, Neuchatel, Switzerland, in 1969 under the auspices of the Institut J. J. Rousseau in Geneva. I carefully waded through a large portion of that book some fourteen years ago, and made the summary note at the time that Freinet was:

“a pseudo-intellectual mouthing a hash of psychological ideas, poorly tied together and unsupported by data on his ‘conclusions,’ which are only flights of literary fancy.... He admits the fact that children taught by a mixed global method have severe reading problems, but says his is built on interest, so is not a house on sand....”

Some of Freinet’s exceedingly boring writings were published by Delachaux & Niestle, Neuchatel, Switzerland, and some by other publishers. His most interesting publisher, however, was probably the François Maspero company in Paris. Elise Freinet, most probably Celestin Freinet’s wife, wrote Naissance d’une pédagogie populaire in 1949. It was being published in 1978 by that François Maspero company, which also published La Sante mentale de l’enfant by Celestin Freinet. A 1978 copy of the latter book, published after Celestin Freinet’s death, has a foreword by Elise Freinet. In her foreword, she said:

“The health of the child was the fundamental end of the change in teaching to which [Freinet] was consecrated since 1923.”

She said it had been the theme proposed by Freinet at the 16th Congress of the Modern School in Avignon in 1960.

On page 5 of Elise Freinet’s foreword appeared the intriguing phrase:

“...de toute la societe capitaliste d’exploitation humaine.....”

The François Maspero press which published in 1978 the 1949 and 1978 books, and some others, about and by Celestin Freinet, also specialized in publishing Communist literature, to judge from its 1978 appended very long list of authors and book titles in its La Petite Collection Maspero. The list included Che Guevara, Castro, Marx, Trotsky, and authors writing of Vietnamese Communism. A host of other authors on that list of 210 books whose names were unfamiliar were shown with book titles which implied those materials were also Communist. An interesting title was number 85, Le petit livre rouge des ecoliers et lyceens (“interdit par le gouvernement francais”) [The Little Red Book of Schoolchildren and Secondary School Students “(Prohibited by the French Government”)]. To give the general flavor of that Maspero book list with entries concerning every continent on earth but Antarctica, it is worth while to cite the last two titles: title 209, Patrick Tissier, L’éducation en Chine et la pensee de Mao Tse-Toung, and title 210, Karl Marx, Friedrich Engels, Sur Malthus.

On pages 48-50 of her 1949 book, Naissance d’une pédagogie populaire, Elise described how Celestin’s class looked when she arrived in 1926. She described the room as “beautiful disorder” but floating on top of it was an “inextinguishable enthusiasm.” Books were strewn everywhere. The room had a “biological laboratory” containing tadpoles, snails, slugs, “innumerable insects,” butterflies, a “garden of plants” and brook water with vegetables and rose petals in which the insects could “frolic.” The “altar” was the printing press. (Translation: the place was a noisy, probably dirty, mess. Worthwhile open classrooms are NEVER “disordered,” dirty or noisy.)

Celestin Freinet was a “syndicalist” and his kind of teacher is discussed in the article from The Saturday Review, London, England, September 13, 1924, by Ernest Dimnet, “Radical School Teachers in France,” which article also touches on the history of French schools. (I regret I no longer recall the printed
source which directed me to this article.) Elise Freinet reported (pages 46-47) on Celestin Freinet’s accompanying in 1925 the first group of European teachers to visit the U.S.S.R. and the groups’ happy meeting with Krupskaya, Lenin’s widow. Krupskaya received them at the Kremlin, where they:

“...all ate apples offered with simplicity....”

This was probably, I assume, because in the Soviet near-famine conditions Krupskaya had nothing much else to give them to eat!

Celestin Freinet wrote dreary, interminable works which are a fine match for the kind our “experts” have been churning out since 1918, but he and Decroly, the other European sight-word luminary, actually have government schools named after them all over Europe. At least we do not have any named after James, Cattell, Thorndike, Dewey, Judd, Gray or Gates, so far as I know.

The “global” sight-word method was being promoted in most of Europe, including France, after 1920. Yet, while the Soviet Union reportedly had used the sight-word approach briefly in the 1920’s, it reverted to the phonic approach by 1932, according to the article, “Primer,” in the Great Soviet Encyclopedia, Volume 4, 1974. The Library of Congress has a copy in Russian of V. P. Bogdanov’s 1974 Ot Azbukilvana Fedorovavo Sovremennaug Bukvaria, which is a history of Russian primers from 1574 to 1974, and it seems to confirm that statement, illustrating actual primer pages. Another source for information on Soviet methods is Gertrude Hildreth’s article, “How Russian Children Learn to Read,” in The Reading Teacher for December, 1959. Yet her remarks suggest that Soviet children had been learning to read by phonics (“sound”) since at least 1930, not 1932, because she said that syllables had been separated on a 1930 beginning reading book which she saw. Separating the syllables in words is done only if the teaching emphasis is on “sound” and not “meaning.”

The curious fact is that in all the Communist sphere, “sound” or phonics has been the method used to teach reading, at least since about 1930. Franz Biglmaier of Padogogische Hochschule, Berlin (obviously a teachers’ college) on page 349 of his article in John Downing’s Comparative Reading, The Macmillan Company, New York, 1973, said that the method used in East Germany to teach beginning reading was phonics, but that the West German “experts” endorsed the global (sight-word “meaning”) method.

Even in Castro’s Cuba the method used was phonics (“sound”), according to a very interesting article in The National Review, September 30, 1983, on the teaching of reading in Cuba. Tom Bethell’s article was entitled, “But Can Juanito Really Read?” (pages 1996-1199). Bethell said:

“A big reported increase in the national literacy rate is one of the absolutely predictable aftermaths of all Communist revolutions, wherever they may occur....”

He cited Vietnam, Ethiopia and Nicaragua as some of “the latest triumphs of literacy.” Yet he reported that the content of the primers being used to teach reading in Nicaragua was highly political and amounted to indoctrination.

Bethell quoted what Lenin said in 1919:

“An illiterate man is non-political. First he must be taught to read.”

Bethell said that in the Soviet literacy campaign of the early 1920’s, one slogan was, “Literacy is the road to Communism,” and in 1980, billboards in Nicaragua read, “Literacy is liberation!” Yet Bethell added that Lenin had said in 1922:
“In general, as you probably know, I do not have much sympathy for the intelligentsia, and our slogan “liquidate illiteracy” is in no way to be interpreted as being aimed at the creation of a new intelligentsia. The purpose of “liquidate illiteracy” is only that every peasant should be able to read by himself, without help, our decrees, orders, and proclamations. The aim is completely practical. No more.”

Concerning reading achievement in the Soviet Union in 1977, the Russian M. Kashin made the following statements in his report, “Concerning the Results of the Soviet Schools’ Adoption of the New Curriculum” (from M. E. Sharpe’s May, 1977, periodical, Soviet Education):

“By the end of the third grade, the vast majority of pupils read fluently and expressively, and correctly understand what they read.”

Kashin said that promotion rates in Russia were 98.7% in the first grade, 99.2 in the second grade and 99.4 in the third.

The most recent victim of the “meaning” fallacy in the teaching of beginning reading appears to be Japan. The effects may not have shown up there yet, but they may any day now. Japan’s justifiable pride in its twentieth-century literacy can be expressed as a paraphrase of the proud remark of John Adams in eighteenth-century America: to meet a Japanese who cannot read is as rare an occurrence, almost, as a comet or an earthquake. Yet some ominous information on fairly recent Japanese teaching practices which may still be in effect today and which threaten Japanese literacy is contained in a 1978 article, “Beginning Reading in Japan,” from Beginning Reading Instruction in Different Countries, “Selected Papers, Seventh IRA World Congress on Reading, Hamburg, August 1-3, 1978,” published by the International Reading Association, Newark, Delaware, in 1978.

As discussed previously, Japanese script is composed of two kinds of characters, the Kana sound-bearing characters and the Kanji meaning-bearing characters. Very roughly, the Kana are about two-thirds and the Kanji about one-third of adult material. For little children, however, it has been customary in the past only to use the Kana sound-bearing characters. However, the 1978 paper contained the interesting fact that “experts” have been at work in Japan since 1968, pushing the teaching of the Kanji characters (meaning-bearing signs) to little three-year-olds. Yet the brains of the majority of three-year-olds have not matured enough to store characters, as shown by the Bender-Gestalt test norms on geometric designs.

Japanese four- and five-year-olds used to start to learn the 71 sound-bearing Kana (or Hiragana) syllable characters at home informally, and only finished learning Kana sound-bearing characters in first grade. Formerly, the learning of the 1,850 basic Kanji meaning-bearing characters was spread out gradually over the nine years of compulsory education, but now the “experts” want children to learn hundreds of Kanji in kindergarten!

The paper reported a second interesting fact. Picture books for three-year-olds in Japan used to be just picture books, with very little print - not reading texts. That reportedly had begun to change by 1975, presumably also with the endorsement of “experts.” By 1975, toddlers’ books were no longer just picture books with occasional print, but many were story books in Kana syllables, even though previous research showed little pre-schoolers only knew some of the Kana characters and so obviously could not have read connected stories without guessing unknown characters.

I do not know whether there has been any meaningful resistance to these changes, but they are ominous. The first change is the deliberate teaching of Kanji meaning-bearing-characters to three-year-olds before most are mature enough to distinguish differences in geometric designs, according
to the Bender-Gestalt norms. Those who became hopelessly confused would be incipient dyslexics. The second change is giving toddlers stories printed in Kana syllables when they only know some of the syllables, so that the toddlers are forced to guess the other syllable characters “psycholinguistically” with the help of the pictures and the context. Obviously, this poses the risk of turning toddlers into subjective readers of Japanese.

The 1978 article from which I obtained this data did say some people objected to too-early teaching of reading, but not for the reasons I gave above, and whether their objections were effective, I do not know. The article also said that many kindergartens were involved in the teaching of Kanji starting in 1968, and an “expert” was quoted who claimed that an average child could learn 500 Kanji meaning-bearing characters before school age! That is one of the silliest statements I have ever read. If these “improvements” remained in place in Japan after 1978, we may begin to hear about reading disabilities there any day, now.

Some Japanese industrialists have regarded American functional illiteracy with great disdain, according to fairly recent newspaper reports. I wonder what they will say when the functional illiteracy chickens arrive at their own homes to roost. Will they admit then that they have been just as negligent and gullible in Japan in permitting “experts” to damage their children’s beginning reading instruction as we in America have been?

Highly organized government schools are firmly in place in Japan, so the organizational pipeline with control from the top certainly exists there, as here, for almost immediate implementation of any “improvements” in education desired by “experts.” Concerning whether such “improvements” have possibly been under way for some time in Japan, an interesting comment was made at a very large meeting on January 18, 1992, at Hauppauge, Long Island, New York, which was sponsored by The Literacy Council, TaxPac, and others on the theme, “What Business Can Do to Improve Education.”

The speakers were Charles M. Richardson of Educational Engineering and John Gatto, New York State Teacher of the Year for 1991. At this meeting, the remark was made that the achievement scores from the much-praised Japanese schools were currently being surpassed by schools in free-market Asian areas such as Taiwan and Hong Kong, though such statistics never seem to reach the newspapers here. That Japanese schools were being surpassed elsewhere in Asia suggests that more than reading instruction may already have been “improved” in Japan, of which probable fact the self-satisfied Japanese industrialists seem to be ignorant.

For over two thousand years, the Chinese have had a “meaning” writing system. It is composed of thousands of characters, and is obviously difficult to learn, but Chinese students were given many years in which to learn the characters, during which time they made much use of writing to memorize the forms. This age-old writing system in China was altered by the Communist Chinese not long after 1949, very much for the better. Furthermore, relatively recent practices in teaching beginning reading in Communist China have been the exact reverse of recent Japanese practices. Not long after taking control of the country, the Communist Chinese installed the “pinyin” sound-bearing alphabet in schools. These sound-bearing letters are used first to teach beginners who are about seven years of age to read. Only later are the children taught the meaning-bearing Chinese characters.

Curiously, this exactly reverses what the “experts” have relatively recently been trying to do in Japan, where “experts” have recommended teaching the meaning-bearing characters first instead of the sound-bearing characters. Furthermore, in China, the teaching of reading is delayed until the late age of about seven, when the Bender-Gestalt norms show most children can distinguish among geometric shapes, while in Japan “experts” have been trying to force the teaching of meaning-bearing characters to three-year-olds, the majority of whose brains have not matured sufficiently to distinguish one character.
from another, according to the Bender-Gestalt norms! However, the quality of the resultant Chinese scholarship from the Chinese Communist methods of teaching beginning reading by “sound” instead of “meaning” cannot be seriously questioned. We all remember Tiananmen Square and the global computer links that the accomplished Chinese scholars there used to get their news out to the rest of the world.

According to Franz Biglmaier of Padogogische Hochschule, Berlin, on page 349 of his article in John Downing’s Comparative Reading, The Macmillan Company, New York, 1973, headlines appeared in German newspapers and magazines in the mid-1960’s referring to the global sight-word “meaning” method in these outraged terms:

“Stupid Children or Stupid Methods?
The Downgraded Global Method.
The Thalidomide Case of Education.
Attack Against Global Method.”

Biglmaier said that 74 per cent of the sixty-one available German primers in 1964 used the global approach. On page 351, he described his own materials published in 1972. From his description, they are two-step, phony-phonics Code 3 materials, very comparable to our sight-word basal readers. Yet when I was in Hamburg in November, 1977, where teachers were permitted to choose their reading texts, of the eight first-grade and second-grade teachers with whom I spoke, seven endorsed a heavily phonic Code 10 reading program (Bunte Fibel). The eighth teacher, a young man, was using a sight-word program from Berlin which appeared to rate Code 3 or less. Most of these classroom teachers in Hamburg in 1977, therefore, were diametrically opposed to the “reading experts” of Germany. A friend of mine who has relatives in the north of Germany whom she regularly visits gave me copies about a year ago of workbook pages from the Bunte Fibel that had been used about 1992 by a little first-grade relative. Therefore, the Code 10 series appears to continue to prosper in the north of Germany.

In Sweden in 1977, I found the schools were required to use an excellent Code 10 phonic text, Nu Laser. However, as discussed in Appendix D, the effect was watered down in some schools by the use of experience charts. The experience chart approach, called “LTG,” was currently being highly praised in Swedish teachers’ journals as something new!

In Amsterdam in the Netherlands in 1977, the dominant series was apparently a very poor series which began with “meaning” and did not introduce phonics until far too late, in the mid-term. One school I visited, however, did use a heavily phonic series, and another was using a new phonic series by Dr. Kooreman which he had adapted from materials he saw in the Soviet Union.

In Innsbruck, Austria, in 1977, I saw an excellent Code 10 phonic series in use. A school administrator in the Innsbruck administrative offices with whom I spoke, however, appeared to be very aware of the “sound” vs. “meaning” controversy in the teaching of reading. The installation of that excellent Austrian program may well have come as a result of such a controversy in Austria.

In the French schools I visited in 1977, none used a program lower than Code 6. The reader, Remi et Colette, appeared to be required material, and it was a weak “mixte method” approach, starting with sight words and then introducing phonics. However, individual teachers greatly strengthened the material by their classroom materials which were largely (and astonishingly) experience chart stories used to teach real phonics! Therefore, Freinet’s “meaning” experience-chart influence lived on, but in “sound” adaptations that he would vehemently deplore!

In France, despite the churning out of books in French defending the global method, it had been in enormous trouble by the 1950’s. In La querella de los metodos en la enseñanza de la lectura (The Dispute

“In a paper published in 1950, Madame Roudinesco, Trelat and Trelat state that despite the inadequacies of their statistics, they were able to determine that (schools) using methods of synthetic operation had 2 per cent dyslexics ‘while 20 per cent of the children had typical disturbance patterns in the new schools where only the total method was used.’”

This paper, “Etude de Quarante Cas de Dyslexie d’Evolution,” appeared in the French magazine Enfance for January-February, 1950. The only “inadequacy” to which it referred was that the group of reading disabled children with which the authors had worked was relatively small. Then, in 1951, a flood of articles supporting the “meaning” global method appeared in Enfance. Their appearance in Enfance in 1951 certainly suggests a cause-effect relationship with the pro-“sound” 1950 article in the same periodical. One of those 1951 articles was written by Suzanne Borel-Maisonne, and in it appeared, for the first time as far as I know, the word “psycho-linguistique,” made famous for so-called reading instruction much later by Kenneth Goodman in his American writings.

Concerning practices in Communist-dominated countries before 1983, see the article in the National Review of September 30, 1983, “But Can Juanito Really Read?” by Tom Bethell, which was mentioned earlier and which is reviewed further in Appendix E.

In de Braslavsky’s article in John Downing’s Comparative Reading, The Macmillan Company, New York, 1973, she said (page 273-274):

“When the ‘global’, ‘ideovisual,’ or ‘natural’ method was at its zenith in Europe in the 1930’s, one of the most orthodox variations of its ‘pure’ form was elaborated in Argentina.... this method was anything but a success. An increasing number of children showed signs of difficulty in reading, writing, and spelling, both in primary school and, even worse, in alarming numbers in secondary school....”

De Braslavsky reported it was not the first time Argentina had been poisoned by academic imports. In the 1870’s, Argentina and Uruguay had imported the German analytic-synthetic phonics method. It undoubtedly worked well, because, properly taught as in Bunte Fibel which I saw used in Hamburg a hundred years later in the 1970’s, it is a Code 10 method. Unfortunately, she said Argentina and Uruguay in the 1870’s also imported the whole-word method from the United States:

“The ‘word method’ arrived precociously in ... Uruguay and... Argentina... probably thanks to the Spaniard Jose Maria Torres and the North American teachers engaged for the first Normal School in Parana.... In Montevideo, in about 1874, Romero prepared placards on which words were illustrated with pictures, together with an explanatory booklet. This was severely criticized by Berra, who advocated the ... analytic-synthetic method.”

So, the “movers and shakers” in America in the 1870’s even exported their errors to unlucky South America!

Other Invasions by “ Meaning”

The war between “sound” and “meaning” did more than jump national boundaries. It jumped the boundaries between disciplines, and even affected typing and shorthand, and continued to affect the teaching of the deaf.
Short vowels, present in Gregg shorthand manuals before 1918, were not present in shorthand manuals after that date but only unmarked vowels which could be either long or short. As a stenographer of Gregg shorthand who learned it at the age of sixteen without the use of the critically important short vowels, I can assure anyone that transcribing such Gregg shorthand, with its additional reliance on “brief forms” (a kind of sight word) can only be done with heavy, conscious, context guessing. Although I have taken shorthand rapidly and quite accurately for over fifty years, I find transcribing it requires conscious judgments (“psycholinguistic guessing”) and is therefore unpleasant. I much prefer to use longhand to take notes because I can read it automatically and avoid unpleasant conscious decoding. I pity those who must read all printed matter “psycholinguistically.” It is no wonder they prefer to watch television.

Testimony to the discomfort of reading “psycholinguistically” as must be done with Gregg shorthand, instead of automatically, was given in an address at the Reading Reform Convention in Princeton in 1979, “Deafness and Reading, A New Approach,” reported in The Reading Informer, Scottsdale, Arizona, October, 1979. At the time of his talk, the speaker, Dr. R. Orin Cornett, was Research Professor and Director of the Cued Speech Program at Gallaudet College, Washington, D. C., and had formerly been U. S. Commissioner of Education and the Director of the Division of Higher Education, U. S. Office of Education. Cornett said that, while he was the Director in that U. S. Office of Education division, he had read reports from Gallaudet College. Cornett said two comments from those reports struck him in particular. He reported:

“The average IQ of students at Gallaudet College (the world’s only separate college specifically for deaf persons) is probably higher than that in any other institution of higher education in the world....

“Eighty percent of the students at Gallaudet College never read for pleasure, and three fourths of the 20% who do were not born deaf.

“It was the second statement that aroused my interest in deafness. I was horrified....

“Reading is the only hope of the deaf for learning about the world and what is happening in it. The average reading level of 19-year-olds in schools and programs for the deaf in the United States is about that of a nine-year-old hearing child.... It was this shocking fact that caused me to begin learning about the problems of deaf persons and in 1965 to accept a position at Gallaudet College....”

Cornett said he confronted the problem of reading for the deaf where the problem originated, which was that they had insufficient knowledge of spoken language.

“What I did was to develop the first practical way to convey spoken language visually, face-to-face. Called Cued Speech, it utilizes eight hand shapes in four places near the face to supplement the visual information provided on the face, so that the combination makes clear each spoken sound.... If Cued Speech is used consistently by hearing parents with a young deaf child, that child can learn the spoken language naturally, through the usual communication of the family....

“A deaf child who knows the spoken language in this visual representation, Cued Speech, can use it as a base for reading, just as does the normal child.”

Although Dr. Cornett is aware of and disapproves of the sight-word method to teach reading, Dr. Cornett apparently believes that hearing children nevertheless learn to read sight-words with far more emphasis on “sound” than deaf children. The hearing children’s knowledge of the vocabulary and syntax
of spoken language certainly helps them to learn more sight words by “meaning,” since the hearing children already know them as spoken words, but most hearing children today nevertheless read with primary emphasis on “meaning,” just like sight-word-trained deaf children.

This is confirmed by a remark by Roger W. Shuy, Professor of Linguistics, Georgetown University, Washington, D. C., in the February-March, 1981, Today’s Education, published by the National Education Association, Washington, D. C. Shuy was reviewing All Our Children Learning: A Primer for Parents, Teachers and Other Educators, by Benjamin S. Bloom, and indicated in his review that he thought the teaching of phonics was of little practical use. Shuy said:

“...many teachers complain that their students can read with comprehension but cannot attain the objectives for decoding. Of what use are the presumed steps - such as decoding - toward comprehension if students can achieve comprehension without them?”

Therefore Shuy confirmed that many sight-word-trained hearing students today could not identify out of context many of the words on the pages in front of them. They are guessing at their meaning from the context, just like sight-word-trained deaf students. They are helped in their guessing, of course, by the fact that the hearing children know the syntax of English better than deaf children trained in sign language. Yet such guessing at unknown words is fraught with error, so the hearing children’s teachers are apparently not demanding very much in the way of “comprehension.” That decoding skills are absolutely necessary to achieve maximum reading comprehension is proven by the average reading level for deaf students in the United States: that of a nine-year-old hearing child.

Shuy did not mention, of course, that reading “psycholinguistically” must be done consciously and is therefore very unpleasant, and undoubtedly is the primary reason that 80% of the brilliant students at Gallaudet College never read for pleasure. That, obviously, must also be the case with many hearing students who were taught to read like the deaf-students, by “psycholinguistic” guessing: they avoid reading, too.

Dr. Cornett mentioned the fact that signed language does not have English syntax, but has a peculiar syntax of its own. Obviously, a deaf child learning the syntax of normal language with Cued Speech is far ahead of a deaf child who learns signed language, since signed language not only lacks English syntax but is a conflicting system.

In his 1979 talk, Cornett told of a little child born deaf in one of the most isolated parts of Australia, whose parents had taught her from infancy with his Cued Speech. Her speech developed absolutely normally, and at the same age as a hearing child’s speech develops, and even included the use of intonation! Yet, when a convention for educators of the deaf was being held in a Washington, D. C., hotel near which I was staying a year or two ago, there was no indication in any of the literature being distributed outside the meeting room, some twenty years after Cornett’s brilliant work at Gallaudet College, Washington, D. C., that any change had been made in the signing and sight-word methods for teaching the deaf. The “meaning” approach apparently still reigns supreme in the teaching of the deaf, despite the work of Samuel Heinecke, Abbe Deschamps, Alexander Graham Bell, Dr. R. Orin Cornett and presumably hosts of others over the centuries since the ill-starred appearance of the Abbe de l’Epee who began teaching the deaf in Paris about 1760.

“Meaning” has even invaded the teaching of typing. When I learned to type in 1942, the typing manuals used in the Washington School for Secretaries in Newark, New Jersey, gave heavy finger practice, very like the finger drill given for centuries to those learning to play the piano. First the index fingers were drilled on touching the appropriate letters for those fingers: for the left index finger resting on the home position of f: fgf, frf, ffl, fvf, fbf; and for the right index finger resting on the home position
of j: jhj, juj, jyj, jmj, jnj. Then the next fingers received similar practice from their home positions, each finger in turn being drilled on all its correct positions. During this practice, the eyes were averted to the paper containing the printed letter patterns so that purely touch typing could be learned and the need to look at the keyboard removed. After, and only after, such reflexes had been set up, associating all letters with appropriate finger positions, were words introduced.

I was appalled recently to find that typing manuals dating from as long ago as the 1950’s had dropped this effective finger practice. For instance, one beginning lesson in one manual kept hammering only on all home positions: fff, ddd, sss, and then immediately introduced WHOLE WORDS! It appears that “experts” have been hard at work since at least the early 1950’s, and possibly before, damaging the teaching of typing in America. (Whether current manuals are any better than those I saw from the 1950’s, I do not know.) “Experts” interfered with proper conditioned reflexes in typing skills by replacing practice on “sound” letters with practice on “meaning” whole words. Who were those people (presumably psychologists) who were initially responsible for recommending such a harmful “meaning” method in the teaching of typing?
Chapter 59
Conclusion

Not everyone agrees with the “experts,” and those who disagree have terrible stories to tell about reading failures. My own special memory on the long-term cost of the 1930 deaf-mute method concerns the back row of young men, probably most ex-servicemen, in Fairleigh Dickinson University’s evening-college English class in Rutherford, New Jersey, in the fall of 1958. They could not read anything out loud without hopeless, inaccurate stumbling. Later, I remember a young man who told me about his sixth grade class, in the early 1960’s. Children being asked to read aloud sometimes missed so many words that they put their heads down on their desks and cried. But they should not really have cried, for most of them were probably scoring acceptably on their “silent reading comprehension tests.” At the very least, the “class average” was probably “at the national norm” and that is always a very nice statistic to publish in the local paper. The young man said that he had always considered himself to be one of the good readers until he reached high school and was put in a remedial reading class.

With the increased emphasis on “phony phonics,” and the constantly decreasing vocabulary in all school books, fewer such abject failures in reading occur now, so that sixth graders can mask their disabilities better. (This will no longer be true when the “whole language” cripples from present first-grade malpractice reach sixth grade in a few years!) It is at the high school level that deafness to print finally shows up today, where we are told the problem is with “reading comprehension.” The scandal is that we believe that explanation, or that we believe anything at all told to us by the education establishment, even if it concerns only the time of day. The education establishment, at all levels from nursery school to graduate school, has become a very nasty joke. (Obviously, a very great many individual teachers and professors are very fine professionals, but they are themselves prisoners of the system. I, myself, was such a prisoner for almost 23 years.)

The education establishment will remain a very nasty joke until a Constitutional amendment forbids all education control from above, however it is exercised. That includes any control by teacher and professor unions. It includes any government control, whether exercised through licenses, certification, the setting up of curriculum, the choosing of textbooks or any other kind of regulation whatsoever. What should MOST EMPHATICALLY be forbidden is national (and state) testing, because it is testing which drives the choice of curriculum, and those who control tests therefore control the curriculum. Actually, government control of curriculum and textbooks are violations of the free-speech provision of the Bill of Rights, and might be declared un-Constitutional if the issue could reach the Supreme Court.

Since educational money vouchers may become available to parents, that Constitutional amendment or that Constitutional finding should forbid any government control through such vouchers of the three T’s: Teachers, Texts, or Tests in the schools which parents choose for their children. Furthermore, attempts to control these areas for the whole country by private groups such as foundations, through “teacher certification” or in any other way, should be specifically outlawed, and subject to criminal penalties. Could anything really be more criminal than interfering in the upbringing of other people’s children, and then harming their children? It would not be the first time that legislation outlawing the control of American education by foundations was considered. As mentioned earlier, it was discussed in Congress in 1917 but the issue was dropped because of the advent of World War I.

Remember Edmund Burke’s adage: power corrupts, and absolute power corrupts absolutely. Governmental control of American education through strings attached to money vouchers would amount to “absolute power” over private education as well as over public education. Corruption could be anticipated in its wake. Such control would give the government (or more precisely the activist
bureaucrats in control of the government machinery) the potential power to form the minds of America’s future citizens. It could spell the death of freedom and result in the ultimate triumph of Big Brother.

Education must be returned to the consumers: to the parents of school children, or to adult students seeking an education, who should be free to choose those schools which meet their needs. With consumers having that ultimate power, those schools which meet the needs of America will prosper; those which do not, will fail. Free-market forces (“enlightened self-interest”) will then make short work of our education problems, including our functional illiteracy.

We should never forget that the disease of “functional illiteracy” came in with the push for government schools in 1826. That disease will only disappear when the government schools which created it disappear by being given back totally to their users, with NO strings of ANY kind attached.

Autobiographical Note

My summary on the history of methods of teaching beginning reading is based on my teaching experience in the primary grades from 1963 to 1986 (in Wayne, New Jersey, public schools to December 31, 1985, when I retired, and in St. Anthony’s School in Kearny, New Jersey, from January to June of 1986. Until November, 1962, I had worked as an executive secretary at Exxon’s chemical subsidiary, Enjay Chemical Company, and I had been employed at Exxon since 1944.)

My history is also based on my visits to beginning classes in England in 1971, and my visits to first and second grades in the United States, Luxembourg, Holland, Sweden, Germany, Austria and France in 1977-1978, as well as my review of some available beginning reading texts for those countries and Belgium and Russia.

In 1976 and 1977, I completed about half of the credits necessary for a master’s degree in reading instruction in New Jersey, but dropped out of the program because of its faulty content. (I already had a master’s degree in natural history.)

Since 1976, I have done extensive reading and corresponded with specialists and libraries here and abroad on the subject of beginning reading. My teaching experience in the primary grades gave me the necessary background to evaluate teaching methods, but my history is the result primarily of extensive personal research at the New York Public Library; the Library of Congress; the U. S. Department of Education Library in Washington, D. C.; New York University Library; the Syracuse University Library; the Syracuse Public Library; the nineteenth century school records of Syracuse, New York; Boston, Massachusetts; and Lyndhurst, New Jersey; the library of the University of Chicago; and the American Antiquarian Society Library at Worcester, Massachusetts. In addition, I spent a little over a week researching at the British Library in London, England, in March, 1991, and the summer of 1986 researching at the libraries of Harvard University. My work at Harvard was primarily on its 19th century reading textbook collection, the largest single collection of reading textbooks in America.

I was granted a six-months’ salary-paid sabbatical leave from the schools of Wayne, New Jersey in 1977-1978, during which I observed first grade classes and tested second grade classes in Europe and in the United States at my own expense. I was also granted a two-weeks salary-paid leave from the Wayne schools in 1971 to visit Open Classroom schools in England with other Wayne teachers at our own expense. Apart from these two instances in which my salary was not suspended while doing research, and apart from some tuition reimbursement for after-hour courses taken on the teaching of reading in 1976 and 1977, none of my research on which this history is based has been supported by any kind of government or foundation grant.

For sixty years, Nila Banton Smith’s appalling disinformation has remained as the primary historical reference on reading in America. During all that time, education has been dominated by government bureaucracies and a Niagara Falls of tax dollars has been poured into “improving” education, but no acceptable history of reading instruction has ever been written. (Mitford Mathews well-meant but misleading history, Teaching to Read, Historically Considered, University of Chicago Press, 1966, in which he effectively repeated much of Nila Banton Smith’s disinformation, was a private effort. As a philologist instead of a primary-grades teacher, Mathews did not have the background to deal with the disinformation.)
Our education establishment has mindlessly accepted Nila Banton Smith’s “history” over all these long years, despite the Government’s almost bottomless fund of tax dollars with which to underwrite a proper history. That fact is just one more proof of the education establishment’s incompetence.

Nila Banton Smith’s harmful disinformation therefore remained essentially unchallenged for sixty years until, as a retired primary-grades teacher and private citizen and with only personal funds and no help of any kind, I chose to challenge it.
The History of Beginning Reading
From Teaching by “Sound” to Teaching by “Meaning”

By Geraldine E. Rodgers

APPENDIX A
Illustrative Attachments

Table of Contents

2. Excerpt from The School Bulletin, Syracuse, New York, June, 1878, pages 155, 156, and 157, taken from the novel Roderick Hume, by C. W. Bardeen, Chapter XVII, “A Change of Text-Books,” a parody on the textbook wars in the glutted American textbook market of the 1870’s. This 1878 material demonstrates that it is inconceivable that McGuffey’s could have been the dominant reading text in America.

3. Excerpt from The School Bulletin, Syracuse, New York, May, 1876, Vol. II, No. 21, reproducing a circular which advertised a teachers’ institute at Wethersfield Springs, New York, on October 18, 1843.

The knowledge has been lost of the existence of these once enormously influential “institutes.” From before 1843, in a different form, and until well after 1900, institutes were the primary pipeline for transmitting “expert” opinion to schools all over rural America, since most teachers at that time did not attend the normal schools. Institutes, like the normal schools, endorsed “meaning” instead of “sound” in the teaching of beginning reading.

4. Reproduction of an illustration from a 1508 edition of Margarita Philosophica of Gregory de Reisch, originally published in the fifteenth century, which reproduction and comments were taken from page 154 of The History of Education by Elwood P. Cubberley, Houghton, Mifflin Company: 1920. It demonstrates the standard curriculum in the fifteenth century and before.

A. The first page of a possibly pre-1534 printed ABC in Latin.

B. The beautiful sixteenth-century “hornbook” given by Queen Elizabeth I to Lord Chancellor Egerton and preserved by his family.

6. Tabulae Abcдарiae Pueriles, Leipzig, 1530? Reproduced, with permission, from a copy held by the Rare Books & Manuscripts Division, The New York Public Library, Astor, Lenox, and Tilden Foundations, New York, New York This single sheet contains alphabets and an elaborate and unusual syllable table, as well as the customary Pater Noster used in European ABC’s.

7. The Levels of Reading and Speech

8. The Suzzallo reading triangle, from his article on the teaching of reading in the Cyclopedia of Education of 1913, and comments concerning its nature.

9. A list of the great number of different spelling books in print in America in 1839, from a copy held by the American Antiquarian Society, Worcester, Massachusetts. Webster’s publishers claimed sales of a million a year not long afterwards, which may or may not have been true. However, as this list makes obvious, in no way could Webster’s have almost totally blanketed the market, as is usually assumed.

11. Testimony before the National Education Association annual meeting by A. L. E. Crouter, based on thirty years of experience in the Pennsylvania Institution for the Deaf and Dumb, where Crouter was Superintendent, that the signing method for teaching the deaf is an acute failure in comparison to the oral method. Crouter’s remarks appeared in the July 28, 1900, issue of The School Journal, New York City.

12. Concerning the Different and Opposite Conditioned Reflexes in Reading, and Their Brain-Based Origin (With Illustrations Taken from Very Old Sources)

13. Whole Language: Emancipatory Pedagogy or Socialist Nonsense?, by Dr. Patrick Groff. Reprinted, with permission, from Ideas on Liberty, July 2000, published by the Foundation for Economic Education, Irvington-on-Hudson, New York. Dr. Groff, Professor of Education Emeritus at San Diego State University, is the well-known and highly respected author of many other articles and books on reading instruction theory, reading research, and research summaries.
THE GLORY OF TEACHING A·B·C.

Possibly it may serve to encourage us who toil on this side of the Atlantic, to know that our co-workers on the other side experience rather more difficulties, and toil under less favorable circumstances, than do we. The following was clipped from a recent copy of an English paper. F.

We have received from an eminent member of a provincial school board the following notes of an "examination day":

Mixed girls' and infants' school. Time fixed for examination sharp 9 a.m. At 10.15 H.M.'s Inspector enters hastily; children stand. H.M.'s Inspector leisurely divests himself of coat, hat, etc., which he deposits on the girls' needlework, and throws his bag on the harmonium. Puts on coat again. "This school-room is much too cold; shut all the doors and windows." Proceeds to examine registers, summary, logbook, etc., with his back to the children, turning round occasionally with, "There's a child not attending to me," or "If that girl with a squint looks about her any more I won't examine her." At eleven o'clock: "Oh? how many pupil-teachers have you? Four, eh? Well, let them all give a collective lesson to the whole school; subject, a cocked hat, or a pair of garters; or if they don't know what they are, the great sea-serpent, or Barnum's white elephant. Whoever finishes first shall have extra marks." About 11.30 begins to examine the school; gives dictation to Standard II. in a low and rapid tone so that they do not catch half he says,—"As a fierce lion was prowling about in search of prey. At the same time he read from a card a sum for another class,—"If 17 couple of fat ducks sell for 3s. 6d. each, and I lose 9s. 0½d., what shall I have left?" The second standard get puzzled, and write down, "As 17 fierce ducks were prowling about, trying to sell a fat lion who had lost 9s. 0½d." The sum was taken down something like this: "If 17 couple of lions lose 3s. 6d. each, how much prowling would be left
out of 9s. 0½d.?" He "fails" them all, turns to mistress, "Your children are perfect idiots." Mistress weeps copiously. H.M.I. goes on to next class. Takes reading: "Now, boy! I'm not deaf." Children have been specially implored to "speak up for the inspector." "Now, that girl,—no, not you, the one next but five,—tell me the meaning of a concatenation of events? Now don't be a week over it." Girl doesn't know. "Then you're a stupid dolt! Can't you tell me anything about it? Is it about a cat or a nation, or what?" "Please, sir: yes, sir." "Now which do you mean?" Girl: "Please, sir: no, sir!" "Fails" her. Takes a class in geography: "Now all stand,—oh! you were standing,—and look at me. That girl with red hair, tell me the exact distance in English miles from Dan to Beersheba." Girl: "Please, sir, it's the other class learns the colonies,—not us." Mistress mentally resolves to give her "what for" presently.

Twelve o'clock strikes. H.M.I., cheerfully: "Now I'll examine the infants." (sotto voce: "I almost think I shall catch that train.") Mistress: "Please, sir, they're all crying, sir, they're so tired of standing." H.M.I.: "I can't help that; let them sing, 'Oh, how we love inspection day!' and meanwhile show me your 'appropriate and varied occupations.' How many girls have you among the elder infants who can turn topple-tail accurately? and how many boys who answer to the name Mary, and can knot comforters? What proportion of this class brings pocket-handkerchiefs, and how many, if any, use them, except to clean their slates? How many books have the three-year-olds read through this week, and can the whole school do Swiss darning?" Mistress: "Please, sir"—H.M.I.: "Now, I don't want any opinion from you. I'm here to inspect this school, not to hear what you think about it." (Song ended.) "Well, that's fairly good; only I can make out neither words nor tune. Can they all say, 'A little cock-robin sat on a tree,' and 'A storm in a teapot,' and all 'Thompson's Seasons,' and 'Meddlesome Mattie' from beginning to end without a mistake? Oh! if they can't do that I shall recommend the withdrawal of one-half of the grant;" (sotto voce:) "I shall catch the 12.35 train, I do believe." Exit, forgetting to take away any of the papers, and to examine the needlework, writing, and singing.
Concerning the Falsity of the McGuffey Myth

The following chapter from an 1875 novel, printed in 1878 in a newspaper which was published for school personnel, demonstrates the falsity of the ludicrous McGuffey Myth. The McGuffey Myth states: (a) that eight or nine of every ten American children in the nineteenth century learned from the McGuffey Readers, and (b) that the publishers of McGuffey’s were the largest textbook-publishing firm in the world.

For the very first occurrences of misstatement (a), see the November, 1927, Saturday Evening Post Article, “That Guy McGuffey,” (citing eight of ten children) and the 1928 book, America Finding Herself, which was the second volume of the Our Times series by Mark Sullivan (citing nine of ten American children). Sullivan’s false claim was quoted in the 1934 book, revised in 1965, by Nila Banton Smith, American Reading Instruction.

For misstatement (b), which apparently grew out of misstatement (a), see page xiii of the Introduction to Early American Textbooks, 1775-1900, published by OERI, the Office of Educational Research and Improvement, Washington, D. C., 1985. A monumentally false claim was made on that page concerning the largely regional publishers of the McGuffey reading series, whose market at all times was largely limited to the American Midwest and to some parts of the American South. This statement was made on page xiii, “By the 1870’s, the company W. B. Smith had founded was the largest textbook publishing company in the world.”

The excerpt which follows from an 1875 novel was printed in The School Bulletin, June, 1878, Vol. IV, No. 46, Syracuse, New York. Concerning the story’s use of the title, “Principal,” that title in the nineteenth century usually meant the “principal teacher” in a school, who was the one with authority. Principal Hume, therefore, was not only a school principal but was an active teacher in what was apparently the only school in the fictional village of Norway, N. Y.

Some of the publishers’ names given by the story’s author, C. W. Bardeen, are obviously meant only as a joke, but some come close to being paraphrases of real publishing company names. For instance, instead of naming the major publishing company, D. Appleton & Co, Bardeen referred to D. Peachpound & Co.

The word-method “Hypothetical Readers” as described by “Mr. Cockrell” in the following story are obviously the John Russell Webb Word-Method “Normal” readers of circa 1846 and later which did change publishers many times, as Cockrell said of the Hypothetical Readers, but which was not true of most other series. The Webb series threw out the reciting of letters as children were memorizing new sight-words, which is what was meant by the “word method.” Nevertheless, in contrast to Cockrell’s description of the Hypothetical Readers’ “word method,” the J. R. Webb series did use some phony phonics above the beginning levels.

However, the author of this story, C. W. Bardeen, who edited and published The School Bulletin until 1920, and who was a highly competent judge in most areas, never seemed to have any real understanding of reading methods or even any interest in them. That is despite the fact that Bardeen became the publisher of Farnham’s book on the sentence method in 1881. Instead of shedding light on reading methods, what Bardeen’s story set in 1875 and printed in 1878 does is to prove that there were massive numbers of books in all subject categories before 1875, and massive numbers of book agents and publishers before 1875. Those facts alone demonstrate that the McGuffey Myth is sheer nonsense.
Not long after the opening of the term, Roderick was accosted on his way home from school by a man who rushed out of the hotel and asked breathlessly -

“Is this Professor Hume?”

“My name is Hume,” replied Roderick.

“I am so lucky to have caught you, as I am obliged to leave by the five o’clock train. My name is Whittlebe, and I represent the firm of Gilpinth, Burden & Co., of Philadelphia. Can you give me five minutes in the parlor of the hotel?”

“Certainly,” said Roderick; and followed him.

Mr. Whittlebe nervously unstrapped a bundle of books, saying as he did so:

“What text-books are you using here, Mr. Hume?”

“If you have only five minutes, Mr. Whittlebe, you had better ask me what text books we don’t use, for I could tell you quicker. Several series have been adopted in part, and there is a change of author with almost every grade.”

“Then of course you are intending to introduce some new and uniform series?”

“I have thought some of it, but it seemed wise to get thoroughly introduced myself before I began to introduce new books.”

“Very prudent, very prudent, Mr. Hume, especially as it gives you an opportunity to examine these books of ours, which are the freshest, handsomest and altogether the best now printed. Here are Womanrow’s Readers: just look at those engravings, and see how interesting to children are these continued stories running through the first books. Ishmael’s Arithmetics, too: aren’t they handsome? So simple, too; useless matter left out; half the time saved. Of course you know Prof. Ishmael? Principal of the Engedi Normal School. Then here are White’s Grammars: these of course are the standard; but I must hurry, because I want to show you this new edition of Rabbit’s Geographies. I wish I had a cent for every copy of those books sold. All the large cities use them exclusively. They have just been re-adopted in Boston, and when Smintheus’s tried to displace us in Hong Kong, we not only held them in there, but drove out theirs for ours in Yang tsi Kiang. Now I mustn’t stop to go into these books more than to run through the pages in this hasty way; but I am sure you will enjoy studying them. I can’t give you this set, for it is the last I have, and I am going to stop off at Utica and make Rome howl; but I will send you a set by express, charges paid, and I hope you will like them well enough to introduce them at once. Our terms are very liberal,” (here the train whistled, and Mr. Whittlebe started on a run, but talked back over his shoulder,) “and I know you will like them. All the best schools - - - :” and his voice died away in the distance.

“I wish he had brought another set with him,” said Roderick to himself. He thought a bird in the hand was worth two in the bush, and doubted whether the glib agent would remember his promise. He got better acquainted with the glib agent afterward. The glib agent not only sent the book[s], but sent a long letter with them, and sent letters every week thereafter for several months, invited Roderick to come down to the city and spend a week with him, suggested to Roderick possible vacancies in other places at higher salaries, in case he was willing to leave Norway, and in general manifested an interest in his welfare and that of the school, which was simply amazing.

“Considering that there are thirty thousand of us teachers in this State,” said Roderick to himself, a year or two afterward, as he finished reading Mr. Whittlebe’s thirty-ninth letter, just as carefully, and kindly, and skilfully, and hopefully written as the first, though not a book of his had yet been introduced, “It strikes me that we must keep Mr. Whittlebe tolerably busy.” And he made a place for White’s Grammars, as being on the whole not much worse than the rest, merely as a tribute to Mr. Whittlebe’s persistence.
Roderick opened the package from Mr. Whittlebe with considerable gratification. They were the first books he ever got without paying for them, and they were certainly worth owning. He examined them carefully, and asked Mr. Dormouse whether it would not be well to recommend the geographies to the Board.

“How do they compare with Smintheus’s?” asked Mr. Dormouse.
“I have never seen Smintheus’s,” said Roderick.

Mr. Dormouse pulled out from under the counter a package containing with other books Smintheus’s geographies.
“These were sent me the other day” he said; “you had better take them and look them over.”

This suggested to Roderick that it might be well to send to all the leading publishers for specimen books. Evidently they were freely distributed, and Roderick was honest in his intention to examine them carefully and impartially. So he got what addresses he could find from the advertisements in a school journal which had been sent him, and wrote to each a letter reading somewhat as follows:

Norway, N. Y., April 20, 1875.

Messrs. ____ ____:

Gentlemen-

As we are proposing to adopt a uniform series of text-books for our public schools, we would suggest that you send us whatever books on your list you desire to have examined. They may be sent at our expense, and will be returned if you so desire. We shall compare carefully all books presented, and shall be ready to give our reasons for whatever selection we make.

Respectfully yours,

RODERICK HUME,
Superintendent of Schools.

Precisely why Roderick, who had protested so sarcastically against being called “Professor,” chose to call himself “Superintendent,” instead of “Principal,” I don’t know. That word “Principal,” which is so entirely satisfactory to the president of a Scotland University is somehow not regarded as ornamental by American pedagogues.

The return mail brought these letters:

Dear Sir -

In reply to yr. letter of 20, we enclose catalogues of our pubs., and shall be glad to send you any books you wish to examine on receipt of price.

Y’rs respect’y,

SMITH, JONES & CO.

Dear Sir -

Repling to your esteemed favor of the 20th inst... we take pleasure in sending you a selection from our latest editions. We bill them at one-half price and will deduct the charge for any book which you may decide to introduce. You can hardly hesitate over our readers, arithmetics and geographies, but we hope that you will also adopt our grammars and writing books. Indeed, we doubt very much whether you can do better than to introduce our entire series, which will thus give you the latest, the best and most widely used. Awaiting an early response, we are,
Dear Sir-

As requested in your letter of the 20th, we forward you specimens of such of our books as you are likely to need. Please accept them with our compliments. Should you like them, we shall be glad to introduce them on liberal terms.

Yours respectfully,
MARK & HARDCLAY
Dear Sir-

We are delighted to get your letter, intimating that at last you are prepared to adopt a uniform set of books. News of your remarkable success at Norway had already reached us, and we have been hoping that our Mr. Hook would find time to call upon you. Don’t fail to come and see us, the first time that you visit the city. Our establishment turns out fifteen million books an hour, and you would be interested to see the various processes to which each volume is subjected.

The city schools, too, would interest you, if you have never visited them. The office of the Superintendents is close by, and any of them will be glad to take us through some of the representative buildings.

As to text-books, we hardly know what to send you, as you do not specify the branches taught in your higher departments. We make up a little package of fifty of those most universally used, and send them, express paid. We send also our complete catalogue. Please look it over and check anything you would like to see, no matter whether you think of using it or not. We consider it a favor to have an intelligent teacher accept our books. He may not want to use them now, but he is sure to like them, and if he does not some time use them himself, he will suggest them to somebody else who will. We need more men of your stamp in this State, Mr. Hume, and we trust that you will be deaf to any tempting offers which may come to you from abroad. There is room here for those who are fit to be at the top, and whenever you want a little backing, call on us. Our publications are used in all the best schools, and we are thus in friendly relations with those who control matters. You have a good field to start from, and we look to see you occupying the place you have already shown yourself fitted to fill.

As to our books, we venture no argument, trusting them entirely to your judgment. Most of them are in such universal use that you may feel under obligation to adopt them, because children who move into or out of your village will thus have the same books which are already in use. But we do not urge this consideration, preferring to put the books entirely upon their merits.

Let us know when we can do anything for you. Many of our friends in the interior entrust us with little commissions to make purchases, etc. Any favor of this kind, or any other, will be a pleasure to us.

With great regard, we are,

Your[s] truly,

HIREHISSON, BREAKHIMIN, NAILHER & CO.

Other letters flowed in, followed by express packages, till Roderick’s shelves, and table, and floor, were successively over-flowed. He plunged into the comparison with enthusiasm, made tables of details, and marked each book in each particular on a scale of ten, till he became entirely muddled and hardly knew the best series from the poorest.

At this state of the examination, he was called to the door of the school-room one morning. The visitor presented a card, saying:

“‘Tis her brothers, Sorrell & Co., publishers, New York; I’m Sorrell, but I’m not sorry to meet you.”

“And I am glad to see you; come in,” said Roderick, wondering how many times Mr. Sorrell had repeated his feeble pun, and how it sounded to him after the hundredth attempt.

Mr. Sorrell was exact in dress, had a quizzical face, and united the assurance of George Francis Train with the humor of a gentleman. The trade ranked him among the most successful agents in the field.
“Are you busy just now, Mr. Hume?” he asked.
“No,” replied Roderick; “you came at a fortunate time. It is half an hour before my next class.”
“Then let us plunge right into business, Mr. Hume. Are you thinking of putting out our Hypothetical Readers?”
“We are comparing other readers with them, Mr. Sorrell, to see if we can gain by a change.”
“Then you are not particularly dissatisfied with the Hypothetical?”
“In some respects, we are. We find them too much subject to material analysis. The binding is not as strong as it should be.”
“Great Heavens!” cried Mr. Sorrell. Then stretching forth his hand, he grasped Roderick’s and exclaimed: “Mr. Hume, I am under great obligation to you. The main objection to our business is its monotony. We have to listen to the same complaints and meet the same arguments, day after day, till in the course of four or five years they become an old story. Now, if you had urged that our readers were too easy, or too difficult, or prudish, or immoral, or sectarian, or atheistic, or radical, or copper-headish, and so on, I should have waited calmly till you got through, and then I should quietly and politely have selected and spoken my little piece entirely refuting the objection, and convincing you that from your own point of view the Hypothetical Readers were a thing of beauty and a joy forever. These declamations are all very pretty and convincing, but I have got rather tired of them, and I yawned in mind at the prospect of having to deliver one of them for your benefit. But you have given me a genuine sensation. For once, I am taken unawares and have no little piece ready. Why, Mr. Hume, our worst enemies have admitted that our binding was unassailable, and have even gone so far as to claim that it was a disadvantage, since our books never wore out and therefore grew so dirty by generations of constant handling as to be a source of danger to the primary departments. And you think they are not bound strongly enough! Mr. Hume, show me some of those feeble books, and let me face my misery at once.”

So they started down stairs to the primary department. On their way, Mr. Sorrell stopped to tie his shoe.

“These are English shoes, “ he said; “genuine Waukenphasts.”
“I have seen them advertised,” said Roderick; “of course that isn’t the real name of the maker.”
“No,” replied Mr. Sorrell, “only a nomme de cuir.”
“Very queer,” said Roderick. He wondered whether that pun, too, was another of Mr. Sorrell’s old soldiers and whether he had loosened the string before he entered the building.

Reaching the lowest room they had some conference with the teacher.

The fairest way will be to examine a book or two chosen at random,” said Roderick. “Here Willie Smith and Willie Thompson, bring your readers to the desk.”
“I see you follow the circus-posters,” said Mr. Sorrell.
“How?” asked Roderick.
“For particulars, see small Bills,” replied Mr. Sorrell.
Roderick looked at him long and gravely.

“On the whole,” he said at length, “I believe that was original, Mr. Sorrell. I thought your other puns were part of your stock in trade, like your ‘Commendations from distinguished educators.’ But I am willing to accept the ‘Small Bills’ as impromptu, and as you have thus established your reputation, you won’t need to try any more. By the way, now that I scan your features more closely I think I can tell you something about yourself.”

“Go on,” said Mr. Sorrell; “I shall be glad to peer into my future.”
“No, I am going back. You were once a scholar at Lawrence Academy.”
“Yes, and- “
“You once walked four miles on a muddy spring night to attend a sociable at Pepperell.”
“Now, I - “
“Two other boys walked over with you, and all three of you hung around the walls of the church vestry because you were too bashful to be introduced.”
“Now hold on - “
“Then all three of you walked home again, four miles in the mud, and dragged yourselves to bed about two o’clock in the morning.”:

“And you -“

“The same. Shake.”

“That massive brow, those Jovian locks,” cried Mr. Sorrell, “how could I have forgotten the name? But those beards[s]?

“A modern improvement,” said Roderick. “But I want to ask a question or two. You graduated somewhere?”

“Yes.”

“And went into the book-business?”

“Yes.”

“And began on the Hypothetical readers?”

“Yes.”

“So that you got all your business training from those books?”

“Yes.”

“Very good. Now, Sorrell, I’m glad to see you, and I want you to stay here and visit with me as long as you can. But I tell you, frankly, your business here is ended. If the Hypothetical Readers have transformed a boy too bashful to be introduced to a giggling country deacon’s daughter into - well, into a gentleman of your present characteristics, they shall stay in this school as long as I do. It is one of my doctrines that success in life depends upon a stiff upper lip, and I will trust to the Hypothetical Readers to provide it.”

In his next letter to his partners, Mr. Sorrell wrote:

I had a stroke of luck at Norway. The new principal was going to put out our readers, but I chaffed him till I got him good-natured, and then discovered that he was an old school-mate of mine at Groton, though he left about the time I entered. He shook hands to keep our books in, and spoke as positively as though nobody else had anything to say about it. So I dropped in on a few members of the board, and found that he is not very secure in his own position. But I was assured by two or three men who spoke as if they knew that no change would be made in opposition to his wishes. So I think we are all right for this term.

A day or two after, Roderick was passing through one of the lower rooms, when he saw a pudgy little man with red whiskers puffing up the merits of a big parcel of books he had laid on the table. Although it was in school hours, all three of the teachers were gathered about the new-comer, giggling at him and at each other. Roderick approached rather haughtily, and asked him his name and business.

“Cockrell, sir, Cockrell; agent of the publishing house of O. X. Shedd & Co., sir. Just showing your lady-teachers our new readers, sir, the Inconsecutive, sir. Just look at that picture, sir. And now compare it with the botchwork in these wretched Hypotheticals.”

Here Mr. Cockrell seized a Third Reader, and apparently at random, but really with skill born of long practice, plunged his stubbed thumb between the two leaves that contained the very worst wood cuts in the whole Hypothetical series.

“Now compare,” he said, holding up the two books.

“Just see,” cried the women; and Roderick had to admit that the contrast was striking.

“But after all, that ain’t the point,” continued Mr. Cockrell, with amazing volubility, “this Hypothetical is a cheap got up series and has changed hands three or four times already. Nobody dares to put any money into it because it’s built on a scaly plan. ‘The Word Method,’ they call it, you know. That is, a child shouldn’t spell a word by letters, but he should learn the whole word, and keep learnin’ em. Now what nonsense that is! Here is Shakspere with twenty thousan’ words in ‘im; do you s’pose the child is goin’ to learn every one o’ them twenty thousand words seperit? Not by a darn sight. An’ here’s Webster’s dictionary, with a hundred and twenty thousan’ words in ‘im, ‘n what blarsted fool is goin’ to
say these children mus’ go to work ‘n learn every one o’ them hundred ‘n twenty thousn’ words each one all alone seperite by itself? Ye see it only needs a little common sense to show up the folly o’ such talk, ‘n yet here’s folks goin on ‘n teach’n year after year by “The Word Method.” Of course such teachers as these here: bright, smart, active, handsome gals twenty years old, ‘n full o’ snap n’ fire ‘n ingenuity can get pretty tol’able results even out o’ these books; but give ‘em such books as that (and he held up an Inconsecutive Reader and gazed at it admiringly) , give ‘em such books as that, ‘n these here gals could learn these scholars to read the roof off ‘o the school-house.”

The gals, none of whom was under thirty seven, were highly edified, but Roderick suggested that as the course of study apportioned no time to book-agents, it might be as well to go on with the day’s work and let Mr. Cockrell do his talking at recess. In fact, he assured this worthy individual that it was highly improbable that any change would be made in readers, and accepted a set for examination only under protest.

Mr. Cockrell wrote to his firm:

You made a big mistake in not sending a complete set of our books all around to Hume. The rest of em did, and he felt. [...] about it. I’ve got all the women solid for the Inconsecutive and I’ll bet you we fetch the board with em. One of em [was] struck with em, and says he thinks they’ll go in. His name is Abrahams, Jacob, and he has checked some things on [our] price list that he would like to have you send him. It will [pay] to treat him well for he knows all about our books and [has] always preferred em to any others. Ime coming back here [as soon] as I fix things at Oxford, and Abrahams will telegraph ... if anything comes up sudden.

Roderick’s next visitor wore a stove-pipe hat, sported a cane, and presented the following card:

S. L. Umber,  
2816 Mortgage St.,  
New York.  
With  
Willy Winkle & Co.

“I suppose you’ve heard of me,” he remarked.  
“Possibly, though I do not recall the name,” said Roderick.  
“Then you can’t have many book-agents around,” continued Mr. Umber. “Lord, how they hate me.”  
“Indeed? And why.”  
“O I’ve swept out their books everywhere., Why... look here. I left New York Tuesday morning, [and] it’s now Friday noon: three days and a half. Now, sir, in those three days and a half, how many cities do you suppose I’ve carried?”  
“I really couldn’t guess:”  
“Nineteen, sir, nineteen. I carried the eighteenth [last] night, and I was going to be satisfied with a [dozen] and a half. But I found by my time-table [that] I could get in three-quarters of an hour at Albany, and, by Jove, I stopped off there this morning, and carried the city for our Arithmetics. What do you think of that?”  
“Quick work, surely,” said Roderick.  
“Why every time I get back to the office and look over my introduction account, I am amazed, “ continued Mr. Umber.  
“Places that I have forgotten all about come rolling in for readers, or histories or grammars, till, I vow, I believe we get almost as [many] orders at our branch office in Mortgage St. as does the house itself at Crimecrimehorrid. Why, sir, our cash receipts for copy-books alone, first introduction, last month, were over seventeen thousand dollars.”  
“You must be a profitable agent, Mr. Umber.”
“I think the house are satisfied,” replied Mr. Umber, modestly. “They have doubled my salary five times since I began with them, and they write me very pleasant letters, very pleasant letters. Why, a friend of mine implored me, on his knees almost, to open a cigar store with him, offering me a tip-top thing. But I said to him, ‘No, sir,’ I said, ‘Willy Winkle & Co. stuck by me when I was learning my business and wasn’t worth much to them, and now that I have some little value, I propose to stick by Willy Winkle & Co.’”

“That was creditable in you, Mr. Umber.”

“Well, sir, the fact is, a man has to sacrifice something for principle, Mr. Hume. Why often and often my friends have said to me, ‘See here, Umber,’ they would say, ‘why don’t you just tell Willy Winkle & Co. you’ve been an agent long enough, and that they must either take you into the firm, or you’ll draw out and start a rival concern.’ But I tell them, ‘No, sir,’ I tell them, ‘Willy Winkle & Co. have treated me well, and I won’t go back on them. If they by and by decide that my experience and my acquaintance and my knowledge of books makes it worth while for them to take me in as an even partner, my brains against their capital, why I’ll consider the matter,’ I say, ‘I’ll consider the matter. But I can wait, I can wait. And, by Jove, I’ll never go back on the firm.’”

“How long have you been an agent?” asked Roderick.

“Since the first day of January,” replied Mr. Umber, rather confusedly; “but then I did a good deal of indirect work while I was teaching.”

“Well, Mr. Umber, it is now time for school to begin, and you have interested me so much in yourself that I shall have no time to examine your books. But you can call on the members of the board, if you choose. I rather think Mr. Abrahams will give you encouragement,” added Roderick, slyly.

Mr. Umber did not see Roderick again, but he left a set of books for him, and wrote to his firm:

“We’ve got Norway, dead as a door-nail. The new principal, Hume, said to me, said he, “I don’t care to examine your books, Umber, all I want is to know you. You may depend upon it, I’ll do all I can for them, because you’re a good fellow, Umber, and by Jove, I like you.” He recommended me to Abrahams, and Abrahams and I fixed the thing right up. I enclose a memorandum. See that the Cyclopedia is sent right off, for we want to make things sure while we’ve got ‘em easy.

Other agents followed, sometimes two or three a day. There was Bismark, for D. Peachpound & Co., a quiet, unassuming man, who would point out every flaw in his opponent’s books and every merit in his own, and clinch the argument by leaving behind him the impression of a thoroughly good fellow. There was little Turbid, for Scribbler, Biceps & Co., who never said an unkind word of any body else’s books, but was always eager to defend and display his own. There was Rollin Stone, for Mark & Hardclay, who considered his books so far superior that argument was superfluous, but who went off contented as soon as he got Roderick’s subscription to the Monthly Blackboard, a new school journal of unknown parentage and mysterious purposes. There was Theodore Hook, the right-hand man of Hirehisson, Breakhimin, Nailer & Co., who planned further ahead and won more victories than any other agent in the State. He said very little about his books to Roderick, but he took deep interest in his school, visited every department, threw out many useful hints, expressed considerable suspicion of Captain Stone and his wife, warning Roderick to beware of them, and engaged Roderick, at a liberal compensation, to correct the proof-sheets of a forthcoming text-book.

“It isn’t for me to talk books to you, “he said to Roderick. “You know what books are as well as I do, and you know what this particular school wants better than I do. Only, there is this much about it: you are perfectly safe in putting in our books. They are used everywhere, and if you adopt them, why you follow plenty of good examples, and cannot be held personally responsible, as you could for an untried book which proved a failure.”
This argument had weight with Roderick, who had become convinced of the futility of the sort of comparison he had first undertaken. So he made out a list, largely from Mr. Hook’s list, and was about to present it to the board. But Mr. Dormouse heard of it, and came to see him.

“Take my advice,” he said: “don’t get mixed up with text-books. They have cost many a strong teacher his place, and they would unseat you in a month. Let me keep this list, and we will follow you as far as we can. But let the book-agents do the work, as they are paid to.”

This advice was certainly self-sacrificing on Mr. Dormouse’s part, for it brought upon him, as upon the rest of the board, a daily swarm of agents. Every member had arithmetics for breakfast, grammars for dinner, geographies for tea, and copybooks to sleep on. At last, a special meeting was called for a Friday evening. Seven houses were represented, and each agent was allowed ten minutes to present his claims. No decision was reached, and the board adjourned to meet at ten the next morning, and conclude the matter.

The agents all stopped at the same hotel, and as there was really nothing more to do but to await the decision, they spent the rest of the evening together, and gave the occupants of adjoining rooms the impression of a jolly crowd.

Only six of them were there, however. The seventh, a new man named E. Riker, who represented Rummond Health, of Boston, had arrived upon the ground too late to make any impression. He was a gentlemanly fellow, a pleasant talker and full of enthusiasm; but Norway was tired of book-agents and nobody would listen to him, so he had gone from the board-meeting to his room, despondent.

“I wonder what the blank Riker is up to, exclaimed Umber, during a break in the stories. He left the room, crossed the entry to Riker’s door, and listened a moment. Then he rushed back, stifled with laughter.

“By Jove, fellows, keep quiet; O Lord! I shall burst; just come out here and listen a minute; O jimminy, this is the richest thing yet.”

Wondering what caused this exhilaration, the others followed Umber to Riker’s door, and listened.

Riker was kneeling in fervent prayer.

“O lord,” he plead[ed], thou knowest how important it is to me to carry this place, and thou knowest that we have the best books, especially the geographies. O Lord, wilt thou not soften the stony hearts of the board, that they may listen to argument and be guided wisely in this matter. O Lord, thou has all power, and now, even now, thou canst bring to naught the designs of the enemy. O Lord, hear me and succor me, for I am in sore distress. And the glory shall be thine, forever.”

It was with difficulty that the six got back to their room, and inextinguishable, indeed, were the peals of laughter that arose.

“I say, fellows,” said Umber, “let’s put up a job on Riker. Come over to Jim Dormouse’s, two or three of you, and we’ll build up the biggest joke of the season.”

He outlined his plot, which was approved and elaborated, and at once carried into effect. Mr. Dormouse was just leaving the shop, when the three agents came rushing in.

“By Jove, Jim,” said Umber, who made it a point to be familiar with common people - ‘they like it, because it is condescending;’ “by Jove, Jim, we’ve got up the biggest joke of the season. Now we want you to get up at the meeting to-morrow, and say that at about half-past ten, to-night, you were suddenly impressed with the idea that the best geography for use in this school is ‘Our Oblate Spheroid,’ Riker’s book. He’ll think that it is in answer to his prayer, you know, and we’ll let him tell the story a dozen times before we let out on him. By Jove, won’t it be rich?”

“That would be something of a joke,” said Mr. Dormouse, his little black eyes twinkling; ‘you fellows had better go to work now and convince me, so that I shall be honest to-morrow morning, when I say that just at this time I suddenly thought it was best to introduce Our Oblate Spheroid.”
“Well,” said Umber, entering into the humor of Mr. Dormouse’s suggestion; “that is easily done. The fact is, Mr. Dormouse, we are paid to advocate other books, but when you come down to our own real opinions, we have to own up that Our Oblate Spheroid is really the only book published which makes geography a pleasant and profitable study.”

“To tell the truth,” put in Mr. Stone, since the Oblate Spheroid was issued, the other publishers have stopped making geographies, and are eager to carry places only to get rid of their old stock.”

“Why, jest see ‘here,” added Cockrell, “our folks in the firm hires a boy fur nothin else but to cut all notices of the Spheroid out o’ the noospapers before the ol’ man sees ‘em. Ef he sh’d lay eyes on this book his conscience never ‘d let ‘im sell another copy of Hillteeth’s, fur he’s a diggun in the Presbyterian church.”

Then they all three laughed uproariously. What a rich joke it was, to be sure!

“I think that will do, gentlemen,” said Mr. Dormouse, his eyes still twinkling; “I see that you are skilful and experienced agents, and you may depend on having your little joke carried out.”

* * * * *

The next morning, Mr. Dormouse rose at the meeting and said:

“Mr. Chairman, when we adjourned last evening it seemed to be pretty certain that the Collected geographies, Inconsecutive readers and Apdidymus’s arithmetics, would be adopted this morning.

“I was myself opposed to any change, but the board stood four to four, and I understand that Mr. Blarston, who has just returned to town and is present, is prepared to vote for this list of books. But, Mr. Chairman, about half-past ten, last evening, I was suddenly persuaded that it was best for us to examine more closely the Oblate Spheroid series, and I am convinced that it is best for us to adopt them. I therefore move that they be substituted for the series now in use.”

Mr. Baker seconded the motion and the roll was called. Messrs. Angell and Abrahams voted “No.” Mr. Baker voted “Yes.” Mr. Blarston said:

“I’ve just got back and don’t know anything about this thing, and there’s only one thing I want to know, and that is what Mr. Hume thinks. We’ve got a man in charge of this school that understands his business, and I believe in letting him run it.”

Roderick replied that he considered the Spheroid series satisfactory, and Mr. Blarston voted “Yes.” Roderick looked gratified, and exchanged a glance with Mr. Dormouse.

The vote stood 6 to 3 in favor of the Spheroid. Mr. Umber began to think the joke was going a little too far, when Mr. Dormouse rose and moved a reconsideration.

“That’s more like it,” whispered Umber to Cockrell. He winked at Mr. Dormouse, but that gentleman did not respond.

To Mr. Umber’s consternation, the vote was carried again by precisely the same majority.

“What the blank does that mean?” he whispered to Cockrell.

“Go home and consult your Cushing’s Manual,” growled that worthy, intensely disgusted.

Then Mr. Dormouse moved that, in view of the approaching election and the close of the year, all further changes be postponed to the fall term. This vote also was carried, was reconsidered, and was carried again.

* * * * *

Three humiliated agents, and three others, who had stood no chance and were on the whole rather gratified at the turn things had taken, were gathered at the hotel.

“All we’ve got out of this is the joke,” said Umber, at length; “let’s make the most of that, anyway.” So he called to Riker, who was skipping up to his room.

“Riker,” said he, “how the blank did the board come to swing around to your books?”

“Why, the fact is,” said Mr. Riker, innocently, “I had about given the thing up, when a message came for me at eleven o’clock last night. I went over to Mr. Dormouse’s shop, where I met Mr. Baker and Mr.
Marvin. We spent an hour comparing the Spheroid with the Collected, and they decided to go for my book."

"By Jove, that wasn’t fair," cried Umber; "Why didn’t they call me in and hear my side?"

"Why, Mr. Dormouse said you acknowledged that your book was in every way inferior."

"Yes, but that was a joke—"

"Mr. Umber, let me give you a little advice. Not to question your taste in eavesdropping at my door and making sport of my private devotions, I would call your attention to the fact that it was only through your doing just what you did that my prayer was answered. When you try to put up a job on the Lord Almighty, you are likely to find yourself following your nose into the very pit you are digging."

"But one thing puzzles me," said Umber, crestfallen; "I thought Jim Dormouse was a free-thinker and would fall right into this."

"Don’t judge from appearances," said Riker. "A man may dress plainly and talk quietly and yet have money and influence; he may listen without expressing any opinion to your absurdest talk, and yet keep up a tremendous thinking all the while; and he may be, as Mr. Dormouse is, the leading trustee of the Presbyterian church."

"See here," said Stone, "we’re beaten, and we give in. Now be generous and let the story stop right here."

"All right," said Riker, "shake."

They shook: and that is why it has never before been told how the geographies in the Norway high school were put in by prayer.
The School Bulletin
AND NEW YORK STATE EDUCATIONAL JOURNAL

SYRACUSE, N.Y., MAY, 1876.

ARELIC.

We have received from Hon. John H. French, LL. D., late State Superintendent in Vermont and well known throughout this State as an Institute instructor, and an author of the N.Y. State Gazetteer and Map, the call to what was probably the second Teachers' Institute ever held in this country. Our printers have reproduced this call in almost exact fac simile. The State is not mentioned, but is of course, New York. The original is upon yellow paper, which somebody seems to have cut in two, removed a sentence, and pasted together again. Whether this was done to all the copies issued or only to this one we have no means of knowing. At any rate, the handbill is a curiosity.

MEETING OF COMON SCHOOL TEACHERS.

A Teachers' Institute will be opened in the village of Wethersfield Springs, on WEDNESDAY, THE 18TH DAY OF OCTOBER INST., at nine o'clock A.M., and continue ten days. The object of the Institute is improvement in the greatest of all arts, the art of Teaching. It is expected that every person, male or female, proposing or intending to teach a Common School in the county of Wyoming the ensuing winter, will attend the Teachers' Institute.

Instruction will be given in the various branches taught in Common Schools, viz., Orthography, the analysis of words, their significations, the importance of sounds, and the authors' meaning; English Grammar, Arithmetical Geography, and the System of Outline Maps. Particular attention will be paid to Mental Arithmetic and the use of the slate and black-board. Lectures will be delivered on the best mode of school government and discipline; the best manner of instructing children according to their age and ability, together with the most successful methods of developing the intellectual powers and arousing the mind to vigorous action, in the exercise of its thinking and discriminating powers. Gentlemen of the best qualifications will be engaged as Instructors of the Institute. Mr. Leonard Hooker is engaged in the department of Arithmetic and Mathematics. He is an experienced teacher and we believe he is known nothing need be said of his qualifications; there is not probably his equal in western New York, in Mental Arithmetic and Fractions. Mr. Huntington, of the Perry Centre Institute, will give instruction in Geography and in the use of the Globes and Outline Maps. Other gentlemen equally well qualified, will be engaged in teaching and lecturing upon Education, Orthography, Analysis, English Grammar, Penmanship, &c.

Several Clergymen who have been Teachers, have already volunteered to give lectures on School Government and other subjects. The Town Superintendents will be present most of the time. Trustees are invited to be present, and especially during the last days of the term, as they will then have an opportunity to find good teachers. As it is proposed by the Town Superintendents to defer the examination of teachers until the meeting of the Institute, they can be examined there. Teachers will thus have an opportunity for free interchange of views among themselves, connected with their own experiences, and the proposal of such questions as any may choose to offer. They will also become acquainted with each other, the knowledge and experience of all will be imparted to each, and the best methods of teaching and governing will be adopted by all; and thus teaching may be reduced somewhat to a system of uniformity. Lectures will be given upon the subject of building and repairing school houses. In short every thing will be done to render the exercises interesting and useful; to create a more lively interest upon the subject of education throughout the county; and to raise the standard of common schools and common school teachers. Blackboards and other apparatus will be provided. It is expected that teachers will bring books for reading. The expenses for boarding and incidental expenses will not exceed $5 each. Teachers for the next summer school are invited also to attend. A Visiting Committee for each town will be appointed. Citizens generally are invited to attend.

A. S. STEVENS, Superintendent of Common Schools, Wyoming County, with the concurrence of the following Town Superintendents.

E. BISHOP, Attleboro.
R. TOLLES, Bennington.
W. H. CONKLIN, Castile.
JOHN SMITH, China.
OCTOBER 9, 1846.

F. McGee, Orangeville.

J. DURFEE, Cornville.
R. WHITNEY, Gainsville.
L. G. WARD, Jay.
M. A. HINMAN, Sheldon.
A. HOLLEY, Warren.
B. BANCROFT, Wethersfield.
Allegorical representation of the progress and degrees of education, from an illuminated picture in the 1508 (Basel) edition of the *Margarita Philosophica* of Gregory de Reiach.

The youth, having mastered the Hornbook (ABC's) and the rudiments of learning (reading, writing, and the beginnings of music and numbers), advances toward the temple of knowledge. Wisdom is about to place the key in the lock of the door of the temple. On the door is written the word *congredia*, signifying Grammar. ("Grammar first hath for to teche to speke upon congruite.") On the first and second floors of the temple he studies the Grammar of Donatus, and of Priscian, and at the first stage at the left on the third floor he studies the Logic of Aristotle, followed by the Rhetoric and Poetry of Tully, thus completing the *Trivium*. The Arithmetic of Boethius also appears on the third floor. On the fourth floor he completes the studies of the *Quadrivium*, taking in order the Music of Pythagoras, Euclid's Geometry, and Ptolemy's Astronomy. The student now advances to the study of Philosophy, studying successively Physics, Seneca's Morals, and the Theology (or Metaphysics) of Peter Lombard, the last being the goal toward which all has been directed.

In nomine patris et filius et spiritus sancti. Amen.

Aeternitatem aeternam. Amen.

Quid abehiobui, quid abebo bux.

Accipit accecu accecu accecu.

Quid adeiobui, quid adeiobui.

At est inst ufu et se stof su.

Quid agegigo gug gage gigo gux.

Orationis dominicae.

Aeter noster qui es in celis: saete quid, eum autem et secum.

Adiutus munus tuum. Fiat voluntas tua, sicut in coelo et in terra.

Panem nostrum quotidianum, da nobis hodie.

Et dimitte nobis debita nostra sicut et nos dimittimus debitoribus uiros.

Et ne nos inducas in tentationem, sed libera nos a malo. Amen.

Hail, Mary, full of grace, the Lord is with thee. Blessed art thou among women, and blessed is the fruit of thy womb, Jesus. Amen.

Que Deus sit in coelo et in terra. Et in coelo et in terra.

Qui unigenitus, homo et deus. Amen.

THE LEVELS OF READING AND SPEECH

Requires Conscious Attention

(Level 3 - Consciousness of Meaning

Automatic Levels Not Requiring Conscious Attention

(Level 2 - Syntax-Generating-Words

(Level 1 - Syllables

If conscious attention is focused on automatic Levels 1 or 2, the result in speech can be stammering and stuttering, and in reading a divided and therefore reduced attention to meaning at Level 3. Correspondingly, if conscious attention is focused on the automatic action of walking, the result can be an altered gait and stumbling.

THE READING TRIANGLE

From an Article by Dr. Henry Suzzallo

Source: Article Entitled, "Reading, Teaching Beginners," on page 118 of the 1913 volume of A Cyclopedia of Education, Edited by Paul Monroe, Columbia University. Suzzallo was also with Columbia, at Teachers College, and had been a student of E. L. Thorndike about 1901.
Comments on the Suzzallo Reading Triangle

Henry Suzzallo’s 1913 Cyclopedia of Education article and its triangle illustration prove that the “experts” at Columbia in 1913, where Suzzallo was then a professor, knew of the existence of two mutually exclusive and contradictory kinds of reading, or mixtures of the kinds. One of those two kinds is to read by the “meaning” of print, and the other is to read by the “sound” of print.

In William James’ 1890 psychology text, James reproduced diagram illustrations similar to the Suzzallo triangle diagram. Such diagrams were used at that time by psychologists to demonstrate the paths followed in the association of ideas. The topic, the “association of ideas” was of interest to the psychologists. Even as early as March, 1880, James published in the Popular Science Monthly an article with the title, “The Association of Ideas.”

Yet what is extremely unusual about Suzzallo’s triangle is that Suzzallo did not discuss just one path in the association of ideas to be followed in a specific activity, which was the case for the other diagrams in James’ 1890 text. Instead, Suzzallo showed two opposite paths on the same diagram for the same activity. Since the two paths obviously contradict each other in the carrying out of that activity, they cannot be used simultaneously.

The corners of the Suzzallo triangle diagram are labeled, the lower right corner standing for “visual,” or the sight of print, the lower left corner standing for “sound,” or the sound produced by print. The top point of the triangle stands for “meaning,” or the meaning of print. Furthermore, the line connecting the two bottom corners between “visual” and “sound” is short and suggests a path involving a simple response. Yet the lines reaching to the top, either from “visual” at the right-hand bottom corner to “meaning” at the top, or from “sound” at the left-hand bottom corner to “meaning” at the top, are about twice as long as the line between the two bottom corners. That obviously suggests that a more complex response is involved in going from “visual” to “meaning, or in going from “sound” to “meaning,” than in going from “visual” to “sound.”. Obviously, the reflex should be quicker in the bottom and shorter path (from “visual” to “sound”), than in the longer paths to the top (either from “visual” at the bottom to “meaning” at the top, or from “sound” at the bottom to “meaning” at the top).

Statements made by Herbert Austin Brown in his article, “The Measurement of the Efficiency of Instruction in Reading,” Elementary School Journal, University of Chicago, June, 1914, mentioned earlier in this history and again in Appendix E, establish clearly that the “experts” knew before 1914 that children taught to read by the “sound” of print learn to read very rapidly, but the “experts” discounted that achievement because they thought that children were not getting the “meaning” of print but were only reciting the “sound” of print. Yet the “experts” also had to know that children taught to read by the “meaning” of print instead of by its “sound” learned to read very slowly. The relative length of the lines on the Suzzallo triangle obviously provides the “experts’” explanation for that observed difference in the speed of learning to read to which Brown obviously referred. (Brown had received his master’s degree from Columbia Teachers College on June 13, 1912, where the psychologist, Edward L. Thorndike, William James’ former student, was a professor. In 1912 Henry Suzzallo was at Columbia Teachers College and the psychologists, James McKeen Cattell and John Dewey, were at Columbia University)

On Suzzallo’s triangle diagram, a clockwise path begins at “visual” (meaning at the sight of print) at the lower right-hand triangle corner, stopping at “sound” first at the lower left-hand triangle corner, and then only secondarily moving to “meaning” at the triangle top. Suzzallo’s contradictory counterclockwise path also begins at “visual” (meaning at the sight of print) at the lower right-hand triangle corner, but goes immediately to “meaning” at the triangle top, and then only secondarily moves on down to “sound” at the lower left-hand triangle corner.

It is evident that the clockwise path on the triangle describes the phonics “sound” approach in the teaching of reading, and the counter-clockwise path on the triangle describes the whole-sight-word “meaning” approach in the teaching of reading.

James McKeen Cattell’s and William James’ comments on perception suggest that they wrongly concluded that only one stop on such perceptual routes as that shown on the Suzzallo triangle could be done automatically, but that secondary stops had to be performed consciously. Obviously, therefore, if
that had been true, it would then have been “correct” to teach children to read whole sight-words automatically as the first stop, for their “meaning,” even though it took longer. However, it would presumably have been incorrect to teach children to read print first for its “sound,” automatically, even though it took far less time, because children might fail to make the conscious effort that Cattell and James apparently considered necessary to make the second stop, and the second stop for children taught by “sound” concerned critically important “meaning.” Therefore, the Suzzallo triangle supported the teaching of children to read by “meaning,” but it discredited the teaching of children to read by “sound.” The diagram also clearly proposed the existence of two different and opposite perceptual types, even though Suzzallo’s article which contained the triangle did not do so but only discussed paths that could be followed in reading.

However, the showing of two such contradictory paths on the same illustration for the association of ideas was quite extraordinary. Very possibly, Suzzallo’s triangle was the first “conflict” diagram ever drawn in psychology. It is also highly probable that Suzzallo’s triangle diagram did not originate with Suzzallo himself, but that Suzzallo received it in his close association with Thorndike, and that Thorndike had received it in his close association with William James, whom I consider to be its probable author.
A LIST OF SPELLING BOOKS REPORTEDLY IN USE IN AMERICA IN 1842, AND SOME OTHER CONTEMPORARY DATA

The following list of spelling books available in America in 1842 is excerpted from an original copy held by the American Antiquarian Society, Worcester, Massachusetts. That original 32-page-long copy is entitled:

The American Society for the Diffusion of Useful Knowledge -
Report of the Committee on the Subject of Spelling Books.
Published by the Executive Committee, January, 1843.

The column listing the spelling book titles is next to three other columns, one headed 1804, one headed 1832, and one headed 1842. The explanation given for those headings reads:

“The following is a Catalogue of the principal Spelling Books now on sale in the country. The indices under the years 1804 and 1832 show what books were included in the Catalogues of American School Books, published in those years. When a book has survived its cotemporaries [sic], it is indicated under the next date.”

The meaning of that last sentence is unknown, and so is the reason why only a few checks were given under the 1842 heading, when the committee stated that all of the 110 books listed were available in 1842. (Ninety of the books on sale in 1842, as discussed below, were in the possession of the committee). For quite a few of the books, no checks at all were shown under any of the three dates, 1804, 1832 or 1842. In addition, there is no consistency in the kind of checks given to some books which are known to have been in print at the earliest date. Therefore, since the “checking” notations under the three dates on the original document appear to be absolutely senseless, they have been omitted below.

The fact that the “checking” on the original document was senseless, however, is not too important, because what is of interest for the purposes of this history is the fact that the document did list many spelling books that were on the American market in 1842, even though it is apparent that the titles on many were not correctly quoted.

It is puzzling that this list has only 112 books, even though the committee made the following claim in this January, 1843, publication:

“There are now on sale in our country not less than one hundred and twenty different spelling Books, about three fourths of which the Committee have collected together.”

Three-quarters of that 120 would total, of course, the figure of 90. Possibly 8 of that 120 did not qualify as among the “principal Spelling Books now on sale in this country,” which was the description the committee gave to its list of 112. Therefore, the titles of the 8 “non-principal” spelling books on sale by January, 1843, which were omitted from the finished list of 112 will probably forever remain unknown.

In addition, so far as is known, no “Catalogues of American School Books” were prepared in 1804 and 1832, so that data (such as it was in the utterly confusing entries) was probably abstracted from some unspecified lists of books in all categories available for sale in those years.
Despite the statistical discrepancies and despite the slip-shod manner in which known titles are listed below, which is often incorrectly, this list of spelling books available in America in 1842 is of real historical importance, since it is apparently the only such contemporary list in existence.

The 1843 document continued:

“The following is a list of foreign spelling books before the Committee:

“Mavor’s Spelling Book
Carpenter’s Spelling Book
Fenning’s Spelling Book
Vyse’s Spelling Book
Cobbins’ Spelling Book
Williams’ Spelling Book
Porney’s French Spelling Book.

“The first of these, (Mavor’s,) in 1835 had passed through 420 editions in England, and it has been stated, that for many years, the profits on the publication were sufficient to meet all the expenses of the publishing house of Longman & Co., Paternoster Row.”

“The following Table shows the variety of Spelling Books used in the State of New York, and the number of towns in which each is introduced. It is compiled from the Abstracts of the School Returns, during the Superintendency of Gen. Dix.
A review of its contents reveals that this January, 1843, report is very incompetently done. However, that review not only suggests incompetence on the part of the authors of this paper but also suggests incompleteness in the data from the New York State “School Returns” which it cites.

Note that the last entry, “Juvenile Spelling Book,” shows only one figure, under the year 1839, while “The Juvenile Spelling Book,” probably the same text, also shows only one entry, under 1837. It is probable that these two should have appeared as only one entry, and that a figure should almost certainly have been given for 1838, as well. Similarly, the degree of use of some of the other less popular titles is almost certainly under-reported.

This January, 1843, paper also reported data for two other states, Michigan and Massachusetts. The Michigan report is dated January, 1841. However, no date was given for the Massachusetts report. Yet the Massachusetts report presumably was later than the New York report, since it showed Sanders’ 1838 speller as in use in three towns, while the New York report ending with 1839 only listed Sanders’ but gave no figures on its use. The material on Massachusetts is shown below:

| “1827 1830 1833 1834 1836 1837 1838 1839 | “Bentley’s” | 16 41 36 32 36 32 35 28 |

“The Annual Report of the Superintendent of Public Instruction in Michigan, presented in January, 1841, states that
“Webster’s Elementary Spelling Book is used in 548 Districts
Cobb’s “ “ “ 62 “
Towne’s “ “ “ 14 “
Emerson’s “ “ “ 2 “

“The other 880 Districts of the State, had made no specific report. The Superintendent
remarks, that,

“If the Elementary Spelling Book is used in the same proportion, in the whole 1506 Districts
of the State, as it is in the 626 that reported, it is used in one thousand three hundred and fifty-six
Districts of Michigan!”

Note that at some unspecified date after 1839 but before January, 1843, the displacement of
Webster’s Code 10 speller for lower code spellers was most pronounced in Massachusetts, where the
change-agents were most prominent. Yet Webster’s speller was almost unchallenged in far-away
Michigan by January, 1841.

The displacement of Webster’s Code 10 speller for lower code spellers was only slightly less
pronounced in New York State than in Massachusetts by 1839. Orestes Brownson had testified in later
life that in 1829 and 1830 he had worked to promote government schools. As a member of a secret
society, Brownson had clandestinely organized education activists all through New York State in 1829
and 1830. (Brownson’s remarks have been quoted elsewhere in this history and were taken from Samuel
Blumenfeld’s book, Is Public Education Necessary?)

As quoted in this history, Cobb of New York State in an article written about 1826 had attacked
Webster’s enormously popular speller and claimed his lower code speller was superior. Note the
explosion of sales in New York State for Cobb’s speller after 1827.

Yet the displacement of Webster’s once overwhelmingly dominant Code 10 speller was only slightly
underway by 1841 in Michigan. Michigan was then a near-frontier state anapparently spared some of the
effects of the activists.

However, Webster’s once vastly-used speller was clearly a target long before January, 1843, when
this report was published. The figures for Massachusetts, New York and Michigan reveal that Webster’s
had begun to lose its pre-eminence in the East first, and that the loss started about 1827.

Page 27 of this January, 1843, report implicitly confirmed that Webster’s had been dominant in the
past:

“During the last forty years, there have been sold in this country, as stated by Dr. Noah
Webster, eighteen million of his spelling books, which, at the retail price of twelve and a half
cents, has amounted to $2,250,000. It is not unreasonable to suppose that half that sum has been
expended for the hundred other different Spelling Books, in the same period....”

The near market-monopoly of Webster’s since 1783 had been under attack since about 1818 as an
undesirable thing. Yet, starting in the late 1820’s, the change-agents’ cry had been for a state-approved
monopoly of school books to remove a so-called evil, the “multiplicity of School Books.”
State-sponsored monopolies could counter the free-market forces that once had placed Webster’s Code 10
speller in the minds of most Americans not far below the U. S. Constitution in importance.
As has been discussed at length in this history, it was not just Webster’s “sound” approach speller which was under attack, but the use of such “sound” approach spellers to teach beginning reading, instead of the “meaning” sight-word primers which began to arrive in 1826, and which pushed spelling books out of the primary grades. However, spelling books at the upper grades continued to be used massively after 1826 until about 1876. Therefore, the fact that Michigan was still using Webster’s speller heavily in 1843 in no way guarantees that Webster’s speller was being used to teach beginning reading.

Concerning the so-called evil of the “multiplicity of School Books,” the following appeared in this January, 1843, report:

“The late Secretary of State, and Superintendent of Common Schools in New York, in his Annual Report, 1840, says,

“‘This is an evil of the greatest magnitude; yet it is feared from past experience, that our fellow citizens would be unwilling to submit to the prescription by law, or under its authority, of any school books to be used by their children.... The only remedy that has occurred to him, is the organization of some general society, whose members will devote themselves to the selection of the very best books that can be found.... There is an ample field of selection, not only from the productions of our own country, but from those of other countries. The National School Society of Ireland has issued a very excellent series of text-books, which are in use in the schools of that country.’”

The National School Society of Ireland published the Irish Spelling Book, which has been reviewed at length in this history. The Irish Spelling Book, not a commercial but a government-sponsored text, was an exceedingly low-code book. It was certain to cause disabilities in beginning readers. Yet the New York State Superintendent praised, presumably sight-unseen, such productions of the Irish quasi-governmental group. He also referred to past opposition of his American “fellow citizens” to such government prescriptions of text-books as was then being done in Ireland. American opposition to government control of textbooks is specifically discussed in a late 1820’s report published in Vermont, which has been quoted at length elsewhere in this history.

As has also been discussed earlier in this history, the American Society for the Diffusion of Useful Knowledge, which published this January, 1843, report, was composed of a small group of ambitious men who wished to reap personal profits on such calls for “official” books, as well as on the opposition of the American public to official government interference. As a non-governmental body, they proposed to publish a selection of “acceptable” books, from which they would obviously get the profits. A scathing indictment of the self-serving nature of this group appeared in print in the 1840’s, which indictment is discussed elsewhere in this history.

The 1843 report which the “American Society” issued is 32 pages long and makes many (very possibly unfounded) statements about the state of education and textbooks at that time. However, since the “American Society....” was manifestly unreliable, the only portions of the report that are quoted here are excerpts from reports issued by various states, and the “American Society....” list of spelling books that were on the market in 1842. That list was apparently quite reliable, since most of the titles they listed (or their more accurate wording) are presently in American libraries, or are mentioned in American reference works.
Bibliography of Books on Teaching, VIII.

All books printed have at least one copy of that I can for sale at the price named; where the price is in parentheses, it is for the whole volume, of which our price named is only a part. For abbreviations, see BULLETIN for Mar., 1914.

From the July 28, 1900, issue of The School Journal, New York, an abstract of a paper before the Department of Education of Defectives of the National Education Association.

Teaching Deaf-Mutes
Experience of the Institution at Mount Airy in Changing from Sign Speech to the Oral Method
By Supt. A. L. E. Crouter, LL.D.

From 1820 to 1870 the Pennsylvania Institution for the Deaf and Dumb employed the sign or French method, signs being the basis of all mental development and the principal means of communication. In 1870 articulation teaching was introduced, from thirty to forty-five minutes’ instruction daily being given by a special teacher to such pupils as it was thought might be able to learn to speak and read the lips, the rest of the time being devoted to instruction by signs. Experience demonstrated the impossibility of securing the desired results under this method, and in 1881 there was opened a branch school where instruction was given by oral methods exclusively. At the same time two oral classes were formed in the main institution, the pupils of which were taught by oral methods but were permitted to mingle freely with the sign-taught pupils out of school. Practically all approved methods of instructing the deaf were then in operation under the observation of the same officers, by whom comparative tests were made at stated intervals.

In no instance were orally-taught pupils found inferior to the manually taught, and their progress in language was notably better. The work under separate oral instruction was found to be greatly superior to that done in the oral classes whose pupils were allowed to mingle with manual pupils. The speech and lip-reading of the half-hour articulation classes was less and less satisfactory the longer it was compared with that of pupils taught by purely oral methods, and such instruction was finally discontinued in 1888. On the removal of the school to Mt. Airy in 1892, the two oral classes of the main institution were merged with those from the Oral Branch, and since then only two methods have been employed, the pure oral and the pure manual.

The oral method has won its way in competition with the manual by sheer force of merit, so that since the establishment of the separate oral department in 1881, when nearly ninety per cent. were under manual instruction and only a little over ten per cent. under oral, the conditions have gradually reversed themselves until the enrollment for 1899 showed over ninety per cent. in the oral department and less than ten per cent. in the manual. Since 1892, only 20 of the 493 pupils entered under oral instruction here had to be transferred to the manual department because of inability to learn by speech methods, and their subsequent progress has proved that their failure was due not to the method but to defective mental powers.

After twenty years’ experimentation with and comparison of methods the school has arrived at the conclusion that proper oral methods - meaning the use of speech and speech reading, writing, pictures, and the free use of books - are fully adequate to the best education of the deaf and that when a deaf child cannot be so educated it is useless to hope for any marked success under any other method.
Concerning the Different and Opposite Conditioned Reflexes in Reading, and Their Brain-Based Origin

Reference has been made in this book to the fact that work done on stroke patients had revealed, long before William James wrote his 1890 Principles of Psychology, that sound-bearing print is processed through the left angular gyrus area in the back of the brain.

On page 37, in his Figure 18, James reproduced an illustration from an 1887 book, Aphasia, by James Ross, which clearly showed the areas in the brain, including the angular gyrus area, which are used sequentially in reading (and writing). The illustration is reproduced above. On the diagram, “A” marked Wernicke’s area (“auditory”), “E” marked Broca’s area (“expressive”), “W” marked writing, and “V” marked the angular gyrus area (“visual”).

James also included on page 25, in his Figure 11, a diagram of the brain with clear labels on the areas known as Broca’s and Wernicke’s, and on page 36, in his Figure 17, a diagram of the brain which showed the “Angular Conv.” (obviously, the angular gyrus area).

Those areas also appeared in a diagram of the brain in the 1911 text, Elements of Physiological Psychology, by Ladd and Woodworth. For purposes of illustration, that diagram (labeled Fig. 5. in that text) is also reproduced above.

Summarizing much work that had been done in Europe, William James reported at length on language in his 1890 book, The Principles of Psychology. On pages 25, 26, 32, 33, 35, 36 and 37, James referred to Broca’s area, first identified by Broca in 1861. Broca’s area is on the lower front lobe of the surface layer of the brain’s cortex and is normally in the left hemisphere. James called the aphasia
resulting from damage to Broca’s area “motor aphasia.” Those patients might understand speech but not be able to produce it. It seems apparent that Broca’s area deals with the production of syllable sounds.

James also reported in 1890 on the effect of damage to Wernicke’s area, producing what he called “sensory aphasia” (pages 35, 36, 37). In sensory aphasia, aphasics do not understand the meaning of words, even though they can hear them. James said (page 35):

“Wernicke was the first to discriminate those cases in which the patient can not even understand speech from those in which he can understand, only not talk; and to ascribe the former condition to lesion of the temporal lobe. The condition in question is word-deafness....”

Broca’s area must process syllable sounds, but Wernicke’s area must process word meanings.

The literature indicates that spoken word meanings are handled through the front of Wernicke’s area, and printed word meanings through the back, in the angular gyrus region. (The angular gyrus is now considered part of Wernicke’s area, although it was considered to be separate from it in James’ day).

It appears self-evident that spoken language has three levels, the first two of which are processed automatically: the syllable level (presumably processed through Broca’s area) and the syntax/word level (presumably processed through Wernicke’s area). The final level, “meaning,” is conscious and is handled in the front of the brain.

At the syntax/word level, it is postulated that it is syntax which generates the words, and not the other way around. Words are, after all, only parts of speech - which is to say, parts of syntax. William H. Calvin, Ph. D., and George A. Ojemann, M. D., in their book, Inside the Brain, A Mentor Book, New York, 1980, reported that they found that grammar (syntax) occupied a different site from word meanings in Wernicke’s area on the cortex, which appears to support this assumption. Furthermore, Sid J. Segalowitz, in his book, Two Sides of the Brain, Prentice-Hall, Inc., Englewood Cliffs, New Jersey, 1983, reported that some aphasic patients, who were incapable of understanding the meaning of speech but who retained the ability to repeat other people’s speech, have been found to correct grammar in repeating heard sentences. Obviously, syntax was controlling their production of words, and it was doing so at the automatic, not conscious, level since those patients were incapable of understanding word meanings. That indicates that the automatic production of “syntax” precedes and generates “words.”

William James reported on an elaborate study by Naunyn on 71 cases of aphasia (Nothnagel and Naunyn, Die Localization in den Gehirnkrankeiten, Wiesbaden, 1887), and quoted other authors on the subject. (It is surprising to find aphasia mentioned so seldom in the literature since then.) James said in 1890 (p. 37):

“Naunyn... plotting out on a diagram of the hemisphere the 71 irreproachable reported cases of aphasia which he was able to collect, finds that the lesions concentrate themselves in three places: first, on Broca’s centre; second, on Wernicke’s; third on the supramarginal and angular gyri under which those fibres pass which connect the visual centre with the rest of the brain...”

Dr. Wilder Penfield in his book, The Mystery of the Mind, Princeton University Press, Princeton, New Jersey: 1975, and Dr. Calvin and Dr. Ojemann in their book publish illustrations which include James’ third section described above (the angular gyrus area) as part of Wernicke’s area, rather than showing it separately. The Encyclopedia Britannica illustration of the brain, page 76, Volume 4 (1963), shows the same site for the left angular gyrus, although it is not specifically labeled as part of Wernicke’s area.
Calvin and Ojemann referred to a patient who had lost his reading ability, but only that portion, apparently, which was sound-bearing. They then included a drawing of the brain showing where a computerized tomographic scan had revealed the location of that patient’s stroke. It was clearly in the same area as that labeled the angular gyrus area in the illustrations mentioned above.

“The brain does not operate in isolated units but this does not mean that we cannot pin-point anatomically specific areas in the brain that have very specialized functions... damage to certain crucial shunts or sidings invariably causes loss of function. Brodmann’s area 39 in the angular gyrus in the parietal lobes, which is located at the center of the reading region, is such a shunt. Any kind of damage to it causes Alexia (complete inability to read), and at least a partial Agraphia (an inability to write). This does not mean that the neurophysiologic basis for reading is located in area 39 exclusively. This area is only one part, even though a crucial one, of the entire cerebral reading apparatus.”

Dr. Mosse referred (page 46) to Norbert Wiener, who originated the scientific method he called cybernetics, and said that others have applied communication engineering to the study of the brain. The most practical results have been in producing a machine to read to the blind, the Kurzweil Reading Machine. Mosse said (p. 46-47)

“The Kurzweil Reading Machine consists of an optical scanner on which printed material is placed, a computer, and a small control unit with 30 buttons. A (small) program tape is inserted.... The scanner searches the page, finds the top line, and moves across the text, line by line. It takes an electronic picture of each word, which the computer analyzes into letters. The letters are then blended according to phonetic rules into spoken words....

“Wiener and McCulloch suggested that the brain might also use a ‘scanning apparatus’....”

Professor Frank Smith, the renowned psycholinguist, who promotes “meaning” in the teaching of beginning reading and opposes “sound,” wrote in his book, Reading Without Nonsense:

“Skill in reading depends on using the eyes as little as possible (p.9.)

“If you are not making errors when you read, you are probably not reading efficiently. (p.33.)

“The reason phonics does not work for children or for computers is that the links between the letters and sounds cannot be specified.... They are too complex. (p. 51-52.)”

As Dr. Rudolph Flesch pointed out in his 1981 book, Why Johnny STILL Can’t Read (p. 27), concerning Smith’s last statement:

“This would be a splendid argument against phonics except for the awkward fact [of the] Kurzweil Reading Machine.”

A remarkable picture appeared in an article in Scientific American (239 (4): 62, 1978). It showed blood flow changes during silent reading. The authors of the article were N. Lassen, D. Ingvar and E. Skinhol, who also recorded blood-flow changes during other activities. That picture was reproduced as a drawing in Calvin and Ojemann’s book. Although it showed the activity in various parts of the brain
during the act of silent reading, none of them were labeled. Nevertheless, clearly lit up in that reading “apparatus” were the angular gyrus, Broca’s and Wernicke’s areas.

Before William James wrote his 1890 psychology text, it was known that ALL THREE of these areas concerned language, and that the angular gyrus area was specifically involved in reading. James showed them all in his diagram taken from Ross’s 1887 book. So much of this information was general knowledge in education long before World War I. Where has all this information been since James’ 1890 book and others like it were published, until that blood-flow map in the 1978 Scientific American illustration showed so many of James’ areas lighting up during silent reading, like a string of lights on a Christmas tree, almost a hundred years after James published his book?

In their teachers’ college courses, speech teachers today reportedly do receive information on Broca’s and Wernicke’s areas, but one speech teacher told me, and she is exceptionally competent, that her college courses indicated that the function of the general area of the angular gyrus is not understood, “though it is known to be very important.” That state of affairs is, of course, surpassingly strange.

In the spirit of progress marching backwards, duplicated in a 1912 book written specifically for teachers, Principles and Methods of Teaching Reading by Joseph S. Taylor, The Macmillan Company, New York, in a discussion headed, “Localization of Brain Function,” appeared the illustration reproduced above from Ladd and Woodworth’s Elements of Physiological Psychology (1911). That drawing of the brain clearly labeled Broca’s and Wernicke’a areas, and, in the back of the brain where the angular gyrus is located, appeared only the simple word, “Reading.”

Taylor’s 1912 text recounted the following case of aphasia, “alexia,” the loss of the power to read, which had been reported in an 1897 book, Brain and Personality, Dodd, Mead & Co., page 88. That book had been written by a medical doctor, William H. Thomson of New York:

“I was once hurriedly sent for by an old patient of mine. I found her much disturbed by a strange experience which she immediately detailed in the well-chosen words of an educated woman: ‘What is the reason, doctor,’ she said, ‘that everything in a book or newspaper is illegible to me?.... I took up the Herald and found that I could not read a word of it. At first I supposed my eyesight had failed, but I could see everything around the room as well as ever... I then opened the Bible, but could not read a word. What is the matter with me?’ I at once recognized that she had been struck with word-blindness.... she had absolutely no other disorder of speech and none of vision. She heard every word that came to her ears, and she could speak as fluently as ever, but no word could reach her consciousness through her eyes. All that as yet had happened to her was that a little artery which supplies blood to a small area in the visual region of her brain had become plugged, with the result of totally disorganizing the gray matter where eye words are registered....”

After quoting Thomson, Taylor wrote:

“The printed characters are seen, but they convey no meaning. The individual thus affected may be able to write, but is unable to read what he has just written. Words as visual symbols are blotted out.”

Taylor went on to describe other types of aphasia, those resulting from damage to Broca’s area (the inability to make speech sounds), and those resulting from damage to the front of Wernicke’s area (inability to attach meaning to speech sounds).
An earlier edition of *Elements of Physiological Psychology* had appeared long before the 1911 edition from which Taylor took his illustration of the brain. That book had been published originally in 1887 as *Elements of Physiological Psychology: A Treatise on the Activities and Nature of the Mind from the Physical and Experimental Point of View* (New York: Scribner), and it had been written only by George Trumbull Ladd. It is of great interest that James McKeen Cattell was commissioned to write a review on Ladd’s original text when it was first published in 1887 (and that original text may have included the same kind of brain diagram as the 1911 edition, since “Ross” had produced a similar one by 1887). Cattell would, further, have almost certainly been familiar with that 1911 revision by Ladd and Woodworth, since, at the 1926 honorary program at Columbia Teachers College for E. L. Thorndike, Cattell said he had been closer to Thorndike than any other, EXCEPT possibly Boas and WOODWORTH.

In *Mind* (11, 1886: 63-65), J. M. Cattell suggested as one possible use of his own psychological work on naming objects:

> “Such experiments would be useful in investigating aphasia.”

Therefore, Cattell (and by extension, James’ and his ex-student, Thorndike) surely must have known about the brain areas shown in Ladd’s and Woodworth’s 1911 text: Broca’s, Wernicke’s and the area labeled, “reading,” which was plainly the angular gyrus area.

Obviously, the information about areas in the brain concerned with reading and speech was common knowledge before World War I, not only for psychologists like James and Cattell, but for Ross, whom James quoted in 1890, and for Ladd, whose book Cattell reviewed in 1887, and for Woodworth, whom Cattell said in 1926 was his very close friend and who collaborated with Ladd on a revision of the book Cattell had reviewed in 1887. It was also common knowledge among educators, like Taylor, who wrote a book for teachers containing that information.

Furthermore, in the *School Journal* for October 19, 1897, on page 362, an article appeared by the psychologist G. Stanley Hall, who was the close associate of both James and Cattell, which article was an abstract of a lecture Hall gave entitled “School Reading.” Hall said:

> “Ross on Aphasia ought to be read by every teacher....”

So G. Stanley Hall in 1897, more than a century ago, recommended that “Ross on Aphasia” ought to be read by every teacher. Ross’s illustration had been given in William James’ book seven years before Hall’s remark, and it had included almost all the areas which lit up like a string of lights on a Christmas tree in the 1978 blood flow diagram on silent reading printed by Ojemann and Calvin, taken from *Scientific American*. (Ross’s 1887 diagram left out the area in the frontal lobe which is the conscious portion of the brain, but included an area in the motor strip concerning writing.)

If teachers today were taught to read “Ross on aphasia”, the silent reading blood flow diagram from the 1978 *Scientific American* would only tell them what they already knew from Ross’s book, published some time before 1890, and which James then just copied wholesale in 1890. Where HAS this essentially
simple information for teachers been since long before WORLD WAR I, when it was taken for granted by G. Stanley Hall in 1897 and by Taylor in 1912 that teachers should have access to it?

It really is amazing to see Ross’s 1887 diagram on reading (and writing) almost perfectly match a 1978 state-of-the-art blood flow diagram taken during silent reading.

James said, after his discussion on Ross’s diagram and aphasia in general:

“Meanwhile few things show more beautifully than the history of our knowledge of aphasia how the sagacity and patience of many bands of workers are in time certain to analyze the darkest confusion into an orderly display.”

The actual history, of course, is just the opposite. The many banded workers managed to turn “an orderly display” into “the darkest confusion”.

Japanese script has two kinds of characters: Kana, which are meaning-bearing like Chinese characters, and Kanji, which are syllable characters and are therefore sound-bearing. For comparison to Western writing systems, Kanji are like the purely meaning-bearing digit, “6,” while Kana are like the sound-bearing alphabetically written English word, “six.”

It was discovered over twenty years ago that some Japanese stroke patients with aphasia (loss of language) could still comprehend the Kanji meaning-bearing characters in Japanese script. Yet they had lost the ability to read words composed of the Kana syllable characters in that script, which characters are purely sound-bearing. That fact was reported by Itoh Sasanuma (1975, 1977), and was mentioned on page 92 of Sid J. Segalowitz’s Two Sides of the Brain.

From other references in available literature on the brain, it may be presumed that the loss of ability to read words composed of the Kana sound-bearing syllables resulted from damage in the LEFT angular gyrus area of the patients’ brains, where for over a hundred years damage has been known to cause a loss of ability to read alphabetic sound-bearing print. (In some cases, that type of aphasia has been only partial, affecting only the reading of alphabetic print but not the ability to speak aloud and to understand the spoken language of others.)

Logically, therefore, if the reading of Kana sound-bearing script, like the reading of alphabetic sound-bearing print, is processed through the left angular gyrus area of the brain, the reading of Kanji meaning-bearing script (and the reading of its equivalent, sight-words taught by the “meaning” method) should be processed through the mirrored counterpart, the RIGHT angular gyrus area of the brain. The left angular gyrus areas and the right angular gyrus areas in human brains should then provide the anatomical basis for processing the only two types of visual writing which are possible for humans: sound-bearing, or meaning-bearing. However, such an anatomical basis for processing the two types of reading, which appears to be logically probable, has never been clearly spelled out in any literature which I have ever seen.

The right side of the brain processes information simultaneously, spatially, or all-at-once. Of course Kanji, like Chinese characters, has to be read like spatial pictures, all at once, and its processing is therefore a right-brain activity. However, the left side of the brain processes information sequentially, or serially. Spoken language (and sound-bearing print) are, by their nature, sequential, so their processing is a left-brain activity. Charles M. Richardson, the engineer/educator from Huntington, New York, has pointed out the resemblance in these two types in the human brain (simultaneous vs. sequential) to the types in computers: parallel vs. serial processing.
Reading is a conditioned reflex. Therefore, it should be anticipated, it appears to me, that learning to read meaning-bearing print such as Kanji, Chinese characters, or whole meaning-bearing sight-words should establish a conditioned reflex to the angular gyrus area in the right, meaning-interpretive, picture, all-at-once side of the brain; learning to read sound-bearing print should establish a conditioned reflex to the angular gyrus area in the left, or sound-interpretive language side of the brain.

However, since we now teach beginning readers in America to regard words as meaning-bearing, sight-word “wholes,” while we simultaneously drill them to sound out only some letters of those words (phony phonics) in order to help in guessing the meanings of the whole words, children are therefore being drilled in the use of opposing reflexes on the SAME stimulus at the SAME time, something which occurs in no other activity. The resultant conflict is one of the probable causes for the reading disability known as “psycholinguistic guessing.”

Not surprisingly, laboratory studies, such as by Davidson, Perl and Saron reported by Daniel Goleman in the New York Times Magazine on May 12, 1985, show that young American readers today can read alphabetic print with BOTH SIDES of the brain. They are unlike the classic aphasic patients, most of whom would have been elderly and have learned to read before about 1826 or in non-English-speaking European countries teaching by “sound,” referred to in William James’ 1890 book on psychology. These patients had lost the ability to read after damage to the left side of the brain. Our modern American subjects are therefore also unlike the Japanese aphasic patients who lost ALL ability to read Japanese sound-bearing Kana print after damage to the left side of their brains.

The fact that reading BY MEANING and reading BY SOUND use opposite sides of the brain can be confirmed further, but indirectly, from some very modern laboratory data in combination with some very old historical facts.

In the act of seeing, research has shown that, when subject matter is being handled by the left side of the brain, the eyes scan from left to right, but when subject matter is being handled by the right side of the brain, the eyes scan from right to left. Sid J. Segalowitz referred to these directions in scanning as “Lateral Eye Movements (LEMs)”, in his book, Two Sides of the Brain, Prentice-Hall, Inc., Englewood Cliffs, New Jersey, 1983, pages 80-81.

A very old historical fact can be used in combination with this laboratory data, and it is the fact that different directions have been used historically in different writing systems. The Latin and Greek alphabets moved from left to right; but Chinese writing and the ancient Hebrew and Phoenician scripts moved from right to left.

It is this writer’s contention that the different directions used in writing systems (left-to-right as in the Latin and Greek alphabets, and right-to-left as in the Chinese system and in the ancient Hebrew and Phoenician scripts) arose from two different “pulls” from the opposite sides of the brain, and that these pulls are demonstrated by what Segalowitz referred to as Lateral Eye Movements. One “pull” from the left-angular gyrus area results in a left-to-right direction for sound-bearing print, and the other “pull” from the right angular gyrus area results in a right-to-left direction for meaning-bearing print.

The right side of the brain should be used for reading meaning-bearing symbols, as it is the right side of the brain which deals with pictures. The question arises, then: why did the Phoenicians write from right to left in their script, since their script was sound-bearing like the Protosinaitic from which it was derived? The obvious answer is that, lacking the vowels, Phoenician could not be read back as sound-bearing syllables but only as meaning-bearing whole words (sight-words). Therefore, with their letters, they could consciously spell - and read back - only meaning-bearing whole words (as in “Th cw jmpd vr th mn,”) but never syllables.
I. J. Gelb explained in his writings, (as in his article “Logogram and Syllabary,” page 334A of Volume 14, in the 1963 Encyclopedia Britannica), that the Egyptian “consonant” signs should not be considered as consonants, because they were really an abbreviated syllable system. “B,” for instance, stood for any syllable formed with b: ba, be, bi, bo, bu, etc. After a thousand years or so, the Protosinaitic script developed out of these Egyptian influences. (See Egyptian Hieroglyphs, particularly page 40, by W. V. Davies, University of California Press/British Museum, 1987, and Cuneiform, by C. B. F. Walker, University of California Press/British Museum, 1987.) It was this abbreviated syllable system which was used in the ancient Canaanite/Phoenician alphabet, and it is presumed it may have developed from the Protosinaitic script.

The Phoenician alphabet, (which could only be used to record words, not whole syllables, since it lacked any vowels), is presumed to have reached Greece about 800 B.C. William A. Mason said in A History of the Art of Writing (The Macmillan Company, 1920, 1928, page 343):

“The early Greeks also may be credited with other substantial contributions to the alphabet. At the time when the earliest known Thera inscriptions were written there already had been evolved out of the Phoenician characters five true vowels: alpha, epsilon, iota, omicron, and upsilon....”

When the Greeks, between probably 800 and 700 B.C., invented the vowels, they completed the alphabet and made it possible for the first time truly to record the sound of speech (which means to record accurately the whole sound of its syllables, instead of just parts of meaning-bearing “words” as in “Th cw jmpd vr th mn.”

Now that writing was purely sound-bearing, it could be read by the left or language side of the brain, understanding (meaning) arising only as a result of the recreation of the sound forms of words, as the Russian D. B. Elkonin described alphabetic reading (quoted in Brian and Joan Simon’s Educational Psychology in the USSR, 1963, page 165.)

It is rather amusing to see what this switch from the right side to the left side of the brain caused in these early writing systems. When vowels first arrived in Greece, writing ceased to move from right to left, but the direction of their writing showed the great puzzlement caused to these ancients by the totally unsuspected “pull” from their brains. They now had to be using the left side of the brain to read their sound-bearing syllabic print, and eye movements dominated by the left side move from left to right. Therefore, they stopped writing consistently from right to left but showed great initial confusion. As William A. Mason said in his 1920 book, page 340:

“Strange as it may seem to us today many queer experiments were tried by the early Greek scribes before they finally adopted the consecutive left-to-right writing of each succeeding line. A strong predilection was manifest for continuous and uninterrupted writing. This was carried out in a variety of ways before the writing became standardized. Sometimes the writing was boustrophedon (Ed.: meaning as the ox plows) with the letters reversed in the alternate lines, sometimes the boustrophedon lines were written in inverted characters, and sometimes the writing proceeded spirally from the middle, at times rightward, again leftward.”

This confusion did not last long, and the ancient Greeks responded to the pull of their brains by switching the direction of alphabetic writing, now that it was sound-bearing and not meaning-bearing, from the left to the right.
Happily, mankind now had a totally syllabic and efficient system of writing which was sound-based. The ancients learned to read this syllabic writing with great ease, as shown by a quotation from Dionysius of Halicarnassus. That ancient Greek, writing about 20 B.C., was quoted by Mitford Mathews on pages 6 and 7 of Teaching to Read, Historically Considered, The University of Chicago Press, Chicago, 1966. Mathews took the quotation from the book by W. Rhys Roberts, Dionysius of Halicarnassus, London, 1910, page 269:

“When we are taught to read, first we learn off the names of the letters, then their forms and their values, then in due course syllables and their modifications, and finally words and their properties, viz. lengthenings and shortenings, accents, and the like. After acquiring the knowledge of these things, we begin to write and read, syllable by syllable and slowly at first. And when the lapse of a considerable time has implanted the forms of words firmly in our minds, then we deal with them without the least difficulty, and whenever any book is placed in our hands we go through it without stumbling and with incredible facility and speed.”

Yet at that time no separation existed between the written syllables which were generating syntax as they were read aloud. (Oral reading was the norm as late as the time of St. Augustine of Hippo in the fourth century. W. J. Frank Davies quoted St. Augustine’s surprised comments on seeing St. Ambrose reading silently, in Teaching Reading in Early England, Pitman Publishing, London, 1973, page 78.) It was Alcuin, the English monk in the court of Charlemagne about the year 800, who “improved” this ancient system of continuous text by making it standard to show separations between parts of speech, or “words,” which had previously only been done on such things as monuments. What Alcuin actually did was to take the first step to change a sound-bearing system into a meaning-bearing system.
Whole Language: Emancipatory Pedagogy or Socialist Nonsense?

by Patrick Groff

The "whole language" method of reading instruction is a highly popular, yet experimentally discredited teaching innovation. The educational principle that governs it falsely states that students best learn to read in the same informal, natural manner they previously learned to speak as preschoolers. The WL doctrine also erroneously insists that children be empowered to add, omit, and substitute meanings and words in written material—as they individually see fit.

Critics of WL note its appeals to educators to abandon direct, intensive, systematic, early, and comprehensive (DISEC) instruction in a hierarchy of prearranged discrete reading skills. The WL movement protests that DISEC teaching of reading is inhumane; a violation of each child's unique, immutable "learning style"; stifling of teachers' creativity by disempowering them; not "progressive" enough; too technical and mechanical; and hostile to the culture of low-income families.

But WL is misunderstood if it is seen as just a method of reading instruction.

In 1991 education professor Kenneth Goodman, co-founder of the whole language (WL) literacy development movement, edited the Whole Language Catalog. It includes chapters written by leading WL economic/political theorists who sought to convince educators and other audiences of the validity of the political, social, economic, and cultural agenda of WL. The writers made clear that the WL "philosophy," as it is dubbed, views teaching students to read as a prime means to bring about definitive political, social, economic, and cultural changes—of a radically left-wing nature.

The Ultimate Aim of WL Teaching

The DISEC teaching of reading is objected to by the Catalog on ideological (political, social, economic, cultural) grounds. The book emphasizes that WL is more than a sweeping reconstruction of how to teach reading skills; it prepares students to challenge traditionally or historically venerated political and socioeconomic mores or precedents.

The politically active WL teacher uses reading instruction as a convenient vehicle to aid and abet the establishment of socialist goals, policies, values, and ideals. Through bona fide WL reading instruction, students learn how to rise up and challenge "the interests and values of the Anglo, white, middle and upper classes." Harry Giroux proclaims in the Catalog. They are prepared to oppose, writes Michael W. Apple, "the political right of the United States" by being ready to use...
their collective powers to change the world so that democratic [read ‘socialist’] power replaces corporate power.”9 Elimination of the present “economic, cultural, and social policies of business and industry” clearly is the ultimate aim of WL reading teaching.4

In WL terms, for students to be literate in the full and finest sense means they are eager to disrupt the political, socioeconomic, and cultural status quo by committing themselves to a socio-historical reconstruction of society.5 Reading instruction by WL teachers arms students to engage in socioeconomic class warfare, whenever and wherever it is ordained, the Catalog explains. The WL teaching envisioned to that end is given a fetchingly revolutionary title: Liberation/Emancipatory Pedagogy.

Update on WL’s Supreme Purpose

The socio-political agenda of WL, as expressed in the Catalog, was updated in six articles in the summer 1997 edition of the educational journal Reading and Writing Quarterly. Here, seven education professors, all well-known enthusiastic defenders of WL, and a fourth-grade teacher of like persuasion, expanded on what they call “The Politics of Literacy.”

The first argument posed for the need to transform students’ literacy development into political action is that the United States is not “a just and democratic society.”6 Proof of this provocative allegation is the supposed fact that “high unemployment is becoming a permanent condition” in America. It is claimed that unemployed parents are provided only “$208 a month” to “feed a family.” At the same time, the family is “paralyzed by all the variables of pesticides and other chemicals” found in its food. The writers find that the depressed “state of the American economy” has “dampened working class and poor students’ interests” in learning to read.

Also, so much “discrimination” now abounds in the nation that “many Americans” give up hope of finding a job. It thus is deemed outlandish to propose that “individuals must stand on their own”; that is, be expected to show personal initiative and responsibility for their future lives. Even philanthropies “are losing any sense of social responsibility”7 for ameliorating the above evils, the writers complain.

Therefore, DISC literacy development programs are criticized as not having “the power to overcome the effects of poverty and discrimination,” as they are described. As the writer puts it, the goal of reading instruction “should be to educate students for democracy as a means of challenging a status quo in which a relatively small number of people—privileged by their race, class, gender, language, and sexual orientation—control a disproportionate share of society’s social and economic resources.”8 Only “critical literacy” programs suffice in this respect. These are ones that teach students “to work toward a more just and democratic [again, read ‘socialist’] society.” Through the WL version of reading instruction, students are trained to attack the economic “status quo.” Whole language reading instruction acts as the means “to help create the conditions for a more just and democratic society,”9 the author emphasizes. That WL instruction has not yet achieved this goal purportedly is the fault of inadequately dedicated teachers, and not the WL theory.

The second major argument in the articles for using WL for political purposes concerns the conventional definition of reading ability. The historical conceptualization of reading ability was students’ capacity to comprehend precisely the meanings that authors intended to impart.

It is argued, to the contrary, that teaching reading “should be viewed as socializing children into a particular set of social and cultural practices in particular social settings.”10 Educators who object to the validity of this approach are summarily dismissed as “cultural dupes merely acting out extant literacy practices.”

The fourth-grade teacher-author in the Reading and Writing Quarterly describes how certain “social and cultural practices” are developed through WL teaching.11 Her students first were led to be “shocked and angered” by past scenes of apartheid in South
Africa. Then, through the selection of literature, a “connection between racism in South Africa” in the past and “racism and injustice in the United States” in the present was established.

The third prominent argument for employing WL teaching to convey political-economic ideology centers on an attack on standardized reading tests. That assault on those tests is not surprising since they measure how well students comprehend precisely the meanings authors planned to convey and not how well they are “socialized into particular social practices” of a left-wing origin.

The Quarterly writers voice vigorous grievances against the tests: they are “scientific,” statistically sophisticated, and based on “meritocratic principles,” that is, “glorify” competitiveness. Proof that these tests “corrupt the concept of fairness” is that students who score low on them typically are from politically oppressed low-income minority families. These students do not possess “the knowledge required” to score high on the tests and do not have “knowledge of test-taking skills.” Therefore, testing these students signifies a “systematic bias” against them of a “racist” nature. Since it is held that the tests pander to students who are “white, male, middleclass, and American,” scores on them thus “may be more findings of cultural difference [among students] than anything else.”

From the advent of the WL movement in the 1970s, its members have charged that standardized reading tests deliberately project socioeconomically disadvantaged students onto “a trajectory of school-based failure.” The Quarterly writers repeated the common WL outcry that such testing must be abandoned and replaced with “individualized assessment” by bona fide WL teachers. This changeover, if activated, doubtless would work to the advantage of WL’s reputation. So far, all the published accounts of WL instruction involving teacher assessment of students’ reading conclude that it is superior to DISEC teaching. On the other hand, an overwhelming preponderance of relevant experimental research findings conclude the opposite.

The writers’ fourth main argument for the necessity of WL teaching that politically indoctrinates students is that DISEC instruction is expressly designed to “protect the privilege of the upper and upper-middle classes by encoding their values and intentions into school reading practices.” This encoding is said to take place through schools’ adoption of traditional reading instruction textbook series, called basal readers. These series of books are castigated as a dastardly “remote control” device operated by “the upper-middle and upper classes” to “neutralize other peoples’ [the downtrodden masses’] literacies in their efforts to control their lives.” Lower-class and minority students, the writers claim, cannot satisfy the rigorous requirements imposed by the readers, for example, “completing daily assignments and periodic tests,” because they do not reflect these students’ peculiar cultural “intentions and values” and “ways of making sense of [written] text.”

According to the writers, the economic upper-classes induce frustration among students by “design.” Through the imposed adoption of basal readers, the socioeconomic despotism engage in “manufacturing reading failures among their [lower-class] children and hindering their prospects for the future” for jobs with decent wages. As a result, underclass students “doubt the value of who they are and what they do and could know.”

Reflections on the WL Agenda

The WL movement’s contention that certain members of the public school establishment must be authorized to shape the economic, political, and cultural institutions of the nation has distinctive precedents. For example, at the height of its influence in the 1930s, the Progressive Education Association expressed the same ambitions.

However, in light of the abject failure of socialism in the intervening years, revival of claims to its effectiveness, as currently made by the WL movement, takes on a particular distressing tone of déjà vu. The uneasiness one experiences in this regard is intensified by the statistically inaccurate, intensely partisan, and pitifully self-indulgent manner in which the WL theorists construct their argu-
WHOLE LANGUAGE: EMANCIPATORY PEDAGOGY OR SOCIALIST NONSENSE? 43

ment for reading instruction as emancipatory pedagogy.

The scientifically invalid nature of WL reading instruction has been known since its inception. None of its unique principles or novel practices is corroborated by relevant experimental research findings. Whole language thus defends itself with qualitative (nonnumerical, anecdotal, subjective/impressionistic) research findings. A circular form of verification is adopted. Published reports refer exclusively to one another for confirmation.

Complimentary accounts of WL thus are notorious for their practice of the propaganda tactic called "stacking the deck." Any form of evidence that appears to support WL is approvingly displayed. None of the larger bulk of experimental data that finds WL inferior is cited. Examination of the defenses of WL thus leaves one with an eerie sense of disbelief, similar to that experienced in reading documents of Stalin's regime.

The greatest danger of WL's vision of politically oriented reading instruction doubtless lies in its irony. The WL plan, to liberate proletarian students from under the heel of the diabolical business and industrial class, rests largely on a fiction. It depicts a nonexistent society created as a convenient scapegoat for economic problems of the lower class, which in actuality are self-imposed to a great extent. It impetuously plays the "race card" whenever that expedient serves its purposes. It blames the messenger for the message in its aspersions on standardized reading tests.

Thus while it professes to be the savior of abused racial minorities, the WL political-economic agenda paradoxically turns out to be their deceiver. It delivers no demonstrably effective pathways for them to become literate, join in the prosperity of the nation, and actively contribute to its improvement. Why educators loyal to WL appear blind to its weakness in these respects is one of the notable enigmas in the history of government schools.

APPENDIX B

An Annotated, Chronological, Partial List of Beginning Reading Materials Published Before 1880 in Use in America, and Some Related Materials

Nowhere prior to the compilation of the partial bibliographies in Appendices B, C, and D of this history has there ever been published anything approaching even a fairly adequate summary of beginning reading materials in America.

Nor has there been anything definitive published in any other country, for that matter, except for a book published in the Soviet Union in 1974, Ot Asbukilvana Fedorovado Sovremennaug Bukvaria (Russian Primers, 1574-1974), by V. P. Bogdanov. This very large and attractive, heavily illustrated book of 138 pages, covered in white leatherette, has been available at the Library of Congress, untranslated so far as I know and unacknowledged by reading “experts,” for the last twenty years. It is a history in Russian of beginning reading books in the Soviet Union over the last four centuries. I had small portions translated at my own expense about 1980.

Material was published in German in the nineteenth century concerning the general history of beginning reading instruction in German. However, it does not appear to be complete, from the few references I have seen in translation, since it appears to leave out such important influences on German reading instruction as Pascal and Basedow.

The article, “Lecture,” in the nineteenth century Dictionnaire de Pedagogie et d’Instruction Primaire is extraordinary and of great use concerning the developments in beginning reading instruction in French until about 1880, and it does list very many French beginning reading materials. Yet it does not concern any developments after about 1880 and is obviously of little use on American materials.

Concerning books in English covering the periods before 1830, 1820 and 1800, Heartman, Evans and Alston, respectively, compiled bibliographies which contained limited information on beginning reading materials. (The full titles of the works by Heartman, Evans and Alston are given later.) Their lists are only of partial help in identifying American beginning reading materials, although Alston’s which terminates in 1801 is overwhelmingly the most helpful of the three. Yet their listings which name some materials do little or nothing to evaluate such materials.

Furthermore, Alston included in his pre-1801 list of “spelling books” only those beginning reading books which were clearly labeled spellers, thereby leaving out spelling books which carried the title, “primer” instead of “spelling book.” Correspondingly, Heartman, in making his list of “primers,” did not realize that many of the books he listed because they had “primer” in their titles were really only spelling books. Yet spelling books, whether they were called spelling books or primers, were the introduction to reading before 1826 in America, and, for the most part, in Great Britain.

Evans’ extremely long listing of all American materials known to have been published before 1820 contained no break-down into types of publications, such as primers and spellers, which makes his listing extremely difficult and time-consuming to use. Its use is also limited by the fact that it terminated very early, at 1820.

Some other bibliographical references are also of little help, very often being not much more than samplings of materials, and even then the materials are commonly wrongly interpreted. The publication, Early American Textbooks, 1775-1900, which was published by the Office of Educational Research and
Improvement, Washington, D. C., in 1985, is an example of such works, even though it does contain much helpful information.

Other references such as Welch’s and Thwaite’s works, discussed later, intentionally omit almost all schoolbooks, which means they intentionally omitted almost all spellers and primers.

The wildly disorganized History of the Horn-Book by Andrew W. Tuer, first published in England in 1897 and republished by Arno Press, A New York Times Co., New York, in 1979, has a great deal of undigested information. However, it is only of very limited use as a history of beginning reading, and only then if the reader already has a considerable background of information on the teaching of reading.

The inadequacy of Nila Banton Smith’s and Mitford Mathew’s histories of reading have previously been discussed. G. Stanley Hall’s early twentieth century material on reading history matches Andrew W. Tuer’s in its wild disorganization and its inadequacy.

Teaching Reading in Early England, by W. J. Frank Davies, Pitman Publishing, London: 1973, is an excellent source for information on practices until the seventeenth century, but it does not concern materials published after that date. Old Textbooks by John A. Nietz, University of Pittsburgh Press, 1961, however, is of some limited help concerning beginning reading materials in English, as is Susan Steinfirst’s unpublished dissertation, The Origin and Development of the ABC Book in English from the Middle Ages through the Nineteenth Century, University of Pittsburgh, 1976.

Therefore, a great vacuum has existed in reference works concerning the history of beginning reading in English, and particularly concerning the teaching of beginning reading in America. This history and its appendices have been compiled in a painstaking attempt to fill that vacuum for American texts. Even so, it is clearly recognized that this history and its appendices certainly cannot be considered to be complete.

The earliest American appearances known to me of children’s beginning reading materials in use in America before 1880 are shown in this Appendix B, in which texts are listed chronologically. Those after 1880 are in Appendix C, in which American publishers, and not textbooks, are entered chronologically. However, each publishers’ texts are shown chronologically in that publisher’s entries. Appendix D contains all known-to-me American reference works for adults concerning the teaching of reading to children. If any pertinent information has been available on any of these works, comments have been attached on such entries. (Appendix A contains pertinent reproductions from other materials concerning the teaching of reading, and Appendix E is a general bibliography of reference works which have been helpful in compiling this history.)

Some of the texts in this Appendix B are pre-1826 spellers used before 1826 to teach beginning reading, but most are American pre-1880 beginning reading books. A few related materials published before 1880 not used for beginning reading in America are also included.

Where I have been able to examine actual copies of texts, as in the very extensive Harvard collections after 1800, I have given them a code number. Code 1 represented a pure “meaning”-method approach to teaching beginning reading, Code 10 represented a pure “sound”-method approach, and codes in between represented relative mixtures of the “meaning” and “sound” approaches. Code 6 and lower approaches are presumed to produce reading disabilities. I did not examine the pre-1800 Harvard collections of rare texts, but I did examine and was therefore able to code some pre-1800 materials at the Library of Congress and at the New York Public Library.

Of the very many pre-1826 American texts shown in the following list compiled from many different sources, I personally examined and coded 52 different pre-1826 American beginning reading texts. Only
6 of the 52 pre-1826 texts rated Code 6 or lower because they demonstrated a clear attempt to teach with an increased “meaning” emphasis.

However, omitted from that list of 6 pre-1826 texts which were attempting to teach with a greater “meaning” emphasis were 3 other pre-1826 texts which also had low codes. Those 3 texts were omitted because they clearly were not attempting to teach with a greater “meaning” emphasis and their lower codes were only accidental. The first of the three was an inept 1698 book, Pastorius’s, which was clearly attempting to teach by “sound” but which rated only a Code 5 because of its incompetence. The second was an 1822 Code 6 pamphlet which was obviously only meant as a toy book, and not a school book, and which was entitled the 1822 American Primer, Abridged, printed in Cincinnati. The third was an English 1661 text, which was possibly not even used in America, entitled The Fannatick’s Primer. That 1661 text also ineptly attempted to teach by “sound,” but rated only a Code 6. Therefore, these three books only accidentally rated low codes, two because their authors had attempted to teach by sound but were incompetent, and the third because it was not even meant to be a textbook, so those three books do not belong in a list of books which were obviously attempting to teach with a greater meaning emphasis.

Of the six increased “meaning”-emphasis pre-1826 textbooks I examined which rated Code 6 or lower, only three came before 1820: Kneeland’s Code 6 of 1802, Carll’s Code 6 of 1815, and that written by A Friend to Youth in 1819, Code 5. The other three were The Child’s Instructor of 1822, Code 3, the Lafayette Primer of 1824, Code 3 or 4, and the Catholic School Book of 1824, Code 4.

What the above breakdown shows, of course, is that pre-1820 spellers were overwhelmingly “sound” oriented, except for the three associated with two known activists (Kneeland and Carll) and one anonymous 1819 author. The move to “meaning” obviously began to increase from 1820 to 1825, when at least three more such books appeared. Yet, as discussed in this history and as shown by those books on the following list from 1826 onwards which I personally examined and coded, a veritable flood of low-code “meaning”-method beginning reading materials appeared from 1826 onwards. They almost totally displaced the high code “sound”-method beginning reading materials that had been overwhelmingly the norm in America before 1826.

British spelling books in the following listing are omitted unless they were also published in America or had editions that are at least reasonably thought to have been used in America. Nevertheless, it should be noted that a very great number of different spelling books for the teaching of beginning reading were printed in England since just before 1600 until after 1826. The hundreds of editions of spelling books in English up to 1801 on which there are records are almost all listed in Alston’s Bibliography of the English Language, Volume IV, Spelling Books. Alston’s listing includes not just editions in England, but editions in English which were printed anywhere in the world.

Until about 1740, most books printed in English, except for chapbooks, originated in London, and it was not until about 1740 that publishers elsewhere in the English-speaking world became numerous and important. Even after the great increase in American publishing after about 1740, London imprints continued to be widely sold in America until the Revolution in 1776. Therefore, many English spellers were widely imported in America from the seventeenth century until the American Revolution in 1776 when such imports were cut off. A Dilworth speller printed in Lancaster, Pennsylvania, during the Revolution, cited below, refers to the cutting off of such imports as the reason for its publication. Yet some spelling books had been published in America since the seventeenth century and even Dilworth’s famous 1740 spelling book had been published by Benjamin Franklin in Philadelphia as early as 1747. The comment by the American publisher who was publishing Dilworth’s speller during the Revolution seems to confirm that it was the imported British spelling books which had the lion’s share of the American spelling book market before 1776.
Very many of the eighteenth-century spellers which survive in American libraries have London imprints. That fact alone certainly supports the supposition that America depended to a large degree on imported spellers, rather than on domestically printed spellers, at least before the American Revolution in 1776. Some records of such imports survive in advertisements of the eighteenth century, as does a 1632 reference to the importing of a considerable number of horn books for the teaching of beginning reading in Massachusetts. The latter reference was given on page 8 of Beulah Folmsbee’s A Little History of the Horn Book, Boston: Horn Book, 1942, according to Dr. Susan Steinfirst’s interesting unpublished book, The Origins and Development of the ABC Book in English from the Middle Ages Through the Nineteenth Century. (This material was Dr. Steinfirst’s 1976 Ph. D. dissertation at the University of Pittsburgh.) Obviously, however, most imports of such trivial items as horn books and spelling books must have left no convenient records attesting to their existence.

As should be expected, before about 1740 in Alston’s exceedingly lengthy listing of all editions of spelling books known to him to have been published in English until 1801, most spellers were published by printers located in London. Yet, Alston’s listing shows that after 1740 many printers who were located in Scotland, Ireland, and America published spellers. Therefore, before about 1740, the English-speaking world must have been largely dependent on London printers for almost all its schoolbooks, not just its spellers. Benjamin Franklin arrived as a successful printer in Philadelphia shortly before 1740, and he also printed “primers” and spelling books. Franklin was probably representative of the growing class of non-London printers throughout the English-speaking world.

Therefore, the fact that few American-printed spelling books are on record before 1740 obviously does not mean that spelling books were not in wide use in America before that date. It simply confirms that America, like the rest of the English-speaking world, was getting most of its books, including spelling books, from London instead of from local printers before about 1740.

The source for the listing in many cases is included below, usually abbreviated. “L. of C.” is the Library of Congress. “Harvard” refers to Harvard’s remarkable libraries. Other library names are self-evident. “Alston” is Alston’s Bibliography of the English Language, Volume IV, Spelling Books. “Evans” is American Bibliography by Charles Evans, A Chronological Dictionary of All Books, Pamphlets and Periodical Publications Printed in the United States of America from the Genesis of Printing in 1639 Down to and Including the Year 1820 With Bibliographical and Biographical Notes, Volume I: 1639 - 1729 [also later volumes], New York: Peter Smith, 1941. “Welch” is d’Alte A. Welch’s A Bibliography of American Children’s Books Printed Prior to 1821, published by the American Antiquarian Society, Worcester, Massachusetts, in 1972, which book omits almost all primers and spellers but provides much other useful information. Reference is also made to Mary F. Thwaite’s From Primer to Pleasure in Reading, first published in 1963, the revised edition of which was published by The Horn Book, Inc., Boston, in 1972, which also omits most primers and spellers but is nevertheless very useful.

One important source is Charles F. Heartman’s “American Primers, Indian Primers. Royal Primers And thirty-seven other types of non-New-England Primers Issued prior to 1830, A Bibliographical Checklist,” Printed for Harry B. Weiss, Highland Park, N. J., in 1935. However, many of the books Heartman listed are clearly just the New-England-Primer catechism type and are therefore not pertinent for this listing. Only those books listed by Heartman on his list of non-New England primers which appear to have been spellers or beginning reading books, instead of catechisms, are included in this appendix.

Heartman also prepared three very exacting bibliographical checklists on The New England Primer Enlarged, the last of which was in 1934. Heartman’s entries on The New England Primer Enlarged have already been analyzed in this history chronologically and numerically, and discussed at length, since his
painstaking records clearly demonstrate to an unbiased observer that The New England Primer Enlarged only began to come into wide use after about 1760. This fact becomes even more obvious when comparing his early records on The New England Primer Enlarged to the records shown elsewhere on early eighteenth century spellers. Such spellers were obviously in far greater and far older use than The New England Primer Enlarged, because their surviving records are far more numerous.

Yet the fable persists that The New England Primer Enlarged was the text uniformly used in America before 1750 to teach children to read. Because of the general acceptance academically of that fable, the roots of The New England Primer Enlarged are discussed at some length in this appendix. That is despite the fact that The New England Primer Enlarged clearly was not meant as beginning reading material, but only as catechetical material, like The Royal Primer of 1750 and King Henry VIII’s primer of 1545, both of which were clearly labeled for use as a child’s second book, and both of which also carried “review” lessons on the syllabary, just like the New England Primer Enlarged. The Royal Primer of 1750 was meant to be used only after the battledore hornbook also published by Newbery, which fact was clearly stated in Newbery’s advertisement. King Henry VIII’s official primer of 1545 was to be used only after a child had already used Henry VIII’s equally official ABC book, which fact was clearly stated in the king’s pronouncement.

Nineteenth-century purely “ABC” books are also omitted. After the shift from “sound” to “meaning” in the teaching of beginning reading about 1826, elaborate picture books became popular which had an illustrated alphabet and short verses for each letter. Yet these were very different ABC books from the old-style ABC books because they omitted the critically important syllabary which had always been used in teaching by “sound” and which had always been present at the beginning of the old spelling books as well as the old-style ABC books. The purpose of the post-1826 “ABC” books was not to teach reading but only to acquaint the child with the names and shapes of the letters before introducing him to “meaning”-bearing whole words, which whole words a child was expected to remember in the same way that he remembered pictures.

The picture-book alphabets that began to appear after 1826 should not be confused with the centuries’ old ABC books whose purpose had been to teach reading by the “sound” of the syllables, first by teaching children the syllabary, and then by teaching children whole words by the sounds made by their syllables. However, excellent summaries of the nineteenth- and twentieth-century picture-book alphabets have been published which are available in libraries for those who wish to refer to them.

Some of the entries in this Appendix B have only one copy in the records, as far as I could determine, but others have multiple copies of different dates. However, duplicate listings are usually not shown, but only the earliest American date is recorded for each title. For instance, the Fox speller is shown with its earliest American edition in 1702, but Alston lists other American editions of the Fox speller in 1737, 1743, and 1769. Only the 1702 American entry is listed below.

Omitted from this list are the many German ABC books used to teach beginning reading in America. These have been covered exceedingly well up to about 1830 in Walter Klinefelter’s excellent text, The ABC Books of the Pennsylvania Germans, Volume VII of Publications of The Pennsylvania German Society, Breinigsville, Pennsylvania, 1973, which has been discussed elsewhere in this history. Since the German language reportedly was under consideration as the official American language after the Revolution, German-speaking people must have been very numerous in America at that time (presumably largely in Pennsylvania), and the books used to teach their children to read are therefore of historical importance. Klinefelter’s book, however, and a few similar ones, do ample justice to the eighteenth- and early-nineteenth-century German ABC books in America (which taught beginning reading by “sound,”) so there is no need to summarize them here. One of those other useful histories with information on
teaching reading in German in America is Early Moravian Education in Pennsylvania by Mabel Haller, published by the Moravian Historical Society, Nazareth, Pennsylvania, in 1953.

Also omitted from this history are all but one of the Indian primers in the Indian languages. For those who wish to learn more about Indian primers, “American Primers, Indian Primers. Royal Primers And thirty-seven other types of non-New-England Primers Issued prior to 1830, A Bibliographical Checklist,” by Charles F. Heartman, Printed for Harry B. Weiss, Highland Park, N. J., in 1935, did ample justice to these materials printed before 1830 in what is now the United States. Of course, Heartman omitted known Canadian and Mexican materials (and presumably South American materials) published for Indians which pre-date the American materials. Mention has been made in this history of some Mexican and Canadian materials. Heartman referred to a reliable source of further information on American materials for Indians, Dr. Wilberforce Eames’ Early New England Catechisms, a bibliographical account published in Worcester in 1898.

Mary F. Thwaite’s truly excellent book, From Primer to Pleasure in Reading, has been of help in compiling this bibliography, although her book is intended as a history of children’s literature and has little to say about textbooks. Yet “primers” certainly did not “evolve” into “pleasure in reading,” with the passage of time, as her title wrongly implies. Since the title is very misleading, a discussion therefore is in order at this point to distinguish “primers” (by which she meant beginning reading books) from “pleasure,” by which she meant storybooks whose purpose was only to entertain.

The origin of the word, “primer,” has been discussed at length in this history, and at no time did so-called children’s “primers” have the primary aim of giving “pleasure in reading.” Nevertheless, “pleasure in reading” or pleasure in hearing stories has always existed, for children and for adults. It is certain that pleasure in hearing stories pre-dates literacy, since Homer composed his pleasurable stories, which were recited in public orally, long before the alphabet arrived in Greece. Ancient Celtic Irish traveling story-tellers (and those from other countries) memorized hundreds of stories to entertain the public - including children - in oral recitations, centuries before the advent of Christianity. Those oral tales had absolutely nothing to do with teaching literacy.

The title, From Primer to Pleasure in Reading, implies acceptance of the ridiculous notion that children in the past were not expected to take pleasure from reading. Even more ridiculous than that notion is the current widely accepted academic doctrine that, before the Reformation, Europeans did not even recognize the existence of a stage called childhood but instead equated children past infancy with adults. That nonsense was given the most sober and elaborate credence not long ago in a children’s book exhibit at New York City’s main library at Fifth Avenue and 42nd Street.

While Thwaite was most precise in providing corroborating sources in footnotes and elsewhere when she made statements concerning texts from the eighteenth century or later, she was not so precise when she stated that children had not been expected to take pleasure in reading before the eighteenth century. For instance, she said on page 245:

“The tradition of the past lingered after the Reformation in the continued domination of the Church in education and books for youth, both Catholic and Protestant.... everywhere catechisms, works of piety, primers for learning, and manuals of behaviour were the main mental fare provided for the young, long after Gutenberg and his fellows ended the era of the hand-produced book. Entertainment in reading was for long discouraged or condemned.”

Yet she gave no corroboration for the statement, “Entertainment in reading was for long discouraged or condemned.”
Many parents at Christmas, who could afford to do otherwise, unfortunately spend considerably more on clothes for their children than they do on toys. Yet does that mean that those parents condemn toys? Does it not mean instead that they are being what they consider “sensible”? The cost of books was relatively very high in the early days after printing arrived. If parents could find money to spend on books for their children, it was far more likely to go for the equivalent of “clothes” than for “toys.” Nevertheless, that does not mean the parents (or their churches) “condemned” entertainment in reading!

Furthermore, no reasonable person can conclude that children in the late Middle Ages were deprived of stories, any more than children today are deprived of television. Television programs specifically prepared for children are only a minor portion of the television programs children actually watch. Most of the time children watch, and enjoy at their own level, so-called “adult” programs. That fact is implicitly recognized by the very few “adult” television programs which carry a warning that they will not be suitable for children. In the Middle Ages, old tales were the equivalent of our television programs, and the telling of old tales was very alive indeed, for enjoyment by both adults and children. For instance, Thwaite wrote on page 247 about Giovanni Francesco Straparola’s Le Notte Piacevoli, published in Venice in 1550-1553:

“About twenty of the seventy-three tales, taken from many sources, were folk-tales. Among them were versions of Beauty and the Beast, Puss-in-Boots, and other familiar examples.”

These tales were old and widespread long before 1550 when Straparola repeated them in his book. Yet they had only survived because they had been enjoyed by ordinary people, including children, for many centuries. To say that children did not have enjoyable “literature,” meaning “stories,” before the eighteenth century is manifestly wrong.

Thwaite listed children’s books in English printed in England from 1479. Her list omitted foreign editions. Yet, as stated elsewhere in this history, foreign editions of books in English were necessary in the early 1500’s because English printers simply could not meet the demand in England for books. Therefore, there were undoubtedly other books suitable for children available in England besides those she listed. It is even possible there were many of those other books before Henry VIII broke with Rome in 1534 and such imports largely from France were probably curtailed.

The first book suitable for children that Thwaite listed was a book on manners printed by Caxton in 1479, but it obviously was not meant for enjoyment. The second English book Thwaite listed that could have been suitable for children was on page 275, The Historye of Reynart the Foxe, printed by Caxton in 1481. The third was an edition of Aesop’s fables by Caxton in 1484, and the fourth was Le Morte d’Arthur (The Death of Arthur) in 1485 (presumably in English) by Caxton. About 1500, A Lytell Geste of Robyn Hode was printed by Wynken de Worde. Thwaite showed on page 276 that, about 1500, three printers published the popular medieval romance, Guy of Warwick, and in 1517 Gesta Romanorum (Tales of the Romans) was published by Wynken de Worde in English.

Therefore, it seems obvious that reading purely for amusement - by adults or children - was acceptable from 1481 to 1517 for those who could afford to spend money on such “unnecessary” books. (Such Englishmen were undoubtedly a minority). However, after these early entries of purely entertaining storybooks, there were very few like them in Thwaite’s list of books in English for children, all through the rest of the turbulent sixteenth and the whole of the turbulent seventeenth century. It was in that unhappy time that so many people wrongly confused religion with gloom instead of joy, as well they might with their appalling views on predestination. It is hardly surprising that “merry” England ceased to be merry when the butcher, Oliver Cromwell, and his like came on the scene. Cinderella dressed up in the finery given her by her fairy godmother, and dancing till midnight at an elaborate ball would hardly have been to Cromwell’s liking, so Cinderella’s tale and those like it were certainly not going to be widely sold
in England in those days. Yet entertaining books in English suitable for children began to come out once again in the early eighteenth century, primarily in the flood of chapbooks meant for both adults and children, just as the old folk tales had been. Many of those centuries-old folk tales were retold in those eighteenth-century English chapbooks.

France and Spain fared far better, where ugly ideas on “predestination” found fewer adherents, though they found some, as with the heretical French Bishop Jansen. Such ideas presumably influenced Pascal in France when he wrote his gloomy Pensees, and such ideas certainly inspired the founding of the famous, dreary, and joyless Port Royal school. (Curiously, that school usually receives great praise in education “histories.”) Yet how could such joyless “Christians” account for Christ’s very first miracle at the marriage feast of Cana? He changed water into wine for a gathering which had already used up its first supply, and it is recorded that the miraculous wine was very excellent (enjoyable) wine. That certainly seems to put a stamp of approval on virtuous merrymaking and parties, and certainly ought to rout any proponents of “Christian” gloom. The necessary penance of Lent has been preceded for centuries by the merry-making carnival and followed by the elaborate and enjoyable celebrations of Easter. There certainly is nothing joyless about real Christianity.

For instance, some years ago, I was in a restaurant in the evening just outside the world-famous religious shrine of Lourdes. I was struck by the merrymaking, noisy, party atmosphere of the happy crowd in the restaurant. That crowd speaking a jumble of different languages had come from all over Europe on a religious pilgrimage, and they presumably came from farther away as well. The kind of people who made up that merry, religious crowd might be expected to enjoy hearing “pleasurable” stories, if there were nothing morally wrong with such stories. Yet it was the same kind of religious people who made up Western Europe all through the Middle Ages, and they provided the audience for the pleasurable folk tales that it is known were widespread for so many centuries.

Nevertheless, the early eighteenth century “development” of pleasurable stories to be enjoyed by children is wrongly attributed by Thwaite and others to a presumed decline in “religion.” Actually, the centuries-old and wholesome pleasurable element had simply gone underground during the gloomy Puritan-influenced period, and had simply resurfaced in the early eighteenth century as the Puritan influence waned.

“Primers” and pleasurable “storybooks” therefore must be seen as representing two parallel lines of development, instead of the sequential line of development that Thwaite implied. It is true that “primers” or spellers increasingly used stories for reading practice which were entertaining, instead of instructive, and it is true that “storybooks” frequently had a practice alphabet at their beginnings. Yet the two lines of development never melded into one. By the beginning of the nineteenth century, spelling books followed by reading series were displacing the old school sequence which John Locke had described in the 1690’s: horn book, primer, Psalter, Testament and Bible. Stories were used in these reading series after children had been taught to read in the spelling books, yet these readers remained schoolbooks, not storybooks, At the time Locke wrote, chapbooks were spreading, and many had the same old entertaining stories from the Middle Ages, meant only for “pleasure” and having no connection with schooling. The anonymous author of The Irish Spelling Book in 1740 Dublin specifically found fault with such chapbooks which he implied were in wide use, but he certainly did not regard them as schoolbooks. The two strands therefore remained separate, just as they are separate today: one strand was meant for “school,” and the other, the chapbook, was meant only for pleasure.

However, in the listing below, a few pivotal “pleasure” story books are listed because they do provide various kinds of useful historical background.

The list follows, in chronological order.
1643 A Spelling Book, Cambridge, Mass., printed by Stephen Day

(Mentioned in Dunster MSS, Harvard. Not extant. John Clyde Oswald’s book, Printing in the Americas, on pages 57-58, provides information on this first American press in Cambridge and the families who operated it and successive presses. Oswald said that on the death in May, 1649, of Mathew Day, who had been operating the press under the control of his father, Stephen Day, (his father had apparently never been the printer), the successor was Samuel Green, then 34. Samuel Green had been born in England, had come to America with Governor Winthrop in June, 1630, and died when he was 87. Green founded a family of printers which remained in the printing business for nearly 200 years. Very possibly that first Samuel Green was also the ancestor of Dr. Samuel Green who donated so many beginning reading books to Harvard Library in the nineteenth century, which books have been so helpful in the writing of this history. The Green family worked in various colonies and in the states that succeeded the colonies. Oswald said the Green family achieved:

“...a record that, with one exception, the Didot family of France, has never been equaled....”

Samuel Green married twice and was the father of 19 children. Three sons, Samuel Junior, Bartholomew, and Timothy, learned printing from him. The 1697 entry below, published by B. Green of Boston, was presumably published by the printing house of one of the sons, Bartholomew.)

1654 John Eliot’s A Primer or Catechism, in the Massachusetts Indian Language, printed in 1654 by Samuel Green. See the discussion in the 1683 entry on The New England Primer.

The “Fannaticks” were a religious sect of that period in England, mentioned briefly in Samuel Pepy’s diaries because they had predicted the imminent end of the world on a specific date.)

1679 The Protestant Tutor, a spelling book by Benjamin Harris, London, England, and later editions. Also, the completely different 1685 Boston book with the same name which was not a spelling book, also credited to Benjamin Harris.

The dates of Harris’s birth and death are unknown, but library sources report “fl. 1673-1716,” meaning he “flourished” from 1673 to 1716. On page 228 of From Primer to Pleasure in Reading, Mary F. Thwaite lists the 1679 London edition. However, Alston stated it was not the same book as the 1685 Boston text with the same name. Alston listed the 1679 and later English editions of The Protestant Tutor in his list of spelling books, but noted that he was omitting the 1685 Boston book with the same title because it was not a spelling book.

On the title page of the 1685 Boston text appears “Printed by Samuel Green and are to be sold by John Griffin in Boston, 16(85)?”. The title page is mutilated on the date portion of the only surviving Boston copy, but it has obviously been dated by experts to 1685. That 1685 Boston copy is held by the American Antiquarian Society in Worcester, Massachusetts, but copies are available on film in other libraries. Harris had arrived in America reportedly in 1686, and returned to England in 1695, which makes the 1685 Boston date for this uniquely different edition puzzling. Although Harris’s 1679 London book with this title was a speller, and he published more editions of the speller after he returned to
England, the short 1685 tract is only inflammatory anti-Catholic propaganda. It has no alphabet, syllabary or word lists. The first question in the “catechism” at the beginning reads:

A number of other questions concerned the pope, very negatively. The most noteworthy was No. 20:

“Is the Pope’s power [missing portion] from Satan? Ans. Satan Rev. 13.2. [missing portion] gave him his Power and his Sea (sic) and great authority.”

Other questions not mentioning the pope were also anti-Catholic. In no way should this ridiculous “catechism” be compared to that serious earlier work, the Westminster Shorter Catechism. This so-called “catechism” was on the first nineteen pages of the 1685 book, followed by ten pages with the Verses of Mr. Rogers that later appeared in the New England Primer Enlarged, after which section came the word, “Finis.”

However, Nila Banton Smith’s description of The Protestant Tutor of 1685 in her “history” in no way matches the surviving 1685 Boston edition. In her book, American Reading Instruction, on page 18, Nila Banton Smith described The Protestant Tutor:

“The principal contents were the ‘Roman Small Letters,’ the Syllabarium, the Lord’s Prayer, the Creed, the Ten Commandments, John Rogers’s biography and verses, words of from two to seven syllables, the “Proper Names” (from Scripture), a catechism, and other religious selections.”

It also seems unlikely that Smith’s description could be a correct one for the Harris spelling books of 1679 and later which had the title, The Protestant Tutor, and which were on Alston’s list.

In sharp contrast to the fact that a copy of the obscure 1685 Boston book survives, as well as different editions of Harris’s various speller editions published in England with the same title, Harris advertised the New England Primer Enlarged in 1691 but no surviving copy appeared until 1727 when it was published by someone other than Harris or Harris’s 1691 partner, John Allen. That 1727 copy is entered below.

However, The New England Primer Enlarged in its surviving 1727 edition contains the “Mr. Rogers” material from the 1685 Protestant Tutor which is presumed to have been written by Harris, so Harris is therefore also considered to have been the compiler of the New England Primer Enlarged which he advertised in 1691. The Verses of Mr. Rogers were supposed to have been written before “Mr. Rogers”’ execution under Queen Mary in 1555, but since no record of the verses appears apparently anywhere until The Protestant Tutor, and apparently only in its 1685 version, it seems obvious they were written about 1685, presumably by Harris.

The history of The Protestant Tutors and of the New England Primers, and the biographical data on Benjamin Harris, as well as the biographical data on Harris’s 1691-1692 partner, John Allen, are therefore closely entwined. Because of that fact, it is necessary to discuss all of them together.

The make-up of the New England Primer, with its capital-letter alphabets used as a framework for the listing of catechetical material, is reminiscent of Rothschild’s French sixteenth-century supposed “ABC book” which was really a catechism and which has been discussed in this history. That book was listed in the Catalogue des Livres of Baron James de Rothschild (1884 - page 177-179), with the name La Croix de Par Dieu, the French expression for the English equivalent, “Christ’s cross.” The Rothschild French
copy certainly used the alphabet for listing concepts of a religious nature. On the back of the first leaf of the Rothschild copy, the alphabet was shown in red, but it was obviously catechetical in intent, as following each letter was a word for a religious concept: A = Amytie, B = Benivolence, C = Crainte, D = Doulceur, etc. It seems probable that the unsurviving circa 1683 New England Primer which is known to have been registered in England in 1683, during which year Harris was still living in England, was also a catechism in the same “Rothschild” type of format. Like the 1727 New England Primer Improved, the 1683 version probably had precepts in alphabetical order followed by the Our Father, Creed, Commandments, and the Protestant equivalent of the Catholic catechism.

Much of the material in the surviving 1727 primer is gentle, and it appears probable that the gentle material, such as the following, appeared in the earlier 1683 version that showed up in England:

“The Dutiful Child’s Promises... I will love my friends. I will hate no man. I will forgive my enemies and pray to God for them....”

It even appears possible to separate out some of Harris’s “enlargements” to that original 1683 primer by the fact that they are obviously not gentle. That is not surprising, considering the nature of his 1685 Protestant Tutor. For instance, it is almost certain that Harris added the picture alphabet, and it is the picture alphabet that carries the callous verse that has repelled so many people ever since: “The cat doth play and after slay.”

A very interesting series of articles on Benjamin Harris appeared in a London periodical, and they are available on microfilm (New York Public Library *ZAN-3662, Notes & Queries, London, 1932, v. 163, p. 129-133, 147-150, 166-170). The articles by J. G. Muddiman primarily concerned Harris’s activities in England, since he had only spent nine or ten years in America. However, on page 167, the following appeared:

“Harris’s American Newspaper. It has long been known that Public Occurrences Both Foreign and Domestick of Boston, Massachusetts, No. 1, Thurs., September 25, 1690, ‘Printed by A. Pierce for Benjamin Harris at the London Coffee House’ was the first American newspaper.... The paper was suppressed at once... ‘because of passages referring to the French king and the Manquees.’ Turning to the paper itself, the accusation against Louis XIV is found to be an accusation of incest. The other piece of scandal was the story of a body of Indians revolting to the Manquees and being massacred by the French. Thus, for the second time, Harris’s journalistic career had been cut short by his publishing ‘false news.’“

Harris had been put into the stocks before he left England for publishing lies in a newspaper he printed there.

The old Bostonians probably had little liking for either Louis XIV or the French, but outright libelous lies about them in Harris’s Boston newspaper were too much for those old Bostonians, particularly when one of Harris’s lies concerned the unmentionable crime of incest. Therefore, the newcomer and foreigner, Harris, must have been a very visible and very notorious character in the provincial Boston of 1690. It is probably no accident that The New England Primer Enlarged apparently only began to be published again some thirty years after Harris, and probably the very memory of Harris, had faded from the New England scene. It is probably also no accident that Harris’s name appears nowhere on the 1727 reprint.

In the early 1870’s after returning from London, Henry James considered Boston to be an intolerable cultural backwater. Boston must have seemed extraordinarily so about two hundred years before that, about 1686 when Benjamin Harris arrived there from the turbulent London of Samuel Pepys and others. Harris’s opening a coffee, tea and chocolate shop in Boston at that time may well have seemed to those
conservative old Bostonians like someone’s opening a bar and grill to cater to the attendees of a meeting of the Women’s Christian Temperance Union.

What was most notable about Harris’s “enlarged” New England Primer was the inclusion of the startling, ground-breaking alphabet woodcut pictures. However, to the eyes of 1691 Bostonians, those woodcut pictures meant for impressionable children (although boring to us) may well have appeared as real, London-style, worldly decadence, since nothing like them for children (and very likely, not even for adults) had appeared in Boston before. Those woodcut pictures may have fallen into the same fleshly category as all that probably “expensive” coffee, tea and chocolate that Harris was serving up in his very possibly notorious London Coffee House. After all, those old town fathers had come into Harris’s London Coffee House in September, 1690, specifically to pick up and destroy all the lurid newspaper sheets that Harris had put out for sale (and they truly were lurid, even by today’s standards). Yet, probably considerably less than a year later, Harris put out for sale in that very same coffee shop his New England Primer Enlarged, and it contained those startling, brand-new and seemingly worldly woodcut pictures. It therefore does not seem very likely that those old Bostonians would have viewed those unconventional, “entertaining,” woodcut pictures for children in the same kindly light that they did their ministers’ Sunday morning sermons.

In A Bibliography of American Children’s Books Printed Prior to 1821 by d’Alte A. Welch, published by the American Antiquarian Society in Worcester, Massachusetts, in 1972, the following information appears on page xxi-xxii concerning a 1717 American edition of another one of Harris’s books which is very pertinent to the history and which Harris first published in England in 1698.

Welch said that The Holy Bible in Verse, 1717, is the earliest book on the Bible which was published for children. He said it was originally written by Benjamin Harris, but the 1717 edition was probably printed in Boston. It carried a different title than Harris’s original English edition, which was called “The Holy Bible, Containing, The Old and New Testaments, with the Apocryphy. Done into Verse by B. Harris for the Benefit of weak memories.” Welch said that only four American printings of this book exist today, but, from advertisements of the period, he assumed many more than those four printings were made, since the book was apparently very popular. He commented that the 1717 edition is of particular interest, because it included ten of the illustrations that appear in the 1727 (and first surviving) edition of The New England Primer. However, in the 1727 edition, the pictures, or “cuts,” were reversed.

Therefore, some of the alphabet “cuts” in the very first surviving New England Primer Enlarged, that of 1727, were copied from pictures which were identical to those used in the first Boston edition of The Holy Bible In Verse of 1717, except in reverse. Yet, while the 1717 material only had SOME of the alphabet cuts, that 1727 edition had ALL of them, so the 1717 material was NOT the source for the 1727 material. It seems obvious that a paper copy of the original 1691 primer must have been available to the 1727 printers, and the 1727 cuts were made from it. Yet, because they all appeared in reverse, as mirror images, a reversal must have occurred in the process of copying from the original 1691 paper copy to the new 1727 printer’s wood blocks. The comment is made elsewhere that the 1727 printed cuts were poor in comparison to the few cuts in the 1717 book. It is obvious that the copying from the 1691 paper copy must have been very badly done by those 1727 printers, probably because they were unused to the fancy “new” woodcut process which was obviously very rarely done in the American Colonies at that time.

After a lengthy discussion on type imperfections in the 1717 first American edition of The Holy Bible in Verse, which imperfections can be used to identify a printer, Welch said on page 160:

“The cuts furnish further evidence that John Allen published the first American edition of The Holy Bible In Verse, 1717, written by his former partner Benjamin Harris. Whether John
Allen printed the 1724 edition early in 1724 before his death... is not known.... After his death the primer alphabet cuts were acquired by Thomas Fleet as well as some of Allen’s business.”

These comments shed considerable light on the probable history of The New England Primer Enlarged. The original woodcuts most probably were prepared specifically for Harris’s 1691 edition of The New England Primer Enlarged. Furthermore, as Welch’s description of the four surviving American editions of The Holy Bible In Verse made clear, the cuts in the first surviving American edition of 1717 were in good condition, with the lined framework around them in place. Yet in the third edition of 1724, the cuts showed wear. Welch said on pages 160 and 162 concerning that third American edition of The Holy Bible In Verse in 1724:

“The primer cuts are from the same blocks used as in no. 492.1 [Ed.: the 1717 American edition], but portions of the borders are now lacking in certain ones.”

Concerning such wear on cuts, Welch said on page 389, about the different cuts used in a different and far later book:

“This date seems too early, for if 1163.3 were the first edition, it would have all the rule borders in perfect condition, which is not the case.... Even no. 1163.1 has breaks in the border.... On this assumption the conjectural date [ca. 1787] is assigned no. 1163.1. This at least allows sufficient time for the Poupard blocks to acquire the breaks which appear in 1807, no. 1163.9. If the cuts had been used over a period of 32 years, more and larger breaks would be expected.”

Using the same reasoning on the woodcuts that Allen, Harris’s 1691 partner, is known to have used in 1717, their apparently pristine condition in that edition indicates the blocks could not have previously been used in many prior editions of The Holy Bible in Verse or of The New England Primer Enlarged. However, as discussed below, it is the conviction of this writer that The New England Primer Enlarged was published seldom, if at all, between the beginning of 1691 when Harris advertised it and presumably published it with his 1691 partner, John Allen, and 1727 when the first surviving copy was put out by publishers unrelated to either Allen or Harris. That first surviving edition of 1727 came out after Allen’s death in 1724 and Harris’s presumed death in or before 1716.

On page xxiii-xxiv, Welch discussed the rarity and high value of such woodcuts in America in the first half of the eighteenth century. Welch’s comments certainly suggest that Allen would have placed a high value on any woodcuts he might have possessed before 1717:

“While The Holy Bible In Verse (1717) had Primer cuts, early extant American children’s books were usually not illustrated. It must have been a great pleasure to the children of New England when a crudely illustrated little book was available entitled The History of The Holy Jesus. Third Edition (Boston, 1746), which also was in verse. One verse reads:

“The Wise men from the East do come
Led by a shining Star,
And offer to the new-born King
Frankincense, Gold and Myrrh.

“The picture accompanying these verses shows a group of men in Puritan dress, two of them looking through telescopes at a star.”

That is certainly charmingly ingenuous, but it also puts into focus the relative importance of the primer woodcuts which Allen had available to use in 1717. American woodcuts of any kind were very
scarce in that period, even poor ones like the ridiculous but far newer 1746 one mentioned above. Therefore, the primer alphabet woodcuts must have been very rare and valuable printer’s materials in Colonial America when they were presumably used for the first time in the original edition of The New England Primer Enlarged, presumably published jointly by Harris and Allen in 1691.

Who paid to have those 1691 woodcuts made? Did both Harris and Allen split their cost, or did Harris bear the cost alone? It seems unlikely that experienced woodcut artisans would be readily available in the small Massachusetts colony of 1691. Were the woodcuts perhaps ordered from London through some contact of Harris, who had been a printer in England before 1686? Woodcuts were a scarce American commodity as late as 1746, as shown by the above reference, and Welch recorded that those particular primer woodcuts that Allen possessed in 1717 were passed to other printers and used for decades in America after Allen’s death in 1724, but were NOT used in the New England Primer of 1727.

Therefore, does it seem likely that Allen would have paid to have those ten woodcuts (identical to ten in the New England Primer) made solely for his first circa 1717 American edition of The Holy Bible in Verse? It seems particularly unlikely that Allen would have done that, since it is probable those woodcuts had not appeared in Harris’s 1698 London edition, because, if they had, that fact should certainly have been mentioned by Welch. However, Harris IS on record elsewhere for having used woodcuts in an edition of Aesop’s fables that he published after returning to England, but no information is available on those woodcuts. Could they have been the other part of the 1691 New England Primer woodcuts - Harris’s “share”?

Is it not likely that Allen already had those ten primer woodcuts on hand, and had had them on hand, unused, since he and Harris split up in 1692? Is it not likely that Allen finally decided in 1717 to make some good use of those woodcuts, particularly since Harris is presumed to have died in or before 1716 and was no longer around to argue about any use that Allen made of them? If the original 1691 edition of The New England Primer Enlarged had not sold well because of hostility in Boston to Harris, the cuts would not have become worn through heavy use in printing the Primer. When Harris and Allen ended their partnership only a year later in 1692, those expensive alphabet woodcuts may well have been divided between them, or Allen could simply have unilaterally expropriated about half of them, in partial “payment” for his work in the previous year. If Allen did that, his subsequent failure to use the woodcuts for 25 years, until after Harris died, could be explained, because it would mean that Allen did not have a clear, unchallengeable title to those “expensive” commodities.

Yet the actual publishers of that unsurviving 1691 edition of The New England Primer Enlarged are not on record, because the only surviving reference to that edition is Harris’s brief advertisement in an almanac he had published around the end of 1690 or beginning of 1691, in which he said he would be selling the primer in his coffee shop when it was issued in the near future. The almanac, written by Henry Newman, showed a date of 1691, and was entitled News from the Stars... An Almanac... For the Year of the Christian Empire, 1691, “Printed by R. Pierce for Benjamin Harris at the London Coffee House.” Nila Banton Smith and Paul Leicester Ford show 1690 as the publishing date of the almanac, but the only surviving copy at the Massachusetts Historical Society actually shows 1691. Therefore, the almanac was obviously published at the end of 1690 or beginning of 1691, presumably just about the time that Harris went into partnership with Allen. Harris and Allen are known to have been in partnership and to have jointly published in 1691 The Shorter Catechism of The Westminster Assembly of Divines, which has no surviving copy. It is even highly likely that the unsurviving 1691 Westminster Shorter Catechism listed by Evans was actually the last half of the original edition of The New England Primer Enlarged, since the 1727 title of The New England Primer Enlarged ends with the phrase, “To Which Is Added the Assembly of Divines Catechism.”
The advertisement in that 1691 almanac was reproduced by R. R. Reeder on page 25 of his text, and by Nila Banton Smith on page 19 of her text. Evans copied part of the advertisement as his entry for the unsurviving 1691 edition of The New England Primer Enlarged. Microfilm copies of the complete original almanac are available in many libraries in microfilm collections of early American materials. The material read:

“ADVERTISEMENT.

“There is now in the Press, and will suddenly be extant, a Second Impression of The New-England Primer enlarged, to which is added, more Directions for Spelling: the Prayer of K. Edward the 6th. and Verses made by Mr. Rogers the Martyr, left as a Legacy to his Children.

“Sold by Benjamin Harris, at the London Coffee-House in Boston.”

The record does seem to provide the proof on the real history of The New England Primer Enlarged. Harris is known to have been in England in 1683. In that year, two men in England named John Gaine and William Scoresby were selling a book in England called the “New England Primer or Milk for Babes,” which is entered below under 1683. Harris had apparently seen that 1683 New England book which was probably a version of the standard Westminster catechism. It had reached England and been officially recorded there as The New England Primer instead of as a Westminster catechism. That book recorded in England in 1683 would have been the “first impression” of The New England Primer which Harris mentioned eight years later in his 1691 Boston advertisement. As discussed, Harris had previously written a speller in 1679 called The Protestant Tutor. Yet he is also credited as the author of a different 1685 book with the same title, containing the “Verses Made by Mr. Rogers...,” and they became a good part of Harris’s 1691 “enlargement” of The New England Primer.

Therefore, while Harris was in Boston in 1691, apparently earning his living largely by running a coffee shop and selling materials in it which he had published by others (which materials are listed by Evans), Harris incorporated part of his own 1685 material with the circa 1683 standard New England Primer version of the Westminster catechism. Since Harris had already written a 1679 speller, it is not surprising that he also added “more directions for spelling.” However, since the spelling material is short in The New England Primer Enlarged, that certainly indicates the circa 1683 New England Primer must have had even shorter “spelling” exercises and could not have been meant primarily as a spelling book. While Harris’s advertisement mentioned nothing about the alphabet woodcuts and verses, they were probably additions to the 1691 primer also, since pictures in children’s books of that period were so rare.

For that amalgamation, Harris must have had the famous alphabet cuts made, and they would indeed have made his new book a very striking and seemingly salable commodity in his 1691 Boston coffee house. Harris’s new partner, Allen, would have provided the use of his printing press, and very likely Allen would have provided some of the capital. The “enlarged” primer with its fancy and startling woodcuts was published in 1691, but it was very possibly entered in whatever records Evans used under two names, since the title on the primer actually suggests it is composed of two separate books.

The title on the 1727 first surviving edition reads, “New England Primer Enlarged. For the more easy attaining the true reading of English to which is added the Assembly of Divines’ Catechism.” No copy of the Westminster Assembly of Divines’ catechism of 1691 that Evans listed as published by Harris and Allen survives, and no copy survives of the 1691 New England Primer Enlarged that Evans listed as printed by “R. Pierce” who had printed Harris’s 1691 almanac with the New England Primer advertisement. Yet that advertisement had mentioned nothing about the printer of the proposed new primer, so Evans obviously only surmised that the primer would be printed by R. Pierce because R. Pierce had printed the almanac carrying the primer advertisement. Therefore, those two 1691 entries by Evans...
may very well refer to the same book, made up in the exact form of the surviving 1727 primer. The title of that surviving 1727 edition certainly does suggest that it is a compilation of those two separate texts listed by Evans.

However, after the 1691 edition came out, Harris and Allen split up in 1692, and those expensive primer woodcuts may well have been divided between them. Yet that would have made it impossible for either Harris or Allen ever again to issue a New England Primer Enlarged, without incurring the large expense of making up the missing half of the alphabet cuts. After Allen’s death, his old paper copy of The New England Primer Enlarged must have passed to the Boston printing partners, S. Kneeland and T. Green, who published that first surviving copy of 1727. Very crude new alphabet woodcuts are known to have been made up for their 1727 edition, and the cuts were almost certainly made from a paper copy. Therefore, in 1727, The New England Primer Enlarged once again re-entered history, eventually to explode into a trans-Atlantic publishing wonder by the 1770’s.

The above scenario seems a far more likely one than the totally unproved scenario that is extant in academia. Untold thousands upon thousands of New England Primers are supposed to have been printed between 1691 and 1727, but every single one of those primers and every single historical reference to them are supposed to have somehow mysteriously disappeared, even though numerous records and numerous copies of far, far less famous books have survived.

In his book, The New England Primer, Dodd, Mead and Company, New York, 1897, Paul Leicester Ford said Benjamin Harris came to America in 1686 and set up “a book and ‘Coffee, Tee and Chucaletto’ shop.... A year later his imprint reads ‘at the London Coffee House’ and he was [enlisting] the printers of the town to print pamphlets and broadsides for him.... In 1691 he formed a partnership with John Allen, and seems to have set up a press....”

The actual ownership of those 1691 woodcuts may well have become a cause for conflict between the two Boston printing partners, Allen and Harris, since a relatively great sum must have been paid to have them prepared for the 1691 edition. Such a conflict might account for the fact that by 1717 Allen apparently had almost exactly half of the woodcuts (ten of them), in almost brand-new condition. Therefore, Harris may very well have had the other half. [The woodcut alphabet covered only 24 letters.]

The Holy Bible in Verse carried a note:

“The Reader is hereby Caution’d against a little spurious Book, Printed with the same Title as this, and shaped like it, as ignorantly and illiterately as can be, Printed by one Bradford, which Book is partly stolen from the Original first printed by B. Harris, Senior, partly Corrupted, and perverted in its Sense; and generally the Word of God imposed upon with Nonsense, and Inconsistency: so that the real Design of the Author is Abused by such scandalous Imposition upon the Publick. B. Harris, Junior. March the 15th, 1712.”

Was Harris’s son referring to the New York printer, Bradford? Harris had been married before he came to America (which Ford dated to 1686), so Harris’s son who was writing in 1712 was probably at least twenty-nine years old. Before coming to America, Harris had been fined and put into a stock in England for his publishing activities, and Ford recorded that Harris’s wife had tried to defend him. As mentioned, after arriving in Boston, Harris had further trouble with authorities in 1690 for publishing an unacceptable newspaper. Obviously, Harris was a man used to conflicts, and perhaps one of his conflicts was with his 1691-1692 partner, John Allen. After all, theirs was certainly an unusually short partnership.

Some possible explanations suggest themselves. The elder B. Harris’s last clearly identifiable London book came out in 1716 according to Alston, although it is possible that it was published by B. Harris
“junior” and not B. Harris “senior.” Did Harris’s son contact Allen after his father’s possible death about 1716 asking Allen to publish in 1717 an “authorized” American version of The Holy Bible in Verse, to counter the objectionable “Bradford’s” possibly American version? About 1717, did Harris’s son return half of the possibly contested 1691 woodcuts to Allen in some kind of settlement after his father’s death, which would explain why they were almost brand-new when Allen used them in 1717? What is considerably more probable, Allen may simply finally have felt free after learning of Harris’s death to use the half of the contested woodcuts which he may have been holding since 1691. Furthermore, the probably unhappy memory of Harris and the original 1691 use of those woodcuts would have faded in Boston after the passage of twenty-six years. Allen might also have felt free in 1717 to publish Harris’s The Holy Bible in Verse, if Harris was no longer around to make any embarrassing public objections. However, if Allen only had half of the alphabet woodcuts in 1717 in almost brand-new condition, that probably means he could not ever before 1717 have published by himself, without Harris, an edition of The New England Primer Enlarged.
